Allied to the porous stone filters are those of porous porcelain prepared in this country. Porcelain baked at the same low temperature as the porous cups used in electric batteries is, in its efficacy, very much like the stone just described. Under a low pressure, water passing through this substance during one or two days, can become completely sterilized, which is a result superior to that got from the stone filters. Before much water has passed, the bacteria make their way through and multiply somewhat on the passage. This material, as I have thus far found it, of American manufacture, is therefore imperfect, yet is superior to rebaked porcelain in the single important respect that it is not brittle, while the rebaked porcelain cylinders of the Chamberland-Pasteur filters are quite fragile.

Recognizing the defects of other substances, Pasteur and Chamberland called attention to their filtering cylinders, in which the important element is unglazed, rebaked porcelain. Originally employed to facilitate "cold sterilization" of fluid culture media, the fact that water went through the porcelain without carrying any bacteria with it has caused attempts to popularize its use. Inasmuch as some bacteriologists on both sides of the Atlantic had reported that this filter prevented the passage of bacteria, I was careful to use only selected cylinders without flaws, and did not omit any precaution to prevent the introduction of contaminations.

(To be continued.)

ADJUSTABLE PIANOS.—It is reported that a Dr. Eisenmann, of Berlin, has invented a piano which by the aid of electro-magnetism can sustain, increase and diminish sound. This has been attempted by other experts, notably Boehm, the inventor of the metal flute. Another novelty will be that by moving the electro-magnets the timbre of the tone is changed; for example, from that of a violoncello to a piccolo. If true, we shall probably hear more of this novelty anon.

A LARGE CORPORATION.—The total miles of wire controlled by the American Bell Telephone Company is 145,732, of which 8,000 are under ground. The total number of employees is 6,132, and the total number of subscribers 158,732. The statement of the treasurer shows that the earnings from all sources, last year, were \$3,453,027.70, and expenses \$1,242,430.89, leaving the net earnings \$2,210,596.81. The dividends paid during the year, 16 per cent. on the capital stock, amounted to \$1,568,326.

SIMPLE TYPE-WRITER.—A newly patented type-writer dispenses with the inked ribbon and is greatly simplified in other ways. With the exception of the roller or platen and the keys, the machine is entirely of metal, yet it weighs only sixteen and a half pounds. There are only nine springs used in its construction. Alignment is secured at the point of printing instead of depending upon the accurate adjustment of the type-bars. The ink is in the form of a pad, making a ring around the type-bar basket at its top. Against this pad the face of the types rests at all times except when in the act of printing. The pad is said to contain ink enough for ten to twenty times as much writing as a ribbon. The type-carrier and the guide carry complementary bevels, which serve to preserve the alignment of the type. The height of the face of the type from the beveled shoulders is not exactly the same in all cases, but is varied to secure uniform impression with a uniform touch on the keys. The types can be quickly removed or replaced, and the carriage with the platen roll can be readily removed, thus allowing of the use of two or more carriages.

DIET IN DYSPEPSIA.

WHAT FOOD RELIEVES INDIGESTION AND WHAT TO AVOID.

There is probably no question more frequently asked the physician, nor more important to answer than "What shall I eat?" It is fortunate that we can now give a pretty satisfactory reply. Laborious investigations have very accurately classified the various articles of our food according to its chemical constitution and physical characters, and physiology very plainly and attractively points out how each and every one of these different kinds are effectively attacked and digested by the secretions with which the alimentary canal is successively flooded. We not only know how many ounces of meat, bread, butter, water, etc., is required for the healthy maintenance of the human being at any given age, but have elaborate table of the amounts and relative proportions of carbon, hydrogen, oxygen, nitrogen, etc., requisite for the same end, and painstaking and painful experiments by the score are recorded wherein it has been proved that man cannot long survive upon a pure diet of any one of the proximate principles of his body. In fact, the physiology of nutrition has now been brought almost to the condition of an exact science, so far as what takes place in a healthy individual is concerned. Under a normal state of affairs it never occurs to one, when he is hungry, to calculate the relative proportions of albuminoids, carbohydrates and hydrocarbons in the dishes before him. Instinct teaches him to so regulate his appetite as to adapt the supply to the physiological demand. This is what the lower animals do, and it is what we do when, as Herbert Spencer says, "we are in perfect harmony with our environments." Here is the trouble. Our physiological organism is out of tune with the concert pitch which characterizes the requirements of modern business and pleasure, and we feel confident that our readers will bear us out in the statement, that one of the first evidences of this discord will be manifest in the digestive organs. Right now, if we are on the alert, subsequent serious and fatal degenerations can be averted. The manifestations of derangement are generally flatulence, a sense of weight in the stomach, gastrodynia, palpitation, nausea, constipation, dizziness, hypochondria, and many other familiar symptoms. The books classify these features into a variety of forms: nervous, atonic, and acute dyspepsia; but we doubt whether any such arrangement would modify the dietetic treatment. To comprehend these symptoms, it is necessary, of course, that the physician should be familiar with the physiology of digestion, and of the chemical characters of the various classes of food. That sugar, fats, and starches by means of organisms swallowed with them are all fermentable and convertible into irritable gases and ichorous acids, which not only distress by their physical presence, but hinder the normal processes by their chemical properties. A patient presenting such symptoms should immediately be put upon a natural plan of living. It will not do to put him off with general instructions to eat and drink "what agrees with him." The general catarrhal condition of his mucous membranes, of which he now complains so much, can best be cured by copious draughts of hot water before meals. Antiseptic and astringent sprays to the upper air passages may be necessary, but our experience and belief is, that the whole track will clear up when physiological life is resumed. Washing out the stomach is rarely called for, except in extreme cases. Then the diet should be strictly according to the following table:

MAY TAKE

SOUPS, ETC.—Thin soups, beef tea, broths.

FISH.—Raw oysters.

MEATS.—Beef, mutton, lamb, chicken, game, venison, chopped meat, meat pulp.

EGGS.—Poached, soft boiled, raw or whipped up with water and liquor or wine.

BREAD AND FARINACEOUS ARTICLES.—Bread sparingly, corn bread, rice cakes, stale bread and butter, macaroni, sago, tapioca, dry toast.

VEGETABLES AND FRUITS.—Green vegetables, such as spinach, turnip tops, cresses, salads, celery, sorrel, lettuce, string beans, dandelion, chicory, asparagus, oranges, ripe peaches and pears,

DRINKS AND LIQUIDS.—Water, abundantly; hot water, an hour before meals; koumiss, buttermilk, milk and lime water, milk and seltzer, tea, claret, dry wines.

Thoroughly masticate all foods.

AVOID

Rich soups, all fried foods, veal, pork, hashes, stews, turkey, sweet potatoes, all starches and saccharine articles except as allowed, all gravies, made dishes, sauces, desserts, pies, pastry, puddings, ice cream, sweet wines, malt liquors, cordials, uncooked vegetables, white potatoes, cooked oysters.

In addition it will be necessary to give thirty drops of dilute hydrochloric acid together with about ten grains of a good pepsin after meals, and the bowels should be kept open. The great difficulty will be to hold the patient to the strict diet. In order to obtain success, however, this must be done, and in the majority of cases the result will fully justify the effort. Of course the above table can be gradually extended or modified to meet peculiar conditions. But as it stands, we submit it as having served admirably in a type of cases most of which were hitherto unmanageable.—*Dietetic Gazette.*

CITY PERILS.

THE DAILY RISKS ENCOUNTERED ON THE STREETS OF THE METROPOLIS.

A lively statement of the perils a wayfarer in the streets of New York encounters, is given by the *Albany Law Journal*, and under a humorous cover the writer tells some forcible truths. Thus, after describing the dangers incident to winter, he says: "Instead of snow-balling there is the base-ball nuisance, maintained by small boys, without pay, in imitation of men who play ball for salaries larger than those allotted to most of the judges. Instead of coasting or 'bobbing,' there is the swift and stealthy bicycle, as deadly as the ancient war chariot, running people down, or at least causing the nervous man to jump to one side like a tarantula. Then a school of sweet little girls on roller-skates swoops down upon us, making it dangerous to turn either way, and compelling us to stand still and see our salvation. Our neighbor's coal-hole is open or insecurely covered, and one leg slips in or both heels fly out, with woe to brittle bones. There is the peel of orange or banana dropped upon the flagging in disregard or defiance of our statute in that case made and provided. There is the danger of the whip-lash, flourished by the profane driver of an over-freighted wagon, or stuck out at conventional right angles over the sidewalk by the liveried lackey upon the carriage box, threatening loss of eyesight, or a mark on the cheek like a sabre slash in a German student's duel. We bruise our legs in climbing over skids stretched across the walk, or we barely dodge a box or barrel, or one of those pasteboard safes, spoken of by the funny man of the *Times*, falling from a hoistway. A rickety sign endangers our head or a low wire our thought. We stop to chat with a friend and lean against a deadly-charged electric pole and it is all over with the conversation. A passing plumber burns our coat with his unextinguished hand-furnace. A passing carpenter lacerates our trousers with a saw; a passing porter imperils our head with a long piece of gas-pipe on his shoulder. One is annoyed if not endangered by the servant washing the sidewalk by a hose, or a fireman carrying his wriggling serpent up a ladder. A fresh young Italian maid from Cork, with a white muslin nightcap on her head, runs us down with

a baby carriage, scarring our shins or necessitating a visit to the chiropodist. Then there is the woman's umbrella that wasteth at noonday, scooping us up after the manner of a drag net, or impaling us in its blind and headlong charge. All these are sidewalk perils. If we undertake to cross the street dangers multiply. The pedestrian has no rights which the driver is bound to respect, and the footfarer, unless a handsome woman personally conducted by a big policeman, will be subject to being run down by the driver of a beer wagon, or a physician in a hurry, or the chief of the fire department on his 'golomping' way to a conflagration, or a coroner intent on beating a rival, or a belated voter standing out till the last moment for his price, or even a hearse on its business way back from the grave. Runaway horses are another source of midway perils, and so are wagons turning around corners with long irons or beams projecting from behind. This list might, perhaps, be increased, but these common instances show that man walks the city amid perils scarcely less than those of the desert, the sea, the forest, or even the battlefield; almost as deadly as those encountered and enumerated by St. Paul. Most of them, indeed, are 'perils by false brethren,' against which the injunctions and penalties of the law are futile. To avoid misapprehension, we will add that these lines are not written in the interest of any particular accident insurance company."

AMERICAN LARD.

OFFICIAL ENDORSEMENT OF COMPOUND LARD IF SOLD WITHOUT MISREPRESENTATION.

The fourth of the Agricultural Department's bulletins on the subject of food adulterations pertains to lard and lard adulterations, and is the work of Prof. H. W. Wiley, chemist of the Department. It is probably the most complete discussion of the subject ever presented. Prof. Wiley has won public confidence by the candor with which he has reported on the sorghum industry and various scientific questions involving commercial interests. As the result of a thorough investigation of lard adulterations, he concludes that the use of adulterants which cheapen the product without rendering it unwholesome is carried on on a very large scale. He finds no confirmation of the charge that adulterants injurious to health are used, and is convinced that this is not the case unless in few instances and to a small extent. Like all other impartial investigators, he reaches the conclusion that the trade in pure and also in compound lard must be recognized, and that each should be conducted under truthful representations. The bulletin, after defining lard, cotton oil, stearine, etc., gives the distinguishing properties of pure lard, which may be summarized as follows:

PHYSICAL PROPERTIES.—The specific gravity at temperature of 35 deg. varies from .903 to .906, and at 100 deg. from .860 to .865; it is distinctively lower than that of cotton oil. The melting point of a pure lard is about 40 deg.; of steam lards about 37 deg. A wide variation from 40 deg. should lead to suspicion. When mixed with sulphuric and nitric acids of proper density pure lard gives only a slight color, varying from light pink to faint brown. The refractive index of pure lard is distinctly less than that of cotton seed oil at the same temperature, the mean number for a pure lard at 25 deg. being about 1.4620. There is a marked difference between the numbers representing the rise of temperature in pure lard and those representing the rise in mixed lard, the extremes in ten samples of steam lards being 38.8 deg. and 42.1 deg., and in two samples of pure lards 37.1 deg. and 46.2 deg.

CHEMICAL PROPERTIES.—The quantity of volatile acid in a pure lard is quite minute. The quantity of fixed acids (non-volatile and insoluble in water) varies from 93 to 95 per cent. The quantity of free acids rarely exceeds 5 per cent. The percentage of caustic potash

REVIEWS OF NEW BOOKS.

ALDEN'S MANIFOLD CYCLOPEDIA, Vol. 12. J. B. Alden, 393 Pearl Street, New York.

In this latest issue of the valuable series to which we have previously taken occasion to refer, the same desirable characteristics present themselves as in the preceding volumes. Comprehensiveness, conciseness, profuse illustrations, typographical excellence and convenience of form are the indisputable features which impart the special value to the *Manifold Cyclopaedia*. The present volume takes the work from *Dominio to Electric Clock*. Among the articles treated at more or less length we notice the following: *Dormant Vitality*, 3 pages; *Drainage* (in *Agriculture*), about 3 pages; *Drama*, over 10 pages; *Dyeing*, 5 pages; *Dye-Stuffs*, about 5 pages; *Ear*, 9 pages; *Earthquake*, 4 pages; *Easter*, 3 pages; *Elipse*, 9 pages; *Education* (including *Military, State and National*, with valuable statistics), 47 pages; and *Egypt*, nearly 24 pages. *Electrical Units*, over a page, embraces the nomenclature recently made by leading scientists, and is here first published in a *Cyclopaedia*. This work is a dictionary as well as a *Cyclopaedia*—a fact which adds greatly to its other merits.

AMERICAN RESORTS, WITH NOTES UPON THEIR CLIMATE.

By Bushrod W. James, M. D., Philadelphia and London. F. A. Davis.

This work, as might be inferred from its title, was prepared specifically for invalids, but it is equally useful to physicians seeking, on behalf of their patients, remedial climates for particular cases. It opens with a brief account of climate as related to the prevention or cure of diseases. The complexity of the elements entering into the formation of climate is well defined and illustrated. Among these elements are temperature, moisture, sunlight, rainfall, air pressure, electricity, soil, configuration of the ground, forests, latitude, altitude, prevailing winds, influence of ocean currents, influence of large bodies of fresh water. All these and more are important factors in producing what we call climate. The character of the vegetation, the character and extent of the forests, the number of villages, cities or towns, etc., all greatly modify climate. It is pointed out that the benefits and dangers of health resorts depend quite as much upon the disease and constitution of the patient as the character of the climate. Suitable surroundings, congenial company, good food, are all factors not to be forgotten, nor are the advantages of a well-lined pocket book omitted from the calculation. The work is both interesting and practical and will fill a useful mission.

EGG LORE.

SOME USEFUL INFORMATION ON A VERY COMMON SUBJECT.

The yolk of egg alone is better for invalids, and will be frequently relished when the white would be rejected. When cream cannot be procured for coffee, the yolk of a soft-boiled egg is a very good substitute. To prevent the juice of fruit pies from soaking into the bottom crust, wash the crust over with a beaten egg before putting in the fruit. When making frosting in warm weather, set the whites of the eggs on ice for a short time before using. If the eggs you have to use for frosting are not quite as fresh as you could desire, a pinch of salt will make them beat stiffer. The white of an egg, an equal quantity of cold water, and confectioners' sugar—triple X—sufficient to make it the required consistency, makes a frosting which is very nice, and, as it requires no beating, is very easily made. When beaten eggs are to be mixed with hot milk, as in making gravies or custards, dip the hot milk into the beaten

eggs a spoonful at a time, stirring well each time, until the eggs are well thinned, then add both together; this will prevent the eggs from curdling. It is often a question what to do with either the whites or yolks of eggs which are sometimes left after making cake, frosting, etc. Either will keep well for a day or two, if set in a very cool place—the yolks well beaten, and the whites unbeaten. Whites or yolks of eggs may be used with whole eggs in any cake or other recipe calling for eggs, counting two yolks or two whites as one egg. Sort out the little eggs and keep them for settling coffee, using the larger ones for cake. When eggs are cheap and plentiful in summer, wash all those used in cooking before breaking. Save the shells, and when a quantity are dry, crush them fine; beat half a dozen eggs well and stir them into the shells. Spread them where they will dry quickly, and, when thoroughly dry, put in a thin cotton bag and hang in a very dry place. In the winter, when eggs are scarce and dear, a tablespoonful of this mixture put in a cup, a little cold water poured over it and left to stand over night, or for a half an hour or so in the morning before breakfast, will answer every purpose of a whole egg in settling coffee. Egg stains can be easily removed from silver by rubbing with a wet rag dipped in table salt. To clean vinegar bottles and cruets, crushed egg-shells in a little water are as good as shot, besides being healthier and handier. To mend broken china, use a cement made by stirring plaster of Paris into the white of an egg. An egg, well beaten, and added to a tumblerful of milk, well sweetened, with two tablespoonfuls of the best brandy or whiskey stirred in, is excellent for feeble or aged persons who can take little nourishment. Eggs are valuable remedies for burns, and may be used in the following ways: The white of the egg simply used as a varnish to exclude the air; or, the white beaten up for a long time with a tablespoonful of fresh lard till a little water separates; or, an excellent remedy is the mixture of the yolk of egg with glycerine, equal parts; put in a bottle and cork tightly; shake before using; will keep for some time in a cool place. For inflamed eyes or eyelids, use the white of an egg beaten up to a froth with two tablespoonfuls of rose-water. Apply on a fine rag, changing as it grows dry; or, stir two drachms of powdered alum into the beaten whites of two eggs till a coagulum is formed. Place between a fold of a soft linen rag and apply. For a boil, take the skin of a boiled egg, moisten it and apply. It will draw off the matter and relieve the soreness in a few hours. To cleanse the hair and promote its growth, rub the yolk of an egg well into the scalp, and rinse out thoroughly with soft warm water. The eggs of the turkey are nearly as good as those of the hen, and that of the goose is about as preferable for most culinary purposes. Ducks' eggs have a richer flavor, but are not as desirable to eat alone; they are, however, as good for all purposes of cookery, and for puddings and custards superior to any. The eggs of the guinea hen are also good for all culinary purposes.—*Good Housekeeping*.

ELECTRIFIED STEAM.—Hemholtz has shown that if an invisible jet of steam be electrified or heated, it becomes visible with bright tints of different colors, according to the potential or the temperature.

EXTREMES MEETING.—Fort Keogh, Montana, has the widest range of temperature of any place on earth. Last summer the thermometer ranged from 120 to 130 degrees above, while recently it marked 65 degrees below zero—a total range of 195 degrees.

DEVELOPMENT OF SEEDS.—According to Schubater, the majority of plants produce larger and heavier seeds at the north than at the equator, and this, according to him, is due to the long duration of the days of summer, and to the long exposure to the sun. Beans carried from Christiana to Dronheim have furnished, in the latter locality, seeds that had gained sixty per cent. in weight. Thyme from Lyons, planted at Dronheim, has gained seventy-one per cent. in weight. On the contrary, the seeds of northern plants, developed in more temperate climates, lose in weight.

used for saponifying a lard is about in the mean 280.33 for pure lards, and 283.45 for steam lards. There is a wide variation between the numbers representing the percentage of iodine absorbed by pure lard and those representing that absorbed by adulterants used in making refined lard. Pure lards treated with a solution of nitrate of silver give no reduction of metallic silver, or at most only a trace of it, and no or only a slight coloration. Under the microscope lard shows a definite crystalline structure, but does not plainly reveal the character of the crystals. The quantity of water in pure lard varies from a mere trace to .7 per cent.

Prof. Wiley then gives the properties of lard adulterants, namely, cotton oil and stearines—lard stearine, oleo. stearine and cotton oil stearine. In reference to other alleged adulterants, he says: "It has been claimed that other substances than those mentioned have been used in the adulteration of lard, but these claims seem to rest on no valid foundation. Among these substances dead hog grease or dead hog stearine is the one most frequently mentioned. Peanut oil and some other vegetable oils have also been mentioned as adulterants of lard. While it may be true that many attempts have been made to use the above substances in the adulteration of lard on a small scale, it is also quite true that such attempts have never attained any importance from a commercial point of view." The total weight of cotton oil used in manufacturing mixed lard is estimated at 120,000,000 pounds a year. In conclusion, Prof. Wiley says: "I have endeavored to set forth in the preceding pages our present knowledge concerning the constitution of pure lard and its adulterations. The question of the wholesomeness or unwholesomeness of the various ingredients has not been raised in these investigations. It is hardly necessary to call attention, however, to the fact that the stearine and cotton oils used in the manufacture of adulterated lard are, so far as known, perfectly wholesome and innocuous. There is every reason to believe these are fully as free from deleterious effects upon the system as hog grease itself. A more serious question which is presented is the effect of selling adulterated lard as pure lard or refined lard. To do this is a fraud upon the consumer. Although it has been claimed by the large manufacturers of refined lard that the term refined is a trade-mark whose meaning is perfectly well known by seller and purchaser, yet it cannot be denied that the meaning of the word refined in the above sense is generally unknown to the consumer. The idea conveyed to the ordinary consumer by the word refined would be an article of superior purity for which he would possibly be willing to pay an increased price. It is gratifying to know that since the investigations recorded above were commenced the largest manufacturers of compound lard in this country have decided to abandon the use of the term refined, and to sell their lards as compound lard or lard compounds, and, in cases where no hog grease at all enters the composition of the article, to place it upon the market as cottolene or cotton seed oil product. In cases before English courts it has been shown that the word 'refined' does not convey to the judicial mind the idea which is claimed for it as a trade-mark, and hence the wisdom of the manufacturers in changing the labeling of their wares is at once manifest. The extensive adulteration of American lards has afforded grounds to foreign countries for prohibiting importation of our production or of levying upon it a heavy duty. By requiring all food products made in this country to be labelled and sold under their true name we could secure for our products immunity from any such exclusion from foreign countries as is mentioned above. The right of foreign countries to levy an import duty on our products is one which we would in no measure seek to abridge, yet by the recognized purity of our exported food articles we should see that they secure a proper entrance into foreign countries. These remarks are not alone applicable to lard and its adulterations, but to all kinds of food products, whether they are to be consumed at home or abroad."

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

May.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant, pigeon, chicken, duck, turkey, goose, snipe,

FISH.—Anchovy, bass, catfish, cod, eels, clams, flounder, halibut, herring, lobster, mackerel, mussels, perch, porgie, rock-fish, salmon, shad, shrimp, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Artichokes, beans, carrots, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, water cress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

GREEN PEA SOUP.—Boil one quart of green peas and one onion in just enough water to cover them till they can be easily mashed; mash and add a pint of stock or water; cook together two tablespoonfuls of butter and one of flour until smooth, but not brown; add to the peas, and then add a cupful of cream and one of milk; season with salt and pepper, and let boil up once. Strain and serve. A cupful of whipped cream added the last moment is an improvement.

HAM CUSTARD FOR BREAKFAST.—Make a custard of one quart of milk and six eggs; add about two cups of finely chopped ham, and salt and pepper to taste; mix meat and custard well together, pour into a deep dish, put little bits of butter over the surface and bake.

EGG PLANT.—Pare and slice an egg plant; lay (the slices) in salted water for an hour before cooking; when ready to cook them, dry the slices with a towel; sprinkle each slice with a little pepper and salt, dust them with flour and fry them in butter; or, after preparing them as above, dip the slices in beaten egg and cover them with grated bread crumbs after which fry them in boiling hot lard to a rich brown color. Drain and serve immediately.

WAFFLES.—Sift together one quart of flour, a teaspoonful of salt, two heaping teaspoonfuls of Horsford's baking powder; beat separately the yolks and whites of three eggs, add to the yolks a pint and a half of milk and an ounce of creamed butter; mix quickly with the flour, then add the beaten whites; heat the waffle iron and grease it evenly—a piece of salt pork is best for this purpose—pour the batter into the half of the iron over the range until nearly two-thirds full, cover, allow to cook a moment, then turn and brown slightly on the other side.

RASPBERRY CUSTARD.—Take half a pint of ripe raspberries, pass them through a sieve, mix it into a pint of milk, in which a dessertspoonful of corn flour has been stirred, free from lumps; beat a large egg thoroughly, mix it with the other ingredients, and set the whole in a stewpan to boil; it must be constantly stirred.

CARAMEL PUDDING.—Put some powdered sugar into a plain copper pudding mould; melt it in the mould so that the inside will be perfectly masked over with the caramel; fill up with a custard of ten yolks of eggs and one pint of cream, flavored with a glass of rum, and sweetened to taste; steam gently for about 40 minutes, and serve without sauce.

CARROT SALAD.—Boil five or six young spring carrots; drain and cut them into narrow strips; arrange them tastefully in a salad bowl; put around them a half pound of cold mutton cut into dice; strew over the dish some chopped celery. Add a plain dressing and serve.

STRAWBERRY ICE CREAM.—Pass a pint of picked strawberries through a sieve with a wooden spoon, add four ounces of powdered sugar, and a pint of cream, and freeze.

SEWED SHOES.

THE DISTINCTION BETWEEN THOSE MADE BY MACHINERY
AND BY HAND.

There are three kinds of sewed shoes. First, those in which the soles are sewed direct to the uppers by the McKay machine—they are usually called machine-made shoes—an acceptable make for all but fine shoes, but not the most flexible, soft and easy. Second, hand-made; which means that the uppers are sewed to a welt and the welt to the sole with the old-fashioned shoemaker's awl and wax-end. Third, Goodyear-welt; which means that the sewing is done by the Goodyear machine exactly the same as by hand; this work can be distinguished from hand work only by its greater evenness and regularity; it is usually called hand-work in shoe stores. Of these three kinds, machine-made shoes are the cheapest and hand-made the dearest. Opinion is divided as to which are the best—hand-made or Goodyear-welt. A merchant, therefore, has to keep them both. But, in our opinion, there is no difference between them; and Goodyear-welt are the cheaper. We expect to see Goodyear-welt take the place of hand-made, just as machine-sewing has entirely crowded out hand-sewing in making uppers; there isn't a stitch of hand-sewing in an upper.

IMPORTED CURRANTS.

THE SO-CALLED CURRANTS ARE SMALL GRAPES.

A frequent error among those interested in cookery is to suppose that the imported articles called currants, used in fruit cakes, mince pies, plum puddings, buns, and the like, are a fruit resembling our own black or red currants dried. In reality, these dried fruits which we call currants are just as much raisins as anything that is offered under that specific name, being only a dried grape no bigger than a common pea, and each bunch but two or three inches long. These little grape bunches are picked and dried in the sun, and are so full of saccharine matter that the exuding sugar crystallizes them into a compact form of sufficient hardness to require considerable strength to open the mass and prepare the fruit for packing, they being then a second time compressed, this time by means of treading with the feet, which processes perhaps account for a great deal of the dirt and gravel usually to be found packed with them. The grapes grow all through the islands and adjacent regions of the Grecian Archipelago, and being exported originally from Corinth, they were called at first corinths, which word was gradually corrupted into currants, till the primitive plant and its fruit was forgotten in remembrance of the little round berry of our own gardens, which might be dried from now till doomsday without developing enough sugar to melt them together as we find the Zante currants melted.—*Harper's Bazaar.*

FIFTY YEARS OF PROGRESS.

WHAT HAS BEEN DISCOVERED IN THE PAST HALF CENTURY.

The last fifty years have probably constituted the most important and intellectually progressive period of human history. Within this half century the following inventions and discoveries have been among the number: Ocean steamships, street railways, telegraph lines, ocean cables, telephones, phonograph, photography and a score of new methods of picture making, aniline

colers, kerosene oil, electric lights, steam fire engines, chemical fire extinguishers, anaesthetics and painless surgery; gun cotton, nitro-glycerine, dynamite, giant powder; aluminum, magnesium, and other new metals; electro-plating, spectrum analysis and spectroscopy; audiphone, pneumatic tubes, electric motor, electric railway, electric bells, typewriter, cheap postal system, steam heating, steam and hydraulic elevators, vestibule cars, cantilever bridges. These are only a part. All positive knowledge of the physical constitution of planetary and stellar worlds has been attained within this period.

BRILLAT-SAVARIN'S MAXIMS.

SEASONABLE SUGGESTIONS IN "THE DECALOGUE OF
GASTRONOMY," DONE INTO RHYME.

I.

Were there no life, the universe were naught;
Life to sustain, apt food must still be sought.

II.

Beasts feed, man eats, the man of cultured sense
Alone gives eating its due eminence!

III.

The fate of nations on their food depends!

IV.

Say what you eat—I'll know your tastes and friends!

V.

Nature compels us all to take a bite,
But softens with the bait of appetite
Her iron rule; obedience she rewards
With pleasures only known at dainty boards!

VI.

Good livers show their judgment in their food.
Why not prefer that which our taste finds good?

VII.

All ages, ranks and climes enjoy good cheer—
A recompense for other goods not here!

VIII.

The first long hour is doubly drear, except
At tables where a knowing *chef* is kept!

IX.

Who finds a planet out, his race may wish
To serve. He serves them who finds out a dish!

X.

A drunkard knows not how to drink; 'tis meet
To say a glutton knows not how to eat!

XI.

First solid foods—then the more delicate!

XII.

Mild wines the first; the heady should come late!

XIII.

To the cloy'd palate's taste no liquor's fine;
So, after several glasses, change your wine!

XIV.

Without the cheese, the dinner's final course
Is like a one-eyed beauty, if not worse!

XV.

Cooking's an art, but genius rules the roast.

XVI.

Promptitude cooks and guests alike should boast!

XVII.

Because one guest is late, 'tis rude to make
The others wait their dinners for his sake!

XVIII.

To an ungarnished board who bids his guests,
His friendship puts to an inhuman test!

XIX.

Post-prandial coffee tests the hostess's skill—
The *pousse-cafe* the host's good taste and will!

XX.

Once in the threshold, every guest should boast
A buffer 'gainst all evils in his—host!

MYSTIC PUDDING.—"I never could understand Browning," said the member of the Dante Club, "but there's nothing difficult about Dante when you once get the hang of him." "Same way with Browning," said the member of the Browning Club. "When I tackled him first I didn't seem to catch on, but he's just pudding for me now."

CHEAP AND POOR.—The Minnesota Legislature prohibited Chicago beef from its State. It is said Minnesota meat is now thin, gristly and stringy. The competition allows the local dealers to buy cheap beef at a less price. Travelers complain about this sort of meat that they get at hotels and railroad stations.—*Buckeye Grocer*, May 9.

POISONING FROM CHROME YELLOW.—Dr. David D. Stewart reports (*Medical News*) seventy-nine cases of poisoning from the eating of cake dyed with chrome yellow. He says, "It is to the point, in this connection, to state that I believe I can trace to lead poisoning from dyed cakes many cases of disease of seemingly obscure or supposed idiopathic origin, seen in the past year and a half of my service in the out-patient medical department of the Jefferson College Hospital. Among these are cases of pronounced anemia, renal fibrosis, peripheral neuritis, spastic paralysis, neurasthenia, obstinate headache, and at least one case of long-standing delusional mania."

ELECTRIC DENTISTRY.

A REPORTED DISCOVERY THAT WILL BE A BOON TO SUFFERING HUMANITY.

Boston people now-a-days have their superfluous teeth drawn by electricity. The process is very simple, scarce any apparatus being required beyond an ordinary two-cell battery with vibrator attachment. This attachment is a thin strip of metal fastened at the ends, which is made to vibrate a thousand or more times a second by the electric current. At each vi-

bration the circuit is cut off and renewed again, the effect being to give a perfectly steady flow of the mysterious fluid. In order to make sure that the flow is quite satisfactory, the operator tunes the machine—assisted by a little reed tuning-pipe—until the strip of metal sings "A." Now, to the battery are attached three wires, two of them handles at the ends, and the third is hitched to a forceps. The patient in the chair is given a handle to hold in each hand, and the current is turned on gradually until it becomes painful. Then he is told to grasp the handle as strong as possible, the electricity—having been switched off for a moment—is turned on again suddenly, and the dental surgeon applies his forceps simultaneously to the tooth. The instant the molar is touched, it, as well as the parts surrounding, become electrified, and absolutely insensible to pain. When it is withdrawn from the socket the subject of the operation feels not the slightest disagreeable sensation. A jerk, and the tooth is out, the patient drops the electric handles, and the painless affair is over.

CONTEMPT OF COURT.

Judges are often, in the estimation of offenders at least, positively vindictive in their infliction of penalties for contempt of court. They seem to elevate, in their estimation, small faults of omission or commission against their mandates almost to the rank of felonies, and, perhaps, were they not restrained by law, might even punish them as such. While it must be admitted that this tendency too often springs from an excessive appreciation of its own dignity in the judicial mind, the resort to excessive punitive measures for wilful disregard of an order of court is not without very high precedent. Nature sets the example. She holds high court in the human body, and no judge is more relentless and severe in enforcing his decrees than is she where there is ap-

parent wilful delinquency. Her rule is gentle to the obedient, lenient to those amenable to proper discipline, but terrible to those who set her at defiance. How mild is the "summons" first served upon us, in early spring generally, but whenever we need it, regardless of season, when we have been transgressing her beneficent laws. It comes, perchance, as a mere feeling of lassitude, depression of spirits, or weariness that is not the fruit of labor. "Spring fever," we say, and put in a "response" in the shape of an alcoholic stimulant, or a plucky resolve to work the harder and not give way to it. Then a "complaint" reaches us. Perhaps a few pimples, a sty or two on our eye-lids, or a boil, may be its form. Our "answer" is some superficial treatment of the affected spots or a violent but valueless purgative, or it may be that we pay no further attention to the matter than waiting, a sort of tacit demanding of "a bill of particulars," for mere purposes of delay. Then we get our particulars with a vengeance. Furred tongue, vile breath, nausea, headaches, pains in the back, constipated bowels, saffron complexion, all these are the items that if we have the sense to read them, sum up an appalling condition of our digestive, assimilative and excretory organs. Each phase of our collective ailments seems serious enough to be regarded as a distinct malady and treated as such; yet, in point of fact, each is but a symptom and cannot be remedied with any degree of permanency unless cure is simultaneously applied to all. But through neglect some of them may be specialized to such preponderating importance that they rise to the dignity of having Latin names of their own—of being made special subjects of treatment, and of serving as excuses for nostrums concocted under pretence of their specific cure. By that time "summary action" on a sort of "supplementary proceedings" has been opened against us in nature's court, and the heads of argument by our medical counsellors are "Bright's disease," "diabetes," "torpid liver," "indurated liver," "enlarged spleen,"

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

ADDRESS ANALYST PUBLISHING CO.,

—19 PARK PLACE, NEW YORK.—

"chronic constipation," "dyspepsia," and other like interesting subjects. Neglect of the summons originally served upon us, and of the subsequent mandatory warnings, has laid us liable to punishment for contempt of court and the great judge, Nature, will not easily let us escape. What, then, is the proper course of a sensible person who finds himself in receipt of even the smallest hint that he has invited the attention of that tribunal? To make his submission at once, and take such steps as will put him on a good footing with the court through atonement for errors past and purging himself of even the shadow of a suspicion of contempt. Delay is the greatest unwisdom. Time here makes small offences great, for there is no such thing as remaining *in statu quo*. One must, when not in perfect health, grow either better or worse. The former is impossible, for unaided nature when once the process of deterioration has set in, and the latter is inevitable. The folly next greatest to delay is in resorting to inefficacious remedies, such as can have, at best, only an impermanent effect upon individual organs, and do not, by comprehensive and potent action upon all together, at once eliminate the cause of disease, restore healthful conditions to the springs of life, and so permanently relieve. The indicated want, when such complaints appear as have been noted, is for a thorough and speedily-acting alterative and tonic medicine, and that which best meets this requirement is Ayer's Sarsaparilla. It is a compound of the best alteratives in the Pharmacopoeia, made more perfectly than would be possible for any individual pharmacists to equal, and has the well-deserved confidence of the medical profession all over the world.

BUSINESS NOTES.

ARMOUR'S BEEF EXTRACT.

THE MOST CONCENTRATED FORM OF NUTRIMENT YET DISCOVERED.

Professor Liebig, in his "Annals of Chemistry," writes on the subject of ordinary beef extracts, with particular reference to his own preparation: "If it were possible to produce an extract of beef at reasonable cheapness, which would contain the albuminoids together with the extractive matter, such a preparation would be prefer-

able to my extract of meat, inasmuch as it would contain all the nourishing substances of the meat. I have declared repeatedly that in the preparation of the extract the albuminoids remain in the residue at a loss to nutrition, and that this certainly is a defect of the extract." It is, therefore, a popular fallacy that home-made soups, bouillon, beef tea, and the ordinary beef extracts after Liebig's formula, contain all the nourishing qualities of the meat; they do not; and such preparations must rank only as stimulants and not as nutrients; they are devoid of the really nutritive substances, for in the methods of their preparation the albumen and fibrine of the meat becomes coagulated like the white of an egg when boiled, and remain unextracted in the residue. The value of such a preparation, containing the most concentrated nutriment in the most digestible form, cannot be over estimated. It is invaluable as a remedial agent in all cases where food is medicine and where the strength of patients must be sustained, while the system with medical aids rids itself of disease; also, when convalescence is established and the system, weak and depressed by disease, needs to be built up by concentrated nourishing diet. Considering the difficulties which had to be mastered in the production of this article, its priceless value as food for patients suffering from severe forms of illness, and its very great usefulness in all cases of anaemia, indigestion, intestinal catarrh, or weakness; considering its purity, fine beef flavor and solubility, we cannot but think that our generation has cause to be thankful for the solution of a great problem by which many lives have already been saved and much distress has been relieved. Such an extract as that just described is now in the market, put up under the guaranty label of Messrs. Armour & Co., of Chicago. It certainly comes nearer the standard of a perfect beef extract than most of those now in the market. Try it.

"KICKING AGAINST THE PRICKS."

Manufacturers of bristle tooth-brushes describe laceration of gums, "scratching of enamel," "injury to fillings," "loose bristles," etc., as resulting from all other "makes" except their own; but forget that "the nature of the beast" does the mischief. What we want is a material which avoids these evils and possesses (as bristles do not) the natural properties to perfectly polish, smooth and cleanse the teeth, as is now supplied by the

Ideal Felt Tooth Polisher. Felt being the best known polisher and a thorough absorbent of the deposits which cause decay of the teeth.

FOR NERVOUS DISEASES.

USE HORSFORD'S ACID PHOSPHATE.

Dr. F. G. Kelly, Alderton, W. T., says: "I have prescribed it in a large number of cases of restlessness at night, and nervous diseases generally, and also in cases of indigestion caused by lack of sufficient gastric juice of the stomach, with marked success, and consider it one of the best remedies known to the professional world."

A SAFE RELIANCE.

"Love all, trust a few," but always trust an Esterbrook Steel Pen for its general reliability. Ask your stationer for them.

PRESERVATION OF MILK.—It is said fresh milk may be preserved indefinitely by freezing it and maintaining it in the frozen state until wanted-for-use. Many of the steamers now sailing on distant voyages are provided with steam refrigerators, in which milk and other foods may readily be preserved for any length of time.

IF YOU ARE SICK and cannot raise your head, use the IDEAL FELT Tooth Polisher

to greatly add to your comfort.

If you are WELL and would enjoy life's fullest blessings, use it to increase your health and happiness. If you live in Society use it to improve your appearance. If you live in Solitude use it to preserve your teeth. If you are Rich it will make you richer. If you are Poor it will save you money.

WHATEVER YOUR AGE OR CONDITION YOU CANNOT AFFORD TO BE WITHOUT IT.

AT ALL DRUGGISTS.

Its Economy. Holder (imperishable) 35 cents. Polishers only need be renewed. 18 (boxed) 25 cents. Dealers or mail.

HORSEY MFG. CO., UTICA, N. Y.

Tabasco Pepper Sauce OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

We Scrub Only with

Because we have found nothing which is harmless, that will make things perfectly clean with so little labor in so short a time; besides, it is economical and makes the work easy.

Do you suppose—that anything could attain such popularity as PEARLINE enjoys, and hold it, without wonderful merit—that people would use it year after year were it harmful to fabric or hands—that the hundreds of imitations are attracted by anything but its wonderful success?

You'll do well to use Pearline—see that your servants use it, and insist that they do not use the imitations which they are often induced to try because of the worthless prize accompanying it, or by the glib and false argument of some peddler.

Remember, PEARLINE is never peddled.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no constructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILLER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, ONLY THREE possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract, and Keppel's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity.

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College. At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alteratives.	Quinine, and Strychia.
MALTINE with Cod Liver Oil.	MALTINE Ferrated.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peptones.	MALTO-VIBURNIN.
MALTINE with Pepsin and Pancreatine.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analysis by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

INVALID'S BEEF TEA

[FLUID.]

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
 ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
 Essentially Different from all other Beef Tonics.

Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

THE BEEF CONTROVERSY.

The uneasy gentry who during the past few months have been exerting themselves so vigorously to overthrow the Western dressed beef industry and the Constitution of the United States, failed to make the impression they aimed at, only a very few State Legislatures having been weak enough to comply with their wishes. Possibly the thwarted schemers may find some consolation in the fact that a committee of the United States Senate will continue during the summer the investigation of the "beef combinations," which, it is claimed, manipulate the meat markets of the country to the detriment of the public. Considering how long the same committee has been at work and how little light it has thrown upon the existence of anything radically evil in the subject of its investigations, it would seem to be a useless waste of the public funds to continue it in so fruitless a quest. The only outcome of their inquiries thus far has been to set forth in more brilliant light than before the advantages which the whole community enjoys through the improved processes and cheapening methods brought into action by

the enterprising men whose combination of capital has made them such objects of spiteful envy. At all events, we trust we have heard the last of the appeals for unconstitutional State interference with which our Legislatures have been belabored during the past few months. If there is anything that needs remedial legislative action, Congress, under its constitutional power to regulate commerce between the States, is the only body that has authority to interfere, and the fact that it has not already done so is *prima facie* evidence of there being no legitimate need for such interposition. The subject is well summed up in the following editorial remarks of the *Commercial Bulletin* of this city: "The Congress of the United States has presumably learned something on the subject of discriminating trade legislation since it passed the anti-oleomargarine law, and will be less likely to be betrayed into another such blunder on the appeals of one interest desiring protection against another. The States, with two exceptions, have shown their disinclination to yield to the appeals made to them for improper legislation, and have left to Congress whatever regulation is deemed necessary. Conditions are favorable to fair treatment of the question on its merits if the Senate investigating committee develops anything that really calls for Governmental interference; but if this inquiry reveals only a continuation of the selfish contest between competitive interests and the petty quarrel between rival Western and South-western cities desirous of advancing their own interests and injuring their competitors by the intervention of Government, then the sooner and the more thoroughly the nature of the contest is exposed the better, for the more fully it is understood the less danger there will be of the success of the effort to pervert the powers of Government to private selfish ends."

BOOK INFECTION.

In many of the European cities extensive investigations are making to prove or disprove the infectiousness of books handled by the sick, such as must of necessity frequently occur in large circulating libraries. The editor of the *Christiania* (Norway) *Sanitary Journal*, in commenting on the subject, remarks that it is the universal pastime of invalids and convalescents to read or look over books, which, if not procurable at home, are brought from some library. Even children are fond of looking at picture books, and the editor relates the following personal experience: "In 1846 an eight-year old brother of my wife was taken down with scarlet fever and died. During his illness he frequently amused himself by looking over a large picture book. This, together with several other of his useful playthings, was packed away in a trunk after his death. Twenty-six years afterward, in 1872, a sister-in-law of mine journeyed across the channel to England, where I was then residing, and with her came the chest and the picture book. On the second day the chest was opened, and the book presented to my two-year old son. Within the next two weeks the little fellow was

taken down with scarlet fever. The doctors who were called in consultation wondered how the disease was contracted, as there had been no scarlet fever in the town for years. The circumstances of the book were called to mind, and the indications were clearly that the twenty-six year old book had retained the poison and communicated it to the child." The process of disinfection now in use in Denmark and Norway, in many of the circulating libraries and book stores, is a good one, and it is claimed to disinfect the books without damaging them in the least. It consists in placing the books fully opened out in a suitable compartment, and subjecting them to dry hot steam at a temperature of over 100 deg. C. for several hours.

FOOD AND FOLLY.

A recent writer on hygienic dietetics says that "the temperature of food and drink should be as nearly as possible the same as that of the blood. Iced water and ice cream are injurious to the stomach, and very hot tea or coffee, especially if followed quickly, is equally injurious." This, as the *National Druggist* vigorously puts it, is a fair sample of the "rot" which passes current as "science" with a certain class, and were it not that it is being copied into journals of some standing, and which should know better, would scarcely be worth noticing. "The idea of drinking water warmed to 98.4° Fahr., "as nearly as possible the temperature of the blood," or coffee or tea cooled down to this most mawkish of temperatures, is too absurd. Ice water and ice cream, like everything else good, become injurious when used injudiciously, but when taken in moderation are not only harmless, but among the greatest of healthful luxuries. The same may be said of hot tea and coffee. Of course it is harmful to "gulp" these articles down, cupful after cupful, as many people do, but it does not need a professor of hygiene and dietetics to tell us that.

BLACK SNOW.

On April 3d there was a general fall of snow throughout the northern part of this State, accompanied in one locality with some phenomenal conditions. For a short time the snow while falling was of a dark color, covering the counties of Lewis, northern Herkimer, southern Franklin, and the north-western part of Essex, and probably Hamilton. From the reports of forty-nine towns it seems that the "black snow storm" extended over a distance of 112 miles in a north-east direction, and southward some thirty miles. The "black snow" fell soon after the passage of the storm centre which crossed the State on the 3d. The snow of darkest color fell, nearly central, over Lewis county. At Copenhagen a panful of snow, when melted, gave a teaspoonful of very fine ashes; and at Saranac Lake about one-half inch of black snow fell over the white snow which preceded it. A specimen of the black snow was examined microscopically, and it appears that the sedi-

DRYDEN & PALMER,
19 Hudson St., New York.

ment collected is finely-divided earth. A comparison of this sediment with that from ashes shows that the snow was not discolored by ashes; which is further confirmed by the large number of vegetable fibres in the black snow, the absence of forest fires to the windward of the region affected, and the close resemblance of the black snow sediment to an artificial sediment made from humus procured near the office of the New York Central station. These facts, together with those which obtained at the time of the passage of the storm centre, made it probable that soil was excavated by some whirlwind, and, after being scattered by the storm, it was deposited over the counties mentioned as the snow was formed.

A GLUT OF ORANGES.

We observe that the newspapers of Florida are calling a halt in the orange planting enterprise in that State. The crop just harvested, which amounted to upwards of three millions of boxes, was all disposed of, not at the most satisfactory prices, but, nevertheless, went into consumption. The orange trees are in blossom and the present prospect is good for a crop at least fifty per cent. larger than the one just harvested. This means upwards of six millions of boxes of Florida oranges. The *Times-Union* estimates that in ten years from to-day, Florida will produce a box of oranges for every man, woman and child living in the United States, say nothing of the quantities that will be produced in California, Louisiana and Mexico. If these facts prove true, people planting orange groves for profit should take warning and investigate the condition of affairs before plunging into deep water. Of course, the above statement will not be heeded by speculators setting out orange groves for the purpose of "booming" real estate. The price at which oranges may sell ten years hence is of little interest to them.

AVOIDABLE RISKS OF TYPHOID.

Dr. Cyrus Edson, of the Board of Health of this city, is quoted by the *Sun* as saying that "typhoid fever is now getting on his robes as the fever king, and though he will not be in full power here till a later period of the summer, he distributes the germs at the opening of the season." The ravages of typhoid are constantly increasing in this city, though Dr. Edson says that it is an easily preventable disease and never infects the atmosphere. He says that the causes of it are polluted water, milk, or meat, and that ice from infected water is a source of danger. It is due to a germ, which can be avoided by refraining from the substances in which it exists. In view of the statements made by Dr. Ed-

son, it is necessary that the Health Board of New York should be vigilant in the performance of its duties at this time of the year.

PIG AND PONE.

AN EDGECOMBE COUNTY (N. C.) BARBECUE.

Editorial Correspondence American Analyst.

BALTIMORE, MD., May 24, 1889.

Barbecues are generally understood to be jovial social gatherings, at which one of the principal features is the roasting of a whole animal. An Edgecombe Co., N. C., barbecue is all that, but in addition it has such peculiarities of its own, that a description of one which it was the writer's good fortune to attend, on May 14th, will be interesting reading. The word barbecue is supposed to be from the French *barbe a queue*, from snout to tail. Edgecombe County is one of the north-eastern counties of North Carolina, being the third county south of the Virginia line and the third west of the head of Albermarle Sound. Tarboro, the county seat, situated on the Tar River, about eighty miles south-west of Norfolk, with which place it will soon have direct railroad connection, is now reached by a fifteen-mile branch from Rocky Mount, on the Wilmington & Weldon division of the Atlantic Coast line, giving it fair railroad facilities and connections to Richmond, Washington and New York, besides which it has two other branch roads running east. It lies in a low, gently undulating plain, scarcely twenty feet above the sea level. Its climate resembles that of France and Italy. The near approach of the gulf stream to the Eastern coast helps to moderate the cold, the average annual temperature of this part of the State being 61 deg., varying from 77 deg. in summer to 44 deg. in winter. The plantations about Tarboro show the effect of this climate in extensive cotton fields, yielding from one-quarter to half a bale to the acre. The celebrated Scuppernong grape grows in abundance here. Situated to the west of the track of Atlantic cyclones, and sheltered by high mountains from the western tornadoes, this part of the State enjoys almost complete immunity from these destructive visitations. It also lies in one of the two areas in the United States where consumption is unknown. The soil is sandy and loamy, of tertiary and quaternary origin, with occasional pine barrens and large tracks of very fertile alluvial soil interspersed. There is also considerable swampy land, with a black peaty soil of great depth and inexhaustible fertility. These soils resemble those of the prairies of the North-western States. Thus situated, it may readily be seen that Tarboro should be a desirable place of residence, as well as a profitable place for merchants. It is both. Wide and level streets, well shaded by elms and red oaks, with great taste manifested by the residents, both in the structure and ornamentation of the houses, as well as in the shrubbery and floral aspect of the surrounding grounds, it bears a striking resemblance to New Haven, the Elm City. With just enough manufacturing to give it a bustling appearance, with busy stores filled with buyers from a large surrounding country, the main street is a relief from the peaceful quiet of the streets more specially reserved for residences. It is to this Edgecombe County, of which Tarboro, just described, is the shiretown, that the barbecues referred to at the outset are peculiar. The one now described was given by the Board of County Commissioners at the County farm, some five miles from the city. A pleasant drive between broad fertile fields and tall stately pines soon brought us to the main building of the farm, the residence of the genial superintendent. A look at this gentleman and his kindly faced wife is enough to assure one that those under their care are not starved nor maltreated, and the appearance and condition of the inmates abundantly corroborate this impression. The majority of those provided for here are colored, and nearly all are either idiots or cripples. The company invited consisted of the County Commissioners and all the

principal county officials, and a more courteous and unaffected body of gentlemen it would be difficult to find. Never having seen such a barbecue, the most interesting thing to the writer was the method of preparation. This was as simple as it was original. Three pigs, weighing from twenty-five to thirty pounds apiece, having been thoroughly washed and split from end to end, were placed on poles across a hot wood coal fire with the flesh side down, and carefully tended by an old colored man who had evidently barbecued pigs for several generations. No flame was to be seen, but hot embers were from time to time added to those in the pit. When the flesh side was thoroughly done, the pigs were turned upon their backs, and after nearly all the grease had been pretty well tried out, and the flesh was well cooked, a basting, consisting of vinegar, salt and black and Spanish peppers, was carefully applied to the inside and cooked in, the thick hide underneath retaining all the juices. Some six hours of this cooking finished the pigs, which were then hashed up and served along with that other favorite southern dish, corn pone. There were other meats, such as chicken, beef and ham, but the guests had evidently come to eat barbecued pig and faithfully stuck to that. There was also splendid wheaten bread, but the pone was the favorite. The guests were assured that barbecued pig never made any one ill, and those who were satisfied by this assurance or by their own previous experiences, did ample justice to the favorite dish of the day, some filling their plates as often as four times. When seen several hours afterwards, none seemed to suffer any ill consequences, excepting perhaps from a slight intrusion of the stomach upon the space allotted to their breathing apparatus. It may be added for the information of Northern readers that not a drop of anything to drink but water and lemonade was to be seen at the festival, and that the whole feast was a remarkable success. Gastronomically, after this our first experience, we can pronounce an Edgecombe County barbecue to be a decidedly toothsome experience.

L.

FILTERING DRINKING WATER.

THE INADEQUACY OF THE AVERAGE FILTER TO PURIFY THE LIQUID.

(Continued from page 242.)

The most satisfactory way of using this for testing was to employ the single porcelain cylinder, within the usual casing, attached to a hydrant system and with a pressure of water varying from six to fifteen pounds. Even with the highest New York hydrant pressure the flow is only drop by drop. It can be used to siphon water out of a jar, and in this way it works nearly as rapidly as when attached to the hydrant in the basement of a house in the centre of this city. By a porcelain cross tube, sold in Paris, two or more cylinders can be siphoning at the same time into the same tube. To avoid risk of contamination, I used for siphoning a single cylinder, to which a bent glass tube was attached by a tightly-fitting piece of rubber pipe, all parts having been sterilized as well as the water by which the flow of the siphon was started. I got germ-free results regularly by this means in seven trials with two cylinders used separately; but, in order to insure this, all the precautions mentioned are necessary as, in the water siphoned in domestic use of these cylinders, bacteria of various sorts are found, yet they are possibly contaminations due to the inherent defects of all such joints as are used. So I have devoted more time to testing these when directly connecting with the hydrant, as very slight precautions are needed, in their use with faucets, to eliminate all chances of contamination. My first thirteen trials of this filter used in this way were under less satisfactory conditions than the fourteenth and those following, as the former were in a laboratory where the available water came under not much more than twenty feet pressure from a tank, and I was not

able so well to control the constancy of this pressure as I was during the later trials. My first sixteen tests of various ones of these cylinders gave sterile water. Then, attached to a basement faucet, with a direct flow from the hydrant under a pressure never exceeding fifteen pounds (except that on Sunday nights it was for a few hours three pounds higher), the filter, after several days of intermitting use, gave over, 3,500 bacteria in each cubic centimetre and all the water examined (two samples per day) for four days showed an increasing number of bacteria. On the third and fourth days after the first passage of bacteria through the porcelain wall of the cylinder the number in each cubic centimetre varied above and below 400,000. The filter was then sterilized by steaming for five hours, as was also done between the second and third series of tests. These tests bore out the results of the former observation.

That these results show that average specimens of this substance have the inherent defect of all filtering material, though in a much less degree than all others, seems to me unquestionable. That the bacteria did not get through owing to some defect in the particular filters which I used is evident from the fact that the cylinders employed (and which were selected by me in Paris as perfect), through which the bacteria passed, are still free from any appearance of a flaw which could explain the passage of these micro-organisms. The same filter which (first of those used in my tests) allowed bacteria to pass through, has repeatedly filtered water free from all bacteria for a few days after each of the several sterilizations which it has since undergone. In three following series of trials of this identical cylinder, bacteria have gone through its walls in from three to four days after each sterilization. They have also gone through a second perfect cylinder with which I experimented. That the bacteria were not introduced by careless manipulation is evident by reason of their number, and because of the fact that, after the filter was sterilized, they were found in each case at a particular phase of each series of tests with the intermittent pressure which only for a few hours once a week was as high as eighteen pounds, and was usually as low as eleven. At the beginning of each series of tests the filter was sterilized. The bacteria was not splashed in from the sink below, for, in the first place, all splashing failed to carry in any, as revealed by testing the water filtered after such experimental attempts to throw water in, and none had ever multiplied inside or even remained there during my first thirteen tests, when there was much splashing in the common sink. During my later trials there was no chance of such contamination.

To answer fully in advance any such objection, I will state that after I got the enormous number of over 400,000 in each c. c. flowing through the porcelain, and had sterilized the cylinder, water was allowed to flow through it and plated, but was sterile in that no bacterial colonies developed. Then, while the filter was in action, I introduced with a sterile needle (from below through the aperture into the inside of the cylinder), and, touching the needle to various parts of the surface, deposited over it peculiar bacteria from a pure culture derived this winter from the water of one of the northern lakes which I examined during my investigations as biologist for the Syracuse Water Commission. The colonies of this bacillus, when growing on gelatine plates, have a peculiar odor, a distinctive green color, and other characteristics which clearly differentiate them from any bacteria ever found in the Croton water. The water flowing out all the while, or rather dropping out, was, three minutes after the introduction of these, collected in sterilized test-tubes and was found to contain 175,000 of these peculiar bacilli in each c. c. After seventy-five minutes there were only fourteen bacilli in each c. c. of the water then flowing through the porcelain, and two hours later, and during the next day, there were no bacteria of any kind in the water which again later in the series showed that the Croton bacteria had passed through with it. This proves that the increase in the number of the bacteria was not after the water

had passed through the substance of the filter. These facts, together with the extreme fragility of this rebaked porcelain, and the exasperating slowness of the flow, which does not improve on long trial, have caused me to modify the recommendations which I gave among my colleagues and others after my first tests of these filters. As regards rapidity of flow and non-fragility, a notable improvement over the cylinder form (which I have just spoken of) is afforded by a series of two or more flat plates of porcelain similarly prepared. In the Varrall-Brise pattern these porcelain plates are backed by carbon plates of the same shape and size and the filter yields sterile water for a long time under gentle pressure, although I do not consider the carbon an advantage. The further such filters vary from the simplest type the greater is the likelihood of the introduction of contaminating bacteria into the filtered water.

Of the various forms of filters used upon faucets, I feel bound to warn against those rotating within an outer shell. Whether packed with charcoal, sand, or any other material, and even if the water go through the filtering mass and not around it, the filter has the great drawback of various irregularities and depressions on the interior which retain organic matter and allow bacteria, both harmful and harmless, to increase in it and maintain their vitality for a longer time than in ordinary filters. This conclusion I am led to by the results of various experiments and observations. In a recent epidemic in a large New England city this form of filter appeared to play an active part in continuing the infection; for cultures, in every respect like those of the germs of typhoid fever, were derived from several of these suspected filters by Dr. Prudden and others. I have found that the typhoid bacillus lives much longer in the sediment collected from filters than in pure water. At its best, this filter cannot remove the bacteria from water, and they multiply in the charcoal or sand, so that, even after several minutes of washing out by the stream flowing from the hydrant, the water coming through this filter may show several times as many as are in the water directly from the hydrant. To avoid waste of time in repetition, I will refer to the facts observed with the sand filter, as the mechanical action of the filtering mass is identical in both. The sand filter, for attaching to faucets, is perhaps the simplest and most popular used. It consists of a cylinder of like breadth and length, being not quite three inches long. It screws by either end upon ordinary faucets, and its interior is filled with crushed silica or fine sand, kept in place by wire-gauze at either end. I have adapted several much larger without securing more satisfactory results. Taking a new one, sterilized throughout, allowing a fair stream of water to flow through it when attached to a faucet, and at the same time taking water directly from the same supply-pipe from the hydrant by means of another faucet by its side, and under the same conditions of pressure and outlet, except that there is no filter upon the second faucet, the water is seen to flow in a free stream nearly as large as from the unobstructed faucet, while the Pasteur filter, attached to the same supply-pipe and with the same pressure, allows the water to come at the rate of only a few drops each minute. Even with a gentle stream through the freshly sterilized sand filter, very few of the bacteria are arrested. With very fine sand in a cylinder holding three times as much as the ordinary one, and a very small stream flowing, I have observed more than fifty per cent. to be retained. This result is seen only in the first use of an absolutely sterilized filter.

Speaking of the tank variety of sand filters, it was shown that moistened sand favored the increase of bacteria brought into it by Croton water which had flowed through. In the sand or other granular contents of these filters attached to hydrants the same multiplication takes place when the water has for some time ceased flowing, and this increase is at a more rapid rate than in water standing in a clean vessel by the side of the filter. The first flow in the morning, for instance,

after the filter has remained unused over night, shows a much larger number of bacteria than the hydrant water then contains. Even after the water has flowed for several minutes for the purpose of washing out the filter, the bacteria are in excess over the number in the original water. After such a filter has had the hydrant steam running through it long enough to wash out all the germs that have resulted from the increase (which complete cleansing is not always producible), the bacteria in the water may appear nearly the same in number as in the hydrant water, varying slightly either above or below. While such filters are worse than useless from a bacteriological point of view, they are good strainers when not clogged by too long use without cleansing. As strainers they are less troublesome than flannel bags (which are as safe as these sand filters for use with suspected water, provided that they are removed at least once a day to be disinfected by boiling). The act of reversing this popular sand filter does not cause the removal of the organic matter upon which the bacteria can be nourished. Only the loose outer portion is thereby removed. Such a sand filter is a safer strainer when never reversible, and it should be cleansed at least once a day when needed at all. Powdered magnesia and other granular substances used instead of sand in the style of filter just described have no superiority over the easily cleansed sand.

(To be continued.)

WHY?—It has been found in experiments at Leipzig that skin grafted from a white to a colored person becomes gradually black, and that black skin grafted upon a white person in time turns white.

EXPLOSIVE MOLASSES.—Petragit is the name of a newly invented German explosive, which is said to be three times as powerful as nitro-glycerine. This powerful explosive is made from molasses.

CHRISTIAN PROGRESS.—It is stated that a German artillery officer has succeeded in making a new explosive from carboic acid; a shell filled with this material possesses a power hitherto unattained. Experiments made with these shells, thrown from mortars, have all, it is stated, proved highly successful.

STOVE VARNISH.—A brilliant black varnish for cooking and gasoline stoves: Asphaltum, two pounds; boiled linseed oil, one pint; oil of turpentine, two quarts. Fuse the asphaltum in an iron pot, boil the linseed oil and add while hot; stir well and remove from the fire. When partially cooled, add the oil of turpentine. Some makers add driers.

TABLE DECORATION.—A neat device for the setting of tables for small parties is to have the table round, with a low basket of flowers in the centre and decoration of smilax reaching out to the edge in each direction, like spokes of a wheel. Each guest has the space between the outer ends of two of the spokes.

A PRETTY NOTION.—At fashionable luncheons now for ladies, egg-nog or some similar beverage is served in the skin of an orange. The pulp and juice are scooped out through an opening made in the top of the fruit, the mixed drink is poured in, and the opening closed by the replacing of the piece of skin cut out. Then it is tied with a ribbon. The beverage is drunk by means of two straws, which, tied together with a bit of ribbon, go with each orange.

ELECTRIC TANNING.—The *Shoe and Leather Review* reports the formation of a company with a capital of \$800,000 in Chicago and New York for tanning by electricity, under a process said to be in successful operation in Sweden, where the invention was discovered. It is claimed that by the electric method leather can be made in four days, while the time usually consumed in this operation now averages five months. A tannery for operating by the electric process will soon be built either at Chicago or Boston, to be managed by a tanner from Sweden who is familiar with the business. Samples of leather said to have been tanned by electricity were examined by the editor of the *Review*, who states they were of good appearance and of sound material.

OLIVE OIL.

WHERE IT IS PRODUCED AND HOW IT IS PREPARED,
AND SOMETIMES ADULTERATED.

The first pressing of the olives yields the finest oil; but this oil, in its natural state, as it leaves the growers' hands, holds in suspension a variable quantity of the minute particles of the fruit, as well as some little water. In this state it is cloudy and turbid, neither pleasing to the eye nor in fit condition for keeping. New oil must be filtered, which is done by passing it several times through layers of carded cotton wool in a suitably arranged apparatus. The raw cotton must be absolutely free from all odor, and the oil in a perfectly liquid state. During the winter, it being the season when most of the olive oil is produced, it is necessary to warm it slightly, which is effected in a pan with a double bottom, or jacket, through which steam passes. If fire were used, the air might be overheated, and "cooked," which would spoil it. When perfectly bright and limpid the oil is pumped into tanks for storage, the tanks being usually built of solid masonry and lined with either marble or glazed tiles. These tanks will hold about 15,000 gallons of oil each. In the tanks the oil remains at an equable temperature, and during the hottest months is kept cool, which is a very important consideration. An erroneous idea is prevalent that fine olive oil is the result of some refining process which renders it fit for consumption. This is not so. Fine oil is the product obtained by pressing sound olives. It cannot be improved by any refining process, and the only thing that can improve it is proper filtering. Olive oil is not like the juice of the grape, which requires a chemical process to transform the sugar it contains into alcohol in order that it may become wine. The oil is then ready made from the fruit, the utmost care having been exercised to extract it just as it was, bursting the cells within which the oil is enclosed. It is not to be supposed that all of the oil produced in any locality is of equal merit and excellence. Qualities vary even in the same locality, and hence the need of a careful selection in order to arrive at the highest possible standard of excellence. An olive farm famed for its product may one year make olive oil of splendid quality and the next year the reverse may be the case. The olive fly is very capricious in its ravages, and the warmer exposure of an olive plantation may lead to all the fruit being ruined by this fly, while not a mile away another plantation in a less sheltered situation may escape such damage. The same is the case with regard to frosts; severe, damp cold may injure the fruit in a low-lying locality, while close by, but higher up, the fruit may be uninjured. Hence, in selecting the finest qualities of olive, it is not by any means sufficient to know in what locality the oil has been grown. The ultimate test of quality is the palate, and to be a good taster of olive oil requires a nice, discriminating palate and long practice. Of course, if olive oil is of dark color, or possesses the least bad odor, it is condemned at once. But even when free from objection on both points, the palate may reveal some fatal defect, due either to the condition of the fruit or the process of expressing the oil, or else the oil may simply be made from an inferior class of olives, and therefore of a second-rate quality. If olive oil of very inferior quality, tainted and rancid, continues to be sold in America as being the very best and paid for proportionately, this can only be because consumers do not taste it in the proper way, by itself, before using it. There is no great difficulty in determining whether olive oil is pleasant to the taste or the reverse. But if in a salad dressing it be overpowered by fiery condiments, bad olive oil may often escape detection. Fine olive oil is not improved by age, like wine. But while inferior qualities become infinitely worse by keeping, the best Tuscan oil, properly kept, will retain its sweetness and freshness for fully two years from the time it was made. It may be remarked that fine oil undoubtedly retains its good qualities longer when it is exported in bot-

tles than in tin cans or casks. Occasionally new olive oil, when bottled early in the season, although most carefully filtered, will deposit a little sediment in bottles. The sediment merely consists of very minute particles of the fruit; though not pleasing to the eye, it ought to be generally known that this sediment has no importance whatever, and proves absolutely nothing against the purity or the excellence of the oil in question. Under the influence of cold, fine olive oil loses its brightness and turns cloudy; often, though it continues to be fluid, flakes are to be seen floating about, the appearance of which in bottled oil has sometimes given rise to unfounded suspicions. The effect of a low temperature is to separate, temporarily, some of the constituent parts of olive oil; hence the flakes. But this natural phenomenon is of no moment whatever; on warming the contents of a bottle in which these flakes are visible, it will be remarked that they disappear and that the oil resumes its brightness. Great scope for adulteration is offered in the number of cheap vegetable oils which can be profitably employed for the purpose, such as cotton-seed, ground-nut, sesame and colza oils. Of these, cotton-seed and ground-nut oils are probably most used, and in Italy cotton-seed oil. To check the practice, a customs duty of fourteen lire per hundred kilograms was imposed in Italy on this oil. Adulteration is not by any means confined to Italy. Seed oils of various kinds are largely imported as well as made in France. There are factories at Marseilles and Bordeaux where oil is extracted from African ground-nuts, *arabides*, of which there is an enormous importation. Not only is this oil used to adulterate olive oil, but it is said to be used to some extent as a substitute for it in packing cheap brands of sardines. In the United States it is a fact that olive oil, imported in casks, is here mixed with cotton-seed oil and retailed as pure olive. In Italy the finer qualities of olive oil are produced in the districts of Bari, on the southeast shore of the Adriatic, Umbria, in Central Italy, Tuscany and Liguria, the latter including the districts of Genoa and Porto Maurizio—the Riviera, it is generally called. The chief olive oil producing districts of France are Nice and Provence (Alpes-Maritimes, Bouches-du-Rhone and Var), the produce of Provence being frequently called Aix oil.—*N. E. Grocer.*

CHAMPAGNES.

AN UNJUST AND UNTRUE COMPARISON.

One of our large dailies has lent itself to an abuse of American wines in the shape of an interview with Mr. G. H. Von Mumm, one of the owners of the Mumm brand. After puffing his personal appearance, titanic proportions and brilliancy as a conversationalist, it puts these words in his mouth. We reproduce them that they may be fully answered:

There is one point upon which he is not an enthusiast, however, and that point is America as a champagne-producing country. He told a reporter the other day that he feared this country would never be celebrated for its champagnes. "I am told," said he, "that there are people here who inject carbonic acid gas into still wines by means of machinery, and call the produce champagne. Such practices are abominable, but they deceive only the ignorant. There are many reasons why your grape-growers cannot produce champagne, the principal one being found in the nature of the soil, which, as you know, has everything to do with the effervescent quality of the wine. In the Province of Champagne the soil is of chalk mixed with silica and light clay and oxide of iron in varying proportions. These properties in the soil give to the grape its effervescent qualities. So far as I have been able to learn, you have no soil of this description over here. Another cause of your failure to produce good wine is the youth of your vineyards and the fact that they are insufficiently cultivated. The older the vine, the better the wine: In a hundred years from now your wines will be better; in a thousand years, good. The vineyards in Champagne are divided into hundreds of very small tracts, each tract having its owner. There are no large vineyards under one proprietor. This fact accounts for

the careful cultivation the vines receive and have been receiving for hundreds of years. Then, again, champagne-making requires long experience and a large capital. The leading manufacturers have on hand in bottles and casks stored away in their cellars thousands of gallons of wines of former vintages. This they must have for "blending" purposes. If, for instance, the wine of this year should be of an inferior quality, we would blend or mix it with a wine of a previous year to give it the desired flavor. A different blend must be made for each market. In America you require a very dry wine, in England a semi-dry wine is demanded, while in Russia a sweet wine is the proper thing. To suit these varying tastes experience is required, as well as a stock of material to carry out its dictates. There is not, as many suppose, a very large profit in the manufacture of champagne. I am told that popular opinion places our profit at about \$10 a case. One dollar is much nearer the mark. There are seasons in which we lose money on every case of wine we sell. This happens when the vintage is inferior. In such cases we must take the wine from the producer whether we can use it for champagne or not, in order to retain their friendship and keep other houses from weaning them away from us. At the same time, because of those who buy our wines, we must keep up its quality by the use of old stock worth many times its weight in gold. The inferior wine we sell for less than it costs us to makers of claret and low wines. The last-named objections to America as a champagne country may be overcome, but the quality of the soil never. You cannot grow a wine in Champagne which will produce Madeira, nor can you produce champagne from grapes grown in Madeira. How, then, can you deem it possible for a man in California to buy a hillside, divide it into two parts, upon one of which he will produce champagne and upon the other Madeira? And yet I'm told they claim to do it."

Mr. Mumm ingeniously tries to convey the untruthful impression that all American champagnes are made effervescent by the addition of carbonic acid gas, while he knows perfectly well that there are several American champagnes which are made precisely as his wine is made, and in the case of one American brand, Arpad Haraszthy & Co.'s Eclipse, with better and more uniform results. He also retails the very old story about California soil, spiced up with the foolish remark that the effervescent quality of the wine depends upon the soil, when every child knows that the natural carbonic acid gas of champagne is the product of the saccharine matter it contains. Then a ridiculous fling at the youth of our vineyards is made to cover up the well-known fact that France was dependent upon our youthful but healthy American vines to replace their effete phylloxera-eaten vines. With an amount of candor, surprising from him, like a grain of gold in a heap of sand, he admits that the champagne manufacturers of Europe do not own vineyards, but depend upon small vine-growers for their supplies for blending, and that when they get inferior wines, as they frequently do, they blend them with better grades, but they all go in. He also admitted that these foreign champagnes are all doctored to suit the varying tastes of different nationalities. The subject of profits on such wines also received attention. A profit of ten dollars a case was strenuously denied, and the allegation that one dollar came nearer the truth is what we are supposed to be gullible enough to believe. How they can afford to maintain expensive salesmen with several thousands dollars a month for treating purposes, pay a heavy bonus to barkeepers on corks and other well-known extravagances on one dollar a case, is evidently like one of Dundreary's puzzles. His final allegation that in California men try to raise champagne on one side of a hill and Madeira on the other is too ridiculous to require notice. To raise such miserable stuff as Mr. Von Mumm admits he uses to blend for his champagne does not need much of a vineyard. Let our German friend take a trip to California and try to look at things as they are. He will conclude that California is large enough to enable us to have a crop of grapes somewhere in its large area that will not need skillful "doctoring" to make honest and non-poisonous champagne.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

May.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant, pigeon, chicken, duck, turkey, goose, snipe,

FISH.—Anchovy, bass, catfish, cod, eels, clams, flounder, halibut, herring, lobster, mackerel, mussels, perch, porgie, rock-fish, salmon, shad, shrimp, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Artichokes, beans, carrots, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, water cress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

OMELET.—Beat well in a basin the yolks and whites of six eggs and two tablespoonfuls of cold water (the latter will dilute the eggs and make the omelet more delicate); then add half a teaspoon of salt, a quarter of a teaspoon of ground black pepper, a teaspoonful of chopped parsley, half a teaspoon of chopped onion, and an ounce of fine butter cut in small pieces; mix well with a wooden spoon; dissolve in the omelet pan two ounces of butter, then tilt at once the beaten up eggs, etc., into it, inclining the pan to the handle for an instant; then shake the omelet into the center, turn up the right and left edges, and fry quickly about five minutes; the exact time cannot be given, as it will greatly depend on the force of the fire and the size of the omelet.

OYSTERS A LA POULETTE.—Put two dozen nice large oysters to cook in their own liquor, allow to just come to boil, or as soon as the oysters are plump, remove (having salted them in the liquor). Skim the liquor thoroughly, add an ounce of butter, half a pint of rich milk and a tablespoonful flour (first stirred smooth in a little of the milk), and a squeeze of lemon juice, more or less as you like. Let come to boil, and just as you remove from the fire add two eggs, well beaten, and a little chopped parsley; pour over the oysters and send to the table.

ASPARAGUS CREAM SOUP.—Take a bunch of asparagus and boil it till very tender; cut off the heads, press them through a sieve; put the tender stalks into a colander, and mash as much as you can of them through. Add a quart of sweet milk and a lump of butter, or half milk and half cream; season with pepper and salt; thicken a little with flour and water if desired; boil up and serve with dice of toast.

TROUT.—Scale, gut, clean, dry and flour; then fry them in butter until they are rich clear brown; fry some green parsley crisp, and make some plain melted butter; put in one teaspoonful of essence of anchovy and one glass of white wine; garnish, when the trouts are dished, with the crisped parsley and lemon cut in slices; the butter may be poured over the fish, but it is most advisable to send it in a butter tureen.

STEWED BEANS.—Boil them in water in which a lump of butter has been placed; preserve them as white as you can; chop a few sweet herbs with some parsley very fine, then stew them in a pint of the water in which the leaves have been boiled, and to which a quarter of a pint of cream has been added; stew until quite tender, then add the beans and stew five minutes, thickening with butter and flour.

STRAWBERRY ICE CREAM.—Mash a cupful of sweet strawberries with enough powdered sugar to make them into a thick syrup, and let them stand for a while; make

a half-pint of custard, with a cup of milk and one egg; let it cool, and to it add one pint of sweet cream, sugar and vanilla. Put this into the freezer; pack and freeze till it is like snow; open the freezer, add the strawberries and freeze till stiff; take out the dasher, pack, and let it stand for an hour, when it should turn out in a solid mould.

LEMON CAKE.—One and a half cupfuls sugar, one cupful butter, two and a half cupfuls flour, five eggs (yolks and whites beaten separately), four teaspoonfuls sweet milk, two scant teaspoonfuls Horsford's baking powder; bake in layers. For Jelly—One coffee cupful sugar, two tablespoonfuls butter, two eggs, juice of two lemons; beat all together and boil till it is like jelly; oranges may be used instead of lemons.

LICORICE ROOT.

WHERE IT COMES FROM, AND HOW IT IS PREPARED.

Nearly three million pounds of licorice root arrived at the port of New York during one week, recently, from Smyrna. The largest share of licorice now comes from Asia Minor, one American having almost a monopoly of it, and having branches for manufacturing the extract in this country. Large quantities of licorice are imported into the United States at a heavy expense of import duties. About a year ago it was settled beyond doubt that the soil and climate of California are perfectly adapted to its production. Licorice is prepared like horse-radish, by means of root slips, which are removed from the main root. The soil must be well fertilized and thoroughly broken to the depth of three feet to obtain the best results. The great depth is necessary to encourage the roots to grow downward to escape the intense heat, not only of one, but of several hot summers, as it takes three or four years to perfect the roots for market, during which time the plant must receive constant and careful cultivation with the prong hoe. Lay off the rows two feet apart, and after cutting the root slips into sections of five or six inches, plant them in vertical holes made with a dibble, sixteen inches apart, observing to thrust them several inches below the surface, and cover over. As the growing season closes each autumn, the stems should be cut down and removed, and a liberal coating of manure composed with rich hammock (top) soil. If the plants have been well cared for, the roots may be large enough in three years to harvest for market, though four years is not uncommon. Harvesting is quite a tedious job, and on account of the depth—two or three feet—has to be done with a spade. When dug, the side roots, used for propagation, are cut off, and the main roots are washed, dried and tied in convenient-sized bundles.

FLOWERS FOR DINNER.

FLORAL DECORATIONS DISPLAYED AT FASHIONABLE
LONDON DINNERS.

The following extract from the *London Confectioner*, of May, gives some novel notions relative to dinner table adornment:

There was a charmingly decorated table in Bruton Street a few nights ago. The flowers were flame colored tulips, spiraea and pteris fern. In the centre was a large silver cup filled with these flowers, and at the base was a star-shaped mound of the same, in each extreme point of which was a spiraea. Silver candelabra stood on either side of this, and at each end were silver cups, and around their bases were circles of the same flower. The effect when lighted up was very light and unique. Carnations and mignonette will be very much in favor again for table decoration. Another table was very uncommon indeed, and must have been very costly, as the flowers used were entirely of the finest and largest calceolaria and palest hue of heliotrope, mignonette and begonia leaves, arranged in dif-

ferent shaped wreaths; but the smell of the heliotrope was rather overpowering. Color tables will not be much affected this season. I must not forget to notice a very quaint dinner-table in Cadogan Square. The centre was of flame-colored plush. This was arranged so as to look like two tiers by the plush being put over two pieces of wood, long in proportion to their width. A brass lamp with many branches stood on the higher portion of it, the lights being seen through ruby glass. Quaint and uncommon orchids and tropical blossoms were used with colored leaves, and were placed in quaint receptacles. The tablecloth was entirely of Chartreuse green silk, which was plaited in wondrous folds. In the centre was a large round glass dish, with a hanging border of maidenhair fern, and in the middle of it were violets arranged in circles and piled high. The outer circle was the dark Russian, the second the grey Neapolitan, and the middle white. Down the sides of the tables, standing among the wondrous folds of the silk cloth, were small white glasses filled alternately with Russian and Neapolitan violets. Before every plate were arranged alternate bouquets of them, and at the corners of the table they were arranged in crescents; little lamps in the shape of cacti were dotted about on the table, and long sprays of variegated creepers were twined around and among them. Japanese monsters and dragons in iron held curious fruits. No metal but iron appeared on the table in the way of ornament. The carafes were in the shape of curious reptiles. Salt-cellars shaped as goblins held the salt in baskets on their backs. Oriental plates were used both for dinner and for dessert. The room was lighted by iron hanging lamps, shaded with silk the same color as the centre-piece. At a luncheon at a very *chic* house, the table was decorated with violets in shades from purple to white. At a very small dinner I saw for a centre-piece three old-fashioned silver decanter-stands placed together to look like a triple basket, filled with white narcissus and fern, a light handle stretched across made of ribbons and bows.

SPONGES.

RANSACKING THE BOTTOM OF THE SEA TO FOSTER
HUMAN CLEANLINESS.

Sponges are found only in a few localities on the earth's surface, and the supply does not nearly equal the demand. A very few men have it in their power to corner the sponge market, but they have never done it yet, and can be depended on not to, for the reason that they already have as much of the world as they care to use. There is no mercantile business known in which sales are so certain with so little effort on the part of the dealer; where overstocking and dull markets are so rarely known, or where the profits acquired are so very generous. In America there are only six firms that are engaged exclusively in the sponge trade. Five of these are in New York; the sixth is located at Chicago. The best sponges are found in the Grecian Archipelago, in water as shallow in some cases as forty feet, and ranging from that to depths below any known soundings. The deeper the water the finer and more expensive is the product found. The Grecian goods are known as silk sponges, and grade in price from \$2 to \$100 a pound, a range which is accounted for by the almost limitless variety in texture, size and shape. To just what kingdom a sponge belongs there seems to be no settled opinion. The formation is the product of myraids of small insects that gather the floating particles found in the ocean and build the fungus-like growth, much as coral reefs are built, attaching it to any substance they find—a rock or the sunken timber of a long-wrecked vessel. The early stage of this strange article—vegetable, mineral or animal—closely resembles a mat of cobwebs, and only gains strength, size and solidity in the passage of years. The Grecian government controls all the Mediterranean sponge fields, and leases to the firms engaged in the business such tracts

of water as are agreed on. The boundaries of these leased waters are fixed by floating buoys, and no lease is made for more than one year. The dealer hires his sailors and divers, who man the clumsy little sail boats and proceed to their employer's grounds. Here the captain in charge employs the water glass, scanning the bottom of the sea in search of sponges. When he finds a promising bed he directs the divers. These men are mainly natives, and work entirely naked. Each boat is provided with a number of stones weighing about fifty-pounds, to each of which is attached a coil of fine rope. The diver takes up one of these stones, poises himself on the gunwale of the boat, inhales a heavy draft of air and plunges head downward into the water, holding the rock ahead of him at arms length. As he reaches the bottom he drops the stone, which is hauled up into the boat by the rope. The diver gropes about until he can find the sponges, which he puts into a netting sack swung to his waist. Sometimes he doesn't find any, and then, after creeping about till his lungs warn him it is time to return to the surface, he springs upward, and, beating both hands and feet, struggles into the air. The long holding of breath soon leaves its mark in shattered health, and no diver can follow the business more than a very few years. However, he makes money while he is at it, often earning from \$100 to \$200 a week—an amount which he finds difficulty in spending on the barren hills and scattered villages of the archipelago. For the lower deeps divers in armor are employed, who are not so plentiful as the wages offered might warrant, and who exact almost any remuneration they want. One objection to the pursuit of sponge-diving is the frequent visits of sharks. Nearly a hundred men are lost every year in Mediterranean waters, chiefly by the voracious sharks, although a few of the divers not in armor are occasionally drowned. When enough sponges are gathered to fill the boat the crew proceeds to the shore, where the goods are spread out for inspection by the officers of the government, and the rate of the lease is fixed by the quantity of sponges secured. A field which yields nothing to the merchant costs him nothing but his time in searching it. After the government dues are paid the sponges are assorted carefully by experienced men, and are then strung with a needle and twine and hung in the sun on a row of low stakes to dry. Hydraulic pressure is then employed in packing the goods. When ready for shipment the bales resemble compressed cotton, excepting that they are enveloped in coarse cloth. The range in quality of these Mediterranean sponges is very great. Now and then, in very deep water, a small, close fibered sponge is found, very light in color, and when dry nearly the size of an orange. These command a price as high as \$50 a pound. The West India sponge is cheaper in price because poorer in quality. The fishing there is done by poles exclusively, the sponges being found in water not more than forty feet deep. They are known as sheepswool, grass, velvet, reef and yellow sponges. The first mentioned is the finest, and is quoted at from two to three dollars a pound, velvet at about one dollar, and grass sponges as low as ten cents a pound. The quantity imported into America amounts to a million dollars in value annually. Key West, Fla., varies her cigarmaking with a sponge fishing industry, from which nearly half a million dollars' worth of sponges are taken each year. The volume of the business increases yearly, as sponges are put to a greater variety of uses as time goes by, and this in spite of the fact that the price has steadily increased for the past ten years. Goods that could be bought for \$1.25 a pound in 1879 will bring \$2.75 to-day. A bad feature of the business is that the American people demand a light-colored sponge, which in very few cases is a natural color. To satisfy this desire strong acids are used to bleach the goods, the effect being very injurious not only to the sponge, but to the human skin upon which it is afterward used. In Europe sponges are used in their natural color, but the general public in America is not yet educated up to the proper understanding of this matter.

Another unpleasant fact, akin to this, is that hundreds of sponges used at hospitals are bought up by street fakirs after their days of usefulness there are ended, subjected to a chemical treatment supposed to clean them, bleached or dyed to suit the fancy of the vendor, and then loaded into baskets and offered for sale on the streets. Whether they are purged of all impurity is a question. Certainly the best sponge is the cheapest one in the long run, and the best can only be secured by paying an equivalent price.

TO REMOVE INK.—Ink stains are entirely removed by the immediate application of dry salt before the ink has dried. When the salt becomes discolored by absorbing the ink, brush it off and apply more; wet slightly. Continue this till the ink is all removed.

TO FASTEN WOOD TO STONE.—For a cement for fastening wood to stone, melt together four pints of pitch and one pint of wax, and add four parts of pounded brick-dust or chalk. It must be warmed before using and applied thinly to the surfaces to be joined.

STRENGTH AND MOISTURE.—The tensile strength of a wet rope is found to be only one-third that of the same rope when dry, and a rope saturated with grease or soap is weaker still, as the lubricant permits the fibres to slide with greater facility. A dry rope twenty-five feet long will shorten to twenty-four feet on being wet.

A PROFESSIONAL FAILURE.—"Can you recommend something as a spring tonic?" inquired a sallow dyspeptic, stepping listlessly into an aromatic pharmacy. "Yes," replied the druggist, "I have a number of excellent preparations. What is your line of business?" "I am a professional Faith-Curer."—*The Epoch.*

IMITATION CEDAR.—Cigar boxes are supposed to be made of Spanish cedar, but there is not enough of the wood grown for the purpose, and nearly all the boxes used by American cigarmakers are made from West Virginia poplar. The wood is sawed up into thin boards, and the cigarmakers dye them brown with cedar extract, which gives the proper color and odor.

WHOLESALE TREATMENT.—At High Ridge, near Stamford, Conn., there is a wife who is the mother of fourteen children, all living and none of them twins. All but two live at home, and these two, catching the scarlet fever, went home to be nursed. They gave it to the other dozen, and the whole fourteen were sick at once, and medicine had to be mixed in pitchers and bread pans.

LUCKY SHOCK.—The conductor of an electric street-car at Wheeling, W. Va., went on top of his car to adjust the running pulleys connecting it with the wire, and, slipping, grasped the wire to steady himself. He got a shock that laid him out senseless, and was about to be taken down for dead when his face was accidentally touched by the wire, and he was brought to life again little the worse for his experience.

POCKET TYPE-WRITER.—A type-writer, so diminutive in size as almost to justify the term "pocket type-writer," has recently been invented. Its extreme dimensions are four inches by three inches, and its weight less than four and a half ounces. Yet it carries all the characters necessary in ordinary correspondence on the inner edge of the revolving disc which forms the principal feature of the machine. The whole frame travels across the paper, which consequently may be of any size, and a roller, to which a spacing-check is fitted, secures an absolute straightness and evenness in the line of printing.

LOCALITY MEDICINE.—There is a phase of the patent medicine business that the world at large is not informed upon. That is the making and vending of what may be called locality medicines. All around this city, in the suburbs, men are making money in a small way by putting up curatives for the besetting ailments of their neighbors—for rheumatism, malaria, headaches, toothache, and dyspepsia. These medicines get fame in the town or country side, in which each is made, the local druggists sell them, and they are more sought than the world-famous medicines. The housewives advertise their virtues thoroughly, and without a cent of expense to the makers.

WORTH REMEMBERING.

Matthews & Pierson are the popular proprietors of the Sturtevant House, Broadway, cor. 29th Street, N. Y. It is one of the best in the city and a home-like, central place to stop.—*News.*

BLAIR'S PILLS

Great English Remedy for Gout, Rheumatism and Kidney Complaints.

Sure, Prompt and Effective. Oval box 34, round box 14 pills.
At all druggists, and 224 William St., New York.

Will buy sufficient

Pearline

to do a large wash—
Clean a house,

or enough of both to prove to any woman its wonderful dirt-removing and labor-saving qualities. Costs almost nothing, but makes the dirt jump. Does it hurt the hands or clothing?—NO, it is harmless. Many millions of packages used every year—no complaints, but many women write: cannot get along without PEARLINE.

Caution

Peddlers and unscrupulous grocers are offering imitations which they claim to be Pearline, or "the same as Pearline." IT'S FALSE. PEARLINE is never peddled. 146 JAMES PYLE, New York,

FACIAL BLEMISHES

The Largest Establishment in the World for the treatment of Hair and Scalp, Eczema, Moles, Warts, Superfluous Hair, Birthmarks, Moth, Freckles, Wrinkles, Red Nose, Red Veins, Oily Skin, Acne, Pimples, Blackheads, Scars, Pittings, Facial Development, etc. Send 10 cts. for 128-page book on all skin imperfections and their treatment.

JOHN H. WOODBURY
DERMATOLOGIST,

210 West 42d St., New York City, N. Y.

Use Woodbury's Facial Soap. By Mail, 50 cts.

is the most reliable substitute known for mother's milk. Its superiority rests on the test of 30 years use in Great Britain and the U. S. A sustaining, strengthening diet for Invalids; nutritious, easily digested, and acceptable to the most delicate stomach. Four sizes, 35c. up. Pamphlet, "Healthful Hints," sent free. LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

P. O. Box 1574. **THE NEW YORK PHARMACAL ASSOCIATION, NEW YORK.**

UNEQUALLED

Ask your Grocer for, and insist on having, **LEA & PERRINS'** Sauce, "The Worcestershire." It is known throughout the whole civilized world as the Best and most Delicious Sauce.

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose purious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING Co.,
19 Park Place, N. Y.

HOARDED COIN.—It is estimated by a mint official that there are still in existence somewhere in the country, tied up in old stockings or in the hands of curiosity collectors, over 100,000,000 of the old-fashioned copper cents, about 120,000,000 of copper-nickel cents, nearly 5,000,000,000 of the present issue of brown pennies and 25,000,000 of nickel three-cent pieces, and about 200,000,000 of the nickel five-cent pieces. The total value of these outstanding various coins is put in round numbers at \$62,950,000.

A CASH DISCOUNT.—A train in Arizona was boarded by robbers, who went through the luckless passengers. One of them happened to be a Hebrew "drummer" from New York, who, when his turn came, with reluctance fished out \$200, but rapidly fished out \$4 from the pile and placed it in his vest pocket. "What do you mean by that?" asked the robber, as he toyed with his revolver. Hurriedly came the answer: "Mine frient, you surely would not refuse me two per cent. discount on a strictly cash transaction like dis'?"

A NEW USE FOR LIQUID PEPTONOIDS.

Successfully used in Dissolving the False Membrane in Diphtheria.

A Physician writes: "In an experience of over thirty years I have never used anything to equal your LIQUID PEPTONOIDS as a local application with a spray. It will dissolve the membrane and destroy the diphtheretic odor in less than twenty-four hours. I use the LIQUID PEPTONOIDS full strength, as a spray, two or three times a day, in bad cases."

Used successfully by another physician in two desperate cases:—"I was induced to try LIQUID PEPTONOIDS in two very desperate cases of DIPHTHERIA. I think I never saw throats more heavily coated with exudate than were these, and I think I never saw it more rapidly disappear than in these cases, by frequent spraying with your LIQUID PEPTONOIDS."

LIQUID PEPTONOIDS can be taken by patients unable to ingest food in any other form. In dyspepsia and loss of appetite its effects are positive, its digestive properties assisting in the digestion of food taken and its peptogenic properties quickly stimulating the natural digestive secretions of the stomach.

PANCROBILIN.

Prepared (in both Liquid and Pill form) from Extract of Pancreas and Bile.

This preparation is designed expressly to increase the digestion and absorption of fats.

We believe that the fat-digesting properties of pancreatic and bile are inseparable, and that without their union in the intestinal tract but little, if any, fat would be digested and absorbed.

PANCROBILIN will be found of great service in Phthisis and other wasting diseases, Nervous Prostration, Constipation, Inanition, Malnutrition, Intestinal Indigestion and wherever there is a failure to assimilate fats.

If the skin is first wet with LIQUID PANCROBILIN, the inunction of oils will be greatly facilitated.

LIQUID PANCROBILIN is put up in pound bottles. PILL PANCROBILIN is put up in bottles holding 100 pills. The coating of the pills will resist acid digestion, when given as directed, but will be quickly dissolved in the alkaline secretions of the duodenum.

PHOSPHO-CAFFEIN COMP.

(Granular Effervescent.)

Formula for each dessertspoonful:—

Caffein.

Acidi Phosphorici aa, grains, ss.

Antipyrin.

Ext. Apii. Grav. dulc. (Celery), aa grains, j.

Sodium Bromide, grains, v.

The satisfactory results produced by PHOSPHO-CAFFEIN COMP. in Headaches, Neuralgia, Insomnia, Neurasthenia and general Nervous Irritability, are not due to the effect of any one ingredient, but to the happy effect of the combination. A thorough series of comparative tests have demonstrated the superiority of the above formula over any other in the market.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

ADDRESS ANALYST PUBLISHING CO.,

—19 PARK PLACE, NEW YORK.—

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

North Moore Street, New York.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED
BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the AMERICAN ANALYST a good advertising medium. Why should not you?

Used by the United States Government. Endorsed by the heads of the Great Universities and Public Food Analysts, as the Strongest, Purest and most Healthful. Dr. Price's Cream Baking Powder does not contain Ammonia, Lime or Alum. Dr. Price's Delicious Flavoring Extracts, Vanilla, Lemon, Orange, Almond, Rose, etc., do not contain Poisonous Oils or Chemicals. PRICE BAKING POWDER CO., New York. Chicago. St. Louis.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2."

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

BUTTER AND OLEO IN BOSTON.

The spring butter season is noticeable for being some three weeks earlier than usual; this is caused by the extremely fine weather we have had during the first months of the year. The butter market has been very slow and dragging, as the season was not long enough to allow dealers to clean up the old butter which they had in stock before the new creameries would arrive. Those creameries that have not been running during the winter have started or will start in a very short time. A good share of the goods coming into our market now is Western stock, some of which is as good as any of the different creameries made. Dairy butter is arriving in fair quantities, though in the East, since the creameries have started, a decrease is noticeable. When the creameries start to collect the cream, small farmers prefer to sell it to them, thereby avoiding all the work connected with making the butter. The butter we are receiving now is of the standard quality, for hay and grain fed cattle, though as a rule it is not quite up to butter that results from grass fed animals, which seems to have better standing quality. The prices of butter are such at present that most all who wish for it can secure it at a small cost; the present cost has made quite a change in the demand and the outlook is much more favorable than it was. The privileges enjoyed by the oleomargarine dealers in this State allow them to com-

pete very sharply with butter people, who have on various occasions made unsuccessful attempts to have stricter legislation on oleo, claiming that it was a cheap imitation of butter sold in many cases to the consumers as butter. The trade here is very large on oleo; most of the marine trade consume it solely, seeming to think that it will stand better on the water. The class of people that consume oleo, as a rule, are people who cannot afford to pay for good quality butter, and who are satisfied with oleo, especially as it can be bought so low. Despite the wonderful growth it has had in Massachusetts the people who favor butter are in the majority, and in all probability will continue to be. The last effort made for stricter legislation on oleo hurt it to some extent, though temporarily. Most all of the retailers carried a very light stock, and would not decide upon taking a license until after the crisis was passed.

The above quotation from the *Boston Advertiser* evidently gives the views of the butter dealers, and considering their natural bias in favor of butter, it shows very fairly for oleomargarine. The reason given why the poor man prefers oleo is not the only nor the principal one. The best butter made by farmers who use only the cream of the best breed of cows, conduct everything neatly and cleanly and produce the gilt-edge article, is in constant demand by the wealthy people of the land at a price nearly double that of creamery or factory butter. Creamery butter, the next best, but very inferior, is a factory made butter from cream brought in by farmers. This generally is our best butter aside from the gilt-edge just described. Then comes the so-called ladle-packed which is butter brought in lumps by the farmers and bought by country storekeepers who pick out the best of it for their village trade, leaving the rest lying around exposed to all the filth and dirt that may come in contact with it, and then mixing and coloring it. It is to this delectable stuff the poor man prefers clean oleomargarine, and to protect such nasty grease our legislators are asked to pass anti-oleo laws.

THE CIGARETTE CURSE.

During the discussion of the bill mentioned by us last week as having been passed by the Michigan Legislature prohibiting the sale of cigarettes to minors, the Superintendent of Schools in Lansing, in co-operation with the Woman's Club of that city, sent out circular letters to all the prominent educators of the State—persons whose daily contact with the young would enable them to observe the extent and effects of the tobacco habit. Between two and three hundred replies were received, and two-thirds of them—notably those from the cities and larger towns—reported a startling increase in the use of cigarettes by youths. In answer to the question, "Can you cite instances of serious disease or failure in school work caused by the use of cigarettes?" nearly all replies noted serious failure in the work, and many gave answers similar to the following: "One young man seriously dwarfed physically." "One boy in this school only eleven years old is almost an idiot from the use of tobacco and beer." "One boy recently lost two weeks' work from throat trouble caused by the use of tobacco." Another reports two

very serious cases where the whole nervous system was seriously deranged. The expressions, "Lost his mind from the use of tobacco," "A total wreck," occur frequently in the testimony of the teachers. One prominent superintendent wrote: "The death of two boys formerly in my school is to be attributed to this villainous habit, and at least half a dozen others have impaired their physical and mental growth fully one-half." In answer to a question relative to the evil effects of the habit noted upon health, progress in study, and morals, the general drift of the replies states that it intensifies nervous diseases, causes diseases of the throat, brain, heart, ears and eyes, epilepsy and fits and muscular debility, stunts the growth of body and mind, and leads to failure of memory. As to its effect on progress in study, all are agreed in having noted incapacity, lack of animation, and inability to do successful work, and that it is directly antagonistic to morality. It is gratifying to call attention to the fact that the States of Massachusetts, Illinois, Maryland, Nebraska, New Jersey and New Hampshire have all enacted laws similar to the Michigan bill.

BEYOND THE REACH OF SCIENCE.

A new food preservative has been invented which will keep food of all kinds fresh and palatable for three months. It wouldn't be a bad idea to sprinkle a little of this preservative over the *AMERICAN ANALYST* and put it away until next fall, when it will come out as fresh as ever.—*Butchers' Advocate*, May 22.

No chemical preparation whatever is required to render our esteemed contemporary "fresh," as that is its essential quality. Neither could any preparation or process short of absolute extinction render the *Advocate* palatable. Providence seems to have protected it so effectually against the possession of interesting qualities that human science is powerless to fill the vacuum.

ANTIPYRINE.

There can be no longer any doubt that this peculiar remedy possesses some valuable properties, and that also it may be very dangerous because it has a tendency to interfere with the heart's action. Physicians, believing from the manner in which it was first introduced into this country that it was a good honest chemical preparation of great therapeutic value, that it would be kept as such strictly within the profession, and sold only on physicians' prescriptions, lent it their countenance and thus enabled the manufacturer to obtain a foothold in this country and sell it in large quantities. It was not generally known among physicians that it was a patent medicine, although druggists must have known this damaging fact, for every package bore the German Imperial *Schutzmarke*, the equivalent of our American "Patented." Had this been known it must have been a serious obstacle to the introduction of such a patented preparation among the profession. Now, however, having gained a foothold and having effectually

30 Shaves

for 2 Cents.

Send a two cent stamp to Colgate & Co. 55 John St., New York, who will mail you a sample of this superior soap sufficient to last a month,

ally succeeded in obtaining valuable editorial puffs and reports of cases in the medical journals, without any representation in the only proper place for announcing a strictly professional remedy—the advertising columns of the medical press—the mask is suddenly withdrawn and antipyrine is advertised broadcast to the public, in the usual style of cure-alls, in the daily papers throughout the country. Can the profession afford to prescribe such a remedy, and further than this, knowing its dangers, can they afford to allow their patients and neighbors to run the risk of injuring life and health by the unrestricted and ignorant use of such a powerful and admittedly dangerous preparation?

CLEAN MILK.

When we look upon the beautiful whiteness of milk we are led to believe that it is absolutely clean. It seems so natural to believe that anything so white and pure-looking must be clean. When we remember, however, that water that seems perfectly clear and sparkling to the naked eye may contain the worst impurities, we are prepared to hear and understand that apparently clean white milk may be impure. We recently had exhibited to us the residuum cleaned out of apparently pure milk by an ingenious system of centrifugal cleansing employed by one of our condensed milk companies. This residuum consists of blood, putrescent matter, hair, dust and other impurities taken from the bottom of one of these centrifugal cleaners. The question suggests itself, May not the continued use of milk containing such impurities be the source of typhoid and other fevers just as much as impure water? And if this is so, why should not the same prophylactic care be exercised in cleansing milk as in distilling water? Here is a fresh opportunity for microscopical and bacteriological investigation, to which we shall again refer.

ADULTERATION IN MASSACHUSETTS.

The Massachusetts State Board of Health, in its monthly bulletin, makes some striking revelations respecting the food market in that venerable commonwealth. The analyses made by the Board in April show that, of 522 articles of food or of drugs examined, 205 were more or less adulterated. Among the more noticeable instances noted are: Of 258 samples of milk examined, 132 were adulterated or found to vary from the legal standard. Of five samples of lard, all were adulterated; 11 out of 59 specimens of spices fell below the standard, as did also 11 out of 16 samples of maple syrup, and 9 out of 19 samples of maple sugar. In the case of molasses, of 28 samples 8 were adulterated, while 11 of 18 samples of vinegar were found to be so

treated. Of 51 samples of drugs, however, but one was found varying from the legal standard. It is found that certain staple products, such as sugar, flour, and the various other cereal products, are very rarely adulterated, and the articles especially looked after by the Board are those found by experience to be especially liable to adulteration.

FILTERING DRINKING WATER.

THE INADEQUACY OF THE AVERAGE FILTER TO PURIFY THE LIQUID.

(Concluded from page 254.)

Asbestos-board I have not been able to procure of sufficiently firm, strong, and fine surface to resist the passage of bacteria under any considerable pressure from the hydrant brought to bear upon such a surface. The quality of the surface seems the important point. To yield a flow of any degree of rapidity, this surface must be large and that creates a tendency to break and necessitates a bulky filter, which most people shun. Packed asbestos shreds allow a few bacteria to pass through when the sterilized filtering mass is so dense as to cause the flow to be very slow. In this substance I have, as already mentioned, not observed so marked multiplication of bacteria as in the sand, porous and other filters. Although large bodies of sand fail to prevent the passage of bacteria with the water which percolates through, it is noticed that certain natural filters of this sort render water much freer from bacteria when the water has first to make its way through a layer of silt and minute particles which have been arrested by fine sand. It is from the application of this principle that the larger filter-beds are built which purify the water distributed by hydrants throughout various cities. Taking as a model the very carefully managed filter-beds of Berlin, it is seen that above the base of the filtering tanks is a layer of a foot of stones, gradually becoming smaller in size toward the upper surface, upon which is coarse gravel to the height of a foot more, then upon this a little more than two feet of sand, which at the top is as fine as can be procured. When the filter-bed has been freshly cleaned, as is found necessary for it after being constantly used for a week or so (occasionally several weeks), purified water is slowly backed into the filtering mass from below until this water, carrying up all the air with it, has reached the top of the upper layer. Then the ordinary river (or lake) water is made to flow very gently in, to the depth of one metre. This is then allowed to stand for at least twenty-four hours. The nitrogenous or other particles, confervoid vegetation, and whatever else the water contains as sediment, have then settled upon the upper portion of the fine sand without sinking deeper, and a delicate film is formed which, with careful inlet and gentle pressure (never to exceed two metres of water), retains nearly all the bacteria of the water supplied, and prevents their passage, provided that the flow through is very regular and slow (never more than three metres in a day). Nearly all this separation of the bacteria is produced by the sedimental matter retained on the surface of the sand, so that, when the filter slows from clogging, it is found that less than half an inch of the upper layer of sand need be removed.

From the statistics of Wolffhugel and of Plagge and Proskauer, we learn that the number of bacteria, originally very large in the River Spree, is reduced to a very small percentage in the filtered water, oftentimes a fraction of one per cent. I may add that the organic constituents are also decidedly lessened, and that the oxidizability, as tested by the reduction of a standard solution of permanganate of potash, is seen to be regularly lowered one-fourth and often one-third of the amount shown prior to the filtering. The long arrays of figures given in the reports of the action of these filter-beds show that, with hardly an exception, the ammonia is constantly removed by the process. In this country

the filter-beds, all of which are built upon the same plan as those in Berlin, are less perfect in their action, as the people in charge do not devote sufficient care to sedimentation in the case of those which I am familiar with. Thus, a very carefully planned filter-bed, which filters river water for one of our cities, allowed, at the time when I examined it, nearly half of the large number of bacteria in the water pumped from the river to pass through. This unsatisfactory result seemed to be due to the fact that too much water was required from the small filter beds, and hence not enough care could be bestowed upon the thoroughness of the filtration.

Of the various large filter systems which I have tested while they were in use in various manufactories and institutions, for which these filters were straining large quantities of water, the only kinds which reduced materially the number of bacteria as found in the hydrant water were those in which, by the addition of a minute proportion of a suitable salt, usually alum (as approved by the general experience of years in many districts), the suspended particles with the organic matter are caused to settle more rapidly, and then these form a deposit upon very fine sand, through which water is forced. From several examinations of a filter of this type, which in every case rendered the water much freer from germs than the original (unfiltered) water, I once found the filtered water wholly sterile, while the (Brooklyn) hydrant water of the neighborhood at the same time showed 379 germs developing from each c.c. This particular filter was constructed on the principle of Prof. A. R. Leeds, who informs me that the alum was present in the proportion of only one part in 100,000 of water. I could not, by the ordinary tests, detect the presence of this salt, and such a small amount can cause no appreciable harm. The alum used is probably decomposed, and its elements taken up by the organic matter and bases present. As previously stated, the sterilization of the water is here caused by mechanical and not by chemical action. In my tests the typhoid bacillus of the first agar culture from a recent spleen was not destroyed by standing for forty-eight hours in a solution of ten times the strength of that employed in these filters, while many other bacteria were alive after standing for forty-eight hours in an alum solution of one part to 1,000 of water, which sufficed to destroy the typhoid bacillus in that time. In the present stage of chemical knowledge there seems no sufficient evidence that in water these micro-organisms evolve the organic alkaloids which are considered to be produced when harmful bacteria are introduced into the system and by their action there cause disease. What the exact nature of the volatile organic constituents carried over in distillation may be, and whether they be deleterious or not, rests for the science of the future to determine. The process of boiling previous to vaporization in the still must kill all harmful bacteria, and all other bacteria that I have ever encountered in the original hydrant water from which such water as the well-known "Hygeia" is prepared. The bacteria which I have found in specimens of this excellent distilled water that I examined must have been introduced from without after the water was condensed from the still and before the bottling process was completed, and in this I have never found any other than harmless varieties. Water condensed from various stills of approved patterns I have found sterile. The relatively large amount of free ammonia found in such distilled waters (it being several times greater than any detected in the Croton hydrant water) does not seem to me to be objectionable. The condensed steam produced in distilling, and which constitutes the Hygeia water, represents a much larger original amount of water than results after the process of vaporization and condensation is completed, and the ammonia may besides come from the air and from other sources.

To those who desire a water freer from alkaline earths than the ordinary "hard" water which they may have to drink, it should be mentioned that the process of heating, in the sterilization by boiling which I so

urgently recommend when it is necessary to drink suspected water, drives off free carbonic acid and so causes the deposition as an insoluble sediment of the carbonate of lime and other objectionable salts which form the so-called "temporary hardness." The water is thus rendered "softer." When boiling is resorted to because of actual infection of the water, it should be carefully done. It is best to have the water, perhaps after a preliminary boiling and straining, decanted into bottles, each holding say a quart, and these covered with a suitable glass cap or plugged with cotton or provided with a clean stopper loosely dropped in, and then the bottles placed in a kettle or cauldron in the absence of a steaming apparatus. This is heated and kept near the boiling point for an hour. Then the whole is allowed to cool, and the bottles may be placed near ice; but into the water thus carefully prepared it is not advisable to put ordinary ice, for harmful bacteria may retain their vitality in ice longer than in water. Pure water loses all its excellence when unwholesome ice is melted in it. For those to whom the taste of boiled water is unpleasant, weak teas, wine, or other savor may be added to mask the absence of the more agreeable taste imparted by the process of aërication (which under ordinary conditions may itself be a means of adding bacteria to the water). There are ingenious hypotheses as to the utility of nitrifying bacteria in overwhelming other varieties and conjectures that, if recognized and planted upon filters, these nitrifying ones would safely destroy the pernicious ones; but among these theories I know of none to be seriously recommended. The recent results in America and various parts of Europe are so inconclusive and diverse that the brief limits and practical aim of this paper will hardly permit any further consideration of them.

SUMMARY.

Boiling sterilizes water, and within thirty minutes will have killed harmful bacteria.

Drugs and other agents acting chemically, if used in amounts which are commonly safe, do not sterilize water.

The prolonged heat which water undergoes in the usual process of distillation destroys all germs which may be in the water undergoing the process.

Ordinary filters, even if satisfactory as strainers, fail to remove all bacteria from drinking water. So far from lessening the number in the original water, the filtering substance may allow a more rapid multiplication than these micro-organisms would ordinarily undergo in the unfiltered water on standing, and the germs of disease, even if held back by the filtering substance, may be harbored in all filters.

The finer the substance through which the water passes, and the lower the pressure, the more perfect is the action of the filter in holding back the bacteria.

Of all substances thus far furnished for domestic filters, porous rebaked porcelain, carefully selected, I have found to be the best. If thick and strong enough to allow the use of a large surface, and the substance remain perfect (without flaw or break), this may yield a fair flow of clear water, free from all bacteria; yet under our ordinary croton pressure of one atmosphere or less, this yield is only in rapid drops, unless the apparatus be complex.

To insure the permanency of this action, the filter should be occasionally sterilized throughout by steaming or by other means; for, under prolonged pressure, various kinds of bacteria can go through, and in the copious organic matter collected on the filter some harmful micro-organisms can retain a high degree of vitality for weeks longer than I have ever found them to live in pure water.

Where filtering is really necessary, it is in general best for the community that it be done carefully on a large scale through sand-beds upon which a fine layer of organic and inorganic matter is expressly produced by sedimentation, because of its valuable action in holding back the great majority of the bacteria.

A bad water filtered is less desirable than a pure water in its natural state. When, therefore, filtration is employed because of real danger of infection, the filtered water should, as a rule, be furthermore boiled, as the entire absence of sediment and cloudiness does not insure that the bacteria of disease may not have made their way through the filter.

In discussing the foregoing paper, Dr. T. Mitchell Prudden said that a good deal of objection had been made to the work of bacteriologists, and largely on the ground that it had been found very difficult by them to detect the typhoid bacillus in drinking water. It was purely a technical matter, and the trouble was the difficulty of distinguishing the typhoid bacillus from other bacilli which closely resembled it. This applied principally to large bodies of water, since in small bodies of water the typhoid bacillus could be much more readily recognized. Dr. Prudden then spoke of the serious epidemic of typhoid fever which occurred in Providence, R. I., in the early part of the winter, and to which reference had been made in the paper. It seemed that last autumn typhoid fever was prevalent in a village of French Canadians situated on the river from which the water supply was derived; and about half a mile above the city. The sewage of the village did not pass directly into the river, but the inhabitants emptied the dejections from typhoid fever patients into privy vaults and also upon the banks of the river. In November there was an unusually severe rain-storm, which washed a large amount of material from the banks into the stream, and early in December the death rate in Providence rose to 127. Notwithstanding the fact that the flow of water amounted to over seven million gallons per hour, he was able to detect a few typhoid bacilli, together with a large number of ordinary water bacilli, in the charcoal filter referred to by Dr. Currier. It consisted of an outer and inner metallic ball, and was so arranged that the water could pass around the charcoal, while there was an orifice half an inch in diameter from which the water escaped.

Dr. John C. Peters said that it seemed that to-day the water of both Berlin and London was more free from contaminations than that of New York. The filter-beds employed in purifying the water supply of London were mostly of sand, the efficacy of which Dr. Currier had spoken of in the paper. Dr. Peters said that during the past four years he had paid considerable attention to the condition of the Croton water supply, and he had been glad to learn that the State Board of Health had undertaken the work of keeping it as pure as possible in the future. At present the amount of contamination that got into the water was very great; yet it was a fact that during the past season there had been a smaller number of cases of typhoid fever reported in the city than for a long time before.

Dr. R. C. M. Page said that for a number of years past, up to last summer, he had used in his house a globe filter about three inches in diameter, containing clean sand. At first tin was the material used in its construction, but afterward copper was substituted for it, as the tin soon rusted out. Last summer, in Paris, he met with the filter spoken of by Dr. Currier in the paper, which he now exhibited, and which he said was the only filter which had really ever proved satisfactory to him. It somewhat resembled the Pasteur filter, and consisted of a large disk of porcelain backed by carbon. It allowed the water to pass much more quickly than the Pasteur filter, and two quarts an hour could be obtained from it. He thought that the water from such a filter was better than distilled water, as a rule, since one could never feel sure that the latter, as ordinarily supplied, was freshly distilled.

Dr. J. Lewis Smith said that from recent experiments referred to in a lecture by Jules Simon, of Paris, it would appear that a filter which would arrest the passage of the Klebs-Löffler bacillus would permit the passage of ptomaines resulting from microbic action. This seemed to him a very interesting point.

Dr. John C. Peters said that he had reason to believe, on good authority, that not one-half of the Apollinaris water put upon the water was derived from the Apollinaris Spring. A considerable proportion of it, at least, was artificially prepared at Antwerp, where this could be done very cheaply.

Dr. Currier inquired if any of those present could inform him what was the effect of distilled water upon children and youth, particularly as regards the lack of salts, of which the water was deprived by the process of distillation.

Dr. H. Jacobi said that the salts in drinking water that could be expected to be beneficial to the system were the chlorides and phosphates. The Croton water, when pure, was regarded as a very excellent water, and yet it came very near distilled water in regard to the absence of salts. Some of the hot spring waters in Europe also contained very few salts. He believed, however, that we all suffered more from the presence of salts

in drinking water than from the lack of them. When we did drink hard water, the salts merely passed through the system without being utilized. It was, unquestionably, a fact that children, as well as older persons, took into their systems, from milk and other liquids, and from both farinaceous and animal foods, more salts than they could possibly utilize. Hence he did not believe that distilled water was detrimental to health on account of its lack of salts.

The AMERICAN ANALYST simply would add that any well-made filter of proper material that can be kept clean and is kept clean by sterilizing, either in hot water or hot air, seems to be adapted to filter water, but that to make sure that the bacteria are destroyed the water should be boiled. The remarks of Dr. Peters on Apollinaris water are also important, and will, no doubt, be read with interest. About obtaining baked porcelain of sufficient porosity to act as a filtering material without being as open as a sieve, we have serious doubts. The potter's art has not yet sufficiently advanced to enable them to so regulate their kilns as to reproduce a porcelain of uniform porosity.

ADULTERATED PEPPER.

ONE OF JOHN BULL'S RECENT "YANKEE" DEVICES.

A writer in the London *Analyst* says: "A new material in extensive use for the adulteration of pepper having recently come under my notice, I wish to call the attention of the public analysts to it, that a united effort in all quarters may stamp out what bids fair to become a very successful fraud. The material in question consists of rice, starch, barytes, calcic carbonate and lead chromate, all, of course, finely ground and intimately mixed. The lead chromate amounts to about 10 per cent. of the whole compound. By the addition of about 5 per cent. of this mixture, the color of pepper is so immensely improved as to raise the market value very considerably, but I have met with pepper containing fully 10 per cent. Such confidence do the manufacturers of this delectable mixture feel in it, that they guarantee their peppers colored with it to be genuine, and I saw one invoice indorsed, 'Warranted genuine as per Somerset House analysis.' Nevertheless, the detection of this adulteration is not difficult. The increased ash and presence of rice would arrest attention, while the peculiar and unnatural tinge communicated by the chromate is readily noticeable. The method of examination, however, which has proved most successful in my hands is agitation with chloroform, by which means the mineral ingredients of the adulterant are obtained in their natural combinations. The well-washed residue is gently warmed until the chloroform has evaporated, treated with a very little soda carbonate solution and allowed to cool. A few drops of ether, which has been agitated with aqueous hydrogen peroxide are then added, and the mixture carefully acidified with hydrochloric acid, when the delicate blue coloration is readily obtained, and the barium and lead remain to be estimated in the usual way.

NATURAL POLISH.—Benjamin Johnson owns a farm in Rush Valley, U. T., upon which he has just discovered a mine of natural shoe-blackening. An analysis of this peculiar material shows that it contains 16 per cent. carbon, 34 per cent. aluminum, and the remainder clay. When taken out the material is moist and soft, and when used as a shoe-blackening produces a fine polish, which is not easily destroyed.

NEW WIRE.—Wire is now being manufactured—whether iron, copper or brass—by a new and greatly improved process, and at a considerably reduced cost. The machine devised for this purpose consists of a series of rolls in a continuous train, geared with a common driver, each pair of rolls having a greater speed than the pair preceding it, with an intervening friction clutch adapted to graduate the speed of the rolls to the speed of the wire in process of rolling. The entire operation of producing the smallest size wires from rods of one-half inch is done cold.

BRAINS IN BUSINESS.

ALL THE PRINCIPLES OF LIFE BASED ON BUSINESS METHODS.

One great secret of success in business—the secret, in fact, of success on a large scale—is to conceive of it as a matter of principles, not merely as a series of transactions. There are great merchants as there are great statesmen, and there are small merchants as there are small politicians, and the difference between the great and the small men is very much the same in both professions. The small politician works by the day, and sees only the one small opportunity before him; the small merchant does the same thing—he is looking for the next dollar. The statesman, on the other hand, is master of the situation because he understands the general principles which control events; this knowledge enables him to deal with large questions and to shape the future. The great merchant does the same thing; his business is not a mere money-getting affair, not a mere matter of barter, but a science and an art; he studies the general laws of trade, watches the general condition of the country, investigates present needs, foresees future wants, and adapts his business to the broad conditions of his time and place. He puts as much brains into his work as does the statesman, and he ends by being not a money getter, but a large-minded and capable man. An eminently successful business man, of the statesmanlike quality, said the other day that the more he understood of life the more clearly he saw that it was all done on business principles. By which he meant, not only that the universe stands for the dollar, but that the universe is governed by unvarying laws; that promptness, exactness, thoroughness and honesty are wrought into its very fibre. On these business principles all life is conducted—if not by men, at least by that Power which is behind man. It ought to be the ambition of every young man to treat his business from the point of view of the statesman, and not from that of the politician.—*Christian Union*.

FAMILIAR REMEDIES.

SOME OLD PATENT MEDICINES AND THE FORTUNES MADE BY THEM.

From an interview with an old Druggist in *Taggart's Times*, of recent date, we glean the following interesting facts:

Some few patent medicines hold their own, and are as popular as ever, but the majority have their day, die, and are forgotten. At one time the most popular patent medicine in this country, was Sand's sarsaparilla, on which the owner made an independent fortune in a few years. This was about 1830. Sand's sarsaparilla is now entirely out of the market. It was followed by Doctor Townsend's sarsaparilla, and the proprietor of this also grew rich, but he had an imitator of the same name, who to evade the original patent right, called his specific Old Doctor Townsend's Sarsaparilla. Another great sarsaparilla man was the eccentric Doctor H. T. Helmbold, who made and spent several fortunes off his famous buchu and sarsaparilla. He is living in New York. Twenty years ago, Doctor Helmbold was probably the most extensive advertiser in the country, and annually expended hundreds of thousands of dollars with the newspapers. One of his methods of attracting notoriety, was by driving around the country in an elegant four-in-hand, and once he took this magnificent equipage with him to Europe, where he created quite a furor. Besides the Doctor's popularity, his wife was a lady of remarkable beauty, which made the couple conspicuous wherever they went. There was a printer named Brown, who flourished in New York about 1860. After struggling with fortune for many years in a small printing office on the Bowery, he finally hit upon a plan by which he made an independent fortune in less than two years. This was his adver-

tisement which became a household phrase from one end of the Union to the other: "A clergyman whose sands of life have almost run out, has discovered in India, a panacea for consumption, which he will be pleased to mail to any fellow-sufferer, on the receipt of a two cent postage stamp." Those who sent the stamp would receive in reply from the alleged clergyman a printed recipe, the ingredients of which it would be impossible to have filled at any drug store. At the bottom of the recipe was a note, informing the correspondent that if he or she found it impossible to have the receipt filled, the good clergyman would, on the receipt of one dollar, send a bottle of the specific already prepared. The clergyman racket took with the religious people especially, and thousands sent Brown their dollar. It was afterward discovered that the principal ingredient was a mild preparation of *Cannabis Indica* which in itself is a deadly poison, but which in its weakened state, had an expectorant effect on consumptives, raising the phlegm, and relieving them, though no positive cures by it were ever known. Brown did not live long to enjoy the independent fortune he acquired by his shrewdness, and knowledge of human nature.

Brandreth's Indian Vegetable Pills enjoyed a large sale forty-five years ago, and reaped their proprietor a fortune. He was the first patent medicine man to advertise extensively in the *Public Ledger*, and his cash helped keep that paper on its legs in its infancy. One of his employees, named Wright, it is alleged, used Brandreth's formula and established Wright's Indian Vegetable Pills, on which he also waxed rich. Stomach Bitters have also yielded large fortunes to their proprietors. Among the most successful of these have been Sheetz's and Hostetter's. Sheetz, who is a Philadelphian, afterward bought the plant of Wright's Indian Vegetable Pills, on which he has coined money. Dr. Wishart's Pine Tree Tar Cordial was a famous cure for consumption in its day, though there is little demand for it now. Wishart was a Kensington grocer and ship chandler, and, it is said, he accidentally discovered the curative properties of tar when a boy down in the Jersey woods. He was a devout Methodist, and died a dozen years ago, leaving a large fortune. Among the patent remedies that had a large sale formerly was Dr. Marchisi's Catholicism, which was a renowned specific for female disorders. Doctors Young, Leidy and Rose, all Philadelphians, made large fortunes from specifics for the same complaints. Among the oldest of the patent medicines now extant is Swaim's Panacea, for cleansing the blood. For whooping cough the Compound Tincture of Seneca and Cox's Hive Syrup were popular remedies formerly, but of late years Delevau's Whooping Cough Remedy has had a large sale.

Godfrey's Cordial was among the oldest of the patent medicines, but, like Dover's Powders and Turlington's Balsam, was long ago incorporated in the dispensatory. The latter remedy was named after its inventor, a famous London physician, and is now known as the Compound Tincture of Benzoime. It is for kidney disorders. Dover's Powders and Godfrey's Cordial are for producing sleep and are full of laudanum. The Oil of Spike and Oil of Brick were formerly patent medicines. There are no patents on them now, but they are generally in use. To the same class belongs Haarlem Oil, which for many generations has been a cure for urinary complaints. In fact, patent medicines date back to the beginning of the seventeenth century. Dr. Dover, the inventor of Dover's Powders, and one of the first patent medicine specialists, in his work, "Old Physician's Legacy," gives the origin of the word quack as applied to the vendors of patent medicines. After describing the use of mercury, which from the beginning has been the chief ingredient in remedies designed for the alleviation of certain disorders, the old doctor asks: "And why should they term me a quack salver, which is the German for quicksilver or mercury?" Until 1847, owners of proprietary medicines found it difficult to secure protection for their goods in this country, but in the latter year they were protected by national laws.

Among the most successful proprietary medicines have been those for alleviating rheumatism. Thirty years ago a popular remedy for this was Seneca Oil, which derived its name from being found near Seneca Lake. It was nothing more or less than the skimmings of coal oil, but when, during the war, coal oil was discovered in large quantities, it leaked out what Seneca Oil was, and the remedy suddenly collapsed. The principal ingredient in all rubbing lotions, whether protected by patent or not, is soap liniment, which is pure castile soap dissolved in spirits of turpentine and oil of oreganum, with a little laudanum to make it soothing. The greatest sale ever realized by a rheumatic remedy was St. Jacob's Oil. Dozens of bottles used to be sold every day by nearly every retail druggist in the land, but now it is scarcely ever asked for. St. Jacob's Oil owed its success to the originality of a Philadelphia journalist named Wm. E. Cunningham, who in 1881 was a reporter on the *Public Ledger*. For twenty-five dollars a week, Cunningham daily ground out long interviews with prominent citizens all over the country regarding the beneficial effects of the oil, and he made these interviews so interesting that the public would read them nearly to the end before they would discover it was an advertising puff. Hobensack's worm medicine still has a large sale. Kunkel has made money fighting the worms, but his medicine don't sell like it did. Worm medicines, unless purely vegetable, are dangerous. Worm powders are especially to be avoided. The most of them contain a dangerous poison, called santanine, designed to kill the worms, but oftener kills the patient. Everybody has heard of Drake's Plantation Bitters. Its proprietor, P. H. Drake, a New Yorker, when he invented the bitters in 1860 made a bet with a capitalist of \$10,000 that he would make half a million of dollars off the bitters inside of ten years. Drake was the first man to start fence advertising and advertising on rocks at summer resorts and other much frequented places. As a reminder of his bet, his bitters were known as Drake's Plantation Bitters X 1860-1-10—signifying that he would make a fortune on them in ten years from 1860. He won his bet, and retired a millionaire. His bitters are now a thing of the past. Their principal ingredient was pure gin and alcohol, and this made them so popular. During the war, as liquor was excluded from the army, the sutlers used to buy up Drake's bitters by the thousands of bottles and sell them to the soldiers. After the encampment would be broken up, the farmers in the neighborhood would go around with wagons, collect the bottles which had Drake's name blown on them, and send them to New York, where they would be bought up by the proprietor for almost nothing, refilled and sent to the front again. Mishler's Herb Bitters were popular twenty-five years ago, but sales are small now. Jayne's medicines still maintain their great popularity. Dr. Jayne, the founder of the house, was originally a South Jersey shoemaker, and began business in a basement on South Second Street. Hood's and Ayer's are the most popular of the sarsaparilla remedies on sale to-day. Ayer's is an old-timer—Hood's is new. Both are from Lowell, Mass. Walker's Vinegar Bitters made a fortune for its proprietor ten years ago, but he lost all his money through difficulty with his female employees. Dr. M. F. Groves, who died ten or twelve years ago, and was a popular physician of Southwark, was the inventor of Anodyne for Infants, cure for rheumatism and other specifics, which still have a large sale. Dr. Yellowstone's remedy, the Herbs of Joy, are never heard of now, but they once had an extensive sale. Considerable money has been made in the past from hair dye, and hair-growing preparations, but like face-beautifying preparations, they are not as popular as they were. Wright made a big fortune with his face preparations, so did Upham, who was one of the pioneers of '49 in California, and who went to Florida, where he bought up large orange groves. He was a good fellow, but he died a few years ago. One of the biggest frauds ever perpetrated on the public was the Scotch Oats Essence, which concern recently col-

lapsed, when sixty-three gross of the bottles were sold at four cents a bottle. The retail price was one dollar. Patent goods in our line that now enjoy the most extensive sale are the porous plasters for colds and the prepared mustard and spice plasters for cramps, which are a great improvement on the old plan of getting up in the middle of the night and making a poultice yourself. The day of big profits is past. Formerly where we retailed a patent medicine specific for a dollar, or about fifty per cent. above its cost, now our profits are not above nine cents per bottle. As a general thing, there has been for the past few years a decline in the number of firms engaged in the patent medicine business. That is the reason that Johnston, Holloway & Co., the largest wholesale, dealers in the city, got out of it. Other Philadelphia firms who deal extensively in patent medicines by the wholesale are French, Richards & Co. and Smith, Kline & Co. The largest dealer in the United States is Charles N. Crittendon, of New York City.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

June.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Pigeon, chicken, duck.

FISH.—Anchovy, bass, bluefish, blackfish, cod, eels, clams, flounder, haddock, halibut, herring, lobster, mackerel, mussels, perch, porgie, prawn, salmon, shad, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Beans, cucumbers, carrots, cauliflower, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, radish, rhubarb.

FRUITS.—Cherries, strawberries, bananas, pineapple.

PRACTICAL RECIPES.

WHITE SOUP.—The day before it is to be used make a stock of a knuckle of veal, separated into three or four pieces, a slice of ham as lean as possible, a few onions, thyme, cloves and mace, stew twelve or fourteen hours, until the stock is as rich as the materials can make it; an old fowl will make it much richer if added. Remove from the fire, after being sufficiently stewed, let it cool, and then cut off the fat; add to it four ounces of pounded blanched almonds, let it boil slowly, thicken it with half a pint of cream and an egg, boil slowly for half an hour, and serve.

RISSOLES.—1. Cut some puff paste with a round tin cutter, about three inches wide. Have ready some cold fowl or veal very finely minced and seasoned with a little pounded garlic, grated lemon peel, pepper, salt and mace, the juice of half a lemon, and moisten with a little good gravy. Put some of the mince upon a bit of the paste, wet the edges, and lay over it another bit. Press it gently round the rim, brush all over with a well-beaten egg, and strew over them some sifted bread crumbs. Fry them a light brown in boiling clarified beef dripping, and lay them upon a sieve before the fire to drain. Garnish with fried parsley.

2. Mince very finely some cold roast veal, and a small piece of bacon. Season it with grated nutmeg and salt, then moisten it with a little milk and make it up into good sized balls. Dip these into the yolks of eggs finely beaten up, and then into finely grated bread. Fry them of a light-brown color in good dripping, then drain them on a sieve. Garnish with parsley.

BEAN SALAD.—Cut up a lettuce, and add to it a pint of boiled broad beans that are quite cold. Chop up two

hard boiled eggs and sprinkle them over the salad. Serve with plain dressing.

MACARONI.—When tender break the macaroni into even lengths and boil in water; pour off the water and fill a baking-dish with alternate layers of grated cheese and macaroni, until it is nearly full; finish off the top with a layer of mushrooms; pour chicken or beef gravy over the whole, and bake until it is heated through.

ALMOND CAKE.—Blanch and pound in a mortar eight ounces of sweet and one ounce of bitter almonds; add a few drops of rose-water or white of egg every few minutes to prevent oiling; add six tablespoonfuls of sifted sugar and eight beaten eggs; sift in six tablespoonfuls of flour, and work it thoroughly with the mixture; gradually add a quarter of a pound of creamed butter; beat the mixture constantly while preparing the cake, or it will be heavy; add two teaspoonfuls Horsford's baking powder; put a buttered paper inside of a buttered tin, pour in the mixture, and bake in a quick oven; cover the cake with paper if the oven is too hot.

CHEESE PUFFS.—One and a half pints of flour made into a smooth batter with one and a half pints of sweet milk; add teaspoonful each of salt and sugar and six well beaten eggs (no baking powder); grate into this a large cupful of strong, rich cheese; stir well and bake one hour in a good oven; this will rise very high and must be eaten at once.

BAKED EGG PLANT.—Pare an egg plant and cut it into pieces, boil them till tender, drain, mash and season; put into a baking-dish, sprinkle with bread crumbs, pour melted butter over all and bake in a hot oven.

CANADIAN ADULTERATIONS.

HOW THE PURE FOOD MOVEMENT LANGUISHES ACROSS
THE BORDER.

The Blue Book just issued by the Department of Inland Revenue in Canada contains some facts of a nature to arouse renewed interest upon the part of those engaged in fighting food adulteration. One hundred and ninety-four samples of spices were analyzed, and the result showed 111 adulterated; 85 samples of coffee showed 23 adulterated, and 3 of doubtful quality. The Commissioners say, while the adulteration of spices is not so serious to public health, yet it is a commercial fraud, and is so serious in extent that they urge upon the Government the licensing spice mills which shall call for inspection. The following list of articles cannot fail to be of interest to every advocate of pure food: Coming to the details of the analyses some interesting particulars are noted. The adulteration of butter are specified as follows: "Excess of salt," "mouldy and unfit for food," "excess of water," "water and salt," "beef fat," "a small amount of foreign fat," etc. In milk the chief adulterations are by removal of butter fat and addition of water. Cream of tartar is shown to be adulterated by "tartrate and sand," "sulphate of lime," "phosphate of lime," "starch of farina," "quartz of silicious matter," "starch," "flour," "traces of phosphoric acid," etc. The adulteration of coffee is largely by "roasted grain and chicory," and "burnt starch;" also "roasted corn" and "roasted beans," and occasionally "burnt sugar" and "starch." The adulteration of coffee, the analyses show, is very large. Drugs also show a considerable adulteration, either by dilution with water, or by weakness in some of the ingredients. The adulterations of spices appears to have been carried on to a very serious extent. As already noted, out of 194 samples, 111 were adulterated, 5 were doubtful, and only 78 genuine. Among the forms of adulteration may be noted: Turmeric, flour and turmeric starch and turmeric, starch, turmeric and cayenne, flour, starch, maize and other starch, wood fibre, wheat flour, clove stalks, roasted grain, pea starch, cassia, cinnamon, cassia and starch, glutinous paste, cayenne,

mustard husks, starch granules, magnetic sand, cereal, starch, millings and excess of sand flour, earthy matter and sand, sulphate of lime, flour and cayenne, flour and corn starch, roasted corn and bread crumbs, etc., etc., almost *ad libitum*. The adulteration of mustard is on a large scale. Out of 55 samples analyzed, only 21 are classed as genuine or good, and even of these a number contain foreign substances to a small extent. The principal adulterations of mustard are flour and turmeric, turmeric and starch, starch, cayenne pepper and salt, cayenne and salt, cayenne and turmeric, wheat and tapioca flour and potato starch, wheat fibre, turmeric, potato, arrow root, etc., etc. Indeed, as regards spices, it would seem as if the purchaser, in about three cases out of five, would be pretty certain to get the adulterated article.

PIPE SMOKING.

THE PROPER KIND OF PIPE FOR ENJOYABLE USE.

The great desideratum in a smoking pipe is its interior porosity; that is to say, its capacity for the absorption of the nicotine and ammonia contained in tobacco. It is unfit for use when it has become saturated with these tobacco poisons, and hence a smoker who desires to enjoy his pipe and avoid tobacco poisons should choose cheap, porous pipes, and change them often. I have seen a meerschaum pipe so saturated with nicotine that it sweats it, and it had to be continually rubbed to prevent tarnishing. Now, anybody knows such a pipe cannot be wholesome. I smoke a cheap pipe made of ground corn-cobs, and throw it away after a few smokes, and so avoid all the disagreeable symptoms of nicotine poisoning. Some of these cob composition pipes are coated with shellac, but they are too odoriferous when first fired, and don't suit a fastidious smoker. But a cob pipe is made that is coated with some simple vegetable glue, and it gives the sweetest smoke imaginable—when fair tobacco is used—for a half dozen smokes.—*St. Louis Globe-Democrat*.

NUTRITION IN EGGS.—Prof. Fresenius, of Wiesbaden, after a long series of chemical analyses, declares that an egg contains as much nourishment as a pound and an ounce of cherries, a pound and a quarter of grapes, a pound and a half of russet apples, two pounds of gooseberries, and four pounds of pears, and that 114 pounds of grapes, 127 pounds of russet apples, 192 pounds of pears, and 327 pounds of plums are equal in nourishment to 100 pounds of potatoes.

COTTON PROTECTOR.—Another device or method has been added to those heretofore proposed to prevent the burning of cotton when being conveyed in vessels. The safeguard now brought forward consists in wrapping each bale of cotton in wire gauze instead of the usual covering of jute bagging. It has been, it is claimed, subjected to all kinds of tests, including hooks and compressions, and it is alleged has proved itself equal in all respects to jute bagging, the cost of the new material at present being about the same as that of jute bagging. The principle involved is that flame will not pass through very small holes, according to the well-known construction of the Davy safety lamp.

CANAL ELEVATORS.—A canal has just been constructed in Belgium in which, instead of locks, the boats are hoisted by elevators from one level to another. The canal extends from the coal region in the interior of Belgium to Brussels, crossing several other canals at the same grade, so that Belgian coal can be brought directly by boats to Paris, as well as to all the principal towns in Belgium and Holland. As the line passes over a rather hilly country, various ascents and descents must be made, and to save the long delays incidental to passing locks, the change of grade is made by means of hydraulic elevators. The boats, which measure about seventy tons, are towed at the low level into an immense tank, with gates, which is submerged in the canal. The gates are then closed, and the tank, which rests on the pistons of a huge hydraulic elevator, is raised to the upper level, when connection is made with the next section of the canal by means of double gates, and the boat proceeds on its way.

ARTIFICIAL BOARDS.—A Swiss inventor has perfected a method of making artificial boards and is advocating their use in building. They are made of a mixture of plaster of Paris and reeds pressed into shape by hydraulic process. The material has the advantage of incombustibility and lightness and will resist the warping action of atmospheric changes.

PAPER POWDER.—For some time past a new gunpowder has been made at the government powder factory at Wetteren, in Belgium; it is known as poudrepapier, or paper powder, and it is stated that a charge of two and one-half grammes, or thirty-nine grains, gives, in a rifle of small calibre, an initial velocity of some six hundred and sixty yards to the ball—this being equal to, if it does not exceed, the celebrated Label powder. The additional advantages attributed to this new powder are those of not smearing the barrel, of producing no smoke, and of causing but little recoil.

AN OLD BUT NEAT TRICK STOPPED.

In the U. S. Circuit Court, Baltimore, in Chambers, Hon. Justice H. L. Bond, on May 28th, granted an injunction at the suit of Messrs. Lea & Perrins, against Jacob B. Levy, to restrain the latter from buying from old bottle dealers, the empty bottles, bearing the genuine labels of the plaintiffs' manufacture of Worcestershire Sauce, and after refilling the same with a spurious liquid, selling them for the genuine. Quite a large and lucrative business has been built up in this seemingly small way, very much to the injury of the genuine sauce. All of this must now stop under this decision, which reads as follows:

The plaintiffs ask the Court to enjoin Jacob B. Levy from selling, or exposing to sale, or causing or being in any way concerned in the selling or exposing to sale, or otherwise disposing of any sauce prepared for sale in the bottles of plaintiffs, or in any other bottles, or in any other way with the genuine labels of these plaintiffs, or labeled in any way with the title of Lea & Perrins' Worcestershire Sauce, or in any manner whatever from selling or exposing to sale, or causing or being in any way concerned in the selling, or otherwise disposing of any sauce purporting to be the Lea & Perrins' Worcestershire Sauce; and that the exclusive right and privilege of these plaintiffs to manufacture and sell sauce under said title may be established.

ORDER OF COURT.

The foregoing bill and exhibits having been presented, read and considered, it is ordered that a restraining order be issued as prayed in the bill, with leave to the defendant to move to dissolve such order upon giving five days' written notice of such motion to the complainants or their counsel of the time and place of such motion.

(Signed) HUGH L. BOND,
Cr. Judge.

THE EVOLUTION OF THE BAR-ROOM.

The fact may be a melancholy one, from various points of view, but nevertheless it is a fact that a very large percentage of men living in American cities habitually indulge, with greater or less moderation, in the use of alcoholic stimulants. Whether the bar-room has "come to stay" or not, is a question that does not seem to demand present discussion. It is sufficient that we recognize that it is here, with a very considerable degree of prominence, and that we note in its evolution from the bar-room of our ancestors at least one ominous change—apart from the general deterioration in the quality of the liquor. That change is in the presence of an astonishing variety of drugs and nostrums, simple and compound, that now constitute a necessary part of the bar-keeper's battery, in all first-class places for the retailing of liquors. In old times the bar-room seldom trespassed further on the province of the drug store than by possession of a few bottles of peppermint, "hot drops," wahoo berries in rum, gin and tanzy, and that awful liquid abomination, gin and rue. Then came in a variety of "stomach bitters," ostentatiously advertised to (when used in conjunction with enough liquor to make

a man "feel good") banish from the human system, temporarily, at least, all consciousness of physical ills. From them the progression was easy. Now the bar-keeper assumes the prerogatives of a prescribing chemist, and with a wide range of tonics, excitants, sedatives, diuretics, etc.—many of them deadly poisons—make up the prescriptions that he confidently recommends to his patrons. Strychnia, the tincture of aconite root, morphine, hydrate of chloral, and a variety of other toxic drugs are thus habitually dispensed. Where the bar-keeper does not venture to go so far, he at least keeps on hand compounded syrups, nominally preparations of phosphorus, but actually largely dependent upon quinine and strychnine for their effect; and elixirs of valerianate of ammonia, calisaya, or other drugs, in themselves harmless, but loaded for bar use with morphine, cocaine, or other more powerful ingredients. There are very grave dangers in this custom, beyond the mere possibility of the bar-keeper poisoning his patrons by excessive doses of toxic drugs. One is in the cultivation of the habit of drug-taking, in itself a pernicious thing sure to have baneful results, however small its indulgence, if continuous. But that which is yet more serious is the inducing—by temporary palliatives of local symptomatic affections—of a fictitious sense of well-being and consequent neglect of much-needed constitutional treatment of the disordered system of the bar-room drug-swallower. People should learn that when their bowels are constipated and their weak, exhausted stomachs revolt against food, it is not wise to take drugs to give them false appetites, and encourage them to stuff themselves with food that their digestive organs cannot properly take care of; that when their heads ache and their nerves are shaky, it is not safe to resort to strychnia to brace up their nervous system, and aconite to affect the action of their hearts; that the causes of persistent insomnia are too deep to be reached by steadily increasing doses of chloral or bromide of potassium; that a spoonful of taraxicum in a glass of whiskey is by no means a sure cure for a torpid liver; and that the bar-keeper is a perilous guide through the mazes and pitfalls of renal disorders. It will be well for the sensible man when he realizes that he is "out of order," instead of going to the bar-room for a dose that will "fix him up," to severely leave that locality alone. As a general rule, his immediate want is for a cathartic medicine, something that will operate mildly but promptly and effectively upon his liver, and for that he can take nothing better than Ayer's Pills. Then, if he has even the slightest reason to believe that there is yet any lack of the proper functional operation of his digestive, assimilative and excretory organs, let him take, in the small and regular doses prescribed, a bottle or two of Ayer's Sarsaparilla. The breaking out of any pimples, pustules or rash; dyspeptic symptoms, headaches languor, pains in the back, bad breath and constipation, are all indications that this medicine is what he needs. And, if he attends to himself in time, that is all he will need for restoration of health. As for the bar-keeper's drug battery, let him remember the warning sign in a Western mill: "Don't monkey with the buz-saw."

BUSINESS NOTES.

FOR TIRED BRAIN

use Horsford's Acid Phosphate. Dr. O. C. Stout, Syracuse, N. Y., says: "I gave it to one patient who was unable to transact the most ordinary business, because his brain was 'tired and confused' upon the least mental exertion. Immediate benefit and ultimate recovery followed."

THE GREAT ESSENTIAL.

"Nature's chief master-piece is writing well,"
And if the reader would with pen excel,
To gain success his first essential then
Must be to use an Esterbrook Steel Pen.

GOOD ADVERTISING AGENT WANTED,

Address, ANALYST PUBLISHING CO., 19 Park Place, New York.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the **AMERICAN ANALYST**, a good advertising medium. Why should not you?

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose spurious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar, we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING Co.,
19 Park Place, N. Y.

WANTED ON LIBERAL TERMS.

A NEW USE

FOR

LIQUID PEPTONOIDS.

Successfully used in Dissolving the False Membrane in Diphtheria.

A Physician writes: "In an experience of over thirty years I have never used anything to equal your LIQUID PEPTONOIDS as a local application with a spray. It will dissolve the membrane and destroy the diphtheretic odor in less than twenty-four hours. I use the LIQUID PEPTONOIDS full strength, as a spray, two or three times a day, in bad cases."

Used successfully by another physician in two desperate cases:—"I was induced to try LIQUID PEPTONOIDS in two very desperate cases of DIPHTHERIA. I think I never saw throats more heavily coated with exudate than were these, and I think I never saw it more rapidly disappear than in these cases, by frequent spraying with your LIQUID PEPTONOIDS."

LIQUID PEPTONOIDS can be taken by patients unable to ingest food in any other form. In *dyspepsia* and *loss of appetite* its effects are positive, its digestive properties assisting in the digestion of food taken and its peptogenic properties quickly stimulating the natural digestive secretions of the stomach.

PANCROBILIN.

Prepared (in both Liquid and Pill form) from Extract of Pancreas and Bile.

This preparation is designed expressly to increase the digestion and absorption of fats.

We believe that the fat-digesting properties of pancreatine and bile are inseparable, and that without their union in the intestinal tract but little, if any, fat would be digested and absorbed.

PANCROBILIN will be found of great service in *Phthisis* and other wasting diseases, *Nervous Prostration*, *Constipation*, *Inanition*, *Malnutrition*, *Intestinal Indigestion* and wherever there is a failure to assimilate fats.

If the skin is first wet with LIQUID PANCROBILIN, the inunction of oils will be greatly facilitated.

LIQUID PANCROBILIN is put up in pound bottles. PILL PANCROBILIN is put up in bottles holding 100 pills. The coating of the pills will resist acid digestion, when given as directed, but will be quickly dissolved in the alkaline secretions of the duodenum.

PHOSPHO-CAFFEIN COMP.

(Granular Effervescent.)

Formula for each dessertspoonful:—

Caffein.

Acidi Phosphorici aa, grains, ss.

Antipyrin.

Ext. Apii. Grav. dulc. (Celery), aa grains, j.

Sodium Bromide, grains, v.

The satisfactory results produced by PHOSPHO-CAFFEIN COMP. in *Headaches*, *Neuralgia*, *Insomnia*, *Neurasthenia* and general *Nervous Irritability*, are not due to the effect of any one ingredient, but to the happy effect of the combination. A thorough series of comparative tests have demonstrated the superiority of the above formula over any other in the market.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

NEW YORK. CHICAGO. ST. LOUIS.

COLDEN'S LIQUID BEEF TONIC.

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of Beef and Tonic Invigorator."

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fused Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M.D., F.R.S., and an endorsement by SIR ERASMUS WILSON, F.R.S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2."

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)". It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

THE JOHNSTOWN CALAMITY.

A thrill of sympathetic horror swept over the community on June 1st when the morning papers announced that on the previous day a flood had washed away the town of Johnstown, Pa., involving the lives of probably several hundred persons in the catastrophe. But the whole civilized world has stood aghast at the later information from the scene of the disaster which showed, not merely the extinction of an active manufacturing town, but the loss of many thousands of lives, under anguishing circumstances which have no parallel in at least our national history. At the present writing, nearly a week after the awful occurrence, but slight headway has been made in clearing away the wreck caused by the flood, and the whole loss of human life has not yet been ascertained. It is computed, however, by the best local authorities as reaching to between twelve and fifteen thousand, of whom fully two thou-

sand were burned to death while imprisoned in a stack of ruins which had been whirled by the resistless current against a railroad bridge, where they lodged and caught fire. No such overwhelming catastrophe has ever before occurred in America as this, in which thousands of lives were destroyed under such tragic and terrible circumstances by flood and flame, annihilating at a blow thousands of happy homes, and wiping out of existence a group of populous villages, constituting a great industrial centre. Language is inadequate to describe the anguishing horrors of the dire event by which thus suddenly one of the most peaceful and picturesque nooks of the Alleghanies has been converted into a vast tomb. As the calamity was without precedent, so likewise has been the nation's response of sympathy and aid, upward of one and a half millions of dollars having been subscribed for the relief of the survivors in the brief space of five days. Large contributions also have been wired from across the Atlantic. Thus while the forces of nature are incessantly and relentlessly operating in the direction of change and destruction, the heart of humanity is ever ready to interpose its impulses to stay the tide of suffering set in flow by powers beyond its reach to grapple with or counteract.

HOLIDAY INCONVENIENCES.

It is a familiar saying that we Americans do not have half enough holidays. Possibly, considered from the standpoint of some European nations, which boast that they have more holidays on their calendars than there are days in the year, we are deficient in that respect. It is probable, however, at the same time that we have more holidays than we are popularly credited with. In New York State particularly this seems to be the case, though the fact is brought to the consciousness of the heads of business firms more distinctly than it is impressed upon that of the general public. As at present regulated, a large proportion of our legally established holidays are contrived rather for the inconvenience of employers than for the enjoyment of the employees, whom, of course, it was the purpose of the law-makers to especially benefit. The list of days in the year that are practically *dies non* in relation to banking matters and the collection of business paper is somewhat noteworthy. Beginning with Christmas and New Year's Day, there are Washington's Birthday, Decoration Day, the Fourth of July, Election Day, Thanksgiving Day and Labor Day, in addition to which, under existing laws, every Saturday in the year, so far as it concerns the details of banking business, is virtually a holiday owing to the conditions arising out of the legal closing of that day at noon. Thus there are in New York 60 days in the year besides the 52 Sundays, or 102 days out of 365 on which notes, acceptances and time bills of exchange cannot be collected. On Saturday forenoon sight bills and checks may be presented up to 12 o'clock, but everything else in business paper falling due that day or Sunday is put off until Monday, and

when Monday is a holiday, until Tuesday, a delay of three days from the due date. Of course this system has operated from the very outset adversely to the interests of all our large commercial houses, and the inconvenience is reflected down the entire length of every avenue of trade. Little or no business in the way of trade is accomplished on Saturdays, except by the up-town retail establishments, whose activity on Saturday afternoons through the greater part of the year is in palpable defiance of the spirit and intent of the law, though not of its letter. At first many manufacturing establishments closed altogether on Saturday, as it did not pay to run half a day, but after a while they opened all the day as usual before the law was passed. Most of our stores are opened without reference to the holiday provisions, as the law only applies to the collection of business paper, and does not prohibit or take notice of any other form of labor. The law has not relieved workmen of any of their burdens. Where labor is suspended, the laborer is only paid for the time he works. Before the law all workmen were released at an earlier hour on Saturday, but paid for a full day. Now, even if they are engaged on Saturday, unless they work all day, they are paid for only half a day. Those who are released do not benefit by the respite, the saloons profiting chiefly by the enforced leisure. Some demagogues may have scored a point, but the public has not derived the expected benefit.

A CENSUS OF BIRTHS AND DEATHS.

An announcement has been made by the Department of the Interior which will afford satisfaction to the public, and especially to the medical profession, that Dr. John S. Billings, Surgeon U. S. Army, has consented to take charge of the report on the mortality and vital statistics of the United States as returned by the eleventh census, to be taken in 1890. As the United States has no system of registration of vital statistics, such as is relied upon by other civilized nations for the purpose of ascertaining the actual movement of population, our census affords the only opportunity of obtaining near an approximate estimate of the birth and death rates of much the larger part of the country, which is entirely unprovided with any satisfactory system of State and municipal registration. In view of this, the Census Office, during the month of May just past, issued to the medical profession throughout the country "Physician's Registers" for the purpose of obtaining more accurate returns of deaths than it is possible for the enumerators to make. It is earnestly hoped that physicians in every part of the country will co-operate with the Census Office in this important work. The record should be kept from June 1, 1889, to May 31, 1890. Nearly 26,000 of these registration books were filled up and returned to the office in 1880, and nearly all of them used for statistical purposes. It is hoped that double this number will be obtained for the eleventh census. Physicians not receiving registers can

ROCK CANDY and ROCK CANDY SYRUPS.

For use at the Soda Fountain and in all Pharmaceutical preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

DRYDEN & PALMER,
19 Hudson St., New York.

obtain them by sending their names and addresses to the Census Office, and, with the register, an official envelope which requires no stamp will be provided for their return to Washington. If all medical and surgical practitioners throughout the country will lend their aid, the mortality and vital statistics of the eleventh census will be more comprehensive and complete than they have ever been. Every physician should take a personal pride in having this report as full and accurate as it is possible to make it. It should be noted that the department promises that all information obtained through this source shall be held strictly confidential.

AN INDEFINITE ALTERNATIVE.

There seems to be a widely prevalent uncertainty among writers of the English language as to the selection of a proper indefinite article to precede an aspirated word. Thus, many writers of otherwise fair judgment feel themselves constrained to use the word "an" before almost every word beginning with an "h," while others appear to be wandering in a maze of uncertainty on the subject. The *Medical Era*, in its last issue, for instance, calls attention to the circumstance that the *N. Y. Medical Times* says "an homeopathist;" while Judge Barrett, in his recent much-criticised decision, says "a homeopathic physician." To which the *Era* adds: "We think the judge can give the editor pointers on the use of the English language. How would it sound, for instance, to say 'an horse?'" It would not sound well, yet there are plenty of writers, not of Cockney birth either, who would write it "an horse"—or, if they should not use that expression, would be at a loss to explain why they selected the other. Grammatically considered, the accepted custom in this country is to use the article "a" before a consonant and a sounded "h," as in the word "horse," cited by our contemporary. Many English writers, however, and conspicuously Macaulay, use "an" before "h" not silent in those cases where the word is accented on the second syllable, as "an hotel," "an historical event"—which might give countenance to such an expression as "an homeopathist," that word being practically accented on its second syllable. But the consensus of literary taste does not sustain this principle, the better expression seeming to be "a hotel," "a harangue," etc. A similar difficulty attends those words beginning with a vowel, which are pronounced as if they began with "y," as ewe, European, useful. Some writers use "an" before such words, but "a" is preferable, as "a ewe," "a European custom," etc. In cases of this kind usage makes the law, and the best authorities in the language sustain the views above stated.

FROMENTINE.

A French chemist named Beaumetz exhibited at a recent meeting of the Paris Academy of Medicine a new alimentary substance, which he names fromentine. It is obtained from wheat by the aid of special mill-stones, and is really the embryo of the wheat reduced to flour. It contains three times more nitrogenous substance than meat, and a large proportion of sugar. It is thought that it may advantageously replace powdered meat as a concentrated food. It may be employed for making soups, and even for making biscuits.

VALUE OF GINSENG.

The absurdly exaggerated respect, amounting to veneration, in which ginseng is held by the Chinese has long been a source of wonder to Western barbarians, the most enlightened of whom can find no medicinal virtues in the plant, but a paragraph in the *North China Mail*, taken from the official report of the military governor of Kirin, in Manchuria, caps the climax. This official states that he had forwarded, for the use of the Emperor, by special commissioners, eight large and sixteen small roots of ginseng, weighing altogether about nine and four-tenth ounces. The total cost thereof is stated to be 1,560 taels, or about \$2,000, being at the rate of \$215 per ounce.

Dr. Francis Wyatt, who is conducting with marked success, a Laboratory of Industrial Chemistry at No. 24 Park Place—opposite the office of the *AMERICAN ANALYST*—has taken into partnership Dr. August Wein-gaertner, a gentleman well and favorably known in scientific circles in this city. The professional business of the laboratory will in future be conducted under their immediate joint supervision, their specialties being expert chemical and microscopical examination of foods, drinks and drugs, analysis of fertilizers, alkali, bleaching powder, ores, minerals and natural and industrial products of every description.

DURATION OF LIFE.

INCREASING LONGEVITY OF MANKIND IN MODERN TIMES.

Dr. Todd, President of the Georgia State Medical Society, read at the annual meeting of that body, held at Atlanta recently, a paper on "Longevity," which possesses great intrinsic interest and at the same time is gratifying as showing how much medical and sanitary science and a more rational mode of life have done to prolong the human span, and how much better in every way are the conditions of to-day than of those "good old times" for the return of which sentimentalists vainly sigh. The Doctor is modest in his claims, making no effort to monopolize in the name of the medical profession credit for a betterment in which so many agencies play parts; but he does claim, and with reason, that the intelligent physician has had much to do with the result, and that the death rates of the various peoples of the globe bears a ratio very nearly inverse to the number of qualified physicians among them. The highest death rate in Europe is that of Russia, ranging from 20 per thousand in Courland and 22 per thousand in the Baltic province, there being many physicians in both districts, to 49 in places where there are but few. But one-half of the children born in some parts of Russia reach the seventh year, and of 1,000 male children only from 480 to 490 reach the age of 21 years, and of these only 375 are able-bodied. Russia, with all its teeming population, has only 15,414 regular physicians, and one surgeon to 100,000 population. The United States, having a doctor of medicine for every 600 population, shows the lowest death rate in the world, England following. The average life expectancy in the United States is now 55 years; in England among the urban population it is

50, and among the ruralists 54 years plus. Russians have a life expectancy of but 28 years, approximately, and Chilians of the same, while in Ellobed, in the Soudan, 23 years is a generation. The average life in the Rome of the Caesars was 18 years; now it is 40 years. Within 50 years the average in France has increased from 28 to 45½ years, and in the days of Queen Elizabeth the English average was but 20 years. Dr. Todd ascribes the great and progressive change for the better to advanced medical knowledge, better drainage and diet, greater cleanliness, and to vaccination and the use of anesthetics, quinine and the like. He thinks that quinine alone has added two years to the average life of civilized man. To these agencies should be added the decrease of war, the more lenient laws, and the greater temperance of our day.

INFECTION BY CONTACT.

A COMMON DANGER THAT SHOULD BE STRICTLY GUARDED AGAINST.

In connection with the warnings which the *AMERICAN ANALYST* has repeatedly given regarding the danger of infection in books, the following from the *Sanitary News* will be found to be timely and significant:

From the number of cases reported of infectious diseases that have been communicated through articles that have been in the possession of those afflicted with such diseases, it would seem that greater attention should be given this matter. The virulence of many disease germs has been shown to be of long life, capable of being transmitted through many years. Cases of scarlet fever, diphtheria, and typhoid fever have been reported in which the infection was communicated by articles that had been possessed by the sick years before. While the matter has not been fully and systematically investigated, many cases have been reported to show that in such articles lie great danger. In cases of small-pox and yellow-fever infection by this means is considered well enough founded and dangerous enough to make the destruction of clothing and all articles exposed to infection imperative by a general law of health departments. If such articles are not burned, they must be subjected to disinfection by steam at a high temperature. The danger of infection from these diseases is more noticeable on account of their epidemic nature and great fatality. Other less fatal diseases bear the same general law of infection, and in the aggregate—in their continuous and silent work—reap a greater harvest of death than do the epidemics that make charnel houses of our cities in a day. When we recognize the great extent to which infection is liable from this source, we cannot but express surprise that some means of investigation has not been instituted to discover at least the liability of such infection and its extent. Our public and circulating libraries, "second-hand" book, clothing, furniture and other stores, are all means by which disease germs could be communicated. Dealing in "second-hand" goods has grown to such an extent that almost all communities have representatives in their midst. One can scarcely go through a city without passing these stores and finding the sidewalks lined with their goods. The purchaser knows nothing about his goods. They are most generally brought to him; a price is agreed upon, and that is all there is of it. The articles may have been the possessions of a scarlet fever or small-pox patient, but it is all the same. Take the article of clothing. Goods may be on the tables of the "second-hand" dealer or broker which could have hung in the room of one afflicted with some infectious disease for weeks, and no one who may want to purchase, or even the dealer himself, know of it. Or there may be the furniture, or even the bed and bedding on which the patient lay. Who can say that all of these outbreaks of infectious diseases which have been called "spontaneous" have not had their origin from this source?

Cases are reported, and seem well-authenticated, in which scarlet fever and diphtheria have been carried from one house to another by birds in gathering material for nests from the premises of the afflicted house and depositing it on the window-caps of the other. If this is true, is it not reasonable to suppose that any contact with such infected articles is dangerous? Probably the most danger lies in books. With most patients there is a time in their sickness when they want books with which they want to pass the hours of convalescence. The home library seldom is sufficient, and the public or circulating library is resorted to. The book goes from the patient's into another's hands, bearing all the seeds of disease of which it is capable. Either there is danger of communicating disease in this way, or the germ theory is a failure. This matter has been deemed of such importance that in many European countries extensive investigations are being made regarding the infectiousness of books handled by the sick. The investigation should extend to all "second-hand" goods, and be conducted with great care and minuteness. In Denmark and Norway the process of disinfection now in use is said to be effective without doing any damage to the books. It is used in many of the circulating libraries and book-stores, and consists in placing the books, fully opened out, in a suitable compartment, and subjecting them to dry, hot steam of the temperature of 100 deg. C. for several hours. Clothing and all other articles once used should be subjected to some sure process of disinfection before they are allowed to be placed on sale, or in any way exposed. Phthisis is said to be communicated by sweepings from carpets in the rooms occupied by such patients, yet "second-hand" carpets are not only placed on sale, but hung out of store windows and displayed on the sidewalks, and no one knows how contaminated they may be from the expectorations of the consumptive. It seems that investigation could find many important and interesting facts in this field.

MAN'S PROGRESS.

THE RACE ADVANCING INSTEAD OF DETERIORATING WITH CIVILIZATION.

A favorite theme with the dyspeptic pessimists, and even common with gentlemen not usually of the cerulean habit, is the physical degeneracy of the human race. This complaint is not at all recent; indeed, it is probably as old as the second generation of men, but it does not require more than a cursory investigation to prove that it is fallacious, as in truth natural law would indicate it to be. In any competitive examination the Homeric heroes and other legendary notables are of course barred out. The strength of Ajax, hurling vast rocks through the groaning air, and the speed of the flying Atalanta, are just as creditable as the lung capacity of Boreas, or the amphibious powers of Neptune and his attendants. We have only to deal with authentic characters, and here the modern need not fear comparison. The exquisite figures of Phidias and Praxiteles are matched in flesh and blood among the athletes of the nineteenth century, as any one familiar with the thews and sinews of our modern gladiators can attest. Of the sports of the Olympic games, pugilism has descended to us, and we have so respectable an authority as Mr. Dana, of the New York *Sun*, deposing that Mr. Sullivan, of Boston, before his unequal contests with that greater John, John Barleycorn, could with his naked fists have vanquished the stoutest Grecian boxer, armed with the crushing cestus, that ever wore the olive wreath. In wrestling, and in foot-racing too, the present day has its champions, the equals of any that ever lived. In the matter of physical endurance, the Roman legionary has been held as far outstripping modern competition. It is true that the Roman soldier, inured from boyhood to the exercise of arms, was capable of great things, but the English

armies in India, in Egypt, and in other parts of the world, have displayed quite as much heroic fortitude and endurance as ever did the veteran legions of the Cæsars; and in his capacity for enduring and suffering, the explorer of the Arctic solitudes or the African wilds, has no parallel in the annals of antiquity. The skill of Caracalla, who severed the neck of the ostrich in full career with his crescent-headed arrows, was certainly admirable, but it was no greater than that of the English yeoman who cleft the willow wand at a hundred yards, or of the Caribbean savage who pierces the floating turtle's back by shooting his arrow in a parabolic curve; and the frontiersman, who strikes the coin from between his comrade's fingers with a rifle bullet, shows an equal finesse with a superior weapon. The Thracian barbarian, Maximin, who ran all day beside the horse of the Emperor Severus, and who was destined himself for imperial honors, filled the Roman with astonishment, but he did no more than the North American Indian runner often does, and only that which is the daily labor of the Japanese palanquin bearer. Hannibal led his army across the Alps, and carried dismay into Italy by his unprecedented feat, but Napoleon did the same thing, and dragged his cannon after him. Such instances can be multiplied indefinitely, and they all point to one conclusion, that the physical degeneracy of the present man is purely mythical. This sighing over past greatness and present incapacity has existed in all climes and under every condition of mankind. The luxuriant fancy of the Orient has far surpassed the colder imaginations of the West in this subject, for we find in the Hindoo traditions that among other departed blessings, time was when the age of common mortals was 80,000 to 100,000 years, and one peculiarly venerable character, who lived in a pure and virtuous antiquity, was made king when he was 2,000,000 years old, reigned 4,300,000 years, and then, resigning his government, rounded out the circle of life with a period of 100,000 years spent in quiet retirement. Those gentlemen who regretfully deplore "these degenerate days" are moved by the spirit of the Eastern sages, but to a less grotesque degree. Our present civilization, by nursing into a precarious manhood the cripple and the starveling who would have perished in a ruder age, may give a factor of weakness to the race, but this defect is far outweighed by those added comforts of modern existence that have increased the span of life fully sixteen per cent. beyond the longevity of earlier times. There is a significance in this greater duration of human life that is not at first apparent; it means an addition of sixteen per cent. to the brain and muscle power of humanity; an augmentation of human energy, and a saving in that most wasteful thing, human death, that has done more than anything else to make possible the wonderful advances on all lines of material progress that make the nineteenth century the most wonderful epoch in history.

CLEANING CLOTHES.

HOW TO RESTORE THE FRESHNESS OF WORN CLOTHING.

It is a mystery to many people how the scourers of old clothes can make them almost as good as new. Take, for instance, a shiny old coat, vest, or pair of pants of broadcloth, cassimere or diagonal. The scourer makes a strong, warm soap-suds, and plunges the garment into it, sousses it up and down, rubs the dirty places, if necessary puts it through a second suds, then rinses it through several waters, and hangs it to dry on the line. When nearly dry, he takes it in, rolls it up for an hour or two, and then presses it. An old cotton cloth is laid on the outside of the coat, and the iron passed over that until the wrinkles are out; but the iron is removed before the steam ceases to rise from the goods, else they would be shiny. Wrinkles that are obstinate are removed by laying a wet cloth over them, and passing the iron over that. If any shiny places

are seen, they are treated as the wrinkles are; the iron is lifted, while the full cloud of steam rises, and brings the nap up with it. Cloth should always have a suds made specially for it, as if that which has been used for white cotton or woolen clothes, lint will be left in the water, and cling to the cloth. In this manner we have known the same coat and pantaloons to be renewed time and again, and have all the look and feel of new garments. Good broadcloth and its fellow-cloths will bear many washings, and look better every time because of them.

THE WRONG MAN SHOT.

THE LAST WISHES OF THE DECEASED WERE FAITHFULLY CARRIED OUT.

Brander Mathews tells a good story of the ethical influence of the East on the wild and woolly West, says the *Washington Post*. A young Bostonian, reared beneath the brow of Beacon Hill and educated at Harvard, went to Texas and turned cowboy. He caught rapidly the spirit of the country, and as rapidly shook off the outward semblance of tenderfooted Eastern habit. Rough-bearded and leather-clad, sombrero as wide as the widest, 42-calibre Colts on his hips, he was wild as the wildest. Yet within his manly bosom still burned the flame of Boston culture and refinement. One day he was riding with a stranger across the prairie. Turning his head suddenly (he was slightly ahead), he saw his companion make a suspicious move toward his hip pocket. Without hesitation he drew his revolver and shot him. The stranger dropped like a log. The cowboy dismounted and looked at the body of his victim.

"I wonder if he was really going to shoot me?" he soliloquized. "I'll see." Turning the body over he discovered a flask of whiskey protruding from the pocket.

"Poor fellow!" said he, in a tone of regret, "I've made a mistake. I've killed an innocent man, and a gentleman at that. He wasn't going to shoot me; he was going to invite me to drink. Well," he sighed, drawing his sleeve across his mouth, "the last wishes of the deceased shall be respected."

A BIRD'S-EYE VIEW.—A novel idea has been put into execution in the machinery hall of the Paris Exposition, with a view of facilitating the circulation of visitors in the vast building. Two traveling platforms, sixty feet long, and capable of carrying ten tons each, are mounted upon the latticed iron girders that connect the columns carrying the shafting. Visitors will be admitted on payment to these platforms, which will be caused to traverse up and down the machinery hall by electric transmission. Access to the platforms will be obtained by elevators placed at each end of the machinery hall.

THE ANIMAL CURE.—At Reinickendorf, a village near Berlin, it is reported by *Building*, a consumptive sanitarium is to be erected on a novel plan, utilizing the supposed therapeutic influence of association with certain animals. A large cylindrical building will be occupied in the upper part by the patients, while the ground floor will be given up to the accommodation of large numbers of milch cows, the exhalations from which will be conducted to the apartments above. A whey and buttermilk diet will also be contributed by the under boarders.

HARD WOODS.—The relative hardness of woods is calculated by the hickory, which is the toughest. Estimating that at 100, we get for pignut hickory 86; white oak, 84; white ash, 77; dogwood, 74; scrub oak, 73; white hazel, 72; apple tree, 70; red oak, 69; white beech, 65; black walnut, 65; black birch, 62; yellow and black oak, 60; hard maple, 56; white elm, 53; red cedar, 56; cherry, 55; yellow pine, 53; chestnut, 52; yellow poplar, 51; butternut and white birch, 43; and white pine, 35. According to this formula, woods possessing a degree of hardness equal to only about 40 per cent., or less than that of hickory, should not be classed as hard woods. Such woods are, however, limited in quantity, and are not of sufficient importance to justify a classification, and the trade will continue to construe hard wood to mean everything except white pine.

PURE WATER.

ANOTHER UTTERANCE ON THE SUBJECT OF FILTERS.

At a recent meeting of the Maryland State Board of Health, held in Baltimore, Dr. Chancellor, who has been investigating sanitary improvements in Europe, read a report of his observations, from which we condense, for the readers of the AMERICAN ANALYST, the following points relative to the purification of drinking water:

The season of the year is now approaching when the domestic water filter becomes an institution of no little importance. It should be so, of course, all the year round, but summer temperature tends to develop whatever potency for mischief water impurities may possess, while, as a rule, cold tends to avert some of the mischiefs of impurity. Householders who derive their water supply from public works, as is the case with all Baltimore, ought, properly speaking, to have no trouble with filtration of their water. It ought to reach them perfectly fit for drinking; but, if one may rely on the smell of our drinking water at certain seasons, it is far from being at all times free from noxious matters, even when it leaves the reservoirs, and the community has to submit for a short time every summer to this domestic abomination; and thus it will be until the supply is filtered at the plumbing house, or before it is delivered in the mains, as is the case with the water supply of London and nearly every European city. The water supply of Antwerp—drawn from a filthy river—is filtered through beds of spongy iron, gravel and black oxide of manganese before being delivered to consumers, and the result of more than two years constant running has to a great extent confirmed the expectations formed respecting the spongy iron filtration. The water was not varied in brightness or quality, and the filtering beds seem to be nearly unaltered. Under the circumstances attending our present water supply in Baltimore, every house would do well not only to boil the water used for dietetic purposes, but also to set up a good filter, and, what is perhaps of even greater importance, to take care that it continues to be a good one. It is a very common and a very dangerous assumption that a filter is a filter, and, once set up, may be relied on for an indefinite period. Another delusion is the so-called "self-cleansing" filter. It is much better not to filter water at all than to believe in such precepts. There can be no hesitation in assuming that the result of the purification must be in a ratio to the care bestowed on the filter. The material in domestic filters should be readily accessible in all their parts for cleaning and renewing, more especially if vegetable or animal charcoal is used; for, although this material may prove satisfactory for a short time as a chemical purifier of water, both chemists and biologists are agreed that its use in the purification of drinking water is attended with much risk; and since the progress of science has revealed the deadly action of living zymotic poisons which occur in contaminated water, another and a much more serious danger through the use of charcoal has shown itself. The commissioners on "rivers' pollution" in England have thus expressed their views: "The property which charcoal possesses in a high degree of favoring the growth of the low forms of organic life is a serious drawback to its use as a filtering medium for potable water." From what has been said, it is quite evident that no organic substance can be employed with safety as a filtering material, and, therefore, the discovery and production of a perfect mineral filtering material is a matter of great sanitary importance. The material which presents the largest surface for the occlusion of oxygen in the smallest cubical space is the most powerful purifier and filterer, provided it is composed of the proper substance. Spongy platinum fulfils these conditions best, and is consequently the most powerful purifier and filterer, and the best insoluble oxidizer known. Its enormous price, however, shuts it altogether out from practical use, and spongy iron has been used in its stead. But a better and cheaper filtering material than spongy iron

has very recently been produced in England, and is now being produced in that country on a larger scale for both public and private filters. This substance, which is known as "magnetic ferrous carbide," is absolutely and entirely free from contamination with animal or vegetable matter, and contains no poisonous metals. The admixture of this substance with sand or gravel forms a filtering medium which purifies itself by deodorizing and disinfecting organic impurities which would otherwise contaminate such beds. The process of combustion is constantly going on in the pores of the material, and the products of that combustion are tasteless, odorless, colorless and perfectly wholesome, creating carbonic acid, with which the water becomes charged to a limited extent, rendering it sparkling, as well as palatable and wholesome, in the highest degree. Polluted water taken from the River Thames, below London Bridge, was passed through a filter composed of this material, and, on being analyzed, was found to be purer than any of the drinking waters supplied by the London water companies.

MILK AND HEALTH.

HOW TO INSURE WHOLESOME MILK.

The relation of adulterated, fermented, putrified or infected milk to the public health is a question which has assumed greater importance with the increase of knowledge of the etiology of disease. Adulteration of so necessary a food product as milk needs only to be mentioned to be condemned. It is now generally admitted that milk which has undergone fermentative and putrefactive changes, is a very frequent cause of diarrhoea in artificially-fed infants. The causative relation between certain products of the putrefaction of milk and other albumenoid substances and choleraic attacks in those ingesting them—known as picnic ice-cream poisoning, stale cream-puff poisoning, etc.—has been demonstrated, and largely through the investigations of Prof. Vaughan. The occasional dependence of epidemics, especially of scarlet fever and other contagious diseases, upon infected milk is an accepted fact. That milk from tuberculous animals may prove a source of infection has long been a prevalent belief in the profession. This belief finds expression in the axiom that a tuberculous mother should not nurse her offspring. At the French Congress for the Study of Tuberculosis, held in 1888, the opinion was strongly supported that milk from tuberculosis cows is a frequent source of infection. A case in point is that of Demme, of Berne, which was mentioned in the *Reporter*, August 18, 1888. In this case an infant artificially fed, and not hereditarily disposed to phthisis, died of tuberculosis of the mesenteric glands, as shown by the autopsy. The cow from which milk from the infant was obtained was killed, and tubercle and bacilli were found in abundance in the left lung and pleura. Bacilli were also found in milk expressed from the deepest parts of the mammary gland. The statement that the relation between bad milk and the public health is an important one is seen to rest upon a solid basis. Unquestionably, however, the question of bad milk as a cause of disease and death among infants is relatively so great as to overtop the other evil influences arising from this cause. The methods of milk supply in general use in cities do not protect the consumer against bad milk; in fact, the incentive to the honest producer and dealer is to adulterate the milk, because he is in close competition with dishonest dealers who do. A number of methods have been suggested and tried to protect the consumer and the honest dealer. Systematic inspection has done much to improve the milk supply of New York, among other cities. It is conceded that proper inspection of milk to detect adulteration, together with stringent laws for the punishment of the adulterators, are powerful factors in ensuring pure milk to the consumer. But, however much the accomplishment of this end is to be desired, it really solves but a part of the problem. Milk

which has undergone putrefactive changes, or which contains the contagium of scarlatina or the bacillus of tuberculosis, is far more to be dreaded than milk which contains an undue percentage of water. The method of delivering milk in sealed bottles or glass cans is advocated and practised quite extensively. In Philadelphia the method has been employed by Dr. J. Cheston Morris and others. In 1884, Dr. Morris read a paper before the Social Science Association of Philadelphia, in which he advocated the general adoption of this method of milk delivery. It is claimed for the method that since the seal is placed upon the bottle at the dairy, the consumer is protected against the dishonest retailer; and since the producer's name appears upon each bottle, the demand for his brand depends solely upon its quality. Hence the producer has a constant incentive to furnish a good quality of milk. On the other hand, it is urged that the multiplicity of milk vessels increases the probability of the use of unclean vessels, and that the liability of milk to be a means of propagating the infectious diseases is increased by the method, since the vessels are left at houses indiscriminately, whether their inmates are suffering from contagious diseases or not; also that no protection is afforded against tuberculosis. Prof. Vaughan, so well known for his researches in connection with the putrefaction of milk, has formulated certain rules, which, if followed, would ensure a supply of good milk, though the spread of the contagious diseases and tuberculosis by means of milk might not be prevented. These rules comprise the exclusion of diseased cattle from dairies, provision for the sanitary condition of stables, exclusion of improper food, and cleanliness of the cattle. In this way good milk is secured. In order that it may be good when delivered to the consumer, it is to be strained in perfectly sweet and clean cans, and chilled by being placed in running water or ice water until its temperature is at or below 65 deg. Fahr. During this time the milk must be exposed to the air; only refrigerator cars must be used in its transshipment; and its temperature must never be above 65 deg. Fahr. when received by the consumer. To ensure the results sought by this method necessitates a large force of inspectors. With a supply of whole, unfermented milk ensured the consumer, the problem of preventing putrefactive changes, and of destroying the germs of tuberculosis or the contagium of the exanthemata, is probably solved by sterilization with heat. The usual method of boiling milk in open vessels probably destroys any germs it contains—the germs of disease as well as those of fermentation; but the method is open to objections. It is necessary to pour the milk into other vessels; thus it is freely exposed to the air and fermentation is favored. Practically, Caille has found that "store milk," after being boiled in an open vessel, when placed in an open dish in an ice-box "turned" after eighteen hours; and that good "bottled milk" treated in the same way "turned" in twenty-six hours; and that the same milk when left standing in an open room with a temperature of 75 deg. Fahr. had a distinct sour taste and smell after from eight to fifteen hours. Milk boiled under pressure in small bottles for thirty minutes and left in the bottles remained good eighteen days. The very superior results obtained by boiling the milk under pressure would indicate this as the most desirable method. The method followed and the apparatus used by Caille were those of Soxhlet. The method is intended more especially for the sterilization of milk for infant feeding in private families. The apparatus is very simple and inexpensive. Practically, the method consists in putting milk into five or six ounce bottles, into which a perforated rubber cork is inserted. The bottles are put in a water bath and the water raised to the boiling point. Glass stoppers are then inserted in the perforated rubber corks and the boiling process is continued for twenty minutes. This method and apparatus are largely used in Munich and Southern Germany, and to a certain extent in this country. It appears that the principle involved in this method is so simple that it

could easily be applied to the milk supply of a city. In discussing this method of supplying milk in sealed bottles, it was found that the two objections to the method were the greater probability of milk contamination from unclean vessels, and the danger of spreading contagious diseases from house to house. These objections would be overcome by boiling the bottles after cleaning them, and sterilizing the milk in the bottles before sealing them. Milk so prepared could not cause diarrhoea or cholera infantum, or be the means of spreading tuberculosis or any one of the infectious diseases.

ACHES OF HEAD AND HEART.

THE BRAIN DEMANDS REST, WHILE THE HEART NEEDS EXERCISE.

There are a good many kinds of headache. In these days the nervous headache is a very distinct variety. It is generally in the front of the head, across the forehead, over the eyes. But it may be in other parts—at the top of the head, at one or both sides, at the back, or all over. It is painful, depressing, disabling. A man feels, at the height of the paroxysm, like a hunter who has galloped his legs clean off, and who could not leap a three-foot ditch to save his life. The spur is of no use, neither is the whip. The pain in the head is worse to bear than either, and the patient will rather endure both whip and spur than make any kind of effort which will make the head pain worse. Physic by itself is of no use. There is not a single drug known to medical science which will of itself at once and permanently cure a nervous headache. On the other hand, drugs are not always needed. A complete change of air and circumstances will usually take away the pain in ten or twelve hours. Perfect rest, of a duration proportioned to the severity and long continuance of the symptoms, will make the cure permanent. There are, of course, methods of relieving or diminishing the pain until such time as it may be possible to obtain the complete rest. But the rest is the thing to be secured at all costs. If not, the pain goes from bad to worse, and the risk from less to greater. The final consequence it is impossible to predict, except that a breakdown is sooner or later inevitable, and the breakdown may be for a year or for a lifetime. A nervous headache is a danger signal; if it be frequent, the danger is increased; if it be continuous, a catastrophe is imminent. The driver must put on his brake at all hazards, or he will probably soon have a leap for his life. There are very few sets of circumstances in which it is a man's duty to go on with his work when he is in this condition, at all risks. Even a threatened bankruptcy had better be risked than a threatened life. Besides, a man who is in the unyielding grip of a permanent nervous headache is not really the best judge of his own circumstances. He magnifies and distorts things amazingly. He takes counsel of his fears, and abandons his hopes and courage altogether. Rest, we repeat—immediate and sufficient rest—is the sovereign remedy. A fortnight at once may be better than a year six weeks hence. A weak heart seems to be decidedly more practically inconvenient than a weak head. If a man or a woman be a little feeble about the region of the brain, it is generally of little moment. Some post or other will be provided if the conduct be respectable; and lack of brains is too common to excite any particular attention either in the person concerned or in those about him. But a weak heart insists upon putting itself in evidence at all sorts of convenient and inconvenient times. If its possessor finds himself rather late for his morning train and makes a "spurt" to recover lost time, the exertion is usually followed by such a "bad quarter of an hour" that he resolves in future rather to lose a dozen trains than to risk temporary suffocation or permanent syncope again. The practical evils which are associated with a feeble heart are innumerable, and will readily suggest themselves to those who possess so unsatisfactory a pumping engine. Weak

hearts are by no means so common as is often supposed. Many a man who thinks he has got one is merely dyspeptic; many a woman owes her symptoms to tight lacing or insufficient feeding. If the dyspepsia be cured, or the tight lacing be dispensed with, the symptoms of heart weakness will disappear. Even when the heart is genuinely "weak," the weakness is not always due to special disease of that organ. It may be only part of a general weakness of the whole system, which is easily curable. The late Sir Robert Christison, one of the most eminent of British physicians, used to smile at certain persons who were always complaining of weak hearts. "Gentlemen," he would say to his students when lecturing on digitalis, "gentlemen, the best tonic for a weak heart is a good brisk walk." Not a doubt of it. The majority of weak, flabby hearts are weak and flabby because every other muscle in the body is weak and flabby, and this general weakness and flabbiness is due to want of vigorous use. Exercise of the legs and back and arms gives additional and much-needed exercise to the heart, and the heart grows strong by vigorous exercise exactly as every other muscular organ does, for the heart is a muscle. If a man has no organic disease of the heart, no enlargement and no functional disorder, plenty of brisk walking, with occasional running, will soon dispel his breathlessness and heart weakness, other things being equal. The muscular inactivity of the modern town man is the parent of more ill-health than any other single cause whatever.

PIGS IN CLOVER.

SCIENTIFIC ORIGIN OF THE POPULAR AND AMUSING PUZZLE.

The "Pigs in Clover" puzzle had a rather curious scientific origin. A student of physiological psychology named Martenfeldt, while making researches in some determinations of the sensitiveness of the tactile sense under the direction of Helmholtz, the great German investigator, found that the ability to balance a marble on a perfectly smooth piece of plate glass depended upon the delicacy of what is known as the reaction time, that is, depends upon the quickness or the nerve current in receiving the impression that the marble will roll, sending the impression to the controlling organs in the cerebellum that contract or relax the muscles of the arm, and the degree of responsiveness in the nervous end organs of the fingers which hold the piece of glass. Martenfeldt found that if he placed the marble in the centre of the plate and marked four or five spots on the edges of the plate, and then asked the subject with which he experimented to tip the plate so that the marble would run across a particular spot, a considerable time elapsed before the subject could determine how to tip the plate to make the marble roll as required. When Martenfeldt complicated the apparatus and placed rings of pasteboard about the centre of the plate, with holes for the marble to run through, the average result of his experiments gave a remarkable psychological law. This was that the "reaction time" depended upon the size of the circles of pasteboard which made an impression upon the field of vision of the retina, and was in direct proportion to the diameter of the circles expressed in millimetres. Martenfeldt's experiments developed the fact that effects of practice and attention diminish the psycho-physical reaction time and fatigue increases it. Thus he found that the will time necessary for choice between two motions was reduced by practice, for three subjects of experiment, from .080 second to .050, from .097 second to .0535, and from .098 second to .062 respectively. For choice among five and ten possible motions the effect of practice was yet more marked; thus, with five possible choices, the will time of one person was reduced by practice from .239 second to .083; and of another, with ten possible choices, from .358 second to .094. For each single day's series of ex-

periments the time diminished faster at first than subsequently, but in many cases more distinctly on the second than on the first day of experiment. The apparatus used by Martenfeldt for his experiments got on the market as a puzzle in a curious way. Martenfeldt sent one of his plates to an American friend, Dr. Hermann Meyer, of Philadelphia, and at the doctor's house C. M. Crandall, a quick-witted business man, of Waverly, N. Y., saw it, recognized how taking a puzzle it would make if simplified, took out a patent in February, and put it on the market immediately with great success.

BRAINS IN TRADE.

IMPORTANCE OF A THOROUGH UNDERSTANDING OF DETAILS.

When a young man starts out to learn his trade and goes into a shop, totally unschooled in the manual performance of his duties in the new field of life on which he is entering, it is important that he should bear in mind this fact, viz.: That his position, so far as it relates to himself, is intrinsically an educational one, as much so as in the school or college from which he may have recently graduated. The simple performance of so many hours' work per day, while it has a certain financial measure of value to the employer, has a value to himself when properly considered that is greater than can be measured in currency. As his progress and standing in the school depended on the thorough mental understanding of each progressive step he took, so, only in a more material sense, his advance in mechanical skill and knowledge is dependent on his thoroughly understanding not only the routine detail of his work, but the why and wherefore of each operation. There always has been and probably always will be two classes of mechanics—those who stand at their bench and go through the manual motions of their work like automatic machines, with little more conception of why the results are as they are; and the other, that class of men who make no moves without knowing why and how results are obtained, and the relative importance of each step. This is the mechanical education that counts, the education that schools the mind to a clear comprehension of principles, equally with details, and leads unflinchingly to that higher field where skill, diligence, and marked ability find their natural level. The young man who, on beginning his mechanical education, realizes and acts upon these truths, will develop that ability which is not gauged by mere manual dexterity, but rather that which, when in later years he may be called to design, lay out, and superintend the work of others, will enable him to creditably fill the position. Such positions come to those who bring thought and brains as well as manual dexterity to assist them in their work. To such men we owe the improvements of the age in every branch of mechanics. It is a fact that too many mechanics work along day after day accomplishing their work by "main strength and foolishness," which is the direct and legitimate result of a lack of proper and thorough application in their earlier mechanical life. The point emphasized is, that the mind that is able, through careful training and application, to bring to bear a knowledge of principles involved, as well as execution of detail in the work, is the one that approaches that standard of ability which should be the aim of every young man who is beginning his mechanical education—his work in the shop. When he has attained this, no question of wages will ever trouble him. Such men are always wanted. The supply is not equal to the demand.—*The Stationary Engineer.*

TALKING CLOCKS.—According to a Paris paper, Edison has combined the phonograph with the clock in a most ingenious manner. Instead of striking the hour, the clock calls out, in well-modulated tones, "Dinner time," "One o'clock," "Two o'clock," &c. Workmen will be particularly pleased with a clock that tells them audibly that it is time to quit.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

June.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Pigeon, chicken, duck.

FISH.—Anchovy, bass, bluefish, blackfish, cod, eels, clams, flounder, haddock, halibut, herring, lobster, mackerel, mussels, perch, porgie, prawn, salmon, shad, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Beans, cucumbers, carrots, cauliflower, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, radish, rhubarb.

FRUITS.—Cherries, strawberries, bananas, pineapple.

PRACTICAL RECIPES.

Cauliflower Soup.—Boil a cauliflower in salted water till tender; put a small lump of butter into a saucepan, and when hot fry half an onion in it till it is brown; then add a tablespoonful of minced raw ham, a few stalks of celery and a quart of stock. After this has boiled slowly half an hour add another quart of stock; drain the cauliflower, rub it through a sieve, add it to the soup, boil up, remove to side of range, and thicken with a little flour rubbed smooth in milk; stir up well and serve.

VEAL CUTLETS.—The cutlet should be cut as handsomely as possible, and about three-quarters of an inch in thickness; before cooking they should be well beaten with the blade of a chopper, if a proper beater be not at hand; then fry them a light brown, and send them up to table garnished with parsley, and rolls of thin-sliced, nicely fried bacon; they are with advantage coated, previous to cooking, with the yolk of an egg, and dredged with bread crumbs.

PARSNIPS.—Boil and mash two or three parsnips; add to them a well-beaten egg, a tablespoonful of flour and two of milk; season with pepper and salt, and fry in spoonfuls in butter.

CORN BREAD.—Sift into a large pan a quart of yellow corn meal, and add a teaspoonful of salt; mix with the meal a pint of rich unskimmed boiling milk, enough to make a soft dough, and add half a pint of sweet fresh butter; beat up five eggs into a foam; stir them gradually into the mixture and let it cool. With the same sort of butter grease some tin pans two or three inches deep and four inches square; fill the pans to the top so that they will rise and puff up when baking; bake them a golden brown, split and butter them while hot, and immediately serve.

RICE MUFFINS.—One pint sifted flour, two heaping teaspoonfuls Horsford's baking powder, and a little salt; thoroughly mix together; then add one cupful cold boiled rice, two eggs, one tablespoonful butter, and enough sweet milk to make a thick batter; bake immediately.

BEEF SALAD.—Cut into dice equal portions of cold boiled beets and potatoes; make a dressing as follows, and pour over them: Stir two ounces of butter into two of flour till it is a paste; have on the fire a pint of cream; when boiling add the flour and butter; let it boil a minute or so, stirring carefully; take off the saucepan and pour the sauce into the dish; add an ounce of butter; stir till cold; season to taste with salt, pepper, vinegar, mustard, lemon juice, pickle, onion, etc. Serve.

OYSTER PATTIES.—Line some small patty-pans with a fine puff paste; put a piece of bread into each, cover with paste and bake them. While they are baking, take some oysters, beard them, and cut the remainder up into

small pieces; place them in a tosser, with a very small portion of grated nutmeg, a very little white pepper and salt, a morsel of lemon peel cut as small as possible, a little cream, and a little of the oyster liquor; simmer it a few minutes; then remove the bread from the patties, and put in the mixture.

PURE FOOD AGAIN.

THE ANTI-ADULTERATION MOVEMENT REVIVED IN
ILLINOIS.

A bill to prohibit the adulteration of food has been introduced in the Illinois Legislature which is causing considerable alarm among the manufacturers of food products and the wholesale grocers of the State. It is supported by the Granger element, and is said to have good prospects of passing both houses. The Chicago wholesale grocers are opposing the bill with might and main, on the ground that it will interfere with their trade with adjoining States. Their competitors in States possessing no laws restricting the traffic in adulterated goods would, they claim, be able to drive them out of business or confine them to the comparatively limited territory within the borders of Illinois. This would be a great hardship, indeed, and their opposition is natural, and should not be regarded as a proof of hostility to pure food *per se*. If this bill becomes a law, Illinois food manufacturers and dealers will perhaps not suffer so severely as they fear. Their State is not the only one in the West that is seeking pure food, and we believe several States enjoy legislation preventing the sale of adulterated food except when honestly labeled. Much, however, will depend upon the manner in which these State enactments are executed. Experience has shown that the mere passage of laws does not insure the purity of the public supply of food. This State has an anti-adulteration law, but the sale of adulterated food is not restricted one whit by it; there appears to be a lack of public interest in the measure, our people evidently believing that the price governs quality and that the demand for pure food is not greater than the supply. But this indifference of the public in some States makes it bad for manufacturers and wholesalers in States in which the laws are properly executed, as they cannot hope to compete with rivals who are in no danger of interference with their sale or manufacture of sophisticated goods. The State of New Jersey has, we believe, a pure food law very similar to that of the State of New York, and until quite recently a similar laxity prevailed there regarding its execution. But the New Jersey Food Commissioner appears to be an energetic man, and determined to carry out the provisions of the State food laws. He is after the sellers of adulterated food with a sharp stick, and, though he tempers his assiduity with a merciful regard for the interests of the innocent retailer, the consequences of the crusade will be highly important to the trade throughout the State. While insisting that dealers shall strictly comply with the provisions of the law, he offers to analyze, free of cost, samples of suspected goods, and will not prosecute until fair warning has been given. The wide difference in the legislation affecting business in the different States and in the manner of executing the same must inevitably hamper inter-State commerce very seriously, and it is a question whether the benefit derived by the public from the safeguards thus placed around its food supply fully compensates for the inconvenience caused by the deleterious effect upon trade. The National Pure Food Bill, however, offers a means of relief from the unequal manner in which the State pure food laws are executed, as it will prevent the inter-State transportation of adulterated food unless honestly labeled or otherwise marked. The spread of the anti-adulteration agitation among the Western States will, no doubt, give a sufficient impetus to the movement for national legislation as to insure the passage of the National Pure Food Law at the next session of Congress.—*Merchants' Review*.

[Reprinted, by Request, from the AMERICAN ANALYST of
May 30.]

CHAMPAGNES.

AN UNJUST AND UNTRUE COMPARISON.

One of our large dailies has lent itself to an abuse of American wines in the shape of an interview with Mr. G. H. Von Mumm, one of the owners of the Mumm brand. After puffing his personal appearance, titanic proportions and brilliancy as a conversationalist, it puts these words in his mouth. We reproduce them that they may be fully answered:

There is one point upon which he is not an enthusiast, however, and that point is America as a champagne-producing country. He told a reporter the other day that he feared this country would never be celebrated for its champagne. "I am told," said he, "that there are people here who inject carbonic acid gas into still wines by means of machinery, and call the produce champagne. Such practices are abominable, but they deceive only the ignorant. There are many reasons why your grape-growers cannot produce champagne, the principal one being found in the nature of the soil, which, as you know, has everything to do with the effervescent quality of the wine. In the Province of Champagne the soil is of chalk mixed with silica and light clay and oxide of iron in varying proportions. These properties in the soil give to the grape its effervescent qualities. So far as I have been able to learn, you have no soil of this description over here. Another cause of your failure to produce good wine is the youth of your vineyards and the fact that they are insufficiently cultivated. The older the vine, the better the wine. In a hundred years from now your wines will be better; in a thousand years, good. The vineyards in Champagne are divided into hundreds of very small tracts, each tract having its owner. There are no large vineyards under one proprietor. This fact accounts for the careful cultivation the vines receive and have been receiving for hundreds of years. Then, again, champagne-making requires long experience and a large capital. The leading manufacturers have on hand in bottles and casks stored away in their cellars thousands of gallons of wines of former vintages. This they must have for "blending" purposes. If, for instance, the wine of this year should be of an inferior quality, we would blend or mix it with a wine of a previous year to give it the desired flavor. A different blend must be made for each market. In America you require a very dry wine, in England a semi-dry wine is demanded, while in Russia a sweet wine is the proper thing. To suit these varying tastes experience is required, as well as a stock of material to carry out its dictates. There is not, as many suppose, a very large profit in the manufacture of champagne. I am told that popular opinion places our profit at about \$10 a case. One dollar is much nearer the mark. There are seasons in which we lose money on every case of wine we sell. This happens when the vintage is inferior. In such cases we must take the wine from the producer whether we can use it for champagne or not, in order to retain their friendship and keep other houses from weaning them away from us. At the same time, because of those who buy our wines, we must keep up its quality by the use of old stock worth many times its weight in gold. The inferior wine we sell for less than it costs us to makers of claret and low wines. The last-named objections to America as a champagne country may be overcome, but the quality of the soil never. You cannot grow a wine in Champagne which will produce Madeira, nor can you produce champagne from grapes grown in Madeira. How, then, can you deem it possible for a man in California to buy a hillside, divide it into two parts, upon one of which he will produce champagne and upon the other Madeira? And yet I'm told they claim to do it."

Mr. Mumm ingeniously tries to convey the untruthful impression that all American champagnes are made effervescent by the addition of carbonic acid gas, while he knows perfectly well that there are several American champagnes which are made precisely as his wine is made, and in the case of one American brand, Arpad Haraszthy & Co.'s Eclipse, with better and more uniform results. He also retails the very old story about California soil, spiced up with the foolish remark that the effervescent quality of the wine depends upon the soil, when every child knows that the natural carbonic acid gas of champagne is the product of the saccharine matter it contains. Then a ridiculous fling at the youth of our vineyards is made to cover up the well-known fact that France was dependent upon our youthful but healthy

American vines to replace their effete phylloxera-eaten vines. With an amount of candor, surprising from him, like a grain of gold in a heap of sand, he admits that the champagne manufacturers of Europe do not own vineyards, but depend upon small vine-growers for their supplies for blending, and that when they get inferior wines, as they frequently do, they blend them with better grades, but they all go in. He also admitted that these foreign champagnes are all doctored to suit the varying tastes of different nationalities. The subject of profits on such wines also received attention. A profit of ten dollars a case was strenuously denied, and the allegation that one dollar came nearer the truth is what we are supposed to be gullible enough to believe. How they can afford to maintain expensive salesmen with several thousands dollars a month for treating purposes, pay a heavy bonus to barkeepers on corks and other well-known extravagances on one dollar a case, is evidently like one of Dundreary's puzzles. His final allegation that in California men try to raise champagne on one side of a hill and Madeira on the other is too ridiculous to require notice. To raise such miserable stuff as Mr. Von Mumm admits he uses to blend for his champagne does not need much of a vineyard. Let our German friend take a trip to California and try to look at things as they are. He will conclude that California is large enough to enable us to have a crop of grapes somewhere in its large area that will not need skillful "doctoring" to make honest and non-poisonous champagne.

MERCIFUL PROVIDENCE.—A Kansas man had a comparatively easy death the other day. He expired just as he entered a railroad eating-house. Five minutes later he might have tackled a railroad sandwich. Providence is merciful.

Subscriptions \$1 per year. Now is the time to subscribe.

SCIENCE IN WARFARE.—The Italian papers report that an electric theodolite, which indicates with mathematical precision the position of an enemy's ship, whether at anchor or in movement, has been set up at Maddalena. The battery, which defends the island of Capra, is situated in a valley separated from the sea by a high hill. On this is placed electric machinery communicating with the battery. There is also a very small "panorama" indicating the position of hostile ships, their direction, their distance from the battery, and the point to which the firing should be directed.

MUSK BUOYS.—Artificial, or rather cultivated, musk, if we may believe what seems to be a very well-authenticated statement, appears to be a thing of the near future. The announcement is made that at the laboratory of the Gesundheitsamt in Berlin a Japanese physician named Kitaisato, a pupil of Koch, has isolated a microbe from an infusion of hay which has the property of producing a powerful odor of musk. The microbe can be cultivated in any of the nutrient media, but thrives best on the potato and the rice preparation. The cultures are at first reddish in color, afterward becoming rust or tile-colored. When the cultures are exhausted with alcohol, the latter possesses the odor of tincture of musk.

SPANISH OIL.—The exports of olive oil from Spanish ports having been on the decline for several years, the Spanish government has taken hold of the matter, and started an investigation as to causes for the decay of the industry. The commission found that the main cause was the inferior quality of the oil produced, the same being far below the standard of the French and Italian makers. The cause of the inferiority was found to be twofold—a deterioration of the trees from long inattention, to the modern methods of culture, and also in the crude and inferior methods of extracting the oil from the berries. It is proposed to remedy both causes of decay by the adoption of a system of technical education which shall embrace the teaching of the best method of culture of the olive trees, and also modern and improved methods of extracting the oil. In this manner it is hoped that Spanish oil will once more regain its ancient reputation, and the olive raisers of Spain re-enter the field of competition with those of France and Italy.

BUFFALO LITHIA WATER

In the Uric Acid Diathesis, Bright's Disease, Chronic Inflammation of the Bladder, etc.

JAMES L. CABELL, M. D., A. M., LL. D., Professor of Physiology and Surgery in the Medical Department in the University of Virginia, and President of the National Board of Health.

"The Water of Buffalo Spring No. 2 contains in notable quantities two of the ALKALIES which are accredited as extremely valuable in the treatment of GOUT, LITHIASIS, and Liver Affections. I refer to the CARBONATES of POTASH and LITHIA.

"I have recently read with interest a paper in 'The New York Medical Journal' on the Buffalo Lithia Water in Diseases of the NERVOUS SYSTEM, in which the writer, Dr. Boyland, citing his own observations and those of other eminent physicians, ascribes to this water a special virtue as a direct tonic for the NERVOUS SYSTEM in cases of CEREBRAL exhaustion. I have only had occasion to test its effects in this direction in cases in which the NERVOUS SYMPTOMS may have been due to LITHÆMIC conditions. In these cases the relief following the use of the remedy was very decided."

Dr. WM. A. HAMMOND, of New York, Surgeon-General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the Buffalo Lithia Water in cases of affections of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION OF THE LITHIA SALTS, and is, moreover, better borne by the Stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from over-mental work—in which the condition called NERVOUS DYSPEPSIA EXISTS—and generally with marked benefit."

Dr. ROBERT BATTEY, of Georgia, SUGGESTOR OF BATTEY'S OPERATION.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of CHRONIC INFLAMMATION OF THE BLADDER, whether induced by STONE, by enlarged PROSTATE in the aged or by NEGLECTED GONORRHOEA, AND HAVE SECURED EXCELLENT RESULTS, which encourages me to prescribe it for the future."

HUNTER MCGUIRE, M. D., LL. D., late Professor of Surgery, Medical College of Virginia, Richmond.

"BUFFALO LITHIA WATER, Spring No. 2, as an ALKALINE DIURETIC, is invaluable. In URIC ACID GRAVEL, and, indeed, in diseases generally dependent upon a URIC

ACID DIATHESIS, it is a remedy of extraordinary potency. I have prescribed it in cases of RHEUMATIC GOUT, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. WM. B. TOWLES, Professor of Anatomy and Materia Medica in the Medical Department of the University of Virginia.

"BUFFALO LITHIA WATER, No. 2, belongs to the ALKALINE or, perhaps, to the ALKALINE-SALINE Class, for it has proved far more efficacious in many diseased conditions than any of the simple ALKALINE waters.

"I feel no hesitancy whatever in saying that in GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE in the BLADDER, and in all Diseases of URIC ACID DIATHESIS, I know of no remedy at all comparable to it.

"Its effects are marked in causing a disappearance of ALBUMEN from the urine. In a single case of BRIGHT'S DISEASE OF THE KIDNEYS I witnessed decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of the disease."

Dr. THOMAS H. BUCKLER, of Paris (formerly of Baltimore), SUGGESTOR OF LITHIA as a Solvent for Uric Acid.

"Nothing I could say would add to the WELL-KNOWN REPUTATION OF THE BUFFALO LITHIA WATER. I HAVE FREQUENTLY USED IT WITH GOOD RESULTS IN URIC ACID DIATHESIS, RHEUMATISM, AND GOUT, and with this object I have ordered it to Europe, from Coleman & Rogers, of Baltimore. Lithia is in no form so valuable as where it exists in the Carbonate (the form in which it is found in the BUFFALO LITHIA WATER), Nature's mode of solution and division in water which has passed through Lepidolite and Spondumine Mineral formation."

Dr. GRAEME M. HAMMOND, of New York, Professor of Diseases of the Mind and Nervous System in the New York Post-Graduate Medical School and Hospital.

"In all cases of BRIGHT'S DISEASE of the KIDNEYS I have found BUFFALO LITHIA WATER of the greatest service in increasing the quantity of urine and in eliminating the ALBUMEN. In certain cases of Melancholia, accompanied by excessive eliminations of URATES and URIC ACID, it is often the only remedy necessary. In GOUT and RHEUMATISM it is highly beneficial, and in many cases of Impotence its restorative qualities have been of undoubted assistance. I have long regarded BUFFALO LITHIA WATER as the most valuable mineral water in use."

Water in cases of one dozen half-gallon bottles, \$5.00 per case at the Springs.

THOMAS F. GOODE, Proprietor, Buffalo Lithia Springs, Virginia.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar.** It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by **E. McILHENNY,**
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

Extract from an unsolicited letter written by a prominent lady in Boston, who requests that her name shall not be used.

Let me suggest as a subject for your next illustrated advertisement, a row of young misses washing their feet with Pearline. I have discovered its almost miraculous effects in removing from the feet, almost instantly, the creak and discolorations resulting from the prevalent fashion of wearing black and other dark colored stockings—even black silk stockings creak as they never used to.

Pearline is for the toilet—bath—laundry—house-cleaning—washing dishes—in fact for any purpose for which soap is required PEARLINE still stands without a rival. It is as harmless as the finest imported castile soap; but beware of imitations.

140

JAMES PYLE, New York.

LATEST ACHIEVEMENT IN

**Celluloid
Collars,**

**Cuffs
and
Bosoms.**

GEO. CLEMENT & CO.

The Celluloid Company confidently assert that they have attained the highest improvement in their Waterproof Collars, Cuffs, and Bosoms, which has ever been reached in this line of waterproof goods. We have examined their latest improvements, and tested them by every means at our command. We are convinced that they have never been excelled, and we are ready to give them our heartiest indorsement. They are pliable, most durable of any goods on the market, and resemble linen more perfectly than any waterproof imitation. Some strangers who have little acquaintance with these goods are under the impression that celluloid is an explosive material. This is an entirely erroneous idea. We can hold celluloid upon the hottest argand burner, and it will melt, but never ignite. The linen interlining makes it much stronger than any other goods in this line. We shall be glad to have any and all of our former patrons try these goods and write us their opinion of the same.

A full assortment of Celluloid Collar Buttons at 5 cents each by mail, post paid; and Cuff Buttons from 25 cts., to \$1.00 per pair by mail. These buttons are durable and never tarnish the Collars and Cuffs.

CELLULOID COLLARS and CUFFS cost no more than linen—look better and wear longer. They never wilt from perspiration, are always white, clean and fresh; require no laundrying—are manufactured in all the leading styles for both Ladies and Gents, Girls and Boys. When soiled, simply wipe them off with soap and water. They save their cost in a week's wear. Try them.

Keep this for reference. CELLULOID COLLARS and CUFFS are as economical and desirable as represented. Can always obtain the same FREE OF POSTAGE, at the following prices:

Gents' Collars,	25 cts.	6 for.....	\$1 30—\$2 25 Doz.
" Cuffs,	50 "	6 "	2 75—4 75 "
Ladies' Collars,	15 "	6 "	85—1 50 "
" Cuffs,	30 "	6 "	1 70—3 00 "
Small Bosoms,	50 "		
Large "	75 "

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no constructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only THREE possessed the power of acting on starch. These brands were **MALTINE**, Corbyn, Stacey & Co.'s Extract, and Keppel's Malt Extract. **WILLIAM ROBERTS, M.D., F.R.S.**

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined. **R. H. CRITTENDEN.**

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alternatives.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Ferrated.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peptonine.	MALTO-VIBURNUM.
MALTINE with Pepsin and Pancreatine.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analysis, sby 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

COLDEN'S

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of
Beef and Tonic Invigorator."

LIQUID

BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.

Essentially Different from all other Beef Tonics.

Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

AMERICAN CORN IN EUROPEAN SOIL.

We took occasion some months ago to call attention to the possible advantages that might be gained by means of a conspicuous and well-handled exhibit at the French Exposition, this year, of our great American product, Indian corn. In view of the universal culture of that inestimable cereal in this country, and the almost infinite variety of uses to which it is adapted as a food product for man and animals, it is certainly remarkable that economists on the other side of the Atlantic should be so ignorant of its value. It is encouraging to observe that the suggestion which the AMERICAN ANALYST was the first to propose is likely to be carried into practical operation. We read in the *Caterer* that "an attempt is being made to create a demand in Europe for Indian corn as food by a special American exhibit at the Paris Exhibition. A proper exposition of the innumerable uses to which this vegeta-

ble may be put is expected to have results of immense value to the corn-growing industry of this country. It is only in the States that corn may be said to be an article of table consumption. If the French can be convinced by actual demonstration that they have been neglecting a cheap, healthful and highly palatable article of food, they may set a fashion that will spread all over Europe, and give American farmers a better market for their principal cereal crop." The proposition, naturally, meets with the earnest approval of the vegetarian school of philosophers and the London exponent of that fraternity, the *Vegetarian Messenger*, in order to facilitate the raising of corn in Great Britain, imparts in its June issue the subjoined instructions for its cultivation, quoted from Beeton's "Dictionary of Gardening." The raising of corn in flower pots for subsequent transplanting would strike the majority of American farmers as a rather finical way of dallying with a product which under their management usually exhibits a sturdy capacity for self-assertion. This is Beeton's advice to English corn planters: "Select a warm, sheltered situation, and trench deeply, adding a liberal dressing of well-rotted manure. Sow in pots in April, or in the open ground in May, but, except in very favorable localities, the plants succeed best if raised under glass, and planted out when the weather becomes warm and settled. If raised in pots, be careful to keep the plants strong and stalky, hardening them by giving air freely on fine days. When planted out, water freely till the roots have got hold of the fresh soil, and also in dry, hot weather keep the surface of the ground from weeds, and in an open state, by frequent hoeings."

WANTED—AMERICAN APPRENTICES.

The action of the trades unions in restricting the number of apprentices that can be employed in workshops and in learning the various trades is exciting increasing disapprobation as its injurious effects are becoming more noticeable. The newspaper press has an important function to fulfill in exposing and overturning this anti-American scheme. Several of our contemporaries are vigorously engaged in the work, and if the subject is thoroughly and intelligently discussed, the time cannot be far off when our American lads shall have the privilege restored to them of earning their living in the same occupations as are followed by their fathers. The right to earn a living by honest labor is as fundamental as any other natural right of man. But when the trades are hedged about with rules which limit the number of apprentices, when the lists are complete, and when the ranks of unskilled labor are full, then the surplus boys are deprived of all chance. There is then no place for them. When the trades unions set up their rules limiting the number of apprentices to be taught their trades in any shop, it was intended to prevent the reduction of wages that would ensue from an over-supply of skilled labor. But the rule has not had that effect. All that it has accomplished has been to prevent the sons of Americans,

native and adopted, from learning their fathers' trades. Our workshops have not fewer mechanics in them than if there had never been a rule against apprentices. Skilled workmen were needed, and, the natural supply being insufficient, the employers readily secured them from Europe. They are constantly getting from over the sea skilled workmen, who come here to take the places which the sons of our workmen should, by every reason of policy and political economy, have a preference right to occupy. That our streets are so full of idle, vicious young and middle-aged men is largely if not chiefly due to the extinction of the apprentices in our workshops. And men who might be earning from \$15 to \$30 a week as skilled artisans are forced to accept salaries of from \$5 to \$10 as clerks, or salesmen, or book-keepers; or, as is too frequently the case, to live a hand-to-mouth sort of existence, doing anything or nothing indifferently, because fitted by training to do nothing skillfully.

OUR WATER SUPPLY.

New York city has a plentiful supply of good pure water, which will be soon largely increased by the completion of the new dams and aqueduct. The building of this aqueduct has been a desirable plum for the politicians, and whenever anything threatens the smooth flow of the large amounts of money expended upon the work, a hue and cry about the probable scarcity of our water supply is immediately raised. The Johnstown disaster has awakened some apprehension about the safety of the Quaker Bridge Dam on the Croton river, and as this threatened the interests of the politicians, we are promptly cautioned that there is danger of a water famine. This is apparently corroborated by the water not running on the second and third floors of houses throughout the city, excepting for two or three hours, late at night. But the public should not allow itself to be frightened on this score. This apparent scarcity is manufactured for the occasion. The valves in the gate-houses are partially shut down, and thus, the pressure of water being reduced, it does not run so freely. Our water officials of course deny this, but let them answer the simple question: If the water is not partially shut off, why does the Fire Department, in case of fire, signal for an increased pressure of water, which could not be increased if all the natural pressure were constantly allowed to flow?

A SUPPORTER OF OLEO.

Governor Bulkeley, of Connecticut, we are pleased to observe, entertains more reasonable views regarding the economic value of oleomargarine than some of his constituents. About a fortnight ago he vetoed a bill which the Legislature had just passed, compelling the coloring of oleomargarine in such a way as would render it obnoxious for use, which was a round-about measure for prohibiting its manufacture. In ex-

plaining his position, Governor Bulkeley said, and his points are deserving of close attention: "The fair interpretation of the proposed bill is that it prohibits either the manufacture or sale of an article of food commonly known as oleomargarine, the use of which as a healthy, satisfactory and economical substitute for butter has become quite universal among the industrial and laboring classes of our more populous communities. The fraudulent sale of this article is, he asserted, abundantly provided against by both National and State laws, more generously and vigorously enforced than usual, and attended with severe and increasing penalties for their violation. The admitted fact that the dairy interests of the State are unable or fail to furnish the needed supply of butter, he regarded as convincing that their interests will not be jeopardized by the continued sale of this article, which has already found for itself a place in the domestic uses of the people of that State, and that the proposed legislation is unnecessary." Notwithstanding the common sense of the Governor's views, the bill was passed over his veto by a vote of 79 to 52, a bare quorum being present.

THE PROTECTION OF OUR BOYS.

The police authorities throughout this State have been officially notified that section 270, of chapter 170 of the laws of 1889, had become a law, and that any person violating it is guilty of a misdemeanor. The section, which took effect June 1, is as follows:

1. Selling malt or spirituous liquors to any person under sixteen years of age.
2. Receiving in pledge any article of jewelry or wearing apparel from a person under sixteen.
3. Selling to any person under sixteen, cigars, cigarettes, or tobacco in any form.

In spite of the publication of the law, and the cautioning of the police officials, the selling of tobacco at least to lads under the prescribed age has not met with any perceptible check in this city. The daily newspapers, in their struggle to cover the entire field of public interest, have gradually become a skilled detective institution, not simply supplementary to but often ignoring and superseding the authorized municipal organization, and they have reported, since the law came into effect, an almost total ignoring of its provisions and requirements on the part of retail dealers. The statute was wisely framed to effect a salutary reform in the habits of the rising generation, and it should be sternly and unequivocally enforced. It would in fact have been well if our law-makers had

inserted a provision ordering the arrest of every boy under sixteen found smoking tobacco on the streets. The pernicious habit would be speedily broken up if its indulgence was not only unlawful but inflexibly certain of punishment.

TRANSMISSION OF TUBERCULOSIS.

The New York Board of Health recently asked Drs. Prudden, Biggs and Loomis, the pathologists of the department, to prepare a statement regarding the ways in which tuberculosis is transmitted to persons. Their report was made public last week. It declares that the germs are transmitted frequently through the meat and milk of infected animals. The disease is contracted also by breathing in the germs thrown off by consumptive persons in crowded rooms and cars. Better ventilation of churches, theatres and halls, the physicians think, would lessen the danger. Their conclusions are as follows: First, that tuberculosis is a distinctly preventable disease; second, that it is not directly inherited; third, that it is acquired by the direct transmission of the tubercle bacillus from the sick to the healthy usually by means of the dried and pulverized sputum floating as dust in the air. The measures, then, which are suggested for the prevention of the spread of tuberculosis are: First, the security of the public against tubercular meat and milk, attained by a system of rigid official inspection of cattle. Second, the dissemination among the people of the knowledge that every tuberculous person may be a source of actual danger to his associate, if the discharges from the lungs are not immediately destroyed or rendered harmless. Third, the careful disinfection of rooms and hospital wards that are occupied or have been occupied by phthisical patients.

LIFE AND SUNLIGHT.

THE VALUE OF SUNSHINE CHEMICALLY CONSIDERED.

That the sun sends us heat and light is obvious to every one, but the wonderful radiant energy which is constantly reaching the earth from the great central member of our system, contains other forces, some of which we recognize, and, probably, others of which we still remain in ignorance. That there is chemical or actinic power among them, every photograph is a proof, as well as the fading or darkening of dye-stuffs under their influence, and the more the subject is studied, the more complex seems the message which comes to us across the celestial spaces, without wire or battery to transmit it. The physiological and hygienic influence of sunshine cannot be doubted. Whether they are due to the actinic radiations, or to other manifestations of energy having a more positive action upon the animal organism, may be considered uncertain, but that there is such an action is a well-known fact. Vegetable life cannot exist without light. The potato sprouting in the cellar instinctively sends its shoot in the direction of the nearest crevice through which a ray of light may find its way, and the plumule of the sprouting seed, no matter in what position it may have been originally planted, grows upward towards the light and air with absolute certainty and exactitude. Every gardener knows that direct sunlight, and plenty of it, is absolutely necessary to his plants, if they are to flourish and bear flowers, and the shade of a few small trees is enough to destroy even such vigorous plants as the grasses of our lawns. Mankind are constituted with greater adaptability to varying conditions, but they, nevertheless, are dependent in a great degree on the health-giving influences of sunshine. Children raised in the dark, fog-laden atmosphere of a large city like London, are puny and sickly, and cannot obtain the bodily development and vigor of the more fortunate child of the suburban or rural districts. The inhabitants of large cities live under unfavorable conditions, and must be constantly re-

cruited from the country, in order to increase in numbers. But even in localities where sunlight is always to be obtained, its benefits are not always appreciated. Too often it is shut out from houses and living rooms, for fear of injury to carpets or upholstery. The extent of this injury is much less than is generally supposed. Most modern dyes will fade in time, and a strong light only accelerates the change in a small degree; but, in any case, it is better to have the carpets fade rather than the occupants of the room, and the health-giving action of the sunbeams, should not be dispensed with because the same action may decompose the dyes with which the furniture is colored. It is impossible to have too much sunlight or fresh air; every living room and every sleeping room, when possible, should face the south, and the radiant energy of the sun will be found to induce such a healthful and vigorous physiological action of all the organs of the body that many doctors, and druggists' bills will be saved, and, in a short time bring about that greatest blessing of life—a state of good health.—*Popular Science News.*

PURE WATER.

SOME CONSIDERATIONS ON THE DOMESTIC WATER SUPPLY.

The matter of securing a pure and wholesome supply of water, is one that is constantly receiving more and more attention. In the larger cities, water works are usually provided, which furnish an abundant supply, and, in the majority of cases, of excellent quality. In the country and smaller towns, each house-owner must look out for himself, and the question of the desirability of any given source of water, becomes a very important one. The most common sources of a supply are from rain-water cisterns, wells—both common and driven—springs, running streams and ponds. In New England, thanks to the absence of a limestone formation, the ground waters are comparatively soft, and, when not contaminated by drainage, are pure and wholesome. Rain water falling on the roofs of buildings, and collected in cisterns, is largely used in all parts of the country, and is, of course, of great purity, but the liability of the cisterns, as well as the roofs from which it is collected, to become dirty, renders it more desirable to obtain the domestic supply from some natural source, where the water is constantly exposed to the purifying influences of light and air. Undoubtedly, the best and safest source of water is from deep springs, which are almost always free from organic impurities. In populous districts, springs which flow near the surface of the earth occasionally become contaminated. Several cases of typhoid fever occurred at Lausanne, Switzerland, from the use of water from an infected spring, but such instances are rare. In most cases, the streams of water which gush forth from the hillsides, may be used with assurance of perfect safety. A large proportion of the "mineral springs," which are so celebrated for their numerous cures, prove, upon analysis, to contain little or no mineral matter whatever, and their health-giving properties must be attributed to the free use of pure water alone, aided by the influence of the imagination. There are thousands of springs in New England, which only need a well-managed "boom" to confer the most remarkable therapeutic properties upon them. Running streams come next in point of desirability, but it is evident there is a much greater possibility of contamination. In thinly settled districts, a simple inspection will usually show any danger that may exist from such a cause, and there are many streams of pure water among the hills, which, by a little simple engineering, could be made to flow directly into the kitchens of the farmhouses, and save the members of the family many tiresome journeys to the well or spring. Lakes and ponds are very numerous in New England, and usually contain water of good quality. Many of the cities and larger towns derive their

supply from such a source. The chief danger is that, as the community grows, dwellings and manufactories will be erected within the watershed of these ponds, and drain their refuse matters into them. There is a most extraordinary indifference and recklessness manifested on this point, and it is almost impossible to prevent such contamination, even by legal processes. The city of Boston has had much trouble from this cause, although, as yet, the contamination is not great enough to be a very serious matter.

The common well is the most undesirable source of all. If it is deep enough to strike a living spring of water, and removed from all sources of contamination, it may be unobjectionable, but these conditions are rarely met with in the country, and, we may say, never in large towns or cities. A well is usually placed near the house for the same reason that the barn-yard, privy and sink-drain are, but their existence in the same vicinity is incompatible with a pure and wholesome water-supply. Some even go so far as to dig the well in the cellar, and we recall the case of a refined and cultured family who actually had *both well and cess-pool* underneath their dwelling, and only a short distance apart. Such a barbarous practice is unworthy of a civilized race, but it is to be feared that a large proportion of wells are not much better situated. As to pipes for conveying water, no certain rule can be laid down. The majority of waters do not, apparently, act upon lead pipes, or else form an insoluble coating upon them, which prevents further action. In other cases the action is continuous and rapid, and lead-poisoning is likely to occur in those using the water. Pipes of compound metals—such as tin-lined lead, or galvanized (zinc-covered) iron—are even more dangerous, and should always be avoided. Iron is perfectly safe, and only has the disadvantage of sometimes introducing iron-rust into the water, to the injury of clothing that may be washed in it. This, however, is a minor disadvantage, and does not often occur. Various patterns of filters are in use, very few of which are of any value whatever. They act only as a strainer to remove the coarser impurities, but have no effect upon the microscopic bacteria, or matters held in solution, which are the most dangerous. A flannel bag is exactly as good filter as these expensive devices, and possesses the additional advantages of being easily cleaned or renewed. The most effective filters are those in which a disk of porous stone or earthenware forms the filtering material, but it is best to make sure of the original supply of water, rather than to attempt to purify it by any such uncertain methods. To sum up, we may say that the best source of water-supply is from a deep and unfailing spring; next to this running streams, large ponds, rain-water cisterns, and, last of all, deep wells, situated far away from any possible source of impurity. Driven wells are less liable to contamination than open ones, but the same objections apply to them in a lesser degree. Iron pipes are safe under all conditions, and filters are generally useless. It is often a matter of some trouble and expense to obtain a pure and abundant supply of water, but the benefits it brings will always more than repay the necessary outlay of time and money.—*Popular Science News.*

BOYS' APPETITES.

THE YOUTHFUL CRAVING FOR FOOD AN INDICATION OF HEALTH.

The relation between appetite and digestion is in general a fairly definite one. At the same time it must be allowed that this rule is largely modified by exceptions. Many persons are subject to morbid craving to eat which food cannot satisfy; and most of us know something of the appetite of idleness, or habit, or of nervous disturbance—the latter bearing a suggestive likeness to the desire for stimulants or the fragrant weed, taken to relieve mental depression. Apart from

such considerations, however, there are obvious variations in the degree of normal appetite in different individuals and at different periods of life. The man of sedentary habits cannot expect to compete with one who spends a life of movement out of doors. The man and the woman differ, so do the younger and the elder, and, in a notable degree, the boy and the man. The vigorous appetite of boyhood is virtually a synonym of health. A rate of daily consumption which would in most men be gluttony, is in young growing lads almost too common to attract notice. The explanation is not difficult when we take into account two chief conditions of existence at this age—the growth going on in every organ and tissue, and a very liberal allowance of active bodily exertion. Under the circumstances a sparing rule of diet would be unnatural and injurious. There is, of course, a limit even in childhood, which it is trite to say is often and wrongly exceeded. There is no age, however, at which this form of excess is pardonable. Whatever the surplus of food taken, most of the self-indulgent youngsters have been provided by nature with a power of disposal which may largely be relied upon to correct its consequences. Measures of restriction are more wise when they are used to regulate rather the wholesomeness of food and the times of eating than the absolute quantity consumed. It is at a later stage that we may require to apply strictly the familiar rule that one should eat to live and not live to eat. A degree of apparent Philistinism in the matter of wholesome food and drink, is in the young both usual and judicious.

MICRO-ORGANISMS.

A POPULAR EXPOSITION OF AN INTERESTING SUBJECT.

From a paper lately read before the American Academy of Medicine by Dr. Samuel R. Nelson, we make the following extracts which will be of general interest to our readers. The solution of the germ theory of disease is probably occupying a greater number of observers than any other subjects. Micro-organisms, called bacteria, comparatively unknown till within a few years, on account of their very minute size, with the improvement of the microscope, are now very closely studied. The history of these micro-organisms is related to that of spontaneous generation, to that of the fermentations, to the pathogeny and therapeutics of a great number of virulent and contagious affections; and in a more general manner to all the unknown, which notwithstanding the efforts of modern science still surrounds the origin of life and its preservation. The bacteria are the lowest of organisms, belonging to the vegetable kingdom, and are thus defined by the botanists, who have most recently occupied themselves with them: "Cells deprived of chlorophyll, of globular, oblong or cylindrical form, sometimes sinuous or twisted, reproducing themselves partly by spores and by transverse division, living isolated or in cellular families, and having affinities which approach them to the algæ, and especially to the oscillariæ." The atmosphere transports myriads of microscopic plants and animals. M. Miquel has pursued interesting studies upon them. M. Pouchet has devised the aeroscope, that bears his name, for collecting dust from the air which contains remnants of articles that we use, existing in the condition of impalpable dust, also pollen of plants, particles of mineral matter, and the spores of cryptogams, the moulds and algæ. Some micrographers have suggested that germs may be transported by the vapor of water; but Miquel's experiments show that the evaporation of water from the ground never carries any schizomycetes with it. On the other hand, dry dust, especially from hospitals, etc., is charged with micro-organisms. The greatest labors, however, have been employed concerning a different class of organisms than the algæ and moulds. The plants comprising this group, under the common designation of *bacteria*, in consequence of their extreme minuteness

and refractive power, are invisible in the preparations of the aeroscopes, and are recognized only by the higher powers of the microscope. The first observer who recognized the micro-organisms was Leeuwenhoek, as early as 1675. While examining with his magnifying glasses a drop of putrid water, the father of microscopy remarked with profound astonishment, that it contained a multitude of little globules which moved with agility. During the following year he observed the presence of bacteria in feces and in tartar from the teeth. M. Cohn is a naturalist who has occupied himself very much with the bacteria. In 1853 he published his first researches upon this subject, and twenty years later there appeared a series of "Memoirs" devoted to these organisms. In the first paper he gives an exposition of his researches upon the organization, development and classification of the bacteria, and upon their action as ferments. His classification is:

1. The sphaerobacteria, or globular bacteria.
2. The microbacteria, or rod bacteria.
3. The desmobacteria, or filamentous bacteria.
4. The spirobacteria, or spiral bacteria.

This classification has probably been accepted by more germ theorists of to-day than any other classification. The classification proposed by Koch is now quite universally accepted. The term *bacteria* is used in the general sense, including both the *micrococci*—the ball forms—and the *bacilli*—the rod forms. The smaller spherical bacteria may be confounded with various objects—*e. g.*, molecular granules, fat globules, amorphous precipitates, etc. To distinguish these pseudo-bacteria, Nageli says: "There are but three distinctive signs which enable us to recognize with some certainty that the granules under observation are organisms—spontaneous movement, multiplication, and equality of dimensions, united with regularity of form." To which may be added the action of re-agents. The atmosphere is laden with these micro-organisms. Developing in the organic infusions into which they fall, they soon determine their complete decomposition; for during their growth bacteria live upon the nutritive material, as all other plants do upon their soil. This is putrefaction, and they are always present as the cause. As is well known, bacteria are always present in some form or other in fermenting liquids. Fermentation only occurs after the access of particles from the outer world, and it is asserted by the supporters of the germ theory that these particles are organisms or their spores, and that it is by the growth of these organisms in the fermentescible material that it undergoes alteration. The essentials for the production of new forms are—a putrescible body, water and air, while heat, light and electricity favor the process.

(To be continued.)

RUBBER SUBSTITUTE.—A substitute for rubber to be known as "kelgum," has been invented by Henry Kellogg, of New Haven. It is produced from vegetable oils, which are treated so as to remove all the unctuous matter, leaving a residuum of a gummy character, very much resembling india-rubber gum, though not possessing so much of the elastic quality. As kelgum is a product of oil it is unaffected by oil. As it does not retain any unctuous matters it possesses an advantage over rubber. Neither is it affected chemically or changed by the action of heat or light. It can be vulcanized exactly as rubber is, except that it is not necessary to use sulphur. Another peculiarity of the substance is that it increases in weight instead of diminishing, as is the case with rubber. It is more durable than rubber under many conditions, as when exposed to light and heat, and also in many cases where rubber is injured by heat kelgum is not. The new substance is especially applicable to beltings, both for all kinds of machinery as well as for tapes for printing presses. It is available for sail covers or bonnets, awnings, tents, mail pouches, carriage coverings and linings, canvas shoes, trunk covers, bags and reticules, book covers and bindings, packing cloths and papers, cart sheeting, tarpaulin, shoe linings, telegraph and telephone wires and cables, under ground or in water, and insulators, roof covering, shoe soles, and numerous other purposes for which rubber is now used. A joint stock company has been organized in New Haven for the manufacture of kelgum.

INSOMNIA.

THE NEED OF VARIETY IN DOMESTIC LIFE.

Are you afflicted with insomnia? Perhaps you have too much time for sleep. Perhaps you depend too much on sleep for rest and recuperation. For sleep is not the sole rest of used-up nerves. Sociability, congeniality, and the enjoyment of good company rest the body quite as much as sleep. The dreary monotony of life in many a household, involving this tumbling into bed with the mechanical regularity of a machine at nine or ten o'clock in the evening, does not always rest weary bodies. "Early to bed and early to rise" does not always make a man healthy, wealthy or wise. Numbers of organizations are only capable of five or six hours sleep at a time, and their early lying down to rest is often succeeded by an early waking up and a consequent restless tossing for hours preceding daybreak. The practitioners of punctuality are often surprised after breaking their own cast-iron rules, and passing two or three later hours of mirth and jollity past their usual bed time, to find themselves even more refreshed in the morning than usual. The relaxation or sociability has rested them more than would sleep or an attempt to sleep. But these are conditions not so easily reached in the average family. In fashionable life we have a formal, exhausting and mechanical evening of more or less dissipation. On the other hand the evenings of great numbers of families are monotonous humdrum. They involve the assemblage of the same people, the same surroundings, the same paterfamilias yawning over his paper, and the same querulous mama overlaid with family cares. Fresh people with fresh thought, fresh atmosphere, anything to stir up and agitate the pool of domestic stagnation, are sadly needed and sadly scarce. There needs to be also a constant succession of such fresh people to bring about these results. The world is full of men and women, and in a better regulated life it would be the business after the day's work was done to entertain each other, and give each other fresh life. As it is now, hundreds if not thousands of our households are little better than cells for the incarceration of each family. Thousands are thus worn out prematurely from utter lack of domestic recreation. There might be written over the graves of hundreds of thousands, "Bored to death by the stagnation of domestic life."—*The Christian at Work.*

SANITARY SCIENCE.

IMPORTANCE OF POPULAR ENLIGHTENMENT ON THE SUBJECT.

Among the professional there is no science more popular than that of sanitation. To the laity, however, it is not as popular, or accepted with that faith and respect usually given to the science of medicine, and the older professions which have more immediately and perceptibly touched their interests and proved their practical worth. Prevention of anything is hard to discover, for we are never sure the thing prevented would have occurred had there been no preventive means employed. We can see gas burn, see the light from electricity, receive the message, hear the words over the telephone, and see the sick healed, but whatever is prevented is unobserved, and we take little notice of what might have occurred, but did not. Any science, however good its office may be, the results of which are manifested in this negative way, is much less recognizable than the science whose forces are positive. This is probably one reason why preventive medicine is slow in impressing its beneficence upon the people. Another reason is found in what the people of this country call their "personal rights." Any interference with these is resented, and whatever regulations and restrictions are deemed necessary in the support of good health are looked upon as oppressive, and as an unwarrantable abridgment of their liberties. To the

citizens of a government conceived amid the struggle for liberty, born with the inspiration of victory, and established on the glory of triumph, any encroachment on the liberty of enjoyment or habits of life is looked upon as tyranny. Such people do not trouble themselves with definitions and philosophy, and civil and personal liberty to them are the same. Nothing is so strongly resented as laws which abridge or trench on their pursuit of happiness, according to their own notions; and a law that will come right in their homes and impose restrictions, rules and regulations meets with disfavor from the very nature of things. This feeling is carried up to the legislative halls, and results in opposing boards of health, cutting down needed appropriations, and a failure to enact the necessary laws for the support of efficient health departments. Sanitary science needs popularizing among the masses. Its lessons need to come more closely to the average home, and enlighten all classes. People value health, but do not fully appreciate the means of promoting it. They, to a certain extent, are acquainted with the simple rules of hygiene, but have not been taught to value them properly. The importance of observing these simple rules is what they need be taught, and through them they will give support to health departments, by which healthy living is taught.

ARTIFICIAL SILK.

A NEW AND SINGULAR TEXTILE FABRIC.

Mr. Chardonnet has succeeded in preparing a new artificial silk—a silk which bears the same relation to the natural article as celluloid does to ivory. Its preparation is somewhat as follows: Cellulose (cotton, or whatever may be available) after being treated with a mixture of nitric and sulphuric acids in equal proportion, as for the making of gun-cotton, is dissolved in a mixture of alcohol and ether, to which is added some perchloride of iron or protochloride of tin and tannic acid. The solution thus obtained is placed in a vertical vessel terminating in a small tube or in a diaphragm pierced with fine holes, so that it can run out into a vessel full of water slightly acidulated with nitric acid. The fine fluid filament which comes out takes on immediately a more or less solid consistency, and forms a thread, which can be wound on a spool. The thread thus obtained resembles silk very closely, and is equally strong and elastic. It is not attacked by water, cold or warm, nor by the acids and alkalies moderately concentrated. By introducing into the solution coloring materials, one may obtain threads of any desired shade. This artificial silk is said to be extremely inflammable—an objection which it is hoped to overcome. It is probable that the nitric acid can be replaced by some other which will render it less combustible. When this progress has been realized, we shall have a new textile fabric of the greatest importance.

TENDENCIES OF THE TIMES.

GENERAL REPUDIATION OF CLASS DISCRIMINATION BY OUR STATE LEGISLATURES.

The Federal and State governments yielded to the hue and cry of Grangerism and followed the lead of demagogues far enough to allow a fair test of the efficacy of their remedies of public ills by arbitrary, restrictive and discriminating laws. The experiment was tried by the states in many ways, and by the nation in its anti-oleomargarine and railroad regulation laws, and the legislatures of this year give evidence of the popular recognition of failure. Bills to make State laws against oleomargarine more stringent have been rejected, and attempts to apply the same principles to other industries have failed. The movement to exclude from each State the beef of cattle slaughtered outside its limits has been defeated in the two States in which it originated, and in all others in which it was proposed except Minnesota

and Colorado, while in these States the results are already such as will operate against a repetition of this blunder and outrage by other legislatures. Many of the States have shown a disposition to adopt the more conservative views and methods of the Inter-state Commerce Commission in dealing with their railroads. Not less noteworthy has been an increased disposition to look to the experience of other States and profit by example, avoiding the errors of sister commonwealths and adopting what has proved successful in their legislation. No tendency in State law making is more promising of good results than this greater readiness to imitate what has worked well and to avoid the needless diversity and conflict of laws that has been such a serious evil. This is specially important to the greatest of the commercial commonwealths, and New York should find an incentive to improve and simplify her commercial laws in this prospect of the adoption of what is good in them by other States. We have dwelt on the brighter side of the record in recent State legislation. There is much that is dark and disappointing, and there are many evils to resist and great demand for more earnest determination among the people to see that the making of their laws is entrusted to competent hands and faithfully performed. While the demands of corrupt and selfish interests are so bold, and while fallacious theorists are sowing broadcast the seed of paternalism and governmental intervention and control as specifics for the cure of evils which can really only be aggravated by State interference, it is gratifying to see that the wider popular discussion of the principle of good government is bearing fruit in the more potent influence of more enlightened public sentiment, and that the failure of unwise and arbitrary laws is making converts to simpler, sounder principles.

THREE HUNDRED YEARS AGO.

HOW OUR BRITISH FOREFATHERS INDULGED IN PAGAN SUPERSTITIONS.

The latest report of the British Historical Manuscripts Commission, relating to manuscripts preserved at Belvoir Castle, furnishes a curious instance of the possibilities of sixteenth century medicine. From a document dated January 12, 1582, it would appear that "Richard Batte, late of Burton, next Sturton, Chirurgeon," was under suspicion of having procured to be made "a picture of waxe wherebye he would consume his wyfe's mother and all the rest of her children," his object being that "theyre lvyngs mighte come to the seyde Batte and to hys wyfe." It seems pretty evident that a "pycture of a maid" in wax had been made, information of which having been laid before "Mr. Meare of Nottingham," Mr. Batte was apprehended and his brother-in-law was bound over to "prosequite the lawe" against him. The case must, however, have proceeded very slowly, for nearly ten years after, in September, 1591, Richard Batte, Surgeon, appears under examination, trying to put a very different color upon the making of the picture and to reduce it to a bit of medical practice. He deposes that he "hath a paycent in the countrye, whose name he wyll not declare, but she ys troubled with a fluxe," and he, wishing to provide a remedy, consulted a friend as to a "cunning man that could make a proporecyon or figure of a mayde with a garlande on her hedde and a flower in her hande." The cunning man was found, who promised to make in wax artificially the figure of a maid "with her heare dyngyng syde about her shulders," for which his reward was to be an "olde angell." Batte added that it was his intention to have "put thereto the powder of a poun garnett or of the shale thereof, the powder of a synamoun, the powder of redde saunders and the powder of nutmeg, to give to hys sayde paycent to stey the flux called dysenteria. He wulde have baken the same together with pyppyns, which hys sayde paycent shalle eat." This is the last reference to the case in these documents, and the judicial decision does not appear.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

June.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Pigeon, chicken, duck.

FISH.—Anchovy, bass, bluefish, blackfish, cod, eels, clams, flounder, haddock, halibut, herring, lobster, mackerel, mussels, perch, porgie, prawn, salmon, shad, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Beans, cucumbers, carrots, cauliflower, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, radish, rhubarb.

FRUITS.—Cherries, strawberries, bananas, pineapple.

PRACTICAL RECIPES.

CARROT SOUP.—A knuckle of veal, three or four quarts of cold water, a quart of finely sliced carrots, a head of celery. Let these ingredients boil two and a half hours; add a handful of rice; boil one hour more. Season and serve.

BROILED WHITEFISH.—Split a whitefish down the back and lay it in salted water for several hours, wipe dry, and place with flesh side down on a well-greased gridiron over a hot fire; sprinkle with salt and pepper; when brown turn on other side. When both sides are nicely browned, dish and serve.

CURRIED EGGS.—Fry two onions in butter, add a tablespoonful of curry and a pint of soup stock, and let it stew till the onions are tender; add a cup of cream or milk; thicken with a little flour or cornstarch, cook a few minutes; cut eight hard-boiled eggs in slices, add them to the stew, and stir gently until they are thoroughly heated, but do not boil.

APPLE PUDDING.—Take one pound of lump sugar and put it into a stewpan with half a pint of water, and boil till it becomes very thick; then add about two pounds of apples, peeled and cored, and the grated rind of a lemon; boil all together till it is quite stiff; keep stirring all the time; pour it into a buttered mould, and when cold turn out and serve with custard, or whipped cream poured around it.

TO STUFF GREEN PEPPERS.—Take one-half a cabbage, two onions, two tablespoonfuls of white mustard-seed, a little horse-radish, and a portion of the seeds taken from the peppers; salt it well and chop very fine. Cut out a round piece where the stem of the pepper is and stuff full of the chopped mixture. Have good vinegar very hot into which you have thrown allspice, cloves and mace, and pour over the peppers. The vinegar should be poured off and reheated and poured back over the peppers for five or six mornings.

TOMATO SAUCE FOR MEATS.—Divide a dozen tomatoes into quarters and put them in a saucepan with four onions sliced, a little parsley, thyme, cloves and a quarter of a pound of butter. Set the saucepan on the fire, stir the ingredients occasionally for three-quarters of an hour. Strain and serve hot.

WAFFLES.—One pint sweet milk, four eggs, one large cupful cold rice or hominy, a little salt, flour to make a stiff batter, Horsford's Baking Powder, in the proportion of three teaspoonfuls to a quart of flour.

PROF. BUNSEN.—Professor Wilhelm Bunsen has resigned the Chair of Chemistry at Heidelberg, which he has held since 1852. He began his career as a university teacher at Göttingen in 1833, and lectured successively at Kassel, Marburg, and Breslau. Prof. Bunsen is in his 78th year.

GERMS IN WATER.

THE EFFECTIVE PURIFICATION OF WATER BY HEATING.

Feltier in a communication recently made to the Société d'Hygiène, stated that the boiling of water as a means of destroying disease germs, is not entirely to be depended on, and has also other considerable drawbacks. The temperature of 212 deg. F. is not sufficient to destroy all the microbes. The air of the water is expelled by the effect of ebullition, and the water becomes heavy and "indigestible," the calcareous carbonates and the earthy portions in suspension are precipitated and the water is rendered disagreeable to drink. To obviate these different objections the author proposes to submit suspected water to a higher temperature than merely boiling, and the following is the manner in which this is effected: A closed metallic vessel, perfectly air-tight, being able to support a pressure of six atmospheres, is provided. At the bottom this vessel presents an enlargement, which is calculated so that by the dilation during the heating the water completely fills it. A tap placed in the lower part, surmounted by a filter, permits the drawing off of the water. When the vessel is full of water, it is placed either in a bath saturated with salt, or in a jacket into which steam is admitted. In the one case, as in the other, it is heated, and the water is thus raised to a temperature varying from 237 to 300 deg. F.

THE MANIFOLD CYCLOPEDIA.

We are glad to note the appearance of Volume XIII., of Alden's *Manifold Cyclopaedia*. It takes the work along from Electricity to Exclaim. The information is condensed, but clear, accurate, and brought down to date. There is no slighting of any points, and the more important topics are treated with admirable fullness. Thus Electricity has 34 pages; Electric Light, 6 pages; Elizabeth (Queen), about 7 pages (with a fac-simile of her signature, which is interesting if not beautiful); Emerson, 4 pages; England, about 15 pages; Engraving, about 8 pages; Ensilage, nearly 3 pages; Episcopal Church, about 7 pages; Ethnology, 10 pages. A cyclopaedia of some kind is needed in every home, and every school. This costs but little, while for general use it is far more convenient and practical than the large and very expensive works. It presents just the kind of information which is needed in everyday life. Another valuable feature is found in the illustrations, which are freely used where needed to explain the text. Thus far this series of volumes has been eminently satisfactory, and there is every reason to believe that this high standard will be maintained until the close.

"SO THEY GO."

An eminent New York physician in conversation a few days since remarked: "I have patients, who although rich already, are so absorbed in the race for more wealth that they actually will not take time to swallow the medicines necessary to keep them in health. They toil unceasingly in their offices or on 'change during the daytime, and lie awake at night planning 'operations.' A man who gets into that current notices after a while that his appetite has failed, that he has frequent violent headaches, that annoying pustules appear on his skin, that his memory is no longer to be trusted, and that in order to sleep at all he has to resort to drugs or more malt liquors than are good for him. For a time he 'braces up' on alcoholic stimulants, which give him a false appetite and fictitious nervous energy. Suddenly he realizes some day that he is 'all broke up,' and had better see a doctor; but that takes time, and it is quicker for him to rush into a drug store on his way up-town and get a lot of violent but simply purgative pills and some wickedly injurious 'nerve tonics' and 'nerve foods,' that will spur his flagging energies to a swifter pace on the road to destruction. By and bye he finds that he *must* see a doctor, and rushes to one—me, for

instance—wanting something that will fix him all right in a day or two, or perhaps before he 'starts for Chicago to-morrow night.' He might as well expect to build a new railroad or dig a ship canal in two minutes. It will be big luck for him if he ever is reasonably well again, and as to undoing speedily his ruinous work of years, it is impossible. Very reluctantly he takes in that idea and begins a serious course of medical treatment. But as soon as he begins to feel a little better he forgets to take his medicine or decides that it is a bore, and that he has had enough of it. 'The end of it all?' Oh! some of them stop in time, take a long rest and good care of themselves—probably going off to Europe to escape the temptations of business—and get back enough of the remnants of their health to give them a new lease of life. More of them keep right on until they either break down mentally with paresis or suddenly die. So they go." Those dangerous habits of life are not confined to the class of business men of whom the doctor spoke. As a people we are too "fast." It appears hopeless to ever think of reforming this national characteristic of restless energy, that relaxes only with life. The best that can be done under the circumstances is to so guard ourselves as to evade its dangers as far as possible through unremitting prudential care for our physical condition. It is well understood by every practical man that the higher the speed at which a piece of machinery is run, the greater must be the watchfulness exerted to keep it in perfect order, especially if it is of at all delicate construction. Nothing is more delicate than that greatest of all mechanisms and mysteries, the human body. If we would work it at high pressure we must protect it against the slightest deterioration or derangement of its nice adjustments. Nature will not allow us to be ignorant of its least injury, if we will but give heed to her warnings, and it depends upon ourselves whether we let her warn in vain, or intelligently make the necessary repairs before the injury so magnifies itself as to ruin the machine. There are no such things as trivial ailments of any of the vital organs which may be cured by themselves without reference to the organs directly involved with those conspicuously affected. Especially is this true of the digestive, assimilative and excretory chain of organs. Failure here in one part very speedily involves all in a perilous course of mutual and reactionary deterioration. The only safe course of treatment is that which cleanses, stimulates and strengthens all, and in so doing sustains their power to make pure and vivifying blood for the building up of healthful tissue and casting out, through natural channels, the effete matter which is the waste of life. Nothing better for this purpose is known than Ayer's Sarsaparilla, a scientific compound of the active medicinal principles of the most effective vegetable and mineral alteratives. There is no secret about its preparation. That it is composed of Honduras sarsaparilla, mandrake, yellow dock, stillingia and the iodides of potassium and iron, is fully understood by the medical profession, hence its endorsement by the best physicians. Every active brain worker, especially those of sedentary habits, should take this medicine from time to time, particularly in the spring, and it is safe to regard even seemingly trivial departures from the conditions of perfect health as nature's imperative demand for its aid.

GLASS BOTTLES.—The Heye factory for glass bottles at Gerresheim, near Düsseldorf, produces on the average 200,000 a day, and, if necessary, can turn out 300,000. From 1,800 to 3,000 men and women are regularly employed in the works, and find accommodation in the adjoining model town.

AUTOMATIC CANDLES.—A new candle has been brought out, which extinguishes itself in an hour. This it does by means of a tiny extinguisher of tin, which is fastened in the wax by wires, and which effectually performs its task. It is only necessary to remove this diminutive extinguisher when its work is done, and the candle is again ready to burn another hour.

SELF-PRESERVATION.—Giles: Old Brown must be getting generous to offer you a cigar.

Merritt: His wife recently made him a present of a box.

NEW ANTISEPTIC.—A Mr. Daniels, of Chicago, claims to have discovered a preparation which will preserve food for any length of time. It consists of a powder, the chief ingredients of which are sulphur and cinnamon. This powder, when ignited, burns slowly, and articles exposed to its fumes resist decay. One pound of the powder will preserve a ton of meat.

TEA CIGARETTES.—Tea cigarettes are said to be the latest feminine fad in the way of "mild" intoxicants. Only the choicest kinds of tea are used; and, though the fumes are not pleasant to the general public, the smokers find their nerves greatly soothed for a time. Afterward, however, the reaction takes place, and they are apt to become somewhat excited. If persevered in, theinism in its worst form must be the inevitable result.

FIRE-PROOF PAPER.—A German patent has been granted to M. Ladewigg for a much needed article—a fire and water-proof paper. It is made by mixing twenty-five parts of asbestos with twenty-five or thirty parts of aluminum sulphate, moistening with zinc chloride; and after washing, treating the pulp with a solution of one part of rosin soap and eight to ten parts of aluminum sulphate. Paper is then produced as with ordinary pulp.

HIGHEST WATER POWER HEAD.—France claims the honor of utilizing a higher water pressure than that recently put in operation in the Chollar shaft on the Comstock lode, in Nevada. At Brignoud, one and one-quarter miles from the valley of Gresivaudan, near Grenoble, a turbine 9 feet 10 inches in diameter was put in operation in the year 1875, utilizing a head of 1,638 feet. It is still working, and gives a force of 1,500 horse-power, with a flow of 75 gallons of water per second.

EDUCATION IN RUSSIA.—According to the latest educational report of 1884, only 1,466,913 of 15,000,000 children in the Russian Empire attended schools. About 90 per cent., therefore, of young Russia receive no instruction at all. In 60 governments there is only one school for secondary instruction to every 18,000 boys and 22,000 girls. Only 63 per cent. of the boys of any age to attend a public high school can be accommodated. For girls, the number of such schools is even more insignificant. The schoolmaster cannot be said to be abroad in Russia yet.

THE FLY CROP.—The common fly lays more than one hundred eggs, and the time from egg-laying to maturity is only about two weeks. Most of us have studied geometrical progression. Here we see it illustrated. Suppose one fly commences "to multiply and replenish the earth" about June 1. June 15, if all lived, would give 150. Suppose 75 of these are females; July 1 would give us, supposing no cruel wasp or other untoward circumstances to interfere, 11,259 flies. Suppose 5,625 of these are females; we might have July 15, 843,720 flies. For fear of bad dreams, we will not calculate what might be by September 15.

CHINESE RAILROADS.—In the summer of 1888, the railway between Lutai and Taku, in China, a distance of 60 miles, was opened, and in the autumn the section between Taku and Tientsin was completed. The passenger traffic on this line is said to be very active, although the trains only run at present at the rate of 20 miles an hour, as they also serve for the transport of goods. It is expected that the railway will be opened as far as Peking some time during the present year, when the Chinese capital will be reached from Tientsin in about one hour and a half. Two short lines are also being constructed in the island of Formosa, one of which runs from Kelung through the Tamsui valley.

COIN STATISTICS.—The weight and bulk of the gold and silver coin now held by the United States Treasury forms the subject of inquiry by a correspondent of a mathematical turn of mind, and he finds that the weight of the gold is 601 tons of 2,000 pounds, and the silver 8,000 tons. Packing it along the highway as cordwood is packed, the gold would make a barricade four feet high and four feet thick for a distance of 335 feet, and the silver, if similarly packed, would extend 4,248 feet, or five-sixths of a mile. If packed in carts, one ton to each cart, the procession would be nearly 33 miles long, of which distance the gold-bearing carts would cover two and a half miles, and the silver a fraction over thirty and a quarter miles.

ANXIOUS MOTHER: "I wish, Susan, that when you give baby a bath you would be careful to ascertain whether the water is at the proper temperature." Susan: "Oh, don't you worry about that, ma'am. I don't need no 'mometers. If the little one turns red, the water is too hot; if it turns blue, it's too cold; and that's all there is about it!"—*Boston Commonwealth.*

TESTS FOR DEATH.—Many tests have been suggested to determine whether or not life is extinct where death has appeared to occur. One of the most recent, and held to be one of the most reliable, is called the ammonia-hypodermic test. In using this test the operator injects one hypodermic syringe of strong solution of ammonia under the skin of the arm or some other convenient portion of the body. If the body be not dead—if there be the faintest circulation—the ammonia will produce on the skin, over the point where it was injected, a bright red patch, on the surface of which raised red spots will appear; but if there be absolute death, there will be produced a brown dark blotch, which is definitely conclusive against any possible vitality.

AIR FROM COAL.—An Englishman is credited with the discovery of a method of producing perfectly pure air from the combustion of coal. The process is very simple, and is described as follows: It consists of a brick chamber about 5x2x2 feet, built upon the ground. At one end is a feed chamber and a fuel chamber, and at the other a powerful exhaust and blast fan. Placed immediately between the chamber and the fan are baffle plates, splitting plates, a standing bridge with perforations at the back, and a hanging bridge with perforations at the front. There are also several carefully proportioned inlets to supply the exact quantity of air requisite for perfect combustion. Issuing from a fan mouth of twelve inches in diameter, comes rushing a column of hot air, marking on the pyrometer at its exit a steady, uniform temperature of 500 degrees Fahrenheit. Not a trace of smoke or fume is visible to the eye; not a taint of any kind is perceptible to the taste or smell.

AN INTERESTING ROAD.—One of the most interesting achievements in modern engineering is the electric mountain railway recently opened to the public at the Burgenstock, near Lucerne. The rails describe one grand curve formed upon an angle of 112 degrees, and the system is such that the journey is made as steadily and smoothly as upon any of the straight funicular lines. The Burgenstock is almost perpendicular—from the shore of Lake Lucerne to the Burgenstock is 1,330 feet, and it is 2,860 feet above the level of the sea. The total length of the line is 938 metres, and it commences with a gradient of 32 per cent., which is increased to 58 per cent. after the first 400 metres, this being maintained for the rest of the journey. A single pair of rails is used throughout, and the motive power (electricity) is generated by two dynamos, each of twenty-five horse-power, which are worked by a water-wheel of nominally 125 horse-power erected upon the river Aar at its mouth at Buochs, three miles away, the electric current being conducted by means of insulated copper wires. The loss in transmission is estimated at 25 per cent.

BUSINESS NOTES.

KINGSFORD'S STARCH.

When an old-established, reputable house advertises an article that has been before the public for half a century, it is safe to quote their statements, and the best proof of their goods being entitled to confidence and patronage is in the fact that none of these claims can be disproven. Kingsford's starch is the strongest, purest, best. A giant in strength; matchless in purity; incomparable in the gloss and beauty of finish it imparts to linen, etc. No other starch does such work.

Kingsford's "Silver Gloss" Starch will be found far superior to all other starches for the laundry in its wonderful strength, purity and uniformity; never varies in quality, and free from odor. Owing to its absolute purity and superior strength, it will be found more economical than the multitude of cheap starches; the best is always the cheapest. Kingsford's Starch has remained the standard for excellence for half a century. Sold all around the world.

A Tonic

Horsford's Acid Phosphate.

A most excellent and agreeable tonic and appetizer. It nourishes and invigorates the tired brain and body, imparts renewed energy and vitality, and enlivens the functions.

Dr. H. K. Clarke, Geneva, N. Y., says:

"It has proved of great value for its tonic and revivifying influence."

Dr. J. H. Stedman, West Brattleboro, Vt., says:

"Best nerve tonic I ever used."

LATEST ACHIEVEMENT IN

Celluloid
Collars,

Cuffs
and
Bosoms.

GEO. CLEMENT & CO.

The Celluloid Company confidently assert that they have attained the highest improvement in their Waterproof Collars, Cuffs, and Bosoms, which has ever been reached in this line of waterproof goods. We have examined their latest improvements, and tested them by every means at our command. We are convinced that they have never been excelled, and we are ready to give them our heartiest indorsement. They are pliable, most durable of any goods on the market, and resemble linen more perfectly than any waterproof imitation. Some strangers who have little acquaintance with these goods are under the impression that celluloid is an explosive material. This is an entirely erroneous idea. We can hold celluloid upon the hottest argand burner, and it will melt, but never ignite. The linen interlining makes it much stronger than any other goods in this line. We shall be glad to have any and all of our former patrons try these goods and write us their opinion of the same.

A full assortment of Celluloid Collar Buttons at 5 cents each by mail, post paid; and Cuff Buttons from 25 cts., to \$1.00 per pair by mail. These buttons are durable and never tarnish the Collars and Cuffs.

CELLULOID COLLARS and CUFFS cost no more than linen—look better and wear longer. They never wilt from perspiration, are always white, clean and fresh; require no laundrying—are manufactured in all the leading styles for both Ladies and Gents, Girls and Boys. When soiled, simply wipe them off with soap and water. They save their cost in a week's wear. Try them.

Be sure this trade mark appears on the all goods you purchase.
Address: GEO. CLEMENT & CO. 33 East 22d Street, New York City.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the **AMERICAN ANALYST** a good advertising medium. Why should not you?

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pub-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose purious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING CO.,
19 Park Place, N. Y.

WANTED ON LIBERAL TERMS

A NEW USE FOR LIQUID PEPTONOIDS.

Successfully used in Dissolving the False Membrane in Diphtheria.

A Physician writes: "In an experience of over thirty years I have never used anything to equal your LIQUID PEPTONOIDS as a local application with a spray. It will dissolve the membrane and destroy the diphtheretic odor in less than twenty-four hours. I use the LIQUID PEPTONOIDS full strength, as a spray, two or three times a day, in bad cases."

Used successfully by another physician in two desperate cases:—"I was induced to try LIQUID PEPTONOIDS in two very desperate cases of DIPHTHERIA. I think I never saw throats more heavily coated with exudate than were these, and I think I never saw it more rapidly disappear than in these cases, by frequent spraying with your LIQUID PEPTONOIDS."

LIQUID PEPTONOIDS can be taken by patients unable to ingest food in any other form. In *dyspepsia* and *loss of appetite* its effects are positive, its digestive properties assisting in the digestion of food taken and its peptogenic properties quickly stimulating the natural digestive secretions of the stomach.

PANCROBILIN.

Prepared (in both Liquid and Pill form) from Extract of Pancreas and Bile.

This preparation is designed expressly to increase the digestion and absorption of fats.

We believe that the fat-digesting properties of pancreatine and bile are inseparable, and that without their union in the intestinal tract but little, if any, fat would be digested and absorbed.

PANCROBILIN will be found of great service in *Phthisis* and other wasting diseases, *Nervous Prostration*, *Constipation*, *Inanition*, *Malnutrition*, *Intestinal Indigestion* and wherever there is a failure to assimilate fats.

If the skin is first wet with LIQUID PANCROBILIN, the inunction of oils will be greatly facilitated.

LIQUID PANCROBILIN is put up in pound bottles. PILL PANCROBILIN is put up in bottles holding 100 pills. The coating of the pills will resist acid digestion, when given as directed, but will be quickly dissolved in the alkaline secretions of the duodenum.

PHOSPHO-CAFFEIN COMP.

(Granular Effervescent.)

Formula for each dessertspoonful:—

Caffein.
Acidi Phosphorici aa, grains, ss.
Antipyrin.
Ext. Apii. Grav. dulc. (Celery), aa grains, j.
Sodium Bromide, grains, v.

The satisfactory results produced by PHOSPHO-CAFFEIN COMP. in *Headaches*, *Neuralgia*, *Insomnia*, *Neurasthenia* and general *Nervous Irritability*, are not due to the effect of any one ingredient, but to the happy effect of the combination. A thorough series of comparative tests have demonstrated the superiority of the above formula over any other in the market.

REED & CARNRICK, New York.

PHYSICIANS' Club Rates on Valuable Journals.

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPEDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

ADDRESS ANALYST PUBLISHING CO.,

—19 PARK PLACE, NEW YORK.—

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by **E. McILHENNY,**
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing pure sodium—insures a purity and uniformity of product which cannot be obtained from any other known material. In making Bi-Carb. Soda from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of sulphate of soda, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA Bi-Carb. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

DEAN'S PATENT

ARDENTER MUSTARD.

BEST IN THE WORLD.

Ardenter Mustard Pellets

— FOR —

Dyspepsia and Indigestion.

UNIVERSALLY recommended and prescribed by physicians. The medicinal property are English mustard seed coated with pepsin and sugar. You will find it will relieve you after using two or three doses. It is very beneficial for Heartburn, Sour Stomach and Headache. They are a beautiful confection for children. Each bottle contains full directions.

W. G. DEAN & SON,

361 and 363 Washington Street, 84, 86 and 88

North Moore Street, New York.

To Subscribers, Readers and Advertisers.

SUBSCRIBERS' attention is called to the great variety of interesting and instructive subjects treated in this number. We respectfully ask the co-operation of our subscribers in extending our Subscription list, which will enable us still further to increase the value of the AMERICAN ANALYST to them.

The CASUAL READER is specially requested to examine our liberal premium offer.

ADVERTISERS who do not know of this Journal already, are respectfully referred to article headed "A Business Benefit."

ALL are kindly requested to peruse this number thoroughly.

The AMERICAN ANALYST can be had at any news stand in the United States. Any news-dealer will take orders for it, the American News Company being our wholesale agents. All post-masters will receive subscriptions.

Used by the United States Government. Endorsed by the heads of the Great Universities and Public Food Analysts, as the Strongest, Purest and most Healthful. Dr. Price's Cream Baking Powder does not contain Ammonia, Lime or Alum. Dr. Price's Delicious Flavoring Extracts, Vanilla, Lemon, Orange, Almond, Rose, etc., do not contain Poisonous Oils or Chemicals.

PRICE BAKING POWDER CO., New York. Chicago. St. Louis.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fused Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS, FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

C. N. CRITTENTON, Sole Agent,

MILK AGAIN.

There is no article of human food of greater importance than milk. A great number of tender infants have to depend upon it for their sustenance, and besides it enters largely into the every-day food of all individuals. Housekeepers generally are willing to pay the highest price for what they really believe to be a pure, wholesome article. Upon this willingness many unscrupulous and dishonest dealers base a wily scheme for swindling the public, not only by robbing their pocket-books, but by endangering their health. In many parts of this city may be noticed small stores bearing the sign, "Farm Dairy," the name selected being generally suggestive of sweet-smelling clover and other adjuncts conventionally associated in the minds of city people with pure cow's milk. We also frequently see wagons on the streets bearing similar legends. All these pretend to sell to the verdant consumer fresh, pure cow's milk put in clean glass bottles "on the farm," and some even

go so far as to impudently claim to sell "one cow's milk" to those who think that a better system of milk supply. Milk from one certain cow, provided she is in perfect health and properly fed, may be very good, but it has been generally found that to take a mixture of the milk given by a herd of cows ensures greater uniformity of quality, and secures in the long run a better article. As to the bottled milk business, if it is honestly done, it is, no doubt, an improvement upon buying milk out of cans opened many times in dusty streets, with a germ-laden atmosphere of dust and other impurities blowing in and over it. If the bottles are properly cleansed, and good, pure milk is filled in them, it is well worth an advance on the ordinary price to obtain such an article, but that the public are generally supplied with such milk when bought from all who pretend to fill their bottles on the farm direct from the cooling house, or even at a depot from a clean can of pure milk, we very much doubt. Any observant man must have seen the drivers of such bottled milk wagons filling empty and unwashed bottles with milk from their cans. To put the best milk, even, and these dealers do not as a rule carry the best, into bottles still containing the decomposing remnants of the last filling is worse than to obtain the milk from the cans. As a matter of fact, with a very few honorable exceptions, these high-sounding names for dairy farms only apply to the wagons carrying the milk, and the alleged dairy farm is a stupendous myth. The public should investigate before allowing itself to be thus swindled. The honest dealers in bottled milk owe it to themselves to assist in the exposure of this imposition, and the AMERICAN ANALYST stands ready to publish the facts. The stronger the light that can be thrown on this subject the better will it be for the public, as well for the honest dealers.

BUGABOO ADVERTISING.

A very old but nevertheless reprehensible system of advertising has again made its appearance in the daily papers throughout the land, which, were it not that, like all such humbug announcements, it is aimed at the ignorant, would hardly be worth noticing. A fellow having a cheap, trashy combination of more or less harmful bitters and drugs calls it by some innocent name, such as celery compound for instance, and impudently advertises it as the only known remedy for what he calls "paresis," which the advertisement defines to be brain and nerve consumption. The inventor, who dubs himself Professor, boldly claims that "the great danger which threatens the American people is paresis." His remedy "is not a nervine or any devised article, but a discovery." "It brightens the mind, removes melancholy, quiets the nerves, restores memory, brings refreshing sleep, checks decay of the brain," and it is further claimed for it that "it has the unqualified endorsement of the highest scientific and medical authorities in the land." To add to the scare, the bright genius who prepares these advertisements closely watches the newspapers and every case of suicide, mania a potu,

heart disease or apoplexy, the victim of which is still well-known in the community is immediately seized upon, regardless of the feelings of the family, and made a text to attract attention to this nostrum. The best reason that can be assigned why such an advertisement is entirely unreliable, aside from the danger of taking a strange compound from a maker about whose skill and honesty nothing is known, and considering the fact that for such a deep-seated disease, as the advertiser admits this disease to be, very powerful remedies are necessary, such as cannot be prepared at wholesale to fit every case and cannot be taken without great danger, is simply this: that the definition of paresis given in this advertisement is positively and entirely false. Paresis, as defined by the best medical authorities, is a partial paralysis due to brain disease and is most usually in the form of hemorrhage into the brain substance or the occlusion of blood vessels and consequent arrest of blood supply to an area of the brain, or it may be due to an injury or to a tumor or morbid growth in the tissues of the brain. Enough has been suggested to warrant our readers in giving this nostrum a wide berth.

GAS ASPHYXIATION.

At a recent meeting of the American Gaslight Association of Toronto, the following rules were given, to be followed when men are overcome by gas: 1. Take the man at once into fresh air. Don't crowd around him. 2. Keep him on his back. Don't raise his head nor turn him on his side. 3. Loosen his clothing at his neck and waist. 4. Give a little brandy and water—not more than four tablespoonfuls of brandy in all. Give the ammonia mixture (one part aromatic ammonia to sixteen parts water) in small quantities, at short intervals—a teaspoonful every two or three minutes. 5. Slap the face and chest with the wet end of a towel. 6. Apply warmth and friction if the body and limbs are cold. 7. If the breathing is feeble or irregular, artificial respiration should be used, and kept up until there is no doubt that it can no longer be of use. 8. Administer oxygen.

DOES THE SUN CONTAIN OXYGEN?

A member of the Paris Academy of Sciences, M. Janssen, claims to have made a discovery which upsets the entire theory based on the analysis of celestial bodies by means of the spectroscope. On May 12 the electric lamps of the Eiffel Tower were turned on the Meudon Observatory, which is 7,800 meters (4 miles 7 furlongs) away. He reckons that the mass of air lying in a given section of that length at the height of the tower is equal to the atmospheric mass above. M. Janssen argues from this that the number of molecules of air encountered by a beam of light sent from the Eiffel Tower to the observatory is about the same as that met by sunlight on its way to the earth when the sun is near the zenith. He then shows that if the analogy

"Moreover, since it is quite possible to put up the baking powders in such a way as to preserve their strength very thoroughly, and since it is evident that many makers fail in this respect, it would not seem unreasonable to require that baking powders should not be sold unless they will yield a certain percentage of carbonic acid gas. The bad effects of the 'heavy food' prepared with some of the baking powders among our samples must certainly be felt by those who use them, and who are yet too ignorant to know where the trouble lies. It is for this class especially that nearly all legislation relating to securing good food and drugs is enacted.

"Since it is evident that some of the alum powders are so prepared as to increase the extent of any injurious effect, owing to the mixture of ingredients whose combination cannot be justified on any grounds, it is recommended that a special and more thorough examination of such be made, with a view to preventing their manufacture."

MICRO-ORGANISMS.

A POPULAR EXPOSITION OF AN INTERESTING SUBJECT.

(Continued from page 291.)

Sir William Roberts says: "Without saprophytes there could be no putrefaction; and without putrefaction the waste materials thrown off by the animal and vegetable kingdoms could not be consumed. Instead of being broken up, as they are now, and restored to the earth and air in a fit state to nourish new generations of plants, they would remain as an intolerable incubus on the organic world. Plants would languish for want of nutriment, and animals would be hampered by their own excreta, and by the dead bodies of their mates and predecessors—in short the circle of life would be wanting an essential link. A large proportion of our food is prepared by the agency of saprophytes. We are indebted to certain bacteria for our butter, cheese, and vinegar. Our daily bread is made with yeast, and to the yeast plant (discovered in 1836 by Cagniard de la Tour, and also independently by Schwann about the same time) we also owe our wine, beer and spirituous liquors. As the generator of alcohol, this tiny cell plays a larger part in the life of civilized man than any other tree or plant." Unfortunately for us, however, they have a powerful potency for evil also, and it is the noble aim of science to be able, by thorough study of the conditions under which that potency is acquired and exerted, to keep it under efficient control. Much still remains to be determined with regard to the disease-producing possibilities of the germs that in invisible clouds drift in the atmosphere. The more delicate and exact methods of the most recent observers—Koch, Pasteur, Tyndall, Ehrlich, Ogsten, Sternberg and others—with regard to their nature, seem to show that there are many varieties of them, each of which has its own conditions of growth, requiring or developing best in a particular soil. Different species multiplying in different media and varying in their susceptibility to different temperatures and to different chemical reagents. Apparent identity of form does not necessarily indicate identity of nature. They are not convertible into each other. Each species produces only itself, and is produced by itself alone, and when introduced into a substance that affords a favorable soil for its growth, always produces the same results. These results are not produced suddenly, but are of gradual development, progressing with the slow and steady multiplication of the organism. They may be cultivated artificially in either solid or liquid media. The best known and most commonly used solemn medium is nutrient gelatine, which unites the advantage of transparency with that of solidity; but it has the disadvantage of melting at a comparatively low temperature.

It has been a widely disputed question as to whether bacteria ever occur in the animal in a perfectly healthy

state; the affirmative view having been taken by Billroth and some others; but it is denied by Koch, by Pasteur and by Ehrlich, who state that they have never detected bacteria in the healthy animal. The failure of putrefactive bacteria, according to experiments, would go to show inability to struggle against the normal cells indigenous to the soil upon which they were planted. Some bacteria showed power of existence only in tissue in which vitality had entirely ceased, while others seemed to possess the power of existence in the presence of the animal cells when the latter suffered from impairment of nutrition, and the tide of life was turning against them. Abnormal composition of the blood seemed to favor the development of some bacteria, after they had found their way into the tissues. The theory of a causal relation between bacteria and diseased processes has recently received a wide acceptance. In some diseases this relation is established, while in others it is presumed on the ground that bacteria are found in the blood and diseased products. As additional evidence in favor of special bacteria for different diseases, the fact is advanced that bacteria found in different diseases have been discovered to have different morphological and chemical properties; to which may be added of still greater value, the different appearances presented by the colonies growing upon solid culture media. Admitting this causal relation of bacteria to disease, it must be demonstrated by successive cultures of the bacteria found to exist in the diseased person, and by the induction of the same disease in man or healthy animals by inoculation, with a reproduction of bacteria. The first discovery of the association of a germ with disease was by Pollender, in 1849, who found certain rodlets in the blood of animals suffering with splenic fever, also variously known as anthrax, charbon, miltzbrand, malignant pustule, and wool-sorters disease. The specific character of the parasite was afterwards pointed out by Davaine (1863), and subsequently carefully investigated and confirmed by Pasteur and Koch. The bacillus can be isolated and developed in proper cultivating media, and, when inoculated into some animals will produce splenic fever. Again, in 1873, Obermeyer, of Berlin, discovered a bacterium in the blood of patients suffering from relapsing fever, which has been named *Spirillum Obermeyeri*. It is found only during the febrile paroxysm, disappearing during the interval. So far, attempts at cultivation have proved unsuccessful. In March, 1882, Koch, of Berlin, announced the discovery of the *bacillus tuberculosis*, which he asserted to be the exciting cause of tuberculosis. His results have been confirmed by many observers, and the bacilli have been found in the tubercles and sputa of persons suffering from phthisis. As you all know, they reproduce themselves when cultivated under proper conditions, and cause tuberculosis when inoculated into animals. The discovery of the parasitic origin of glanders followed closely upon that of the bacillus of tuberculosis. This was also made in Koch's laboratory by Prof. Schultz and Dr. Loeffler; and the results were verified by pure cultures and inoculations. Bacteria have also been found in malaria and in whooping-cough. A micrococcus has also been found associated with croupous pneumonia, by Friedlander. This may occur singly, but is generally found as diplococcus. Von Recklinghausen first described the bacteria of typhoid fever; and Klebs, in 1881, described a large bacillus, which he calls *B. Typhosus*, in which spores are formed in the centre, and often at the end. This is carried by the blood and lymphatics, and is found in all the organs. It is more generally believed, however, that the *causa morbi* is a peculiar short bacillus discovered by Eberth. This is rounded at both ends, and has spores. It is found in the ulcers, mesenteric glands and spleen; and has been cultivated by Gaffky. The inoculation of animals has not been successful; but it must be remembered that they do not have the disease spontaneously. The *Micrococcus Vaccinae* is very small, only half the thousandth of a millimetre in diameter, and is found

isolated or in pairs, and when cultivated forms chaplets. Cohn regards *M. Vaccinae* and *M. Variolae* as different races of the same species, but Magnin thinks them identical. In vaccinia they are found in the lymph of the vesicle, and in its borders in the rete malpighi, and were subsequently traced into the subjacent cutis, especially in the lymphatic spaces. The multiplication and extension coincides with the development of the pustule. In variola, Chauveau (1868) first proved a particular nondiffusible active principle; and Cohn (1872) first proved that the lymph contains numerous micrococci. I have myself cultivated the *M. Vaccinae* into the third generation in liquid media, the first inoculation being made directly from the lymph of the vesicles on a calf at Dr. Martin's stables in Roxbury; but limited experiments failed to produce characteristic vesicles on babies vaccinated from these cultures.

The comma bacillus of cholera (Koch, 1883) has of late attracted much attention. They are found chiefly in the excreta of cholera patients; are slightly curved like a comma or half of the letter U, and occur single or in pairs like the letter S; when their growth is retarded they form a spiral chain of several members. They are easily cultivated on nutrient gelatine, forming a growth easily distinguished from others, even from those which are morphologically similar, viz., the so-called cholera nostras, comma bacillus of Finkler and Prior, the mouth comma of Miller and the 'cheese comma' of Deneke. After much experimentation Koch has succeeded in inoculating animals. The bacilli require an alkaline medium for their growth; so he injects, with a catheter carbonate of soda into the stomach of guinea pigs, to neutralize the acid of the gastric juice. Then he injects a considerable quantity of a solution containing the comma bacilli. Even this is not sufficient; for they pass through the intestines so quickly that they do not proliferate, and therefore he injects into the peritoneal cavity tincture of opium sufficient to paralyze the intestines and stupify the animal for some time. About half of the animals so treated die in from twelve to twenty-four hours, and a nearly pure culture of comma bacilli is found in the intestines.

In scarlet fever Coze and Feltz have found micrococci in the blood, and inoculation of rabbits sometimes produced death; but it is not certain that it was due to scarlatina. Polas Pineas found very minute micrococci on the scales of desquamating epithelium; and in the throat discharge.

In acute infectious osteomyelitis a peculiar micrococcus is found, which is easily cultivated, and, when rabbits are inoculated, and their bones broken, abscesses form containing micrococci.

In measles, Coze and Feltz found bacteria in the blood which were minute and mobile. The rabbits were not killed. Braidwood and Vacher caused children with measles to breathe through glass tubes coated with glycerine, and found sparkling bodies, something like those in vaccinia, but larger.

(To be continued.)

COCAINE IN VARIOLA.—Dr. Cerni calls attention, in *La Normandie Medicale*, to recent observations regarding the treatment of variola by the employment of cocaine in doses of from two to five centigrams. The period of suppuration is said to be shortened to a remarkable extent, and the general results produced are most satisfactory.

EIGHT HOURS UNDER WATER.—During some interesting experiments at Cherbourg, France, recently, two sailors belonging to the French navy were under water at a depth of 10 metres from 9 in the morning till 5 in the evening, on board the submarine torpedo boat Goubet. The commission of examination were enabled by telephone, minute by minute, to receive the impressions of the two men, who were quite fresh when they came up. Not a drop of water had entered the boat, and there was not the faintest odor perceptible. There seems every likelihood that submarine navigation, either by electricity or by means of cars worked from the interior which can be placed on the boat's sides, will soon be generally adopted for torpedo use.

LABOR'S ADVANCE.

WAGES OF LABORERS IN THE UNITED STATES IN 1800.

The condition of the American wages class nearly a century ago is full of instruction. In the large cities unskilled workmen were hired by the day, bought their own food, and found their own lodgings. But in the country, on the farms, or wherever a hand was employed on some public work, they were fed and lodged by the employer, and given a few dollars a month. On the Pennsylvania canals the diggers ate the coarsest diet, were housed in the rudest sheds, and paid \$6 a month from May to November, and \$5 a month from November to May. Hod carriers and mortar mixers, diggers and choppers, who from 1793 to 1800 labored on the public buildings and cut the streets and avenues of Washington, received \$70 a year, or, if they wished, \$60 for all the work they could perform from March 1 to December 20. The hours of work were invariably from sunrise to sunset. Wages at Albany and New York were 3s., or, as money then went, 40 cents a day; at Lancaster, \$8 to \$10 a month; elsewhere in Pennsylvania workmen were content with \$6 in summer and \$5 in winter. At Baltimore men were hired at 18l. a day. None by the month asked more than \$6. At Fredericksburg the price for labor was from \$5 to \$7. In Virginia white men employed by the year were given £16 currency; slaves, when hired, were clothed, and their masters paid £1 a month. A pound, Virginia money, was, in Federal money, \$3.33. The average rate of wages all over the country was \$65 a year, with food and perhaps lodging. Out of this small sum the workman had, with his wife's help, to maintain his family.

THE EARTH'S STRUCTURE.

A BRIEF EXPOSITION OF THE FUNDAMENTAL PRINCIPLES OF GEOLOGY.

[S. BRAZIER, in *Popular Science News*.]

When, emerging from his pre-savage state, man had acquired the use of his reflective faculties, his observation would be attracted, not only by the powers and phenomena which nature exhibits by day, but, when the glare of day was succeeded by the solemn gloom of night, the glittering constellations of the starry heavens invited his upward gaze, exciting his wondering admiration and trembling awe. Age after age passes silently away, during which the untutored vision of the savage is turned irresistibly to the shining orbs of the midnight sky. Millenniums roll by, and watchers on the plains of Babylon, Chaldean shepherds, Indian and Egyptian priests, keep up their endless vigils. Then, in later ages, when science dawned on Europe, Ptolemy and Tycho Brahe, Copernicus and Galileo, Kepler and Newton, directed the highest powers of the human intellect to the solution of those problems which the shining heavens present. It could not be otherwise. From the dawn of the human intellect, through all ages, the magnificence of the star-lit sky must attract the ignorant wonder or intelligent inquiries of man. But it required the slow and painful march of long ages of barbarism and civilization, and the development of art and science, such as was attained in the eighteenth century, before the human mind turned with intelligent interest to an investigation of the earth beneath, and endeavored to read the record which nature has written in the rocks. Geology was necessarily preceded by an advanced state of the other sciences—chemistry, zoology, botany, mechanics, and physical geography being required for the pursuit of its investigations and the solution of the problems presented by the crust of the earth. Geology, therefore, as a science, is entirely modern, belonging to the nineteenth century, and, both with respect to the magnitude and sublimity of its discoveries and its influence on modern thought, it probably marks one of the most interesting and important

stages in the progress of the human intellect. Sir John Herschel declared that "geology, in the magnitude and sublimity of the objects of which it treats, undoubtedly ranks in the scale of the sciences next to astronomy." In the study of astronomy, the mind is overwhelmed by the contemplation of limitless space—of "distances that seem ghostly from infinitude." Scarcely less impressive is the thought of the countless ages which geology requires for the changes which have taken place in the relatively small portion of the earth's crust to which man has been able to penetrate. Geology shows that the configuration of the earth's surface has been remodeled again and again. Valleys, which have been slowly formed, have been filled up again, and then re-excavated; mountain chains have been elevated, and again depressed; sea and land have changed places; wide continents, with their mountain ranges and resplendent rivers, sinking slowly, to become for long ages, the bed of the ocean, and again emerging to become dry land. Old rocks, which required many ages for their formation, have been gradually worn down, and their materials carried away by rivers, to form new rocks at the bottom of the sea. The oldest rocks known to us have been made with the remains of earlier formations. Similar rocks are being made now; and it has been truly said, there seems no indication of a beginning and no signs of an end. During all these innumerable ages, through all these revolutions, the evidences of which remain in those portions of the earth's crust which are accessible to man, vegetable and animal life have existed on the globe. The physical changes brought about by an alteration of the relative positions of sea and land; by gradual change of climate, from arctic to torrid, or from torrid to arctic—all the physical changes which for unknown ages have been taking place on the surface of the earth—have been accompanied by corresponding changes in vegetable and animal organisms. Organic forms have slowly changed, in obedience to external changes; the old forms have disappeared, and new ones slowly taken their places. A succession of new plants and animals has constantly been going on. Many species and genera are only found in the earlier formations, and others do not appear till many ages later, while some few genera have existed through all the changes known to geologists, and are represented by species living in the present seas. This difference is to be observed between the phenomena of astronomy and those of geology: however vast may be the cycles of time required for the revolutions of the heavenly bodies, the same series of events is ultimately brought about; whereas, there is no evidence of exactly the same changes in geological phenomena—the new formations are never exactly like the old; the successive races of plants and animals always exhibit fresh forms and fresh types; the pre-existing forms are never revived. And so the old world is ever new. We know the earth to be a spheroid, about 8,000 miles in diameter, and flattened at the poles. It has acquired this figure under the joint influences of gravitation and the centrifugal force resulting from the rotation on its axis. From a nebulous condition, by process of cooling and condensation, it has gradually assumed its present form, its interior part being probably still in a state of fusion, while the outer surface only has become cooled and solidified. The mean density of the earth is about five times that of water, while the rocks on the earth's surface are only about two and a half times as dense as water. It is not to be inferred from this, however, that the earth is solid to its centre. Owing to the force of gravitation, all matter tends towards the centre of the earth, and so great is the consequent pressure, that steel at the earth's centre would be compressed to one-fourth its bulk. It has been calculated that water at a depth of 362 miles would be as heavy as mercury, and atmospheric air at a depth of 32 miles as heavy as water. It is evident, therefore, that the mean density of the globe does not warrant the conclusion that it is solid throughout its mass. It is probably the expansive force of heat within the earth that renders its mean

density only twice as great as that of the solid matter at its surface. Geology inquires into the origin and development of the earth's structure, the materials of which the various strata of its crust are composed, and the method of their formation. It seeks to ascertain the mutations of land and sea, the changes of climate which have occurred in ancient times, and the effects of physical changes on the numerous tribes of plants and animals which, in endless succession, during interminable ages, have inhabited and adorned the globe. The generic term rocks is applied to all the formations that compose the crust of the earth, whether hard and crystalline—like granite or limestone—or non-crystalline—like shale, or chalk, or sandstone; and also to incoherent masses—such as clay, sand, gravel and peat. Rocks are termed igneous, when formed by the action of fire; sedimentary or aqueous, when formed under water; and eolian or aerian, and sometimes alluvial, when formed on the land. This last class is represented by soil, by the sand-hills of deserts, and the natural accumulations of debris at the base of cliffs and mountains.

This short article may be concluded by giving a chronological table of the various formations, in the order of their superposition, and divided into four great classes, placing the newest at the top, and the most ancient strata, or series of strata, at the bottom.

ARSENICAL POISONING.

RISKS OF INFECTION FROM CONTACT WITH COMMON ARTICLES.

Physicians should never lose sight of the fact that in obscure cases simulating arsenical poisoning, there may really be such poisoning, gotten from wall paper, printed goods, labels and the like. An article in the *Medical Press and Circular* calls attention to the fact that not only is more than a safe amount of arsenic frequently found in wall papers, but that it is also found in dress stuffs such as cretonnes and muslins. A patient who made a number of curtains out of certain cretonne was afflicted a few days afterwards by boils, which broke out on her arms and face. One of the cretonnes examined by a chemist yielded 19½ grains of arsenious acid to the square yard. The writer appended this list of articles in which arsenic has from time to time been found: Paper, fancy and surface, colored: In sheets—for covering card-board boxes, labels of all kinds, advertisement cards, playing cards, wrappers and cases for sweetmeats, cosques, etc., the ornamentation of children's toys, covering children's and other books, lamp shades; paper hangings for walls and other purposes, artificial leaves and flowers, wax ornaments for Christmas trees and other purposes, printed or woven fabrics intended for use as garments; printed or woven fabrics intended for use as curtains or coverings for furniture, children's toys, particularly inflated India-rubber balls with dry color inside, painted India-rubber dolls, stands and rockers of rocking horses and the like, glass balls

(hollow), distemper color for decorative purposes, oil paint colors for decorative purposes, lithographic color printing, decorated tin plates, including painted labels used by butchers and others to advertise the price of provisions, japanned goods generally, Venetian and other blinds, American or leather cloth, printed table baizes, carpets, floor-cloth, linoleum, book-cloth, and fancy bindings.

CONDENSED FOOD.

A PROPOSED NEW INGREDIENT IN THE COMPOSITION OF FOOD.

A suggestion has been set forth by a correspondent of the *N. Y. Sun* that on account of its strength-giving qualities the African kola nut might be utilized in this country in the manufacture of condensed food, particularly for army use. It seems that four years ago Dr. Edouard Heckel, Professor of the Faculté de Sciences of Marseilles, and member correspondent of the Académie de Médecine, claimed to have discovered a condensed form of rations for military purposes, combining two special advantages of great importance. First, its bulk and weight being very much less than those of ordinary rations, it was far more easy for soldiers on a forced march to carry, and relieved the marching force of the impediment of a food supply train. The other advantage claimed was that it greatly increased both the muscular strength and wind of the soldier, so that he could march alertly, rapidly and steadily, and not become tired out or discouraged by fatigue. In January, 1885, Dr. Heckel obtained from the Minister of War authority to have soldiers make trial of the effects of his condensed, accelerative rations. The men were selected preferably from battalions doing service in the Alps, because mountain warfare is the most trying to human strength and endurance. These trials were continued last year. They have shown some very interesting results. The surgeons of the Seventh, Twenty-third and Twenty-fourth Alpine Battalions have reported favorably, giving precise details on the two-fold action of the Heckel rations. They report that it both sustains the body and increases its physical energy. The nine men experimented on of the Seventh Battalion marched rapidly through the mountains nineteen hours out of twenty-seven, and began to show signs of weariness only about the twelfth hour. None straggled, and the physical and moral condition of the men after so long a stretch was as satisfactory as possible. Col. de Cornulier-Luciniere, commanding the One Hundred and Sixth Regiment of Infantry, in company with a lieutenant, made two trials in their own persons of the effects of these rations. The first time they marched in the Pyrenees steadily for eight hours, the temperature being from 28 deg. to 30 deg. centigrade (about 65 deg. Fahr.). The second time they marched twelve hours, and ascended 6,500 feet, skipping during the last hour at the rate of six kilometres, or nearly four miles an hour. Mr. Sanson, professor at the Agricultural School of Grignon, has experimented on horses with the Heckel food. He ascertained that they like it, which is a very important point, that its alimentary power is equal to that of twice its weight of oats, and that it plainly exerts an exciting action on the nerves and muscles of the horses. Similar trials were made upon the draught horses of the Twenty-sixth Regiment of artillery, and on those belonging to the officers of the Fortieth Regiment of the line, and it was demonstrated that, for a few days at least, the Heckel biscuit could be made to take the place of the regular daily allowance of oats, and, besides, increase during that time the muscular energy of the animals. In view of the decisive part which artillery is destined to play in the battles of the future, the importance of Dr. Heckel's discovery is manifest. The essential ingredient of his biscuit was for some time a secret, but has now been discovered to be the nut of the kola tree, which is a native of the western part of Africa, where it grows to the height of fifty to sixty-five feet, and

bears its fruit at the end of its branches in rose-shaped bunches containing five or six nuts with rough shells. The inside meat resembles that of a French chestnut. The kola nut tastes somewhat bitter, but, strange to say, after eating of it, water, no matter how bad, becomes palatable, and is drinkable even when tainted. There are extensive forests of the kola tree in upper Senegal and in the Fouta-Jallon, both countries belonging to France. The tree is also to be found throughout the inter-tropical zone of West Africa, which includes the French Congo. Mr. Elisée Reclus, in several parts of his *Nouvelle Géographie Universelle*, mentions the kola nut. He states that the tree is held sacred by the natives, who, by using it, are enabled "to stand hunger and thirst for a long while, and be shielded against fevers." The French Alpine Club uses the kola nut, and recommends it to mountain climbers. No doubt it might often be made to serve a good purpose in our country.

HEART FAILURE.

A WORD OF GENTLE REMONSTRANCE TO THE MEDICAL FRATERNITY.

It would be an excellent idea if physicians of the present day would invent some other reason for about all the deaths which occur nowadays than the heart failure. It is difficult for any one conversant with the organs of the human body to understand how any human being can die without heart failure, while the causes of the failure of the heart at death may be very numerous. This might not be of serious moment were it not for the fact that hundreds of people are being nearly frightened to death by the constant use of the cause for sudden deaths, and many people who are sick and necessarily, have some heart symptoms, are kept in constant terror by reading or hearing in other ways of death after death by heart failure. It would be well if physicians who are too indolent or too ignorant to search out the disease lying back of the heart failure to consider how much harm they are doing the community, and if they cannot correct the habit, newspapers and the public should avoid giving currency to this unfounded and dangerous phrase. There are probably no more deaths from heart failure in these times than heretofore, but a new cause for death has been coined, and the nervous and timid are being severely injured by it.

SUN IN BABIES' EYES.

THE CAUSE OF SO MUCH POOR SIGHT AMONG CHILDREN.

As the sun slid down the western slope of the horizon last evening he blushed rosy red for the mischief he had been doing. His rays had brought premature near-sightedness or other ocular trouble to hundreds of babies in the public squares or along the streets. The nurse-girl and the baby coach circulated through every part of the city, and the sun was ever with them. The youngsters reclining on their pillows could do nothing else than gaze skyward. They squinted horribly; or scowled furiously, or wept copiously, but the wanton sun-god still persisted in aiming his shafts directly at their innocent upturned orbs, and, their guardians seemed all oblivious of their unhappiness. Some of them dropped their tired eyelids upon tired eyes, and thus avoided the impudent sun's glaring stare; but most of them stared back in the big flaming ball unremittently. In one of the public squares many coaches were uncanopied, while others were adorned with parasols of rare sky-blue silk or filmy lace that slanted over the protected cherub's optics in such a wobbly fashion as to give a constant alternation of dusk and glare that was bewildering. In a corner of the square a group of children of a little larger growth were romping. There were eleven of them all told, and their ages lay somewhere between 7 and 12. It was a melancholy

fact that the noses of five were bespectacled. Six or eight years ago those little romps were twisting and turning in their diminutive coaches in a vain endeavor to shirk the blinding rays of that same relentless sun. A gray-haired physician passed through the square during the afternoon and he heaved a sigh. "The world, they say, is growing blind," he murmured to a companion, "and its growth will be at a rapid rate if this sort of thing continues. Think you that the infant scions of aristocracy can stare uninterruptedly through many a summer's day at the blazing heavens without having their eyeballs scorched? Oh, for a thoughtful nurse and an old-fashioned common-sense baby carriage!" And with these words the M. D. passed on in meditation. — *Philadelphia Record*.

OCEAN RISKS.

IS NOT A LIMIT OF STEAMSHIP SPEED DESIRABLE?

Just when the five-day mark may be reached by the transatlantic racers cannot be foreseen, and in view of the startling progress made very recently in high speeds, it would be a wild guess to predict what record will be made in any given future period. But we imagine that the limit will be set rather by the passengers than by the steamship companies, naval designers or engine-builders. If the traveling public continue to demand excessive speed, and are willing to pay for the saving of a few hours' time, together with the attendant racing excitement—and inevitable risks—the companies will be forced to keep up the competition and to cater to that demand. The length of vessels, docking facilities, power of engines, and all details, will be forced to the greatest possible development, and the ships will be driven to their utmost. The legitimate gain in speed during late years has been due to increased size of vessels, twin screws and boilers capable of standing pressures not dreamed possible a generation ago. Relative, though not actual, fuel economy has been secured mainly by the introduction of triple and now quadruple expansion engines. What may be called illegitimate gains in speed have been reached by carrying initial pressures to an extreme and driving the ships more or less recklessly. The dangers of racing are not confined to a few unfortunate fishermen off the banks and to the other vessels which may haplessly be cut down at anchor, or under weigh in foggy weather; they affect the racing passengers as well. Possibly there may be a reaction against the desire for great speed, or at least against speed attained only by taking unnecessary risks. If so, the steamship lines will devote attention rather to increased economy, safety, regularity of passage, and comfort, than to speed; and if this assumption should turn out to be correct, it is quite possible that after the present crack racers and those now under contract have settled their rivalries, no further increase in speed may be looked for during a considerable period, or even that a retrogression of records might set in for a time, though we confess we have little expectation of seeing it. — *Engineering and Mining Journal*.

LONDON SMOKE—Prof. Chandler Roberts calculates that the weight of the smoke cloud which daily hangs over London, England, amounts to about fifty tons of solid carbon, and 250 tons of carbon in the form of hydro-carbon and carbonic oxide gases. From the actual results of tests made by the Smoke Abatement Committee, the value of coal wasted in smoke from domestic grates amounts, upon the annual consumption of five million of people, to \$11,282,500. The cost of cartage on this wasted coal is calculated to be \$1,343,750, while the unnecessary passage of about fifteen hundred thousand horses through the streets in drawing it adds seriously to the cost of street cleaning and repairing. Then there is the cost of taking away the extra ashes, \$215,000 per year. Summing it all up, the direct and indirect cost of waste coal may be set down at \$13,000,000, plus the additional loss from the damage done to property caused by the smoky atmosphere, estimated at \$10,000,000, the whole aggregating \$23,000,000.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

June.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Pigeon, chicken, duck.

FISH.—Anchovy, bass, bluefish, blackfish, cod, eels, clams, flounder, haddock, halibut, herring, lobster, mackerel, mussels, perch, porgie, prawn, salmon, shad, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Beans, cucumbers, carrots, cauliflower, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, radish, rhubarb.

FRUITS.—Cherries, strawberries, bananas, pineapple.

PRACTICAL RECIPES.

TURNIP SOUP.—Use either beef or mutton. A beef soup-bone, or about two lbs. of scrag of mutton; put four or five quarts of water over the meat cut in small pieces, bring it slowly to a boil, skimming well; stew till the meat falls to pieces, strain and set the liquor away where it will keep cool; the next day remove the fat and add to the broth eight good sized turnips peeled and cut in slices, and a small half cupful of rice; stew till the turnips are soft, being very careful not to let the soup scorch.

FRIED ASPARAGUS.—Dip the asparagus first in boiling, then in cold water, drain, dip each piece in batter and fry it in hot fat, when quite brown sprinkle with salt and serve very hot.

BAKED POTATO CAKES.—Roll out cold mashed potatoes and make into little cakes, using a little flour to form them, but not mixing the flour with the potato; arrange in a pie plate, glaze with beaten egg and bake to a bright brown.

BONNY CLABBER.—Set aside some unskimmed milk for this purpose in the dish it will be served in; when thick put the dish on the ice for an hour or two so that the milk will be very cold. Serve with powdered sugar and sweet cream. This is a nice dish for breakfast on a warm morning, or for tea.

PINEAPPLE SHERBET.—Cut a fresh pineapple into dice and steep it for two hours in two quarts of water, strain and add the juice of four lemons and two teacupfuls of sugar put into the freezer; whip the whites of five eggs to a stiff froth, to them add three tablespoonfuls of sugar, and when the sherbet begins to thicken beat this into it; freeze until quite hard. This is very nice.

BEEFSTEAK AND OYSTERS.—Have some delicate little steaks cut from the sirloin; put them in a close stew pan with sufficient water to prevent burning and place them over the fire to brown; when browned add enough oyster liquor to cook them and some bits of butter rolled in flour; stew thoroughly for an hour or so till they are well done; then add two or three dozen oysters—according to the amount of beef—season with nutmeg, a few blades of mace and a little cayenne; cover the pan and simmer till the oysters come to a boil. Serve hot. Little neck clams may be used instead of oysters.

FRIED MUFFINS.—Sift together a pint of flour, half a teaspoonful of salt and two teaspoonfuls of Horsford's baking powder; beat up the yolks of two eggs with a scant half pint of milk and three ounces of sugar; put both mixtures together, add the beaten whites. Drop spoonfuls of the batter into very hot fat and fry quite brown; drain on thick paper, then dust sugar over them, and serve. If the syrup from a freshly-opened can of peaches is at hand, serve it with them.

BERRY PIE.—Select fresh picked berries, examine them carefully, and reject all unripe and bruised fruit.

Measure out the quantity required, dredge them with flour, and to each quart of blue or whortleberries add half a pint of sugar, no other seasoning being necessary. Make the pies with top and bottom crust.

WATER FILTRATION.

ACTION OF NATURAL SALTS IN PURIFYING WATER.

Probably at no time has the condition of the water supply of our cities and towns received more attention than at present, and perhaps no one thing has conduced to this state of affairs more than the discovery that certain salts contained in the earth act as renovators of all so-called "spring" waters, purging them, so to speak, of the foul matters held both in solution and in suspension. Up to the time of this discovery, it was thought that the earth acted merely as a filter or strainer on a large scale, and that each grain or atom of earth acted its part toward opposing or arresting impurities in the passing water; in other words, that only mechanical straining or filtering took place, and nothing more. Multitudes of filters have been made and put in operation in all ages and countries with the expectation of seeing the water emerge from them as pure and sparkling as from a good "spring," and the greatest surprise has been manifested at the failure to secure the same results when apparently every condition was supplied. The question remains, "Was every condition supplied?" Modern science answers, "No." The peculiar action of the above salts upon the portion of impurities said to be held in solution is well illustrated by the effects produced by dissolving soap in a water of great (so-called) hardness. The white flakes that almost instantly appear are composed not alone of dissolved soap (for soft water would not show such individualized flakes), but a mixture of soap and some substance hitherto held in undisturbed solution in the water, but now withdrawn from that condition and floating above in mechanical suspension. It will be plain that if this soap-treated water was now poured into the earth at one point, and made to emerge at another some distance off, it would be found purged of not alone the soap it contained, but also of the modicum of foreign matter held in its embrace, and which went to make up the quality of hardness spoken of. This subject is so little (generally) understood, that it seems necessary to use the above illustration for the benefit of the casual reader, although to the chemist a hundred different applications of the same law will suggest themselves. Indeed, it is noted here for the purpose of calling more emphatic attention to the simple fact that water may contain impurities in absolute (chemical) solution, and that such impurities, by the addition of another substance, may be rendered tangible, and capable of withdrawal from the water by purely mechanical means. Equally clear and understood should be the statement that water may contain impurities in a state of fine (mechanical) suspension—so fine that they would flow wherever water would flow—and these, by the addition of another substance to the water, be made to flock together into groups, a thousand or two into one (as clouds are condensed into drops); and that one, with its fellows, be tangible, and easily removed from the water by purely mechanical means. It follows, that if the earth contains in abundance this "substance," which has the dual property of disengaging matter held in solution, and rendering the same tangible, and also of curdling together matter held in so fine a state of division as to almost elude the sense into a state of perfect tangibility, we at once get at the secret of how nature makes the true spring water, so wonderfully pure and sweet to the taste, as well as brilliantly clear, and inviting to the eye. What is this substance or substances? Usually some combination of lime, iron, potassium, aluminum, etc., with other basis, such as sulphur or carbon—all existing naturally in the great mother matrix, the earth. The almost universal diffusion of the aluminiferous earth (red clay)

makes that substance take a more prominent place among the agents above alluded to. Water cannot flow far in any part of the world without encountering in its course the coagulating or curdling effect of this single element. Some of these clays are more heavily charged or freighted with aluminous compounds than others. Waters fouled by such are more quickly subsided. In this fact we have a clew to the explanation of why it is, that, of two different waters showing the same degree of turbidity from clayey impurities, such impurities will subside quickly in one, while in the other they may not subside in months. As proof that the quick subsidence is due to the presence of these salts, we have only to add a minute proportion of such (usually aluminum sulphate) to the other water to produce the same effect. Hence, when water issues from the earth in a very clear and perfect state, we may always be sure that it has encountered somewhere on its travels a body of earth or mineral containing a suitable coagulant, the action of which coagulant upon the water accounts for its wonderful purity aside from and entirely independent of the mere filtering effect of the earth. It has remained for the present decade to apply the above knowledge to the art of filtration of water, and for the first time produce results equal to nature. As this industry extends, it will become a common thing to see "spring" water issue from our city faucets, as is already the case in a few American cities, notably Atlanta, Long Branch and Newport. The study of this subject furnishes a striking example of Nature's exhibiting, in the humble way-side "spring," the results of her perfect handiwork for the observation and admiration of man throughout all ages and countries, only to deliver up her secret to the pale student of this century of science.—*Science*.

CALIFORNIA SEED.—The seed trade is looming up in California; in the County of Santa Clara alone not less than 1,200 acres are now devoted to the production of garden seeds. Over 60,000 pounds of lettuce seed and 120,000 pounds of onion seed have been shipped east from California in a single season. The seed is said to be of excellent quality, and there appears to be every probability that California will eventually be one of the great centres of the seed business of the country.

USES OF SOAPSTONE.—A writer in a London journal calls attention to the unappreciated uses and preservative qualities of soapstone—a material, he says, which possesses what may be regarded as extraordinary qualities in withstanding atmospheric influences, those especially which have so much to do with the corrosion of iron and steel, and from experiments made it is said that no other material is capable of taking hold of the fibre of iron and steel so readily and firmly as this. In China soapstone is largely used for preserving structures built of sandstone and other stones liable to crumble from the effect of the atmosphere; and the covering with powdered soapstone in the form of paint on some obelisks in that country, composed of stone liable to atmospheric deterioration, has been the means of preserving them intact for hundreds of years.

GEOLOGY OF PETROLEUM.—The interesting fact appears to be well-established that petroleum-producing strata do not always belong to the same geological period. Thus, in Kentucky and Tennessee the petroleum is furnished by the lower silurian stratum, that is, by the most ancient stratified rocks; in Upper Canada it is found in the lower Devonian, and in Pennsylvania in the upper Devonian. The springs of Western Virginia flow from the upper carboniferous strata; in Connecticut and North Carolina coal oil is found in the trias; in Colorado and Utah in the lignites of the cretaceous formation, while the oil-producing regions of California belong to the tertiary period. It is stated as a remarkable fact that most of the deposits of the ancient world exist in comparatively recent tertiary formations, as for instance those of the oil-impregnated sands of Alsace, of the south of France, and of Abruzzia and Emilia, in Italy. There are numerous deposits in Galicia and the Danubian provinces similarly placed, while the strata that contain those of the Crimea, the Caucasus, and the island of Taman are of nearly the same geological epoch. Another fact stated is that the oils coming from the greatest depth prove to be of the best quality, those produced from nearer the surface of the earth seeming to have lost some of their volatile elements.

BRICK PAVING.—A very smooth, solid and comparatively noiseless road-bed is now made in the following manner: Bricks, constructed from the refuse clay not suitable for regular fire-bricks, are laid endwise, with broken joints, in sand. They are then pressed down with a heavy roller, and boiling tar is poured over them, so as to make a compact mass, as well as to exclude the water. A layer of sand is thrown over the tar before cooling. This paving has been in satisfactory use for some time in various cities.

IS THE MOON INHABITED?—Whether or not the moon is inhabited has always been an engrossing speculation, but probably no more original mode of settling all doubts at rest on the subject has ever been attempted than that credited to the King of Wurtemberg. It is stated that this enterprising monarch has decided to have photographs of the moon made under the best possible conditions, and then to have the negatives enlarged 100,000 times. The result of this experiment, if it is carried out, will be watched with much curiosity and interest.

A WONDERFUL FURNACE.—A furnace has been constructed by a Philadelphia inventor, which he claims will secure the perfect combustion of coal, and thus avoid the great loss and waste of fuel which the best methods hitherto employed have involved. A fire is so arranged, in a common cylinder stove, that two different currents of air of different temperature pass through separate parts of the grate. A partial vacuum is created in the centre of the grate, and a cyclone in the drum of the stove, thus producing perfect combustion all over the surface of the coal. In fifteen seconds from the lighting of the stove the drum is red hot. A few more seconds and a rapid vibration occurs in the drum, and then the cyclone in the stove is raging in full force; the drum loses its heat, and it is discovered that the air is being drawn down the chimney. It is stated that, within four minutes from the time of lighting, cast iron, spiegel and manganese ore can be melted, and yet the temperature of the room can be kept at a moderate temperature. The inventor further claims that the combustion is so slow and so complete that a fifty-pound charge of coal will last twenty-four hours.

NOISELESS DOORS.—Doors are now made of two thick paper boards molded into panels and glazed together with glue and potash, and put through a heavy rolling process. Covered with a waterproof coating, they are hung like wooden doors, and are both beautiful and serviceable. They possess the additional recommendation of being comparatively noiseless.

CANCER TREATED BY ELECTRICITY.—Several cases of cancer have been successfully treated by Dr. Parsons, by passing a powerful interrupted voltaic current through the tumors. The growth as a whole does not entirely disappear, but remains as an inert mass, probably composed of fibrous tissue. This, the doctor thinks, could not be absorbed, but the remains of the growth could always be removed subsequently by the knife if desired.

SUBSCRIBERS' attention is called to the great variety of interesting and instructive subjects treated in this number. We respectfully ask the co-operation of our subscribers in extending our Subscription list, which will enable us still further to increase the value of the AMERICAN ANALYST to them.

The CASUAL READER is specially requested to examine our liberal premium offer.

ADVERTISERS who do not know of this Journal already, are respectfully referred to article headed "A Business Benefit."

ALL are kindly requested to peruse this number thoroughly.

The AMERICAN ANALYST can be had at any news stand in the United States. Any news-dealer will take orders for it, the American News Company being our wholesale agents. All postmasters will receive subscriptions.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a New Subscription with **One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose purious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING CO.,

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by **E. McILHENNY,**
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

IF YOU ARE SICK and cannot raise your head, use the **IDEAL FELT Tooth Polisher**

to greatly add to your comfort.

If you are **WELL** and would enjoy life's fullest blessings, use it to increase your health and happiness. If you live in **Society** use it to improve your appearance. MRS. F. M. G. PENDER,

STUDIO:

47 WEST 22d STREET,

NEW YORK.

Mothers Know the danger in using a poorly washed Nursing bottle—it often causes death. A bottle washed with Pyle's Pearline and water will be perfectly clean—cannot be otherwise. Not necessary to use shot, etc., etc. Ordinary servants may be trusted to wash the baby's bottle if you see that they use Pearline. It has no equal for washing children's linen. For sale by Grocers everywhere. Manufactured by JAMES PYLE, New York.

LATEST ACHIEVEMENT IN

**Celluloid
Collars,**

**Cuffs
and
Bosoms.**

GEO. CLEMENT & CO.

The Celluloid Company confidently assert that they have attained the highest improvement in their Waterproof Collars, Cuffs, and Bosoms, which has ever been reached in this line of waterproof goods. We have examined their latest improvements, and tested them by every means at our command. We are convinced that they have never been excelled, and we are ready to give them our heartiest indorsement. They are pliable, most durable of any goods on the market, and resemble linen more perfectly than any waterproof imitation. Some strangers who have little acquaintance with these goods are under the impression that celluloid is an explosive material. This is an entirely erroneous idea. We can hold celluloid upon the hottest argand burner, and it will melt, but never ignite. The linen interlining makes it much stronger than any other goods in this line. We shall be glad to have any and all of our former patrons try these goods and write us their opinion of the same.

A full assortment of Celluloid Collar Buttons at 5 cents each by mail, post paid; and Cuff Buttons from 25 cts., to \$1.00 per pair by mail. These buttons are durable and never tarnish the Collars and Cuffs.

CELLULOID COLLARS and CUFFS cost no more than linen—look better and wear longer. They never wilt from perspiration, are always white, clean and fresh; require no laundrying—are manufactured in all the leading styles for both Ladies and Gents, Girls and Boys. When soiled, simply wipe them off with soap and water. They save their cost in a week's wear. Try them.

Keep this for reference. CELLULOID COLLARS and CUFFS are as economical and desirable as represented. Can always obtain the same FREE OF POSTAGE, at the following prices:

Gents' Collars,	25 cts.	6 for.....	\$1 30—\$2 25 Doz.
" Cuffs,	50 "	6 "	2 75—4 75 "
Ladies' Collars,	15 "	6 "	85—1 50 "
" Cuffs,	30 "	6 "	1 70—3 00 "
Small Bosoms,	50 "		
Large "	75 "		

Remit by postal order, check, or stamps.

Be sure this trade mark appears on the all goods you purchase.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no constructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only THREE possessed the power of acting on starch. These brands were **MALTINE**, Corby, Stacey & Co's Extract, and Keppeler's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity.

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alteratives.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Fermented.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peptones.	MALTO-VIBURNIN.
MALTINE with Pepsin and Pancreatine.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analysis, by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

COLDEN'S

ORIGINAL LABEL:
 "Colden's Liebig's Liquid Extract of
 Beef and Tonic Invigorator."

LIQUID

BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
 ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.

Essentially Different from all other Beef Tonics.

Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist **ARTHUR HILL HASSALL, M.D., F.R.S.**, and an endorsement by **SIR ERASMUS WILSON, F.R.S.**, is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of **SOLUBLE CITRATE OF IRON**, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "**COLDEN'S**" viz: "**EXT. CARNIS. FL. COMP. (COLDEN).**" It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

CIGARETTE POISONING.

The warnings to which the AMERICAN ANALYST has given utterance against the pernicious habit of cigarette smoking seems to have received at least tacit acceptance from our colleagues of the press, the *Popular Science News*, of Boston, being the only journal of respectable authority that has taken up, as in its issue of June 1, the opposite side of the argument. Meanwhile there is a perceptible growth of hostility to the cigarette habit on the part of the general public, arising from the better knowledge which the press has diffused of its harmful effects, and the Legislatures of New York and Michigan have passed laws forbidding the sale of tobacco in any shape to boys under sixteen years of age. Medical men who did not themselves acquire the habit in their youth are almost unanimous in denouncing it. The most recent utterance on the subject from that source is that of Sir Morell Mackenzie, the distinguished English surgeon, who, in an article in the *Contemporary Review*, describing the effects of various stimulants on the voice, pays his respects to cigarettes in the following language: "I feel bound to warn speakers addicted

to the 'herb nicotian' against cigarettes. Like tippling, the effect of cigarette smoking is cumulative, and the slight but constant absorption of tobacco juice and smoke makes the practice far more noxious, in the long run, than any other form of smoking. Our forefathers, who used regularly to end their evenings under the table, seem to have suffered little of the well-known effects of alcohol on the nerves; while the modern tippler, who is never intoxicated, is a being whose whole nervous system may be said to be in a state of chronic inflammation. In like manner, cigarette smokers (those, at least, who inhale the smoke, and do not merely puff it 'from the lips outward,' as Carlyle would say) are often in a state of chronic narcotic poisoning. The old jest about the slowness of the poison may seem applicable here; but, though the process may be slow, there can be little doubt that it is sure. Even if it does not kill the body, it too often kills or greatly impairs the victim's working efficiency and usefulness in life. The local effects of cigarettes in the mouth must also be taken into account by those whose work lies in the direction of public speech. The white spots on the tongue and insides of the cheeks, known as 'smokers' patches,' are believed by some doctors with special experience to be more common in devotees of the cigarette than in other smokers. This unhealthy condition of the mouth may not only make speaking troublesome, or even painful, but it is now proved to be a predisposing cause of cancer. All fiery or pungent foods, condiments or drinks tend to cause congestion of the throat; and, if this condition becomes chronic, it may lead to impairment, if not complete loss, of voice."

DISTRIBUTION OF EDUCATION.

India, it would seem, is practically uneducated. The total number of scholars in schools and colleges of all sorts is only three and a quarter millions, or 1½ per cent. of the entire population. These are mainly confined to the cities and towns; and out of 250,000,000 in all India, less than 11,000,000 can read and write. A census of the illiterates in the various countries of the world, recently published in Germany, places the three Slavic States of Roumania, Servia and Russia at the head of the list, with about 80 per cent. of the population unable to read and write. Of the Latin-speaking races, Spain heads the list with 63 per cent., followed by Italy with 48 per cent., France and Belgium having about 15 per cent. The illiterates in Hungary number 43 per cent.; in Austria, 39; and in Ireland, 21. In England we find 13 per cent.; Holland, 10 per cent.; United States (white population), 8 per cent.; and Scotland, 7 per cent., unable to read and write. When we come to the purely Teutonic States, we find a marked reduction in the percentage of illiterates. The highest is in Switzerland, 2.5; in the whole German Empire it is 1 per cent.; in Sweden, Denmark, Bavaria, Baden and Wurtemberg there is practically no one who cannot read and write.

AMERICAN SCIENTISTS.

The thirty-eighth meeting of the American Association, for the Advancement of Science, will be held at Toronto, Ont., beginning on Tuesday, Aug. 27, 1889. On Aug. 28, the first general session of the meeting will begin at ten o'clock in the forenoon. After the adjournment of the general session, the several sections will organize. In the afternoon, the vice-presidents will give their addresses before their respective sections; and in the evening there will be a general session, when the retiring president, Major J. W. Powell, will deliver his address. The sessions will continue until the Tuesday evening following, and on Wednesday morning, Sept. 4, a meeting of the council will be held. Saturday, Aug. 31, will be given to excursions. The meeting will close with excursions extending to Sept. 7.

PURE WATER.

The Chicago *Sanitary News* quotes the views expressed by the AMERICAN ANALYST on the subject of filtering water for drinking use, and appends the following endorsement of our opinions: "It is not best to place too much confidence in a filter of any kind. It may lead to the use of impure water when the supposed security of the filter would remove all other precautions and in itself be ineffective. We do not remember any authority who claims that the filter will produce absolutely pure water, or that it should be relied on to remove bacteria. Clear, sparkling water is by no means pure water at all times. It may still contain disease germs, and its clearness as it comes from the filter may induce its use when laden with the germs of disease."

AMERICAN SUGAR OF MILK.

The milk industry of New York State sees a small measure of promised relief from the present depression of prices due to over supply, in the development of the sugar of milk manufacturing industry. Formerly, consumers of the article in this country depended entirely upon importations from Switzerland and Bavaria, and it is only lately, and in view of the increasing demand, that an attempt has been made to supply the market with a home-made product. Sugar of milk is a 5 per cent. constituent of crude milk, and is a peculiar white saccharine and crystalline substance, obtained by evaporation from the whey and afterward purified. The wholesale price is twenty-five to thirty cents a pound. It is coming into very extensive uses in the sugar coating of pills, as an element of food for invalids, and for other purposes. The first plant for its manufacture in this country was set up a year or two ago at Hamburg, N. J. Another factory has recently been started at Oxford, N. Y. A third factory is about to be opened at Unionville, in Orange County, for manufacturing the article by a newly invented process, which is claimed to cheapen the cost of production.

MICRO-ORGANISMS.

A POPULAR EXPOSITION OF AN INTERESTING SUBJECT.

(Concluded from page 303.)

The individuals of the streptococci of erysipelas are smaller than the micrococci of vaccinia. Lukinsky found them in zoogla masses in the lymphatics, on the border of the erysipelatous zone. Fehleisen also found and cultivated them. He inoculated the ears of nine rabbits, and produced the characteristic rash in from thirty-six to forty-eight hours; the animals did not die. He also produced typical erysipelas, in from fifteen to sixty hours, in men who were inoculated to produce beneficial results in tumors. I have also cultivated them in liquid media. Septicæmia and pyæmia have been carefully investigated by Koch; and these diseases have been found due to bacteria, which he has cultivated and inoculated. In diphtheria, micrococci are found in the membrane and in the surrounding lymphatics, blood, kidneys and muscles. They are about the size of *M. Vaccinæ*, slightly oval, single or in pairs, and in colonies. Eberth showed the particulate character by filtration. Klebs claims to have produced diphtheria from inoculation of pure cultures, and to have found micrococci in the tissues and blood. Nasiloff inoculated the cornea with enormous multiplication of micro-organisms in the lymphatics of the palate, bones and cartilages, and says that they are the primary step.

The question as to the origin of life has been much disputed, and the exponents of spontaneous generation and of the germ theory still continue the contest. Extremists in the doctrine of evolution cannot sustain the hypothesis that the whole system of animal life is but a growth of one or more original species, changing into or evolving others through methods of development. The long ages of the past show the universality of the law of life, that like produces like. Neither the agnostic nor the materialist can account for the origin of matter, much less can they account for the origin of mind. Naturalists tell us that while the animal and vegetable kingdoms are reducible to primoidal cells; that while there is a time when the embryos of species cannot be distinguished from each other by any essential features, yet the variety of structural forms, and the diversity of physiological functions which cells develop, are always according to the special type and construction of their parent cells, evidencing a unity of plan in their construction and development.

1. The germ theory asserts that no life has been evolved (except in the remotest periods of the earth's

history) other than from a living parent or a living germ.

2. The spontaneous generation theory asserts that now, as of old, life does also spring *de novo* from molecular rearrangements of the atoms of dead organic matter.

No authority, except that of experimental work, can weigh a feather in the balance; no *a priori* reasoning can give the victory to either creed. The one condition is, to take dead matter, isolate it from all contact with life, place it under favorable conditions for development, and watch the result. The first views founded on experiment and observation, apart from mere philosophical speculation, are those of Needham and Buffon, published in 1748. Needham's theory was that vitality is produced by a force setting particles in motion, which he calls *force vegetatrice*. Needham was opposed by Spallanzani in 1777, who repeated his experiments by methods so precise as to overthrow the convictions based on Needham's labors. Schultz made an important advance by boiling his infusions and using pure air, and was followed by Schwann, Schroeder and Von Dusch. In 1859, Pouchet, one of the most ardent supporters of spontaneous generation, published his work. He does not look on these organisms as originating from dead matter, though he believes that it is the contact of different bodies which gives rise to the development of proto-organisms. Yet their origin is not due to affinity alone; vital force must also come into play, which owes its power to certain unknown concomitant circumstances. The essentials for the production of the new forms are a putrescible body, water and air, while heat, light and electricity favor the process. His experiments were performed very loosely, and are subject to many errors. Appearing shortly after Pouchet's work and leading to diametrically opposite conclusions, were the researches of M. Pasteur, who begins by attempting to demonstrate the existence of spores in the atmosphere. The greatest blow was given to the views of the heterogenists when Pasteur demonstrated that albuminoid materials are not necessary for the development of bacteria and fungi, but that they can be replaced by crystalline salts, such as phosphates and the salts of ammonia. The experiments of Prof. Jeffreys Wyman have been largely quoted by the supporters of heterogenesis as proving their view, though Wyman himself expressed no such opinion, having approached the subject with a perfectly unbiased mind. To Prof. Wyman is ascribed great credit by Cheyne, whose results agree with his own. Dr. Bastian (1872) gives up the theory that organic molecules are derived from previously living molecules, and attempts to demonstrate that vital force and living matter may arise *de novo* under the action of the ordinary physical forces—heat, light and electricity. This change of front on the part of the heterogenists is clearly brought about by the overwhelming evidence produced against Pouchet's views, and more especially by Pasteur's success in cultivating organisms from dust in fluids containing no organic matter. The limitation of cases of spontaneous generation which has been gradually taking place is very instructive. Beginning with the higher animals it became more limited, frogs, flies, etc., being by degrees excluded, till now it is only in the case of the lowest forms of life that the doctrine is asserted, and even then only in certain cases.

Not long since the people of Boston were invited to listen to a series of lectures which continues the discussion of the much-disputed question of the origin of life. The lecturer, although announcing himself as a decided opponent of the germ theory, could not agree with the spontaneous-generationists, and offered views somewhat peculiar to himself. His objective point was the so-called "ambient organic matter," of which he could give no definition, but in a long series of illustrations of what he meant he showed it to be synonymous with the bioplasm of Dr. Lionel Beale. The term bioplasm, as Dr. Beale says, involves no theory as regards the nature or origin of the matter. It simply distinguishes it as living

—e. g., a living white blood corpuscle is a mass of bioplasm, or it might have been termed a bioplast; a very minute living particle is a bioplast, and we may speak of living matter as bioplasmic substance. It is bioplasm, or ambient organic matter, according to the new view, that is at the bottom of all the functions of life, it having, to a certain extent, a low degree of inherent vitality; and the results of the various experiments that have been performed are due to the ambient organic matter, which has never yet been separated, it was urged, from the germs. It was argued that the germ theorists can prove nothing till they can isolate an organism on a needle point and use it for inoculation, after thoroughly washing and drying. Floating dust of the air, he added, is not germs, but ambient organic matter. He also expressed a desire to introduce some ambient organic living matter into the infusions and see what it would do. Hearing it so strongly urged that we have been mistaken concerning the action and importance of the minute organisms which have made up what they lack in size by the interest they have awakened during the last quarter of a century, it occurred to me that such a theory would be of more value if accompanied by facts based upon actual experiments, but no such experiments were offered to prove the theory, which was allowed to stand by itself. In these days a theory is accepted for what it is worth, and when it relates to science it must be supported by facts. Not considering this theory capable of self-support, and not content to leave the subject in this way, I have still further investigated it. I am reminded of Prof. Tyndall's experiments with hermetically sealed tubes. One hundred and thirty tubes were used, and to multiply the chances of spontaneous generation they were filled with infusions of the most diverse materials (in all numbering twenty-four). Each tube contained an ounce of liquid and was boiled for three minutes in an oil-bath, and sealed by a spirit lamp during ebullition. Two months later this group of flasks was submitted to the inspection of the Royal Society and not one of them was found to contain life. That the infusions were not degraded by boiling was proved by similar exposed tubes which "resolved themselves with the usual speed into bacterial swarms." Special care had been taken that the temperature to which the flasks were exposed should include those previously alleged to be efficient. The conditions laid down by the heterogenist were accurately copied, but there was no corroboration of his results. Again sixty flasks were thus prepared containing strong infusions of beef, mutton, turnip, and cucumbers, carefully packed in sawdust and carried to the Alps, 7,000 feet above sea level. Fifty arrived safely, of which twenty-three were opened on a hay-loft, and the other twenty-seven 200 feet higher, on a ledge overlooking the Aletsch glacier. The fifty flasks, with necks open, were then placed over the kitchen stove at a temperature of 50 deg. to 90 deg. F. In three days twenty-one of the twenty-three opened in the hay-loft were invaded with organisms; but after three weeks' exposure not one of the twenty-seven opened in the free air had become contaminated. No germ from the kitchen air had ascended the narrow necks, the flasks being shaped so as to avoid this contingency. Sir Joseph Lister's experiments with milk prove a great deal against the view of spontaneous generation. In his attempts to obtain pure unboiled milk, he found that in none of his flasks did he obtain lactic fermentation, but that in all but two (out of some fifty or sixty flasks), organisms of some form or other occurred, these organisms being in many flasks of totally distinct kinds. The fact that no organisms appeared in two flasks, and the great variety developed, prove that they could not have been developed *de novo*; for all being made under the same conditions any change occurring in one due to something inherent in the milk, or due to some physical force acting on it, would have occurred equally in all.

We have then a great number of experiments made by distinguished observers, of which I have quoted

VIZETELLY vs. MUMM.

A VOICE FROM CALIFORNIA ON THE CHAMPAGNE QUESTION.

The AMERICAN ANALYST has already referred to the misstatements made by Mr. G. H. Mumm, in a published interview on the subject of champagnes. The following letter published in a recent issue of the *Oakland Tribune*, fully corroborates our statements and further answers Mr. Mumm:

The California vine growers were recently startled at the assertion made by G. H. Mumm, that our State could never make champagne, and giving as a reason that we had no soil capable of producing the effervescent quality of the champagne wines of France. Nevertheless, he considerably confesses, that "in a thousand years from now our wines will be fine." Would it not be well for Mr. Mumm to explain that since we have no proper soil now, where it is come from in one thousand years hence, when we are to produce the fine wines he prophesies us? Without such explanation, to say the least, the statement looks very much as if made for a purpose, and that purpose not in the interest of our State. This is a matter in which every part of California is interested, and none more so than the county of Alameda, from which large quantities of wine are now being drawn in the production of a well known and popular branch of natural champagne, made in this State. These wines are largely chosen from the rolling hills skirting the Livermore valley, and grown on soil light in character, abounding with carbonate of lime, silicious fragments, and oxides of iron. In fact, a soil chemically identical to that claimed by Mr. Mumm to be possessed by the Champagne district alone. And this character of soil, beginning on the western side of Mt. Diablo, encircling its base, extends southward over the entire width of Alameda County, and how much further we do not know. Neither this nor any other character of soil, however, has anything to do with the effervescent quality of sparkling wines, either here or in France. The effervescence comes solely from the fermentation of saccharine matter remaining undecomposed in the wine, or saccharine that has been added to it. If G. H. Mumm had spoken as an expert would have done, and had been candid, which he was not, he would have explained the cause of effervescence in champagne just as we have here stated it. Having neglected to do so, it gives us the right to suppose his statement was intentionally made to injure the present and future champagne interest of California, and advance that of the firm he represents. And, on consideration, we hardly think the senior member of a French champagne firm is just the person to give an impartial opinion of the quality possibilities of our champagne wines, even if he were an expert. The county of Alameda, as well as several other counties in our State, has too much at stake to permit such wholesale misrepresentation to remain uncontradicted, and for the purpose of vindication we call the attention of our readers to the opinion of Henry Vizetelly, on the merits of our California champagne. This gentleman is a world-renowned wine expert, and was chosen, and served, as wine juror for Great Britain, at the Vienna and Paris Expositions of 1873 and 1878, and it should be borne in mind, that while he is interested in giving only a true and candid opinion as an expert, that Mr. Mumm has a direct inimical interest to discourage the production of champagne in our State. In his book on champagne, after mentioning the disappointments met at the beginning of champagne making in California, Mr. Vizetelly, alluding to a well known California brand, says: "For ten years past the wine has been constantly improving in quality, owing to the increased use of foreign grapes, which yield a *vin brut* with a delicate bouquet and flavor, which is composed merely of sugar candy dissolved in fine old wine. A French connoisseur pronounces it to be the best of American sparkling wines, clear and fresh tasting, with the flavor of a middle class *Ay* growth, as well

as remarkably light and delicate, and possessed of considerable effervescence." With so disinterested an opinion in our favor, from one who has made wine his life study, and whose attainments Great Britain was proud to acknowledge, we think we need have no fear for the continued success of champagne making in California, notwithstanding the interested motives and unfair expressions of G. H. Mumm. Let the people of Livermore continue their good work of planting only Noble grape varieties, and their wines will build up a reputation that the Mums of the present generation will be compelled to respectfully bow their heads to; and, with soil like that of Alameda County, it will not take a thousand years to do it in either!

FERENZ DE MOKTSAL.

CELLULOID PRODUCTS.

SAFE TO HANDLE, BUT READY TO BURN.

Umbrella and cane handles, collars, cuffs, and scores of other articles of convenience, utility and even elegance, manufactured from celluloid, are in daily use by large numbers of the people. The question is asked, "May they be safely used?" Celluloid is made from gun cotton, the powerful and violent explosive compound. Gun cotton is made by saturating absorbent paper with a mixture of two parts of nitric acid and five parts of sulphuric acid. The cellulose of the paper, derived from the cellular tissue of the cotton in common use, is changed by the combination and becomes gun cotton. To make celluloid, the excess of acid is washed out by a free use of water, and by pressure carefully applied. After the removal of all uncombined acid, it is reduced to a homogeneous pulpy mass, strained until it becomes nearly dry, and is then mixed with about one-third of its weight of gum camphor. These materials are mixed as uniformly as possible by careful manipulation with wooden instruments, and then by grinding. The pulp which is turned out by grinding is spread out and reduced to slabs of various thicknesses and rolled between steam-heated rollers, and then becomes moderately elastic in strips of medium thickness. In this form it is worked up into the various articles which are offered for sale and use. Although gun cotton is easily manufactured, its manufacture for experiment or for general use is not recommended; and, although celluloid articles may be safely used with ordinary care, a bonfire of such articles for amusement is not recommended. No injuries from such use have been reported. A word to the wise, however, suffices.

DIETARY FOLLIES.

SOME RECOMMENDATIONS HOW TO BE WELL AND MISERABLE.

A writer in the *New York Tribune*, who has read the absurd and contradictory statements regarding medical matters which go the rounds of the press with the common preface "a prominent physician says," gives the following burlesque rules for health as a summary of the information he has obtained: Remember, everything depends on what you do not eat. Dr. Husks, of Philadelphia, has made the food question a life study, and you cannot do better than follow his advice. In the first place, you must not eat meat in any form. Meat is not a natural food of man. The man who eats meat is weak; the one who makes a diet of vegetables is strong. This is illustrated, Dr. Husks has ably pointed out, even in the animal kingdom, the stronger and more robust animals feed on vegetable matter, while the weaker and the less active are meat-eaters. To show the force of this it will only be necessary to call your attention to the weak and nerveless lion and the powerful and aggressive lamb; the debilitated tiger and hearty hen. You will, unfortunately, have to drink something. Dr. Husks cannot for an instant

only a few, which show that life does not commence in substances unless something living exists in or has access to them. No one will deny the existence of the bioplasmic or ambient organic matter, but I must believe that it plays a far different role than was ascribed to it by the lecturer, and I also believe that the *germs* exist and play their part. If we examine fresh blood serum, the aqueous humor of the eye, white of egg, or milk, we will find, with high powers of the microscope (1000 x), in greater or less quantity masses of varying size and shape, made up of minute, shining, highly-refractive particles, with or without Brownian motion, which have a low degree of inherent vitality, and which are bioplasmic or ambient organic matter. No one with any experience is likely to mistake these for the minute, highly refractive bodies of uniform size, single or in groups, which we recognize as micrococci or bacteria. These substances, then, containing the ambient organic matter in sufficient quantity, and being free from germs, were selected for testing in the experiments which I made to see if the extraordinary statements of the lecturer had a basis of fact. Fresh blood was caught in flasks at the abattoir, as it flowed from the necks of the animals, and was sealed up until the clot had separated. Bulbs similar to those mentioned above, sterilized by heat, were then filled with the serum, and to the culture bulbs containing sterilized nutrient fluid, serum was added in varying quantity, and the bulbs were hermetically sealed. Milk was carefully drawn from the cow into a flask sterilized by heat, from which culture bulbs were inoculated. Bulbs were filled and culture bulbs inoculated from the white of an egg still warm from the nest, and also the aqueous humor of the eyes of freshly-killed sheep. The substances introduced into the bulbs were never boiled, because it was argued that the boiling of the infusions is unfair, by rendering them sterilized, barren and almost inorganic. These bulbs were kept at a temperature of about 70 deg. F., and examined with the microscope after varying intervals. Of the forty-five bulbs, forty-four remained perfectly clear and pellucid, and the microscope revealed the same bioplasmic masses as the fresh materials. In only one were there any signs of life, and this a bulb that had been inoculated with serum, was found to be undergoing fermentation, and was swarming with the germs of putrefaction, bacteria *termo*, proving it to have been accidentally contaminated. In the control experiments these materials, *exposed to the air*, under the same conditions, give a far different history, as they rapidly underwent fermentation, and then contained, in addition to the same bioplasmic masses, the germs of putrefaction. Such, then, is the effect of bioplasmic or ambient organic matter, *plus* the germs, at a temperature of 70 deg. F. Alone, however, although upon the germinal qualities of it so much has been suggested, not only does it fail to generate life, but it has no power of reproduction, and is at best an organic nutrient material, serving the highest purpose for bioplasmic use, but having in itself absolutely no independent power of growth.

COLOR-BLINDNESS.—An ingenious device for testing color-blindness has recently appeared. It consists in a combination of two adjustably attached cards or surfaces, one made up of different color sections, and the other containing an opening or aperture upon a white surface, the card containing the color sections being arranged so that the several sections can be brought to pass beneath the opening of the card. The subject of color-blindness has been receiving much attention, and many of the government employes are now obliged to submit to a color examination before they can secure an appointment. It is found that forty men out of every 1,000 are color-blind. A color-blind would be useless were the selection of colors to enter into his life work. It appears strange that color-blinds make the best etchers, steel engravers, or wood engravers, but such is the case; by the law of compensation they possess what is known to their profession as the "recognition of tone." But two women in 1,000 are color-blind. The savage races possess the perception of color to a greater degree than the civilized races.

consider anything but water. Tea and coffee are dangerous. We can learn much as to what to eat and drink from a study of the lower animals, whose tastes and instincts have not been corrupted as have man's. The cow does not drink tea, nor, for that matter, coffee either. If a man was not enfeebled by generations of coffee and tea-drinking he might be as large and strong as the cow. Nothing but water should be drank for breakfast, or indeed, for other meals. It should be as nearly as possible of a temperature of 98 deg. so as to avoid cracking the enamel off the teeth or injuring the lining of the stomach. As many of the disease germs as possible should be removed from the water before using, by boiling, and, if possible, distilling. Even then you will swallow a large number of germs every time you drink. You should, of course, have a filter. The cow does not use a filter, but cows are not men. Rise from the table promptly at 7:30, with a slight feeling of hunger. You will thus know that you have not eaten too much. No matter if the third dish of bran does look tempting, do not weakly yield. For an hour after breakfast indulge in light and humorous conversation. After the hour of light and vivacious conversation you may walk about for thirty minutes, taking care to keep the shoulders well back and to breathe twenty to thirty times a minute. After this begin the business of the day—attempting to exclude sewer gas from your nose. A light luncheon of wheat and oats may be taken at 1 o'clock, and dinner of wheat, oats and Indian corn served at 6 o'clock. Go slow on these things. Be in bed by 8 o'clock, and immediately fall asleep. Do not dream; Drs. Lasthope and De Spare's experiments show that dreams are injurious to the general health. Breathe as little as possible on account of the sewer gas.

ASPARAGUS vs. GRASS.

HOW WORDS BECOME CORRUPTED BY THE SUGGESTION OF SOUND.

The word asparagus is taken bodily from the Latin, which derived it from two Greek words whose meaning was equivalent to "juicy." In the *Youth's Companion* we find the following discussion of a popular distortion of the word:

In Webster's Dictionary, under the word "asparagus," this note occurs:

"This word was formerly pronounced *sparrow-grass*; but this pronunciation is now confined exclusively to uneducated people."

Walker's English Dictionary quotes authority to show that not only was asparagus commonly called "sparrow-grass" in England, even by educated persons, at the beginning of this century, but "cucumber" was pronounced "cowcumber." These two pronunciations passed out of use both in England and America, until now few people use them. The marketmen in the great cities and their environs, however, still cling quite tenaciously to "sparrow-grass," which they shorten up to "grass" as a matter of convenience.

"Is that nice asparagus?" a customer asks.

"Yes, that's very good *grass*," answers the marketman, with an emphasis on the "grass," as if to notify his customer that he knows what the vegetable is properly called, and in his next bill the marketman puts down this charge:

4 bunches grass @ 15c. 60

For the pronunciation "cowcumber" there is some excuse, as the word comes to us through the French, in which language it was formerly *coucombres*, and is now *concombre*. The German word *kukummer* was dropped in English for the French one, the English deriving nearly all their words for salads and the nicer table dishes from the French.

But for the word "sparrow-grass," as applied to asparagus, there is absolutely no excuse. It is a sheer corruption of the word asparagus. The sparrows are

not particularly fond of the seeds of the ripened asparagus, nor is it a grass in any sense. The asparagus, indeed belongs to the lily family, like certain other edible vegetables. It is certainly no new discovery, for the word is Greek, and means, according to some etymologists, "to swell with sap or juice;" and asparagus was eaten and much esteemed by the Romans.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

July.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Pigeon, chicken, duck.

FISH.—Anchovy, bass, bluefish, blackfish, cod, eels, clams, flounder, haddock, halibut, herring, lobster, mackerel, mussels, perch, porgie, prawn, salmon, shad, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Beans, cucumbers, carrots, cauliflower, egg-plant, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, radish, rhubarb, corn, beets.

FRUITS.—Cherries, strawberries, raspberries, huckleberries, melons, gooseberries, blackberries, peaches, pears, tamarinds, bananas, pineapple.

PRACTICAL RECIPES.

FORCE MEAT BALLS.—One cup cooked veal and one quarter of a cup suet minced together, add one cupful of bread crumbs, salt, sweet herbs, powdered cloves and pepper to taste. Add a beaten egg, make into little balls and fry in boiling lard to a good brown.

COLD ROAST BEEF STEW.—Cut about three-quarters of a pound of cold roast beef into slices or small pieces; put into a frying pan and pour over it a cup of cold water, a tablespoon of Chili sauce, salt and pepper; heat slowly to boiling. Put a little butter into two tablespoons of flour; add to the stew and let it cook for a few minutes till the flour is done. Serve on slices of toast. If onions are liked a few slices may be fried in the pan and then the meat added to them.

GRAVIES WITHOUT MEAT.—1. Slice three onions and fry them brown in butter. Add to them half a pint of water, some pepper-corns, salt, a slice of lemon, three cloves, a little mace, a spoonful of walnut pickle, one of mushroom ketchup, a dessertspoonful each of soy and essence of anchovy, a small bunch of sweet herbs, and a slice of bread toasted brown on both sides. Simmer all together, and strain for use.

2. Knead some flour into a piece of butter the size of an egg, and fry it over a clear fire. Stir it constantly until a nice brown, taking care that it becomes perfectly smooth. Then pour into the frying pan some boiling water, add some finely-minced onion, some pepper and salt. Let it simmer and then strain it. Mix with it a little mushroom ketchup.

GRAHAM GRIDDLE CAKES.—Mix together dry, two cups Graham flour, one cup wheat flour, two heaping teaspoonfuls Horsford's Baking Powder, and one teaspoonful salt. Then add three eggs well beaten, one tablespoonful lard and three cups sweet milk. Cook immediately.

SUET AND BUTTER PASTES FOR BOILED MEAT OR FRUIT PUDDINGS.—Six ounces of chopped suet, three quarters of a pound of flour, and a little salt. Mix together, and mix lightly with cold water, roll it out; butter a pudding basin, line it with the paste, and fill the pudding with whatever is required; wet the edge of the paste, and cover the pudding with the top crust; tie over with a buttered and floured cloth, and it is then ready for boiling. For butter paste use six ounces of

butter to three quarters of a pound of flour, rubbing the butter into the dry flour before mixing to a dough with water.

RASPBERRY AND CURRANT PUDDING.—Take equal quantities of picked raspberries and red currants; fill the above pudding with these, and about ten ounces of sugar. This is always a good combination, as the two fruits act well on each other. Boil an hour and three-quarters.

BLACK HEART CHERRY PUDDING.—Fill the above pudding with black heart cherries, add half a pound of sugar, and the juice of half a lemon. Boil two hours.

CHERRY SALAD.—Stone a quart of fine ox-heart cherries and put them in a glass preserve dish; dust them with powdered sugar and pour over them half a wine-glass each of curaçoa and sherry. Mix lightly and serve.

Fog.—Fog and its causes have been the subject of much discussion. By one writer the celebrated London fog is attributed to the cooling of the air by radiation from hillsides near the city, which air, flowing down, envelopes the city. It has also been suggested that a cool northerly wind on the west side of a storm flows into the saturated air on the south side and condenses fog. In Newfoundland it is thought that fog is produced by the flowing of a saturated current from the southward to cooler waters, which often have ice floating in them. In none of these cases, however, does it seem that the theories advanced have been substantiated, and the subject offers an interesting field of investigation to the scientist.

BRICK MAY SUPERSEDE WOOD.—There seems to be a very grave question agitating the minds of architects and builders regarding the building material of the future. The timber is being used faster than it can possibly grow; stone occurs only in isolated places, and rarely, if ever, contingent to places where it is needed in great quantities for building purposes, but material for making brick is in abundance everywhere. As a matter of fact, in spite of the modern use of "fireproof" materials in building, nothing will withstand the onslaught of extensive fires equal to good brick.

BIRD INSTINCT.—The French Government has just been warned that a great ornithological calamity is impending. The Department of the Bouche du Rhone has hitherto been one of the chief landing places for swallows coming from Africa. Wires connected with electrical batteries were laid in hundreds along the coast, and as the birds, tired with their long flight, perched on these, they were struck dead. The bodies were then dressed and sent on to Paris for ornamental purposes. This has been going on for years, but this spring it has been noticed that the swallows have not landed on the low-lying coast, but have gone further west or east, and they are reported in other parts of Europe to have come in larger quantities than formerly. A plague of gnats and other flying insects would emphasize this warning, which comes from the Zoological Society of France.

ARTIFICIAL DOUBLE FLOWERS.—Prof. Peyritsch has submitted to the Imperial Academy of Vienna the results of a large number of experiments tending to show that double flowers may be artificially produced by the agency of a mite (*Phytoptus*). In examining a double wild flower, the professor noticed that it was infested with the mites in question, so he transferred them to other plants of different orders. Various kinds of doubling were produced, such as petalody of the stamens and pistil, proliferation and duplication of the corolla, etc., as well as torsions and fasciations of the shoot. The leaves also were affected, the margin showing teeth like those of a comb. By infecting the plants at different times, either the leaves or the flowers may be influenced, and to have the full result the parasite must attack the organ in its earliest stages. Prof. Peyritsch thinks that certain mites produce double flowers in certain plants.

MICA AS A LUBRICANT.—Accounts from Denver state that mica, ground very fine, has been used on the Rock Island road as a lubricant with great success. The agent of the road reports that journals which come in very hot can quickly be cooled down by the mica. One journal which came in excessively heated was sent forward as soon as the lubricant was applied, and from advices from different stations on the road it was found that it had cooled off and was running all right. The experiments were made with crude oil and mica, and also with mica and the residuum from the wells, which is a much cheaper grade of oil.

OUR GOOD REASONS WHY.

We have been asked why we "so emphatically endorse and recommend as a most valuable alternative medicine, Ayer's Sarsaparilla?" We do so for the very excellent reason that it is worthy of such endorsement. Here are a few plain statements of fact that are worthy of the serious consideration of our readers.

The medicine in question has been offered to the public now some forty years, and its hold upon popular esteem has been strengthened by experimental knowledge of it, in all that time, in every country on the surface of the globe. When it was first made, its exact formula (accompanied by samples for analysis and test), was furnished to every practicing physician in the United States and to those of all other countries who chose to apply for it. And to-day any doctor who asks for that formula is promptly supplied with it. It is, consequently, universally accepted as a standard alternative medicine and prescribed by the best physicians. Repeated tests have demonstrated that its excellence has stood the test of time, that it has never deteriorated or been cheapened in its production, to enhance the profits upon it after it had become popular, as has been the case in certain other preparations that might be mentioned. It is still what it was when first put forth, a perfect combination, in their purest forms of the most effective alternatives known to medical science. What these are, it is well that everybody should know. The principal ingredient is the extract of Honduras sarsaparilla, which is the strongest and most valuable medicinally of all the varieties of this plant. The house of J. C. Ayer & Co. have, for many years, controlled the entire importation to this country of the Honduras sarsaparilla and utilized it all in their product, thus retaining a very great advantage over all rivals in the superior quality of their preparation. They also monopolize the yellow-dock produced by the Shakers, who grow very nearly all of it that is cultivated in this country, and twice, within a few years past, the company have voluntarily increased the price of the root, to encourage the Shakers to enlarge their production, which is contracted for years in advance. This yellow-dock is the second in importance of the vegetable ingredients in Ayer's Compound Sarsaparilla and is another of the features of peculiar excellence possessed by it above others. To these are added mandrake—with the active principle of which, under the name of "podophyllin," most intelligent persons are familiar—and stillingia. The iodides of potassium and iron are also added to the compound. The question may properly be asked: "Why, if its ingredients are so well known, may not other manufacturers, or even any ordinary dispensing chemist, make the compound equally well? There are several reasons. One has already been given in the statement of the monopolization of the supply of the most important ingredients, by J. C. Ayer

& Co. Another is in the requirements of manufacture. So volatile are some of the most valuable medicinal principles of the vegetable materials employed, that they are altogether dispelled by heat. A cold process of extraction is absolutely necessary. But this can only be profitably used where an immense business warrants manufacture in enormous quantities. Ayer & Co. make twenty-seven barrels of compound extract of the vegetable ingredients at once, and in doing this employ patented processes and machinery, requiring the constant application of power to the huge hermetically sealed tanks in which the work is carried on, during many successive days, for each lot. And only in a business of such stupendous magnitude would profit be found in the very small margin over actual cost of production, where so high a standard of quality is maintained as is required by this house. The deservedly high reputation of the house of J. C. Ayer & Co., is in itself an excellent guarantee that both honor and interest are concerned in keeping their medicine fully up to the standard of excellence that won for it the favor of the world. That it is to-day what it always has been, and that it merits all the encomiums we have applied to it, anybody can readily satisfy himself by a little inquiry among his friends, for those who have used Ayer's Sarsaparilla and received benefit from it are in the majority in every American community, and are at least numerous in every habitable portion of the world.

BUSINESS NOTES.

DO YOU SHARE THE RESULTS?

Why not use other people's brains as well as your own in order to lessen life's work, and especially so when the coming hot weather will make life a burden to those who have to do laborious house work? The very word "Pearline" sounds clean and sweet enough to recommend even a poorer article. But "Pearline" does as clean and as sweet work as its name implies. Now, if there be a housekeeper among the thousands of *Witness* readers who has hitherto lived so far beneath her privileges as not to have used "Pearline," surely she will at once purchase a packet and test what it will do for her. "Pearline" represents brains. That is, it is the product of long and hard processes of thought, investigation and experiment. You are invited to share the results.—*From New York Witness, June 12, 1889.*

AS A DRINK IN FEVERS

USE HORSFORD'S ACID PHOSPHATE.

Dr. Chas. H. S. Davis, Meriden, Conn., says: "I have used it as an accessory in cases of melancholia and nervous debility, and as a pleasant and cooling drink in fevers, and have been very much pleased with it."

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,

By MISS M. E. BRADDON.

THE GIRL AT THE GATE,

By WILKIE COLLINS.

A BRIDE'S TRAGEDY,

By MISS MULOCK.

THE RECTOR'S DAUGHTER,

By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,

By MARY CECIL HAY.

GABRIEL'S MARRIAGE,

By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,

By ETTA W. PIERCE.

THE RIGHTFUL HEIR,

By M. T. CALDOR.

THE DOUBLE HOUSE,

By MISS MULOCK.

TWICE SAVED,

By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, profusely and handsomely illustrated, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only **Twenty-five Cents.**

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the **AMERICAN ANALYST.**

Delicious Drink

Horsford's Acid Phosphate

Makes a healthful and invigorating drink with water and sugar only. It harmonizes with such stimulants as may be necessary to take. A desirable substitute for lemons or lime juice. Alays the thirst, aids digestion, and relieves lassitude.

"Dr. T. C. Smith, Charlotte, N. C., says:

"An invaluable nerve tonic, a delightful beverage, and one of the best restorers when the energies flag and the spirits droop."

Dr. J. S. Niles, Pownal, Vt., says:

"Excellent as a tonic, and refreshing as a substitute for lemonade."

LATEST ACHIEVEMENT IN

Celluloid  **Cuffs**
Collars, **and** **Bosoms.**

GEO. CLEMENT & CO.

The Celluloid Company confidently assert that they have attained the highest improvement in their Water-proof Collars, Cuffs, and Bosoms, which has ever been reached in this line of waterproof goods. We have examined their latest improvements, and tested them by every means at our command. We are convinced that they have never been excelled, and we are ready to give them our heartiest indorsement. They are pliable, most durable of any goods on the market, and resemble linen more perfectly than any waterproof imitation. Some strangers who have little acquaintance with these goods are under the impression that celluloid is an explosive material. This is an entirely erroneous idea. We can hold celluloid upon the hottest argand burner, and it will melt, but never ignite. The linen interlining makes it much stronger than any other goods in this line. We shall be glad to have any and all of our former patrons try these goods and write us their opinion of the same.

A full assortment of Celluloid Collar Buttons at 5 cents each by mail, post paid; and Cuff Buttons from 25 cts., to \$1.00 per pair by mail. These buttons are durable and never tarnish the Collars and Cuffs.

CELLULOID COLLARS and CUFFS cost no more than linen—look better and wear longer. They never wilt from perspiration, are always white, clean and fresh; require no laundrying—are manufactured in all the leading styles for both Ladies and Gents, Girls and Boys. When soiled, simply wipe them off with soap and water. They save their cost in a week's wear. Try them.

Be sure this trade mark appears on the all goods you purchase.
Address: **GEO. CLEMENT & CO., 33 East 22d Street, New York City.**

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Vandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

It will be sent by mail post-paid upon receipt of only **Twenty-Five Cents**, and is guaranteed to be the best book of the kind ever offered at this low price.

ALL ABOUT HORSES, CATTLE, SHEEP AND HOGS.

The American Live Stock Manual.

No subject is of greater importance to the farmer than that of Live Stock, and few there are who have not much to learn regarding it. Many a man has lost a valuable animal for no other reason than that he did not know how to take care of it when well or to treat it when sick. THE AMERICAN LIVE STOCK MANUAL is a book the cost of which is but trifling, but it is simply worth its weight in gold to every man in America who owns a horse, a cow, a sheep or a hog, for it is a complete text-book, containing the fullest information regarding the care and management, feeding and rearing, of live stock, likewise directions for the cure of all diseases peculiar to these animals and of all unruly and vicious habits, for the construction of necessary buildings and conveniences, etc., etc. The following are only a small portion of the topics treated in this book: How to Judge a Horse; Feeding Horses; Raising a Colt; To Bit a Colt; To Break Horses from Pulling at the Halter; Warts on Horses; Stumbling Horses; Cure for Balky Horses; Kicking Horses; Training Vicious Horses; Galls and Sores on Horses; Reining Horses; Colic; Piles; Founder; Swabs; Epizootic; Shying; Scatches; Ringbone; Spavin; Choking; Bruises; Hide-Bound Horses; Avoiding Indigestion; Worms; Over-Feeding; Sanitary Management of Hogs; To Prevent Hogs Becoming Diseased; Raising Sheep; Washing Sheep; Sheep Rot; Hurdling Sheep; To Tell the Age of Sheep; SheepTicks; Early Lambs; How to Make Sheep Feed; Increasing the Growth of Wool. THE AMERICAN LIVE STOCK MANUAL is a large book of 128 pages, 12mo, with handsome cover, and is profusely illustrated. It will be sent to any address by mail post-paid upon receipt of only **Twenty-Five Cents**. Send for it! The price is but a trifle compared to its real value to every farmer.

Four Books in One! No Household is Complete Without It!

THE COMPLETE BOOK OF HOME AMUSEMENTS.

What most lives need is more sunshine. Let us banish care, have a good time, enjoy ourselves while we may. How much happier—how much better off—are those homes wherein the father and mother, and even the gray-haired grandfathers, join with the children after tea in a merry game or other amusement, than those wherein reticence and reserve and chilly demeanor prevail. "But," you say, "what shall we do? We read until we are tired; and we know of no amusement that we care for. How shall we employ the long winter evenings?" We have published a book to answer this question, and a wonderful book it is. It contains 64 large 3-column quarto pages, neatly bound in handsome covers, and is filled to the brim with every conceivable thing for the enjoyment of home. It is in reality four books in one, for it covers the ground usually occupied by four distinct volumes, and contains four times as much matter as any book published at the same price. It is a complete text-book for Public and Private Entertainments, Private Theatricals, Parlor Exhibitions, Social Gatherings, School Exhibitions and Evenings at Home. It is a book for old and young, grave and gay—a veritable storehouse of good things for all. It contains a number of ACTING CHARADES, with full directions how to perform them. It gives some very excellent PARLOR DRAMAS, easily acted yet very amusing. It tells all about SHADOW PANTOMIMES, and this alone we think you will say is worth the price of the book. It contains nearly fifty beautiful TABLEAU VIVANTS, and gives full and explicit directions for performing them. In it are so many amusing PARLOR GAMES that we have not attempted to count them, but we think we have almost everything, new and old, that was ever thought of in the game line. Then we come to a lot of wonderful ILLUSTRATED FROZZLES—fantastic, perplexing, apparently intricate, but so easy when you turn to the proper places and learn the answers. Here also is a savory dish of RIDDLES, ENIGMAS, CHARADES, ETC.—a nice large lot of them. How young and old heads will puzzle and study over them, and how proud you will feel when you have solved one correctly. As to CONUNDRUMS, there are nearly a bushel of them, some so funny you will want to hold your sides with laughter, and what fun it will be for one of the company to read the questions and see who can give the answers! A considerable portion of the book is allotted to PARLOR MAGIC, and here you will find hundreds of wonderful and amusing tricks, easily performed, yet exceedingly mystifying to your audience. Then there are a lot of amusing and instructive CHEMICAL EXPERIMENTS, showing how the combination and manipulation of the simplest agents will produce the most surprising results. Following these are a number of excellent DIALOGUES, comic and serious, suitable either for school exhibitions or parlor entertainments. Last, but not least, the book contains nearly fifty of the finest RECREATIONS, dramatic, pathetic, sentimental, and comic, ever written. It is handsomely illustrated, and is indeed a splendid book. THE COMPLETE BOOK OF HOME AMUSEMENTS will be sent by mail, post paid, to any address, upon receipt of only **Twenty-Five Cents**.

HOW THE READERS

OF THE

AMERICAN ANALYST

MAY OBTAIN ANY ONE OR MORE OF
THE ABOVE BOOKS

FREE.

TO any one who will send us One New Subscriber to the AMERICAN ANALYST for one year, at \$1, we will send, Free, any one of the above books, to compensate him for his trouble; to any one who will send us two new subscribers, we will send any two of the books; and for three new subscribers, we will send the three books. This will be good pay for little work, for it is a simple and easy matter to get one or more new subscribers to the AMERICAN ANALYST. Show the paper to your friends and neighbors, and you will have little difficulty in inducing one or more of them to subscribe for one year. And when you have received your book or books you will feel doubly repaid for what trouble you have taken. If the parents do not wish to try it, let the little boys and girls do so after school hours. We feel sure that every one of our present subscribers and readers can readily secure for us one or more new subscribers, and we offer this special inducement in order to stimulate effort in this direction. The books will be found well worth the slight effort that will be required to secure them. Try it, and see how easy it will be.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the **AMERICAN ANALYST** a good advertising medium. Why should not you?

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose purious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar, we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING CO.,
19 Park Place, N. Y.

Good Agents

To obtain Subscriptions for

AMERICAN * ANALYST

WANTED ON LIBERAL TERMS.

WE ARE CONFIDENT that we have Reached the HIGHEST DEGREE OF PERFECTION in Solving the INFANT FOOD PROBLEM.

LACTO-PREPARATA.

A Prepared Human Milk perfectly Sterilized and especially designed for Children from birth to six or eight months of age.

Made wholly from cow's milk with the exception that the fat of the milk is partially replaced by cocoa butter. Cocoa butter is identical with milk fat in food value and digestibility, being deficient only in the principle which causes rancidity. The milk in LACTO-PREPARATA is treated with Extract of Pancreas at a temperature of 105 degrees, a sufficient length of time to render twenty-five per cent. of the casein soluble, and partially prepare the fat for assimilation. In this process the remaining portion of the casein not peptonized, is acted upon by the pancreatic ferment in such a manner as to destroy its tough, tenacious character, so that it will coagulate in light and flocculent curds, like the casein in human milk.

Composition :	ALBUMINOIDS.....	19 Parts.
	MILK SUGAR.....	64 "
	FAT.....	10 "
	MINERAL MATTER.....	3 "
	CHLORIDE of SODIUM added.....	1/2 "
	PHOSPHATES of LIME added.....	1/2 "
	MOISTURE.....	3 "

SEND FOR SAMPLE and compare it with every other food used in artificial feeding of Infants.

LACTO-PREPARATA is not designed to replace our SOLUBLE FOOD but is better adapted for Infants up to eight months of age.

CARNRICK'S SOLUBLE FOOD

Is the Nearest Approach to Human Milk that has thus far been produced, with the exception of Lacto-Preparata.

During the past season a large number of Physicians and eminent Chemists visited our Laboratory at Goshen, N. Y., and witnessed every detail connected with the production of Carnrick's Soluble Food. This invitation to witness our process is continuously open to Physicians and Chemists. All expenses from New York to Goshen and return will be paid by us. The care used in gathering the milk, its sterilization, and the cleanliness exercised in every step, cannot be excelled. Soluble Food has been improved by increasing the quantity of milk sugar and partially replacing the milk fat with cocoa butter.

PHOSPHO-CAFFEIN COMP. A SEDATIVE, NERVE AND BRAIN FOOD.

(GRANULAR EFFERVESCENT.)

This preparation has been thoroughly tested, and found to produce the happiest effects in Headaches, Neuralgia, Sleeplessness and General Nervous Irritability. We are confident that the above combination will be found superior to any of the various preparations that are used in nervous affections. It is not only a nerve sedative but a Brain and Nerve Food. The depressing effects of the sedative ingredients are fully overcome by its reconstructive constituents.

As a harmless and positive remedy in Headaches and Insomnia we are certain it has no equal. It is far more palatable than any of the preparations used for similar purposes.

PUT UP IN FOUR, EIGHT AND THIRTY-TWO OUNCE BOTTLES.

REED & CARNRICK, New York.

is the most reliable substitute known for mother's milk. Its superiority rests on the test of 30 years use in Great Britain and the U. S. A sustaining, strengthening diet for Invalids; nutritious, easily digested, and acceptable to the most delicate stomach. Four sizes, 35c. up. Pamphlet, "Healthful Hints," sent free. WOOLRICH & CO., Palmer, Mass.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. **THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE** is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar.** It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

EXPLODING A FALLACY.

There is a prevalent impression, based upon we know not what traditions of overwise medical men and superstitions of over-ignorant old women, that the use of ice-water as a beverage is always fraught with danger. We are gratified to observe that the editor of the *Sanitary Volunteer*, the official organ of the New Hampshire Board of Health, takes up the cudgels in opposition to this sweeping denunciation of a drink that under proper conditions should be accepted as delicious and wholesome. He says, truly that there is a great deal of sentiment, and many opinions, regarding the use of ice-water, that vanish when the light of reason and experience is turned upon them. The fact is, that ice-water, drunk slowly and in moderate quantities, constitutes a healthful and invigorating drink. There is no doubt that ice is a great sanitary agent, and every family ought to be provided with it during the warmer months of the year. It is true that the inordinate use of ice-water, or its use under some special conditions

and circumstances, is attended with great danger; so is improper use of any other drink or food. The assumption that iced water is dangerous, and that iced tea, or iced coffee, or iced lemonade is a harmless substitute, is simply a delusion. As the source of danger feared by some is the degree of cold, we fail to see clearly how flavor modifies the effect of temperature. There are some individuals, undoubtedly, who cannot drink ice-water without injury, and who ought never to use it, but to a great majority of persons it is refreshing and healthful. Its use, temperate and discreet, is in no way to be condemned, which cannot be said of some of its substitutes.

THE FLOWERS THAT BLOOMED LAST SPRING.

Last spring's legislation is already beginning to bear fruit, and the two or three States which decided to ostracise Chicago dressed beef are gradually awakening to the fact that they made a great blunder. We learn from the *Chicago Herald* that an Indiana judge has declared unconstitutional the law requiring that beef sold within a county or State shall have been inspected on the hoof within the limits of the State. The law, he says, is clearly an interference with Interstate commerce and an assumption of power which rendered the articles of confederation between the original colonies a rope of sand, and which the Constitution expressly withheld as inconsistent with the unity of the nation. This is the first case brought before the Indiana courts, and the view taken is so manifestly correct that it is only a question of time for it to be universally adopted and applied wherever such legislation has been attempted. The States which repudiated the unwise schemers can congratulate themselves both that they have no silly class legislation to rescind, and that they have not been deprived during the past few weeks of the excellent beef to which they had become accustomed. Everybody will be content now—excepting the unwise law makers who have probably ended their political careers.

The full text of Judge Johnston's decision will be found in another column of this issue.

"DONNA FERENTES."

Business men in the West seem to be somewhat suspicious of Eastern business methods. The *Commercial Bulletin*, of Minneapolis, sounds a warning against a species of humbug that we infer must be a novelty out there, though its counterpart is familiar enough in this portion of the continent. It says: "The *Bulletin* wishes to warn its readers against a concern that has just come to the city, and which advertises to give away diamonds, gold coin and valuable jewelry to purchasers of teas. It is always safe to assume that where a firm offers to give away ten dollars' worth of goods for a farthing that there is something wrong somewhere. Good business principles do not admit of that way of doing business.

The jewelry is brass and the diamonds are worthless. There are many honest retailers in the city—men who have invested their money here and are aiding in its business growth—and they should be patronized before any wild-cat concern that is running around the country to draw people into their patronage by bogus promises. Beware of diamond tea men of this stamp. Residents of the country should not be deceived by glowing advertisements."

FRENCH FLATS IN NEW YORK.

The rapid growth of this city's population, and the attendant increased value of real estate in New York, are rapidly rendering the owning of one's residence in town an impossibility except to persons of extensive means. Rents likewise are very high, ranging in the thousands in all sections, excepting those from which fashion has been expelled by the aggressions of trade. It was once predicted by the late A. T. Stewart that the day would come when there would not be a residence building remaining on Manhattan Island, the entire space being occupied by business houses. That day is yet in the remote future, but it is an unquestionable fact that business is incessantly encroaching upon localities that a very few years ago were considered securely removed from all risk of its contaminating touch. The problem of providing residences for persons in moderate circumstances is partially solved by the erection of a vast number of apartment houses, supposed or pretended to be constructed on the model of the French flats, which model, however, only in exceptional instances bears any resemblance to the original after which it is named. Close and stuffy as they for the most part are, with light admitted only at the front and rear windows, and lacking in almost all the convenient accessories which impart to the French establishments the comforts of domestic privacy and independence, these New York "flats" are the only substitutes for cheap houses, and are in such demand that those of average convenience already bring larger rents than can be obtained for commodious and well-located houses in other cities. Still, if the European models could be more closely followed, these apartments would be both attractive and desirable, for it is true, as a writer in the *Springfield Republican* affirms, that "in no city can one live so absolutely as he pleases as in Paris, and still be respectable and fashionable. It was some time before New Yorkers took kindly to modern flats, with their possible improvement and convenience. High life of that kind was not to their taste. But in Paris you find the best people living upon some narrow street, and you climb up flight and flight of winding stairs until the fourth and fifth and sometimes the sixth stage is reached, where you stop to breathe and wonder how any American could have pitched his tent so high. Once inside, however, the wonder ceases, or rather takes another channel, as you find yourself in the large, airy and handsomely-furnished rooms where so many of our people live quite as comfortable and with far less care

For use at the Soda Fountain and in all Pharmaceutical preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

DRYDEN & PALMER,
19 Hudson St., New York.

than they can at home. 'I would not go back to America again, with all the worries of housekeeping, for the world,' I heard a lady say, while her companion, fresh from the worries of American housekeeping, was ready to take them up again, and would not stay here for all the world. And so opinions differ. But of the two I think the Parisian housekeeper has the best of it, with better servants, smaller wages, and so many troublesome things done outside—no washing or ironing, for this is done by the blanchisseuse, and no bread-making, for the bakers furnish all that, and of an excellent kind, too."

DRESSED BEEF TRIUMPHS.

THE INSPECTION BILL DECLARED UNCONSTITUTIONAL BY
AN INDIANA COURT.

The last legislature of the State of Indiana passed an act prohibiting the sale of fresh meat in any of the counties of the State, unless the animals had been first inspected alive within the county where the meat was to be offered for sale. James B. Harvey, an agent for Swift & Co., was arrested at Hammond, Ind., last week and fined \$50 by a local magistrate for selling dressed beef slaughtered in Chicago. He was committed to jail for failing to pay his fine. He was taken before Judge William Johnston, Judge of the Porter Circuit Court, on a writ of habeas corpus, where he filed exceptions, putting in argument the constitutionality of the act under which he was fined. Judge Johnston has given an able and elaborate opinion in which he holds that the law under which Harvey was fined is unconstitutional, and he discharged the prisoner. In his opinion, Judge Johnston quotes from many authorities and cites parallel cases. He picks the new law to pieces, taking up section by section, and grows facetious as he quotes the title of the act—"for the protection of the public health." The case is the more interesting as it is the first one under the new law. The gist of Judge Johnston's opinion is as follows:

JUDGE JOHNSTON'S OPINION.

"If this statute is constitutional and valid, then the relief prayed for cannot be granted; otherwise the petitioner is entitled to the benefit of the writ and should be discharged." Courts are loth to interfere and should be very guarded and careful in rendering any opinion that destroys the effect of an act of the legislature, but when such act is clearly unconstitutional, they should not hesitate to so pronounce it.

"This statute amounts to a prohibition against the introduction into our State, for consumption, of all dressed fresh meats. None other can be marketed in our cities except such as has been inspected alive within the bounds of the county and State in which the city is situated, or such as farmers within the State may have raised or fed and slaughtered. It is well known that

dressed fresh meat has become an important article of commerce, and is quite extensively shipped from one State to another as well as into foreign countries. In fact, in very many of our cities our meat markets are largely supplied with fresh meats shipped from adjoining States. It is then, judged by the authorities on the question, an article of Inter-state commerce. Whenever any article has begun to move as an article of trade from one State to another, commerce in that commodity between the States has begun.

"In 'Webster's Unabridged Dictionary' 'commerce' is defined as 'the exchange of merchandise on a large scale between different places or communities.' This embraces two distinct ideas: First, that of exchange in its largest sense, including barter, the giving of one commodity for another, and sale, the exchange of an article of property for money, the representative of all values. From this definition it will be seen that there can be no commerce unaccompanied by exchange or sale. The other idea embraced in the definition is that of transportation, for to constitute commerce the exchange must be between different places or communities; and any law that either prevents the transportation or sale of merchandise totally destroys commerce by the exercise of that power alone. Commerce, then, involves the idea of carrying the commodity intended for exchange to another place where, we may say, the market is to be held and the sale accomplished. Hence, without both transportation and liberty of sale there can be no Inter-state commerce.

"No power of Congress has been more jealously guarded against than this, and the attempt of different States in varied forms to evade it in pursuit of some partial and temporary advantage and the uniform and wise ruling of the Supreme Court of the United States against all attempts to evade and avoid this exclusive power of the national legislature, are one of the most interesting subjects of federal jurisprudence. It may, however, be contended that the act in question is a proper exercise of the police power of the State, and as such ought to be upheld. As the police power of the State in its range comes very near the field committed by the Constitution to Congress, it is the duty of the courts to guard vigilantly against any intrusion. What the police power is, it is difficult to define with a sharp precision. It is generally said to extend to making regulations promotive of domestic orders, morals, health and safety. It extends to the protection of lives, limbs, health, comfort and quiet of all persons and the protection of all property within the State. It may also be admitted that the police power of the State justifies the adoption of precautionary measures against social evils under it. A state may legislate to prevent the spread of crime or pauperism or disturbance of the peace. It may exclude from its limits convicts, paupers, idiots, lunatics and persons likely to become a public charge, as well as persons afflicted with dangerous and infectious diseases, and would justify the exclusion of property dangerous to the citizens of the State; for example, animals having dangerous and infectious disease; but, whatever may be the nature and reach of the police of the State, it cannot be exercised over a subject confined exclusively to Congress by the Federal Constitution. It cannot invade the domain of national government.

"It is then no answer to the charge that such regulation of commerce by a State is forbidden by the Constitution to say that it falls within the police power of the State. For, to whatever class of legislative powers it may belong, it is prohibited to the states if granted exclusively to Congress by that instrument."

Referring to a case in the Supreme Court the Judge said: "It would hardly be expected that such a court would hold that a State may not restrict traffic in alcohol (which possesses no virtues of food or drink), but may absolutely prohibit all commerce in fresh meats. The act of the legislature under consideration makes no distinction between the good and the bad, but all alike is indiscriminately condemned. The act provides that all uncured meat from every other State—the good, the pure, the wholesome, with the tainted and diseased—shall alike be excluded from the cities of the State. And this, it is said in the title of the act, is 'for the protection of the public health.'

"The third section of the act provides that 'nothing herein contained shall prevent or obstruct the sale of cured beef or pork known as dried, cured or canned beef or smoked or salted pork, or other cured or salted meats.' Note the use of the word 'prevent' in this section. Its employment here tends to the conclusion that the legislature understood the first section had prohibited the sale of uncured meats from other States. It was this which in the opinion of the law-makers, rendered the proviso necessary, saving other meats from its operation. By this third section all kinds of meats cured, salted, smoked or dried, no matter how badly the animals from which they were taken were diseased, nor whence they came, are welcome to admission and the market is open and free. Thus, pure, dressed fresh

beef is excluded, and tainted and diseased, canned salted, smoked and dried meats are invited. It seems apparent that the purpose of the act was to exclude foreign dressed meats from the city markets of Indiana; and if such be the case, a consideration of the police powers of the state is unnecessary. Nor can the legislation be sustained as a mere inspection law. The State of Indiana need not admit to her markets meat which is unfit for human food, and she may take such steps as are necessary to ascertain whether or not it is so. When she has ascertained that it is non-commercial, she may exclude it; but no declaration, however solemn, and no pretext, however suspicious, will authorize her to exclude a product which is pure and harmless. It does not provide for the inspection of the commodity for the purpose of ascertaining its quality. It proceeds upon the theory that all uncured meat is noxious and injurious to health. It excludes it in advance and without examination to ascertain its condition. It pronounces judgment without a hearing. All uncured meat is condemned, interdicted, excluded. It has never been regarded as within the legitimate scope of the inspection laws to forbid trade in respect to any known article of commerce, irrespective of its condition and quality, merely on account of its intrinsic nature and the injurious consequences of its use or abuse. The very meaning of inspection is that there should be an examination, and not an exclusion without a hearing. The object of inspection laws is to improve the quality of the articles produced by the labor of a country, to fit them for exportation, or it may be for domestic use. They act upon the subject before it becomes an article of foreign commerce or of commerce among the States, and prepare it for that purpose.

Another provision of the Constitution of the United States with which this act appears to come in conflict is Section 2, Article IV.—"The citizens of each State shall be entitled to all the privileges and immunities of the citizens in the several States." Inasmuch as a resident of the county—for example, Lake County—is entitled to have his animal inspected at home on his own premises, and the citizens or resident of Porter County, Indiana, or of Cook County, Illinois, each adjoining Lake, is obliged to produce his animals for inspection at some point in the latter county, remote from his home and his farm, it is an unauthorized and unjust discrimination, and obnoxious to the constitutional provisions above named."

"Other reasons might be given and authorities cited, but it is unnecessary to prolong this opinion. I have no doubt but the sole purpose of the act was to exclude foreign dressed meat from the city markets of Indiana. The act, therefore, invades the exclusive right of Congress conferred on it by the Constitution and is void. The exceptions to the return to the writ are sustained and the petitioner is discharged."

MUMM SQUELCHED.

AN OPEN LETTER FROM MR. ARPAD HARASZTHY.

At a regular meeting of the Grape Growers and Wine Makers' Association of California, held in San Francisco June 18th, Mr. Arpad Haraszthy, in speaking of champagnes, referred to the interview with G. H. Mumm, recently published, in which Mr. Mumm stated that no good champagnes could be made in this country because our soil does not possess the necessary factors, the principal one of which was said by Mr. Mumm to be chalk. Mr. Haraszthy dissected Mr. Mumm's statements, and showed conclusively that Mr. Mumm, in the words of the speaker, did not know what he was talking about. So gross were the mis-statements of Mr. Mumm, Mr. Haraszthy said, he considered him merely a figurehead who left all his business to peasants and cellar-men. In the interview Mumm stated that in California champagne and Madeira were grown in the same vineyard on the same hillside. "Whoever told Mumm that filled up him to the crop," said the speaker. Mr. Haraszthy said he felt called upon, not only in his own interests, but in those of all the wine-makers he dealt with, to defend as far as he could the possibilities and the continued possibilities of champagne-making in California. Mr. Mumm also claimed that the American production did not possess sufficient effervescence by reason of the lack of soil containing chalk. "Now," said Mr. Haraszthy, with a smile, "I would just like to have a contract with Mr. Mumm, by which he would pay for all the bottles that explode daily in my establishment

through effervescence." Another statement of Mr. Mumm needs correction. He says that our wines are not old enough. "The older the vine, the better the wine," says he. "Now that is ridiculous, and I defy Mumm or anybody else to show me a bearing vine twenty years old. He makes other equally absurd statements that are not worth referring to. The whole amount of the thing is this: Mr. Mumm don't know anything about champagne."

Mr. Haraszthy concluded his remarks by reading to the Association, the following open letter which he has addressed to Mr. Mumm, in regard to his alleged allegations regarding California champagnes.

OPEN LETTER TO MR. G. H. VON MUMM.

Sir: Referring to a statement credited to you by the Eastern press that it is impossible to make champagne in California, I beg to ask you a few questions, to ascertain if possible, where your disinterested opinion ends, and where the desire to advance the interests of your firm begins: And as you have, without provocation, deliberately gone out of your way to injure the champagne interest of our State, I take the liberty of giving a point to my questions. Do you not know that climate exercises greater influence on the character of wine, than soil itself? Do you not know that while parts of California are covered with snow half the year, others have a perennial spring the year around, and still other parts vary between these extremes? Do you not know that we have whole counties lying on carbonate of lime formations, covered with light clay, mingled with silica and oxide of iron, and that this character of soil is practically the same as that existing in the champagne district. Do you really not know that the effervescence of champagne is created solely by the fermentation of sugar, and not by the character of the soil? If you knew this, as you should, then what motive induced you to say to the contrary? Have you ever studied the characteristic differences of any one of our three hundred grape varieties, in different parts of our State? If not, how can you know of our possibilities? Have you ever made a comparison of the wines of all, or any, of our different wine districts? If not how can you presume to judge of their future? Now, is it not a fact that you have never set your foot on our soil, and therefore you really know nothing whatever of the matter in question? Is it not a fact that while the champagne district produces a limited quantity of fine wine, that other parts produce large quantities of inferior, thin, acid, flavorless wines and that you yourself have admitted that these all go into the blends of the various various champagne firms? Is it not a fact that low, cheap grade wines from other parts of France are also very largely used in those covers or blends? And is it not also a fact that these wines, at the time of shipment are sweetened with syrups, artificially flavored with materials not coming from the grape nor grown on your much vaunted chalky soil? Is it not also a fact that the claim of superiority of most French champagne is owing more to the cleverness of artificially flavoring the syrups, than to your grapes, your climate or your talk? If this is not so, will you explain how certain brands take so strongly the green tea, pineapple, pear, spitzberg apple, and other flavors not natural to any grape, and never found in any pure champagne wine, until after the syrup has been added. In other words tell us plainly whether or not it is the flavoring of the syrup in French champagne artificially, that gives the high quality you desire our people to believe comes solely from your chalky soils? Very respectfully,

ARPAD HARASZTHY.

TIN PROSPECTS.—The problem of separating the mica in the tin ores by a simple and effective process is claimed to have been solved by Professor Carpenter, of Dakota. If this should be true, says the *Engineering and Mining Journal*, and the deposits in the Black Hills prove anything like as extensive as they have been represented, it ought to aid the establishment of a vast tinplate industry to compete with the foreign producers.

KITCHEN HISTORY.

THE EVOLUTION OF TABLE COOKERY IN GREAT BRITAIN.

As given to us in scraps, scattered far and wide through tons of ancient manuscripts, is of little or no value until collected together and set side by side; it is then that the rich ripe beauty of the story impresses itself upon the diligent reader. In previous numbers we have given some few jottings which should be interesting, and have endeavored, after a fashion, to explain the extraordinary connection between the words "cock" and "cook," an association that is due to the periods of conquest and Roman invasion. Now we will go back again to early history, and take a flight among our antecedents from the time when they were as savage as New Zealanders or Maoris. Fifty years before year (A. D.) 1, the island of Great Britain is described by Diodorus Siculus as being thickly inhabited, ruled by many kings and princes, and all living peaceably together, though, "with war-chariots and strong arms to settle quarrels." The habitations were built of reed, or of wood, and they gathered in the harvest by cutting off the ears of the corn. Diodorus says that our primitive sires were far removed from the cunning and wickedness of the rest of the world and other writers contrast them favorably with the Irish, who are said to have fed on human flesh, and to have had enormous appetites for such food, and to have been given to the nasty habit of devouring their deceased fathers. "When a Hibernian mother gives birth to a male child," says Caius Julius Solinus, "she puts its first food on the point of her husband's sword, and lightly inserts this foretaste of meat into the mouth of the infant, on its very tip, and by family vows, desires that it may never die but under arms." In other words, the relations wished that the little stranger might never be in want of a row, when disposed to distinguish the family name. The ancient Britains has more than once been likened to, or compared with, the New Zealander, and a writer says "They were, perhaps, more uncivilized, and quite as ignorant, and their abstinence from the flesh of hares and poultry, and, in the northern parts of the island, from fish, bespeaks a race who lacked at once industry and knowledge. Indeed, it is by no means certain that we do not wrong the New Zealanders by suggesting their possible inferiority to the Britons, seeing that the latter are very strongly suspected of being guilty of the most revolting cannibalism." They were clever enough to brew mead and ale, but wine and civilization were brought to them by their enemies—the Romans—invaders whom, for some reasons, they might have welcomed as "our friends, the enemy." They ate but twice a day, the last meal being the more important. Their seats were skins, or bundles of hay flung on the ground; the table was a low stool, around which British chiefs sat, and even in the locality occupied by modern Belgravia, tore their food with teeth and nails, or hacked at it with a wretched knife, as bad as anything of the sort now in common use in Gaul. In fact, they behaved generally at table in a manner that would make the modern Belgravian blush with shame for their descent. The Anglo-Saxons introduced four meals a day; they ate good, solid joints of flesh-meat, boiled, baked or broiled. It would seem that in those days cooks were not of such an illustrious guild as that which they subsequently formed. A cook among the Anglo-Saxons was valued at very little higher than the calf he cut up into collops. He was a slave, and was as unceremoniously bequeathed in his owner's will as any piece of goods or chattels. At Anglo-Saxon feasts, men and women sat together as they do now, which is a mark of civilization and pronounced very refining. Turkey in Europe is the only nation that does not follow this capital example, and Turkey is all to pieces, as we know, hence the deduction is simple, that when men dine by themselves, pop goes the nation. Table-cloths were used at Anglo-Saxon feasts, and the long ends were used as

napkins, hence their condition would scarcely allow of a second use. There may have been some sort of rude display upon the board, but the style of the fittings would have upset the meekest coffee-shop in the slums of Whitechapel. The meats were not dished up, but poked under guests' noses on spits by the attendants, who, by-the-by, were wont to kneel as they offered the succulent morsel. How would our waiters now like to have to kneel as they offered dishes to the company? When the Normans came to England they brought with them greater grandeur, but what often accompanies the same, greater restraint, formality and discomfort. Table-cloths were discarded, and forks were still unknown, but their bills of fare showed greater variety and costliness. "Their cookery," says a writer, "was such an improvement on that of their predecessors in the island, that Norman French and Norman dishes flung the Saxon tongue and table into the annihilating position of vulgarity. The art was so much esteemed that monarchs even granted estates on condition that the holder thereof should, through his cock, prepare a certain dish at stated periods and set it before the king." Under the Normans the celebrated boar's head became a royal dish, and its progress from the kitchen to the banquet was under the escort of a guard and heralded by trumpeters. The crane was then what the goose is to us—highly esteemed, yet almost too coarse for refined palates. The peacock was only seen at tip-top tables, and then it appeared in all the panoply of its tail and trimmings. But, with all this magnificence, the drinks were of very undecided character, being syrupy and spicy or only cider, ale and mead. For the first two centuries after the Norman conquest, cooks and kings improved in their styles of eating and drinking. Richard II. entertained ten thousand guests daily at his numerous tables, and the Earl of Leicester is said to have spent 22,000 pounds of silver in one year for eating. "His household retainers drank no less than three hundred and seventy-one pipes of wine in the same space of time." At great banquets the dishes were reckoned by thousands, and kings in vain dictated decrees denouncing such dinners, but neither cooks nor guests seemed to pay any attention to it at all, beyond altering the number of meals to two; but "these were connected by such a savory chain of 'intermeats,'" now known as *entremets*, and refectations, that the board was spread all day long, and guests were never weary:

"Their life like the life of the Germans would be,
Du lit a la table; de la table au lit."

About this time, also, the purer wines of France, Spain, Syria and Greece became known in Britain, hence:

"Ye shall have rumney and malespine,
Both ypcocrasse and vernage wine;
Mountrasse and wyne of Greke,
Both algrade and despice eke.
Antioche and bastarde,
Pymment also and garnarde,
Wine of Greke and Muscadell,
Both clary, pymment and Rochelle."

An Italian writer, 'about the year 1300, says of the Italians, "a man and his wife ate off the same platter. There were no wooden-handled knives, nor more than one or two drinking-cups in a house. Candles of wax or tallow were unknown—a servant held a torch during supper." We live in a different time now—very different; but the table habits of our forefathers are sufficiently interesting, and, perhaps, amusing, for us to hunt them up now and again.—*British Journal of Catering.*

HOT TYPES.—A new French invention, the thermographic press, is made for printing on wood by means of hot type. As neat an impression is claimed as is obtained in lithography, and by the use of a specially prepared ink it is said that cold type may be used with equally good effect. Its speed is four hundred impressions an hour on flat wood.

OUTLANDISH FOODS.

TASTES THAT CAN BE REPUDIATED, EVEN IF NOT
DISPUTED.

Whilst some people eat too much and others nearly starve themselves, there is another class of eaters who do not care what they eat or how they eat it, and some of whom have very peculiar gastronomical tastes indeed. Such a one was the native Brazilian woman whom a Jesuit one day found wasting away from extreme old age. Having instructed her, as he conceived, in the nature of Christianity, and completely taken care of her soul, he began to inquire whether there was any sort of food which she could take. "A little sugar, now, or a mouthful of some of our nice things which we get from beyond the sea; do you think you could eat it?" "Ah, my grandson," said the old convert, "my stomach goes against everything. There is but one thing I think I could touch. If I had the head of a little tender Tapuya boy, I think I could pick the little bones; but, woe to me, there is no one to go out and shoot one for me." But if this good lady fancied something tender, that was only a failing common to most of us. Far different was the taste of an individual of whom we read in an old volume of the *Gentleman's Magazine*. This person was then being exhibited in France, and Father Paulian writes of him: "In the beginning of May, 1760, was brought to Avignon a true lithophagus, or stone-eater. He not only swallowed flints of an inch and a half long and a full inch broad, and half an inch thick, but such stones as he could reduce to a powder, such as marbles, pebbles, etc., he made up into paste, which was to him a most agreeable and wholesome food. I examined this man with all the attention I possibly could; I found his gullet very large, his teeth exceedingly strong, his saliva very corrosive, and his stomach lower than ordinary, which I imputed to the vast number of flints he had swallowed, being about five-and-twenty, one day with another. Upon interrogating his keeper, he told me the following particulars: 'This stone-eater,' says he, 'was found, three years ago, in a northern inhabited island, by some of the crew of a Dutch ship, on Good Friday. Since I have had him I make him eat raw flesh with his stones; I could never get him to swallow bread. He will drink water, wine and brandy, which last liquor gives him infinite pleasure. He sleeps at least twelve hours in a day, sitting on the ground with one knee over the other, and his chin resting on his right knee. He smokes almost all the time he is not asleep or is not eating.' The keeper also told me that some physicians at Paris got him blooded; that the blood had no serum, and in two hours it became as fragile as coral. This stone-eater hitherto was unable to pronounce more than a few words, 'Oui, caillou bon.' I showed him a fly through a microscope; he was astonished at the size of the animal, and could not be led to examine it."

All over the world have been found tribes, and even whole races, who live at times upon earth. Only recently, indeed, an account was published of several villages on the Mississippi, the inhabitants of which are of mixed French and English descent, and who resort to the eating of a red kind of clay (hydrous silicate of alumina) when run out of all other kinds of provision. This practice was probably originally learnt from the natives, for in 1613 Sir Samuel Argole, writing of his explorations in Virginia, says: "In this journey, I likewise found a mine, of which I have sent a trial into England, and likewise a strange kind of earth, the virtue whereof I know not, but the Indians eat it for physick, alleging that it cureth the sickness and pain of the belly." A medical waiter tells us that the depraved appetite for dirt-eating is so widely spread that it is one of the chief endemic disorders of all tropical America. Children acquire the habit almost from the breast, and "women as they lie in bed sleepless and restless, will pull out pieces of mud from the adjoining walls of their rooms to gratify their

strange appetite, or will soothe a squalling brat by tempting it with a lump of the same material." If this habit be commenced when young, decay usually ensues in a few years. And the same writer speaks of having himself seen a Mestizo soldier sinking from dysentery with a lump of clay stuffed in his sunken cheeks half an hour before death. The Japanese also eat a kind of clay, which they make into thin cakes, called *tanaamps*. These cakes are largely bought by the women, who imagine that the eating of them tends to give a slenderness of form. With some peoples both rats and mice are in high favor. When the French traveller Caillé, was in Africa, a Damere woman gave him for breakfast one morning some yams, and what he thought was gambo-sauce to make them palatable. On dipping his yams therein, however, he saw some little paws, and at once knew that it was mouse sauce; but he was hungry, and, moreover, a philosopher, so he continued his repast with characteristic equanimity. He often subsequently saw the women chopping up mice for their suppers. When the animals were caught, they were singed over a fire, put by for a week, and then cooked. Oftentimes people have had to eat rats from necessity, as, for instance, during the last siege of Paris, when a rat *pate* cost about a franc and a half. In the month of December, 1870, the *Paris Journal* gravely published the following directions for catching the rats which swarmed in the sewers of that city: "Take a long, strong line and a large hook; bait with tallow, and gently agitate the rod. In a few minutes a rat will come and smell the savoury morsel. It will be some time before he decides to swallow it, for his nature is cunning. When he does, leave him five minutes to meditate over it; then pull strongly and steadily. He will make convulsive jumps; but be calm, and do not let his excitement gain on you; draw him up—*et voilà votre dîner!*" From rats and mice to cats and dogs is a natural transition. During the siege, 5,000 cats were eaten in Paris, and considered delicacies. A young one, well cooked, was said to be better than either hare or rabbit. It tastes something like the American grey squirrel; if anything, tenderer and sweeter. Dogs also were eaten, and publicly sold, during the same period, and the flesh fetched from two to three francs per pound. One thousand two hundred are stated to have been consumed.

Only some twenty years ago the scientific Michelet urged upon us to regard the insect world from a dietetic point of view. Caterpillars, he told us, tastes like almonds, spiders like nuts, and, as for ants, with a little butter and sugar they make a sweetmeat fit to set before a king. But ant-eating is far from uncommon; negroes, both in Africa and their descendants in the West Indies, relish them exceedingly. So do the Indians of Central America, and Herrera states that the Panches of North Reyno de Granada keep them in yards and breed them, although he quite forgets to tell us by what means they are prevented from escaping. The Bushmen of South Africa eat white ants, spiders, grasshoppers, moths and grubs; the natives of Australia relish maggots; the Hottentots consider the uncleaned entrails of animals to be delicious eating; and many aboriginal tribes in North America revel in rattle-snake soup, boiling poison and all. The flesh of the lion is also reckoned by some tribes a luxury, but there is this drawback to obtaining it, that possibly you may furnish a dinner for the lion instead of him for you. At Christmas, 1874, some score of contributors and draughtsmen of the *Chasse Illustrée* dined together at Magny Restaurant, in Paris, under the presidency of M. Firmin Didot, to taste the ham and heart of the last lion killed in the environs of Philippe Ville, Algeria, by M. Constance Cheret. The flesh of the lion was found to be particularly firm and close grained, like that of the horse, but nevertheless quite palatable. The ham, though specially cooked, seems to have met with only a *succès d'estime* and the heart, skilfully prepared with truffles, was found somewhat tough and difficult of digestion. But a more curious meal still was that provided by an eccentric old

major, who once invited three friends to dinner, consisting entirely of sauces. The soup took the form of gravy sauce, and oyster and lobster sauce took the place of *filet-de-sole*. Egg sauce represented the sirloin, bread sauce was there to remind them of game, and brandy sauce as a hint for plum pudding. The sauce boats were duly emptied by the guests, and after each the wine was well resorted to. Two of the guests, between excess of lobster sauce and cognac, were all the worse for the banquet; but that proved rather the weakness of their stomachs than the non-excellence of the feast.

IT'S ENGLISH—YOU KNOW.

SOME OF THE DIFFERENCES BETWEEN THE ENGLISH AND
THE AMERICAN LANGUAGES.

Baggage is "luggage" in England, writes Prentice Mulford in the *Rochester Herald*. No livery stables; instead, sign of "cars on hire." No cars on railroad; all "coaches." No rails; all "metals." No conductor; instead, "guard." No depots; all stations. No boots; all "gaiters." No street cars; all "trams." No stoves. No mosquitoes. Very improper to allude to insects on plant or elsewhere as a bug; bugs in Britain belong only in beds. In England's English "to get mad" means insanity. They get angry; never mad. A roasting piece of meat is a "joint." Things are never "fixed" *a la American*; they are arranged. The English never "guess," "reckon" or "calculate;" these words belong to American-English. Wheat, corn, rye, barley, all go by the name of "corn;" corn itself is almost unknown. No wharves; all docks or piers. Most pies are "tarts." Regular fruit pies baked in deeper dishes than ours, crust only at top. Twenty millions or more people in Britain eat hearty supper at night. Table spread often as for dinner. Roast meat, potatoes and porter. No indigestion follows; never think of it. No green corn. No watermelons. No pork and beans. No buckwheat cakes. No succotash. No oysters cooked *a la stew*, fry, roast, broil or steamed. No oysters save raw or in "patties." No clams at all. No pumpkin pie. No dessert pies made in our fashion; very small affairs in small dishes. Plenty of cockles; miserable apology for our round clam. Oysters thin; not savory to American taste; kept at shops in vats of fresh water. Cod and king fish 25 cents a pound. Lobsters very high-priced. Sole, sprat, herring and other fish very cheap. No porgies. No shad. No bluefish. Plenty of mackerel. Yarmouth bleaters in early summer; never found in perfection in this country; relish during that time. Are allowed to decompose after being caught until slight bloat sets in; hence name "bloater;" afterward lightly dipped in salt and water; then briefly and delicately smoked; then broiled. Flavor so acquired doesn't last over four days; salt strikes it afterward. Peas, cabbages, beans and turnips more tender than ours; boil tender in less time. White beans called "harvest beans." Yellow turnips not eaten; deemed fit only for sheep."

THE FOUR HUNDRED.—The following is going the rounds as an extract from the *London Court Journal*: "Affairs in America are in a deplorable condition. Four hundred people in New York have secured all the Government patronage for that district, and much dissatisfaction is expressed. A Mr. Ward McAllister, an owner of a ferryboat that makes weekly trips between New York and Brooklyn, succeeded in gaining the favor of President Morton to such an extent that he was placed at the head of the patronage. The four hundred stockholders in his great ferry company are, of course, favored by him, practically shutting out every one else. Mr. McAllister, backed by the Government, got up a great dress ball which came off April 30. There was a great scramble for invitations to the ball, but they were mostly confined to the four hundred. Ex-President Cleveland wrote a note to Mr. McAllister, stating that he would like to be present on the occasion, but Mr. McAllister replied that the list for gentlemen was already full, but that he might send his wife. This the ex-President consented to do."

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

July.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Pigeon, chicken, duck.

FISH.—Anchovy, bass, bluefish, blackfish, cod, eels, clams, flounder, haddock, halibut, herring, lobster, mackerel, mussels, perch, porgie, prawn, salmon, shad, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Beans, cucumbers, carrots, cauliflower, egg-plant, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, radish, rhubarb, corn, beets.

FRUITS.—Cherries, strawberries, raspberries, huckleberries, melons, gooseberries, blackberries, peaches, pears, tamarinds, bananas, pineapple.

PRACTICAL RECIPES.

BACON AND EGGS.—Cut some very thin rashers of salt—not smoked—bacon, and fry on a very hot pan; they will color yellow and curl up. If there is not enough fat in the pan to fry eggs, add some that has been tried out of salt pork, and fry half a dozen eggs on one side, leaving them soft. Lift carefully to a hot dish, which should also contain the rashers of bacon, and a little round of toast for each egg; pour four tablespoonfuls of vinegar into the fat in the pan, boil up, season with pepper, and pour over the eggs and toast. Serve with baked potatoes.

CALF'S LIVER, BROILED.—Slice it and season with pepper and salt, and broil it nicely. Serve very hot and with a small piece of butter laid on each slice.

CREAMED ONIONS.—Boil the onions till quite tender, then put them into a large bowl and thoroughly bruise them; when well bruised, add thereto some milk or cream, and put the onions into a saucepan; keep stirring until the whole forms a white and creamy mass. Serve very hot.

HORSFORD'S YORKSHIRE TEA, CAKES.—One quart of sifted flour, loosely measured, mixed with two heaping teaspoonfuls of Horsford's baking powder; rub into it one ounce of butter, and then add one egg, well beaten, and mix the whole with enough sweet milk to make a thick batter; bake immediately in small cake tins or gem pans; have the tins or pans hot before filling.

RASPBERRY CREAM.—Extract the seeds from a quart of fine red berries by rubbing them through a sieve; add a quart of thick sweet cream, sweeten with powdered sugar, and whip to a stiff froth; remove the froth to the sieve, turned upside down; fill a preserve dish or small glasses with the cream, put some of the whipped cream on top, and serve up very cold.

PICKLED CURRANTS.—Heat three pounds sugar and one quart vinegar together, and in them scald seven pounds ripe currants; remove currants to a jar; boil the syrup a few moments more, and then pour it over the fruit. Three pounds of raisins and spices may be added if desired. If a sweeter pickle is liked, use less vinegar to this amount of sugar.

WHITE CAKE.—One cupful butter, three of sugar, one of milk, three of flour, one of corn starch, whites of twelve eggs beaten to a stiff froth, two teaspoonfuls of cream tartar in the flour, and one of soda in half the milk (or two teaspoonfuls of Horsford's baking powder instead of the soda and cream tartar). Dis-

solve the corn starch in one-half the milk, and add it to the butter and sugar, well beaten; add the milk and soda, then the flour, and lastly the eggs; flavor with almond or the grated rind of a fresh lemon and half the juice.

CERTIFICATE OF MERIT.—"Dear Doctor; I had a pain in my liver likewise one in my lights, I wore your electric liver pad and now I have got the electric lights. Yours truly, Dynamo.

LIGHT AND EYESIGHT.—The over-stimulating effect of light on the human eye is to be noted by the effects produced. Since the introduction of the electric light into workshops, a new disease has developed. As soon as the attention of the medical profession was called to this fact, the light was rendered less intense, and the evils caused by it have disappeared. Occasionally, however, we still find workmen who are subject to this complaint, but in every instance it is due to the non-observance of the most ordinary precautions. It is a well-known fact that men who work in furnaces or pudding mills are subject to premature cataracts. Dr. Whitney reported several cases of premature injury to the vision in Japanese students from exposure to sunlight during the last eclipse. The intense glare of the snow is also productive of blindness. The bright glare of the tropical seas produces blindness, known as "moon blindness," erroneously attributed to the effect of the rays of the moon, but in reality caused by the sun's rays. Statistics go to show that the social life of a country has much to do with the development of vision. The Germans are proverbially near-sighted. In walking through the streets of any garrisoned city of the German Empire one is struck by the number of officers wearing glasses. The English, as a nation, are far-sighted. In our own country we find the same law holding good. The community, descendants of English, retain this primal defect of their ancestors. The German community the same. Where there has been a commingling, the prepotency of the stronger is shown, and the "American eye" is the result. By this is meant the astigmatic eye. Astigmatism may be either of that kind known as far-sighted or near-sighted, or a mixture of both.

BUFFALO LITHIA WATER

In the Uric Acid Diathesis, Bright's Disease, Chronic Inflammation of the Bladder, etc.

JAMES L. CABELL, M. D., A. M., LL. D., Professor of Physiology and Surgery in the Medical Department in the University of Virginia, and President of the National Board of Health.

"The Water of Buffalo Spring No. 2 contains in notable quantities two of the ALKALIES which are accredited as extremely valuable in the treatment of GOUT, LITHIASIS, and Liver Affections. I refer to the CARBONATES of POTASH and LITHIA.

"I have recently read with interest a paper in 'The New York Medical Journal' on the Buffalo Lithia Water in Diseases of the NERVOUS SYSTEM, in which the writer, Dr. Boyland, citing his own observations and those of other eminent physicians, ascribes to this water a special virtue as a direct tonic for the NERVOUS SYSTEM in cases of CEREBRAL exhaustion. I have only had occasion to test its effects in this direction in cases in which the NERVOUS SYMPTOMS may have been due to LITHÆMIC conditions. In these cases the relief following the use of the remedy was very decided."

Dr. WM. A. HAMMOND, of New York, Surgeon-General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the Buffalo Lithia Water in cases of affections of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION OF THE LITHIA SALTS, and is, moreover, better borne by the Stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from over-mental work—in which the condition called NERVOUS DYSPEPSIA EXISTS—and generally with marked benefit."

Dr. ROBERT BATTEY, of Georgia, SUGGESTER OF BATTEY'S OPERATION.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of CHRONIC INFLAMMATION of the BLADDER, whether induced by STONE, by enlarged PROSTATE in the aged or by NEGLECTED GONORRHOEA, and HAVE SECURED EXCELLENT RESULTS, which encourages me to prescribe it for the future."

HUNTER MCGUIRE, M. D., LL. D., late Professor of Surgery, Medical College of Virginia, Richmond.

"BUFFALO LITHIA WATER, Spring No. 2, as an ALKALINE DIURETIC, is invaluable. In URIC ACID GRAVEL, and, indeed, in diseases generally dependent upon a URIC

ACID DIATHESIS, it is a remedy of extraordinary potency. I have prescribed it in cases of RHEUMATIC GOUT, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. WM. B. TOWLES, Professor of Anatomy and Materia Medica in the Medical Department of the University of Virginia.

"BUFFALO LITHIA WATER, No. 2, belongs to the ALKALINE or, perhaps, to the ALKALINE-SALINE Class, for it has proved far more efficacious in many diseased conditions than any of the simple ALKALINE waters.

"I feel no hesitancy whatever in saying that in GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE in the BLADDER, and in all Diseases of URIC ACID DIATHESIS, I know of no remedy at all comparable to it.

"Its effects are marked in causing a disappearance of ALBUMEN from the urine. In a single case of BRIGHT'S DISEASE OF THE KIDNEYS I witnessed decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of the disease."

Dr. THOMAS H. BUCKLER, of Paris (formerly of Baltimore), SUGGESTOR OF LITHIA as a Solvent for Uric Acid.

"Nothing I could say would add to the WELL-KNOWN REPUTATION OF THE BUFFALO LITHIA WATER. I HAVE FREQUENTLY USED IT WITH GOOD RESULTS IN URIC ACID DIATHESIS, RHEUMATISM, AND GOUT, and with this object I have ordered it to Europe, from Coleman & Rogers, of Baltimore. Lithia is in no form so valuable as where it exists in the Carbonate (the form in which it is found in the BUFFALO LITHIA WATER), Nature's mode of solution and division in water which has passed through Lepidolite and Spondumline Mineral formation."

Dr. GRAEME M. HAMMOND, of New York, Professor of Diseases of the Mind and Nervous System in the New York Post-Graduate Medical School and Hospital.

"In all cases of BRIGHT'S DISEASE of the KIDNEYS I have found BUFFALO LITHIA WATER of the greatest service in increasing the quantity of urine and in eliminating the ALBUMEN. In certain cases of Melancholia, accompanied by excessive eliminations of URATES and URIC ACID, it is often the only remedy necessary. In GOUT and RHEUMATISM it is highly beneficial, and in many cases of Impotence its restorative qualities have been of undoubted assistance. I have long regarded BUFFALO LITHIA WATER as the most valuable mineral water in use."

Water in cases of one dozen half-gallon bottles, \$5.00 per case at the Springs.

THOMAS F. GOODE, Proprietor, Buffalo Lithia Springs, Virginia.

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,
By MISS M. E. BRADDON.

THE GIRL AT THE GATE,
By WILKIE COLLINS.

A BRIDE'S TRAGEDY,
By MISS MULOCK.

THE RECTOR'S DAUGHTER,
By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,
By MARY CECIL HAY.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, profusely and handsomely illustrated, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only **Twenty-five Cents.**

GABRIEL'S MARRIAGE,
By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,
By ETTA W. PIERCE.

THE RIGHTFUL HEIR,
By M. T. CALDOR.

THE DOUBLE HOUSE,
By MISS MULOCK.

TWICE SAVED,
By MRS. MARY A. DENISON.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the AMERICAN ANALYST.

ANALYST PUBLISHING CO.,

19 PARK PLACE, NEW YORK.

CELLULOID NEGATIVES.—Mr. George Eastman, Rochester, N. Y., has made an important invention in photography. He has succeeded in producing a strong and perfectly transparent support, of great flexibility and extreme thinness, which can be wound upon rollers, to be exposed, developed and printed like ordinary glass negatives. The transparent support is a modification of celluloid, specially prepared by a process invented by Mr. Eastman. The celluloid product is but four one-thousandths of an inch in thickness, and the gelatine film upon it is one two-thousandths of an inch in thickness. This extreme lightness enables a large quantity of photographic material to be carried in a very small space, and with no inconvenience on account of weight. Every operator can develop and print his own negatives, and refill his magazine with the exercise of only ordinary skill. This invention is a very important one, and will be appreciated by photographers.

MICA AS AN INSULATOR.—Comparisons between glass and mica show that even at high temperatures the latter is the better insulator.

CELLULAR CLOTH.—A new textile, which is likely to be of a very high sanitary value, as well as greatly conducive to comfort, has just been introduced under the name of cellular cloth. It is of netted or cellular structure; the texture is thick, but open, and the cloth is made of cotton, merino, silk or wool. The construction is based upon the theory of perfect ventilation, combined with due retention of the warmth of the body. Those articles which are the poorest conductors of heat best serve this purpose. Upon this physical fact rests the theory of the cellular cloth. A construction that shall retain heat in winter and exclude it in summer, and that shall at the same time permit free evaporation, is a model for garments.

BUSINESS NOTES.

HORFORD'S ACID PHOSPHATE.

MAKES DELICIOUS LEMONADE.

A teaspoonful added to a glass of hot or cold water, and sweetened to the taste, will be found refreshing and invigorating.

OUR NATIONAL ZOO.—The site for the Zoological Garden in Washington has been selected. It comprises about one hundred and fifty acres to the north-west of the city, about two miles from the White House, along the banks of Rock Creek, and is said to be in every way well adapted for its purpose. Before next winter the necessary arrangements will probably be so far advanced that the animals now housed in the grounds of the Smithsonian Institution can be removed to their new quarters.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. **THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE** is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar.** It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

ADDRESS ANALYST PUBLISHING CO.,

—19 PARK PLACE, NEW YORK.—

Hotter the Weather Bigger the Proof.

As the weather grows warm, the sale of James Pyle's Pearline Washing Compound rapidly increases. This proves that many women recognize the fact that PEARLINE makes washing and cleaning very much easier than when done with the ordinary means. Proves also that summer clothing, being of delicate texture and color, will not stand the rough usage necessary when washed with soap, and establishes the fact that PEARLINE, in doing away with the rubbing, lessens the wear and tear and fills a very important place. Delightful for bathing in fresh or salt water. Its ingredients render it harmless to the most delicate skin. Especially during the hot weather it is to your advantage to use PEARLINE, and only humane to supply your servants with it, and thus lighten their labors; besides you insure much better results. Beware of imitations. JAMES PYLE, New York.

LATEST ACHIEVEMENT IN

Celluloid
Collars,

Cuffs
and
Bosoms.

GEO. CLEMENT & CO.

The Celluloid Company confidently assert that they have attained the highest improvement in their Waterproof Collars, Cuffs, and Bosoms, which has ever been reached in this line of waterproof goods. We have examined their latest improvements, and tested them by every means at our command. We are convinced that they have never been excelled, and we are ready to give them our heartiest indorsement. They are pliable, most durable of any goods on the market, and resemble linen more perfectly than any waterproof imitation. Some strangers who have little acquaintance with these goods are under the impression that celluloid is an explosive material. This is an entirely erroneous idea. We can hold celluloid upon the hottest argand burner, and it will melt, but never ignite. The linen interlining makes it much stronger than any other goods in this line. We shall be glad to have any and all of our former patrons try these goods and write us their opinion of the same.

A full assortment of Celluloid Collar Buttons at 5 cents each by mail, post paid; and Cuff Buttons from 25 cts., to \$1.00 per pair by mail. These buttons are durable and never tarnish the Collars and Cuffs.

CELLULOID COLLARS and CUFFS cost no more than linen—look better and wear longer. They never wilt from perspiration, are always white, clean and fresh; require no laundrying—are manufactured in all the leading styles for both Ladies and Gents, Girls and Boys. When soiled, simply wipe them off with soap and water. They save their cost in a week's wear. Try them.

Keep this for reference. CELLULOID COLLARS and CUFFS are as economical and desirable as represented. Can always obtain the same FREE OF POSTAGE, at the following prices:

Gents' Collars,	25 cts.	6 for.....	\$1 30—\$2 25 Doz.
" Cuffs,	50 "	6 ".....	2 75—4 75 "
Ladies' Collars,	15 "	6 ".....	85—1 50 "
" Cuffs,	30 "	6 ".....	1 70—3 00 "
Small Bosoms,	50 "		
Large "	75 "		

Remit by postal order, check, or stamps.

Be sure this trade mark appears on the all goods you purchase.

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose spurious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar, we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

A BOOK THAT EVERY LADY NEEDS.

THE LADIES' GUIDE TO FANCY WORK.

How to make the Home Beautiful at small cost is a subject now uppermost in the mind of every lady of good taste. This book is a complete practical instructor in every description of Ladies' Fancy Work, and the only first-class work of the kind ever published at a low price. It contains nearly **300 Illustrations**, and the instructions given are so plain and simple that by their aid even a child may make the many beautiful things which the book describes. It gives plain and practical instructions in Drawing, Oil Painting, and making Wax Flowers; likewise all kinds of Fancy Needle Work, Artistic Embroidery, Lace Work, Knitting, Tatting, Crochet and Net Work. It contains designs for Monograms, Initials, Cross Stitch Patterns, Knit Edgings, Embroidered Borders and Corners, Macramé Work, Applique Embroidery, Berlin Work, Java Canvas Work, Tricot and Braid, Antique Lace, Beaded Lace, Darned Net Work, Tiedies, Lambrequins, Ottomans, Counterpanes, Rugs, Carriage Robes, Brackets, Wall Pockets, Waste Paper Baskets, Work Boxes, Work Baskets, Work Bags, Pen Wipers, Hanging Baskets, Catchalls, Pin Cushions, Footstools, Handkerchief Boxes, Glove Boxes, Card Baskets, Sofa Pillows, Table Covers, Table Scarfs, Screens, Scrap Bags, Hand Bags, Table Mats, Toilet Mats, Lamp Mats, Lamp Shades, Pillow Shams, Pillow Sham Holders, Curtains, Toilet Stands, Picture Frames, Slipper Cases, Letter Cases, Toilet Sets, Clothes Brush Holders, Cigar Boxes, Hosiery, Socks, Fancy Purses, Slippers, Dressing Gowns, Music Portfolios, Knife Cases, Fans, Flower Baskets, Plant Stands, Flower Pot Covers, Shawls, Dress Trimmings, Window Shades, Feather Work, Spatter Work, Leaf Photographs, and many other things. It is a book that should be in every American household. With it as a guide you may make hundreds of beautiful things for the adornment of your home and for presents to your friends at the most trifling expense, and no employment for ladies is more fascinating and useful. The book will repay its small cost many times over in a very short time. Every lady will be delighted with it. It is a large book of 64 large 3-column pages, with handsome cover, is finely printed, and, as above stated, contains nearly 300 illustrations. It will be sent by mail, post-paid, upon receipt of price, only **Twenty-five Cents**.

INVALUABLE TO EVERY HOUSEWIFE!

THE MODERN COOK BOOK AND MEDICAL GUIDE.

This is practically two books in one—a perfect cook-book and a perfect medical book—and there is so much in it, and so much care and pains have been taken in its compilation, that we feel perfectly safe in asserting that the Cooking department is fully the equal, in quantity and quality of contents, of any low-priced cook-book published, and the same as to the medical department herein as compared with any low-priced medical work on the market. It is a complete encyclopedia of domestic information, and we fully believe that no lady, after having it in the house a short time, would willingly do without it for ten times its cost. The cooking recipes number 627, and include Breakfast Dishes, Soups, Meats and Poultry, Fish, Vegetables, Salads and Relishes, Bread and Rolls, Jellies and Preserves, Puddings and Pies, Fancy Dishes, Cakes, Confectionery, Ice Cream and Summer Drinks. The compilation of this department was superintended by a practical housekeeper, every recipe will be found reliable, and it has been pronounced one of the best, most complete, and practical cook-books published. The Medical Department will be found fully the equal of any doctor book published at one dollar or less. It tells you how to cure, by simple means, available in every home, Malaria, Pneumonia, Poisons (antidotes for), Nervousness, Measles, Rheumatism, Toothache, Wounds, Sprains and Bruises, Weak and Inflamed Eyes, Dust in the Eye, Sore Throat, Sore Head, Whooping Cough, Neuralgia, Earache, Worms, Warts, Burns and Scalds, Headache, Offensive Breath, Bleeding (to stop), Cancer, Consumption, Felons, Dyspepsia, Dysentery, Diphtheria, Diarrhoea, Croup, Corns, Liquor Appetite, Coughs and Colds, Cold in the Head, Catarrh, Scarlet Fever, Nose Bleed, Baldness, Smallpox, Sleeplessness, Ringworm, Chills, Costiveness, Cholera Morbus, Bright's Disease, Convulsions, Mumps, Superfluous Hair (to remove), Hysterics, Colic, Sciatica, Biliousness, Nettle Rash, Typhoid Fever, Ingrowing Toe Nails, Abscess, Stammering, Hemorrhage, Asthma, Hydrophobia, Scrofula, Bronchitis, Lockjaw, Erysipelas, Hoarseness, Chills and Fever, Dropsy, Bunions, Fits, Dandruff, Scurf, Quinsey, Heartburn, Sydes, Liver Complaint, Cramps, Corpulence, Sunstroke, Knock-knees, Indigestion, Jaundice, Gout, Prickly Heat, Ulcers, Salt Rheum, Fainting, Boils, Tobacco Habit, Gray Hair (to prevent), Cholera Infantum, Deafness, Stiff Neck, Piles, Choking, Freckles, Pimples, Sunburn, Chapped Hands, and many other ailments. It will save you many dollars annually in doctors' bills and patent medicines. Who can doubt that twenty-five cents invested in such a useful and valuable book as this would be the best and most profitable investment that could possibly be made of so small a sum? This MODERN COOK BOOK AND MEDICAL GUIDE is a large book of 128 pages, neatly bound in colored covers. It will be sent by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

AVOID LITIGATION! BE YOUR OWN LAWYER!

EVERYBODY'S LAW BOOK.

Litigation is a very expensive luxury; avoid it, for it doesn't pay. Thousands of lawsuits are brought because people do not understand the simple principles of law and their own and others' rights, and there are plenty of lawyers always ready to take advantage of this lack of knowledge. The object of this volume is to impart, in a simple, concise manner, the fullest information regarding legal matters. It is to be used as a work of reference, and in all ordinary emergencies will save employing a lawyer. It is a complete compendium of business and domestic Law, by a prominent member of the New York bar, contains concise explanations of the general laws and the laws of the several States, regarding Administrators and Executors, Affidavits, Agency, Agreements, Apprentices, Arbitration and Award, Assault and Battery, Assignments, Attachments, Banks, Bills of Exchange, Checks and Promissory Notes, Bills of Sale, Chattel Mortgages, Citizens and Aliens, Common Carriers, Contracts, Corporations, Deeds and Mortgages of Real Estate, Descent and Distribution, Lower, Easement, Exemptions, Farmers' Law, Fences, Fixtures, Garnishment, Gifts, Guaranty, Guardian and Ward, Heirs and next of Kin, Homestead Exemptions, Husband and Wife, Infants, Interest and Usury, Landlord and Tenant, Libel and Slander, Liens, Limitation of Actions, Marriage and Divorce, Rights of Married Women, Master and Servant, Parent and Child, Partnership, Payment and Tender, Personal Property, Power of Attorney, Principal and Agent, Privileged Communications, Railroads, Railroad Real Estate, Receipts and Releases, Replevin, Right of Way, Seduction, Trustee Process, Warrant, Water Rights, Wills and Codicils. Together with complete forms of Acknowledgments, Agreements, Articles of Co-partnership, Assignments, Award of Arbitrators, Bills of Sale, Bonds, Chattel Mortgages, Contracts, Deeds, Executors' and Administrators' Accounts, Interest Table, Liens, Mortgages of Real Estate, Powers of Attorney, Releases, Satisfaction Pieces, Wills and Codicils, etc., etc., specially adapted for the daily use of those who are not lawyers, with directions for their preparation. Every farmer, mechanic, manufacturer, business man, professional man, merchant and householder will find the information contained in this book of great value, and will have occasion to refer to it nearly every day. It is the cheapest book of the kind ever published, and is quite as complete and valuable as other works for which four times the amount, or more, is asked. **EVERYBODY'S LAW BOOK** is a large volume of 128 pages, 12° o, with handsome cover. It will be sent by mail, post-paid, upon receipt of only **Twenty-five Cents**. Send for it! It is worth ten times the amount asked for it to any man, young or old, in America.

For School Exhibitions and Public and Private Entertainments.

The Complete Book of Recitations and Dialogues.

This book contains, so far as we know, the best and most complete collection of recitations ever published in a single volume. All the popular recitation books of the day have been consulted and the cream selected, and the result is a mammoth collection of recitations which cannot fail to answer every requirement. There are hundreds of them, and they embrace every kind and character of recitations, adapted to every need, humorous, dramatic and pathetic—from short juvenile pieces for the little boys and girls on Friday afternoons to pretentious dramatic works for the professional elocutionist. We have space to enumerate the titles of only a very few of them, as follows: "Ostler Joe," "Asleep at the Switch," "The Last Rym," "The Dead-end Journey," "The Engineer's Story," "Grippe Ben," "Two Loves and a Life," "The Mother-in-Law," "The Old Parson's Story," "The Taking Toll," "The Engineer," "The Tramp," "Tim's Daisies," "John Darryll's Dream," "Too Late," "The Book-keeper's Dream," "Saving Mother," "Curfew must not Ring To Night," "The Palmetto and the Pine," "The Polish Boy," "Drafted," "The Blacksmith's Story," "The Burning Prairie," "Guilty or Not Guilty," "The Foreclosure of the Mortgage," "The Clown's Baby," "Bill Mason's Ride," "How we tried to Whip the Teacher," "Driving Home the Cows," "Somebody's Mother," "When the Tide Goes Out," "The Old Farmer's Elegy," "Widder Spriggins' Daughter," "The Light-keeper's Daughter," "How the Parson Broke the Sabbath," "Which Shall it Be?" "Somebody's Darling," etc., etc. In addition to the Mammoth collection of Recitations contained in this book, it also contains a number of fine Dialogues, mostly humorous, among which are: "Marrying a Poetess," "What's in a Name?" "The Train to Mauro," "The Graduates," "The Female Astrologer," "Proposing by Proxy," "Story-Telling," "The Morning Call," etc. Those who have sent for books of this character and been disappointed in them, owing to the meagerness and inferiority of their contents, will be happily surprised in this book, for not only is the largest collection of Recitations and Dialogues ever sold at a low price, but great care has been taken in the selection of its contents, the aim being to include only the best. It is a splendid book, guaranteed to give satisfaction. **THE COMPLETE BOOK OF RECITATIONS AND DIALOGUES** is a large book of 64 large 3-column pages, with handsome colored cover. It will be sent by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

HOW THE READERS

OF THE

AMERICAN ANALYST

MAY OBTAIN ANY ONE OR MORE OF

THE ABOVE BOOKS

FREE.

TO any one who will send us **One New Subscriber** to the **AMERICAN ANALYST** for one year, at \$1, we will send, **Free**, any one of the above books, to compensate him for his trouble; to any one who will send us two new subscribers, we will send any two of the books; and for three new subscribers, we will send the three books. This will be good pay for little work, for it is a simple and easy matter to get one or more new subscribers to the **AMERICAN ANALYST**. Show the paper to your friends and neighbors, and you will have little difficulty in inducing one or more of them to subscribe for one year. And when you have received your book or books you will feel doubly repaid for what trouble you have taken. If the parents do not wish to try it, let the little boys and girls do so after school hours. We feel sure that every one of our present subscribers and readers can readily secure for us one or more new subscribers, and we offer this special inducement in order to stimulate effort in this direction. The books will be found well worth the slight effort that will be required to secure them. Try it, and see how easy it will be.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only three possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract, and Keppel's Malt Extract. WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined. R. H. CRITTENDEN.

Professor of Physiologic Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alteratives.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Fermented.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peptones.	MALTO-VIBURNIN.
MALTINE with Peppin and Pancreatine.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

COLDEN'S

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of
Beef and Tonic Invigorator."

LIQUID

BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.

Essentially Different from all other Beef Tonics.

Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, (inchona), Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

APOLLINARIS AND IMITATIONS.

The representatives in this country of the owners of the so-called Apollinaris Spring have lately invoked the aid of the courts to protect them from numerous parties who have bottled and offered for sale under very similar labels other mineral waters than Apollinaris. We have no sympathy with imitators of any kind of goods, nor with any one who seeks to reap the benefit of other people's enterprise or exertion, by foisting upon the public other than the genuine goods. We do not believe that the great mass of the public will knowingly purchase such imitations, yet we here have an instance of the public openly purchasing proven imitations of a well-known mineral water. There must be a cause for this. It is an anomaly worthy of investigation. One solution which suggests itself is that goods which are positively known to be pure, good and just as represented cannot be successfully imitated and sold to any appreciable extent. The public have confidence in such goods, and will always prefer them. They will positively insist upon having the genuine article, and are

willing to pay any reasonable price to obtain it. We believe this has not been the case with Apollinaris water. The public has heard repeatedly of investigations before the Treasury Department, wherein, by sworn testimony, it was clearly shown that the Apollinaris water as obtained from the spring was one thing and Apollinaris water as shipped to this country was quite a different thing. It has been repeatedly stated before various medical and pharmaceutical societies, and so far as we know without any contradiction, that Apollinaris water is more or less prepared for this market. Under these circumstances, it is not at all surprising that the general public takes very little interest in the results of this legal fight, and, only caring to obtain a pure carbonated water, is just as ready to buy one kind as another. This is a lesson to all who offer for sale any article demanding public confidence. They must maintain the quality, give undeniable proof of genuineness and purity, and be sure to deserve confidence.

CONTAGION ON THE WING.

Another domestic animal, the fly, is coming in for his share of incrimination for spreading infectious diseases. It has long been known that, if not the house-fly, at least some kinds which are near relations of his, have sometimes been guilty of causing malignant pustule by carrying the contagion of anthrax from diseased animals or animal substances to man. During the past year Dr. Alessi has been experimenting with flies to determine their liability to spread the infection of tuberculosis. The bacillus of this disease was found in the intestines of flies which had feasted on tuberculous sputa, and the bacillus being used for inoculating rabbits, the animals became tuberculous. Thus it is found that the digestive tract of the fly is harmless to the germ. Spillmann and Haushalter have also made similar researches, with the same results; and lately, according to the *Annals d'Hygiene Publique*, a Mr. Howe, who has studied the subject in the Nile country, has found that the granular ophthalmia of that region can be spread by means of house-flies passing from the eyes of those who are affected with the disease to other persons.

LEAD, SILVER AND POLITICS.

The first State election in Montana this Fall may possibly turn upon a curious point that has only recently manifested itself. In that new State lead mining is an industry of considerable importance, employing a large number of men and wielding more than enough influence to change the result of a State election. The lead miners have a grievance and have been to Washington to air it, at the same time threatening dire political vengeance if it is not attended to. The fact is disclosed that Mexican lead, which, under the tariff, is subject to a duty of 1½ cents per pound, is being admitted duty free under the guise of silver ore. The question

turns upon a point of classification. Is it silver or lead ore—which? In the former case it is free of duty, whilst in the latter it is amenable to tariff rates. The rule of construction in regard to ores, hitherto adopted by the department, is that the metal which has the preponderance in value shall determine the whole. That is to say, if there is in a given quantity of ore \$51 worth of silver and \$49 worth of lead, it is all declared to be silver ore and consequently free of duty. Silver being by far the most valuable in proportion to bulk, there need not be very much of it present to give it the preponderance in value. The owners of lead mines in Mexico have not been slow to see how the thing could be worked and are prospering by means of what is called "a smuggling device." Thirty millions of capital are invested in combined lead and silver mining in the single territory of Utah, requiring the labor of seven thousand men and yielding an output of over \$8,000,000 annually. In 1884 Mexican lead ore began to be imported at the average rate during that year at 5 tons daily. In 1888 the average daily importation had reached 225 tons, every pound of which has come in free of duty. Against this the Montana miners protest and ask to have the whole classed as lead ore. As that seems to be the proper classification for it, the change will probably be made.

THE PARIS EXPOSITION.

In the light of the hysterical praise that the majority of American correspondents in Paris are bestowing on the Exposition, the sober comment of *Science* is both refreshing and impressive. Our contemporary says: People may walk until they are fatigued through the almost endless buildings on the Champ de Mars, and yet fail to find any great and striking object by which they would especially remember the exhibition of 1889. The place is filled with evidences of untiring industry and skill on every side, but there is a strange absence of great novelties. We believe, however, that the exhibition will be famous for four distinctive features—in the first place, for its buildings, especially the Eiffel Tower and the Machinery Hall; in the second place, for its Colonial Exhibition, which for the first time brings vividly to the appreciation of Frenchmen that they are masters of lands beyond the sea; third, it will be remembered for its great collection of war material, the most absorbing subject nowadays, unfortunately, to governments, if not to individuals; and, fourth, it will be remembered, and with good cause by many, for the extraordinary manner in which South American countries are represented. Several of those nationalities are beginning to put themselves forward as appreciable factors in the politics of the world, and, what is of more interest to the manufacturer, they constitute the richest and largest customers in European and North American markets. Especially is this the case with regard to agricultural machinery of all kinds and those exhibitors are fortunate who are well represented in this respect.

THE NEXT STEP.

The beef conspirators having been foiled in their attempt to monopolize the fresh-beef business of this country by securing the passage of the so-called inspection bills by the several State legislatures are now about to imitate still further the gentlemen of the dark lantern and jimmy by trying another means of ingress into their honest neighbors' business. This time they intend to burglarize the various city governments. Their arguments make amusing reading for hot weather, they are so delightfully cool in their brazen impudence and ignorant assertion. The State legislatures are, they declare, too large and unwieldy bodies for them to handle and can only be reached by large "boodle," so they propose to make their attacks on the city aldermen. "These officials" they say, "are our neighbors, they cannot be bribed by our opponents, we can bulldoze them with threats of our influence at the next election, let us commence right here at home on our New York Aldermen." It remains to be seen whether our local Solons can be induced to surrender in this manner to the meat monopolists, or whether they will prefer to keep the city beef market supplied as now, with the best article at the lowest price.

IGNORANCE AND CREDULITY.

The era of credulity and humbug is still in full activity, and the sillier the doctrine set forth the more earnest are its disciples in maintaining it. The fact that such an impracticable speculation as that profanely designated "christian science" can find believers in this nineteenth century simply shows how fondly weak humanity cherishes theories that save it trouble, and that minister to its love of the marvelous. The fascination for holding odd notions seems to be a weakness of the human mind which is hard to eradicate. Such beliefs have been pretty well driven out of chemistry, physics and other fields of science which can be searchingly investigated, and they remain only in psychology and medicine, dealing with the living human organism, which cannot be freely experimented upon. Human credulity has been greatly lessened by the march of scientific enlightenment, and what remains has taken on a new form. In earlier times it delighted in the supernatural, now it revels in its own false ideas of the natural. Then it trusted the revelations of self-appointed prophets, now it pins its faith to the slipshod

reasoning of sham investigators. Science has done such wonderful things of late that a certain class of people, including many of excellent judgment in other fields, has come to believe any marvels put forth under its name. Hence we have a modern class of mystery-mongers which will flourish until the spread of scientific culture has diffused the power of discriminating between science and base imitations of science.

FRUITS AND VEGETABLES.

SOME SEASONABLE COMMENTS ON BOTANICAL FOODS.

Among the infinite variety of forms into which the different parts and organs of plants are developed, we find some of our choicest and most valuable food products. The leaves of many plants, like the lettuce, chiccory, dandelion, parsley, etc., are largely consumed as salad or cooked as "greens." In celery, we do not eat the leaf, but an abnormally thickened petiole, or leaf-stalk, and asparagus heads are the young shoots gathered before they develop into branches. It is highly necessary for the preservation of a plant that its seeds should be spread widely over the ground, and we find that the fully developed seeds of many plants are surrounded by a pericarp of substances attractive and palatable to animals. In the apple and quince, the calyx leaves and receptacle become altered and fleshy, to form the edible part of the fruit. The strawberry is not a true berry at all, for the fruit is not a ripened pistil, but an enlarged and fleshy receptacle, or extremity of the flower-stalk, thickly dotted over with the minute ripened ovaries containing the seed, and usually mistaken for the seeds themselves. The fig, also, consists of such an enlarged receptacle, but it has been, as it were, turned inside out, and the seed-like ovaries are on the inside. A ripened rose-hip shows the same structure in a lesser degree. Mulberries and pineapples consist of the ripened products of many flowers, placed on a common receptacle, which is itself a part of the edible mass. The Gaultheria, or checkerberry, is not a berry, but the thickened calyx of the flower, which encloses a dry pod containing the seed. The true berry is a permanently closed, ripened, fleshy pistil, inclosing the seeds. Familiar examples are the grape, currant, and cranberry, as well as the orange, pumpkin, and gourd. The peach plum, etc., are known as *drupes*, or stone-fruits, in which the inner part of the pericarp, or ripened pistil, is hard and bone-like, enclosing the seed, while outside of this is the fleshy edible layer. The raspberry and blackberry are not true berries, but are composed of a number of little drupes, or drupelets, placed together upon an elongated receptacle. In the raspberry, the drupelets are readily detached from the receptacle, but, in the blackberry, the whole coheres strongly together, and the receptacle is eaten with the rest of the fruit. A nut is a stone-fruit, or drupe, in which the fleshy part is absent. The true seed is inclosed within the shell, forming the edible part. There are other plants in which the ripened pistil opens at maturity, freeing the seeds within. The pea and bean are familiar examples. The undeveloped seeds of the former delight our appetite as green peas, while the unripened pistil and seeds of the bean are boiled together, and appear as "string beans." The modifications of roots also furnish many valuable vegetables. Most of these, however, are not true roots, but subterranean stems, as is shown by the presence of buds, or scars where buds have previously formed and dropped off. The so-called roots of ginger and sweet-flag are merely thickened portions of a subterranean stem, called the *rhizoma*, or root-stock. *Tubers*, like the potato and Jerusalem artichoke (which, by the way, is not an artichoke, and did not originate in Jerusalem), are the enlarged buds of these subterranean branches, in which a large proportion of starch has been deposited. Examples of a similar tendency to form tubers have been observed in the stems of the

potato-plant above the ground. A bulb, like the onion, is formed by the enlargement of the leaves of an underground stem, as shown by the scales or layers of which it is composed. Solid bulbs, or corms, are not true bulbs, but an enlarged underground stem. In the turnip, beet, and radish, the upper part of the root itself shares in the enlargement, so that these vegetables are of a compound nature. The object of these underground enlargements is, evidently, to lay up a store of nourishment for the plant during the succeeding season. The cauliflower furnishes an example of the use of the undeveloped flowers of a plant as an article of food, and in the true artichoke the thick, fleshy plant-scales are utilized in the same manner. We have thus seen that there is hardly any portion of a plant which may not be so modified as to become food for man. We have also seen that the strawberry, raspberry, and blackberry are not really berries, but that the squash and pumpkin are; while the potato, onion, and flag-root are not true roots. These are only a few of the interesting lessons taught by the science of botany—a science not only extremely fascinating in itself, but one which requires no expensive apparatus for its study, and for which every field, forest and roadside freely furnishes a profuse supply of material for experiment and study. —*Popular Science News.*

NERVE REST.

THE IMPORTANCE OF OCCASIONAL ABSOLUTE CESSATION OF WORK.

As there are so many degrees of nervous exhaustion, so are there many methods of restoration. What would be pleasant exercise to one might prove laborious exertion to another, and what would be soothing to one might be irritating to another. In all cases, however, complete nerve rest implies the maintenance of agreeable sensation and the avoidance of nervous agitation. It may not be possible to obtain such absolute rest as is here indicated, but the aim of treatment is to secure as near an approach to it as can be attained by legitimate means. No means is used which might injure the general health. The fact that women are more liable than men to the severer forms of nervous exhaustion is one reason why the cases quoted are chiefly those of women. Another reason is that in men it is rarely possible to study this stage of the disease uncomplicated by the effects of alcoholic indulgence. Most men who find themselves becoming victims of nervousness endeavor to escape the worries of life by taking refuge in drink, so that they usually bring upon themselves other diseases of alcoholic origin. In women this was not formerly the habit, but there is reason to believe that the late increase of inebriety among them is largely due to the spread of nervous exhaustion. On the other hand, there are many cases in both sexes where alcoholic indulgence has undoubtedly been the chief cause of the ailment. Although the most severe forms of this disease have alone been discussed, it must not be supposed that milder forms do not also require special nerve rest. This cannot be secured without more or less change being made in the ordinary mode of life. Nervous agitation is the chief cause of nervous exhaustion. It is almost impossible even for a healthy man to avoid a certain amount of agitation in connection with his affairs, while for the nervous man it is absolutely impossible. For the latter, therefore, a frequent holiday is essential. The way of spending such a holiday is a matter of urgent importance. Many nervous sufferers return home, worse than when they left. They climb mountains in Switzerland when they ought to be loitering on the seashore or lounging on the deck of an ocean steamer. They rise early "to make the best of to-day," when they had better lie several hours longer to fix the benefits of yesterday. Like the unskilled rider, who dismounts for relief,

they are frequently driven to bed to recover from their holiday exertions. The amount of exercise must be regulated by its effect on head or spine. Mere muscular fatigue may be overcome by regular walking, but nervous fatigue must be entirely avoided. If the patient cannot take sufficient exercise to sustain his appetite and digestion, he had better undergo an hour's massage daily. And when he has once gained the power of walking from five to ten miles a day without fatigue of head or spine, he ought, by constant practice, to endeavor to retain it. There is no better preventive of nervous exhaustion than regular, unhurried, muscular exercise. If we could moderate our hurry, lessen our worry and increase our open-air exercise, a large portion of nervous diseases would be abolished. For those who cannot get a sufficient holiday, the best substitute is an occasional day in bed. Many whose nerves are constantly strained in their daily vocation have discovered this for themselves. A Spanish merchant in Barcelona told his medical man that he always went to bed for two or three days whenever he could be spared from his business, and he laughed at those who spent their holidays on toilsome mountains. One of the hardest-worked women in England, who has for many years conducted a large wholesale business, retains excellent nerves at an advanced age, owing, it is believed, to her habit of taking one day a week in bed. If we cannot avoid frequent agitation, we ought, if possible, to give the nervous system time to recover itself between the shocks. Even an hour's seclusion after a good lunch will deprive a hurried, anxious day of much of its injury. The nerves can often be overcome by stratagem when they refuse to be controlled by strength of will.

COOKING AND VENTILATION.

SOME CONSIDERATIONS REGARDING GAS AND OIL STOVES.

It is a well-known fact that an individual confined in a small, air-tight chamber would soon die, poisoned by his own breath. The reason is that the oxygen, which is the only stimulating and vitalizing constituent of pure air, and without which life cannot continue, is largely exhausted by respiration, and its place taken by another gas, the carbonic acid gas, which is so destructive of life that no animal can exist in it. Man, and all animals, take in, by breathing, the oxygen, which is a part of pure air, and it is absorbed into the blood through the lungs, and is distributed to all parts of the body by the circulation of the blood. But oxygen, while it gives vitality and force to the body, also, while accomplishing that purpose helps make carbonic acid gas, the destroyer of life. The oxygen meets everywhere the worn-out material of the body and burns it. This worn-out material is a kind of fuel, which the oxygen consumes, or, in other words, decomposes, and combines with one of the constituents of the fuel (carbon), and the product is watery vapor and carbonic acid gas (carbon and oxygen united). This gas is thrown out of the body while breathing, and the oxygen taken in; and thus, if there is a deficiency of pure air, the poisoned air accumulates and the individual suffers from the deleterious effects of the carbonic acid gas to a greater or less degree, in proportion to the confinement of the air in which he is placed. It is known that there is no surer mode of destroying life than that by burning charcoal in a closed room. Charcoal is nearly pure carbon. By starting the process of combustion or burning, the combination of the charcoal (carbon) and the oxygen (acid maker) of the air, goes on with the production of volumes of a somewhat heavy, tasteless and invisible (carbonic acid) gas, which will destroy life when it forms a tenth part or much less of the breathing medium. The basis of illuminating gas is carbon, and so also of all of the oils. The product of burning gas or burning oil, or fluid derived from oil, is

nearly the same as in the process of breathing, or in the combustion of charcoal; that is, almost wholly watery vapor and the poisonous carbonic acid gas. It will be understood then wherein the danger lies in the use of gas stoves and oil stoves for cooking or heating. These stoves are a great convenience and comfort. They are also economical. For the purpose of moderate cooking they are to be recommended; but with a proviso. That proviso is, that there must be complete ventilation, unobstructed ingress and egress of atmospheric air. The combustion of illuminating gas, kerosene oil or any of its products, or any other oils, results in the production of the deadly carbonic acid gas, and the greater the quantity consumed the greater the danger, other circumstances being equal, where attention is not paid to ventilation. When using either, therefore, have the windows open or the doors ajar. They are then as safe as any stove for cooking. For warming rooms, it is obvious that neither gas nor oil stoves can be recommended. With complete ventilation, which is an absolute necessity to insure safety, the requisite warmth would scarcely be secured with the desired comfort and economy. Let no one be deceived by the assurance of any dealers that in their stoves the smoke is all consumed, or that all hurtful gases are consumed. They may assert that the absence of smell is the proof of the consumption of all harmful products, but such assertions can have no foundation in fact.—*Monthly Bulletin.*

THE EUCALYPTUS.

EXPERIMENTS CONCERNING ITS ANTISEPTIC QUALITIES.

Speaking of the growth of the industry of extracting the various alkaloids and resins from the eucalyptus tree, a recent number of the *London Globe* says: Elaborate experiments have been made in Rome by Senator Count Luigi Torrelli, and they deserve careful attention at the hands of wholesale manufacturing druggists. A number of tin pannikins were filled with pure spring water and various leaves, such as oak, orange, lemon and grass, immersed in them; also eucalyptus leaves and bark. Gradually, but at various intervals, the leaves and water showed signs of putrescence and had to be thrown away. The oak leaves preserve the water for some time, but the water in the pannikins with the eucalyptus leaves and bark remained perfectly palatable after the lapse of more than four months. The Count also placed some meat in water with leaves of the eucalyptus globulus, and in another pan a piece of veal in plain water. After seventy-four hours it was found that where the veal had been merely soaked in water the meat had become putrid and decomposed the water. The water in the pan treated with eucalyptus leaves was colored, and had a slight smell and taste of leaves, but was quite good, and the meat was in excellent preservation, and when cooked was eaten with much relish. The Count then wrapped some veal with a slight taint in a profusion of leaves of the eucalyptus globulus. At the end of three or four hours he cooked the veal in the ordinary way, and it was pronounced excellent and tender. Taking some mountain mutton with a strong and disagreeable muttony smell and flavor, he wrapped it in eucalyptus leaves for three hours. The mutton was cooked, and the objectionable taste had disappeared, though the meat had acquired slight foreign flavor from the leaves. This aroma of eucalyptus, however, was liked by all those who tasted it. We would now suggest that these marked antiseptic qualities seem to point to several ways in which purified eucalyptus extracts might be used with effect.

NOT FULL YET.—There is plenty of room on earth. Allowing 5 acres for each inhabitant, Europe has room for 115,000,000 more people, Africa for 1,336,000,000, Asia for 1,402,000,000, Oceania for 515,000,000 and America for 2,000,000,000.

RAILWAY SPINE.

A NEWLY-DISCOVERED CAUSE OF NERVOUS DISORDER.

One of the most curious developments of modern medical study, and one with an extremely important practical bearing, relates to a form of disorder following railway accidents, which is known by the name of "railway spine." To those unfamiliar with the manifestations of this disorder, it would appear almost incredible that it should play so serious a role in the lives of persons who have received injuries which often seem far from severe, and be so often the cause of protracted medico-legal contests. But one who has studied its phases, under circumstances favorable to a just discrimination between actual morbid phenomena and the simulations which are sometimes practised in order to wring money from a rich corporation, will not wonder that it is regarded as a very grave matter by medical experts, and that they warmly resent the common impression that it is frequently only a form of malingering. There can be no doubt that instances occur in which an avaricious patient and a willing or pliable physician unite to over-estimate the damage done by a railway accident, but these cases are far more rare than is often supposed; and there is, on the whole, more danger of error of being too skeptical of the real existence of a condition for which no better name has yet been suggested than "railway spine," than there is in recognizing it and endeavoring to estimate it justly. The cases which give most trouble are those in which there are few or no evidences of gross lesions in the spinal cord or its surrounding hard and soft parts, but in which there are manifestations of nervous disorder, following an accident and attributed to it, which may be deliberately affected from motives of cupidity. To discriminate between sufferers and pretenders, under these circumstances, is by no means an easy or a pleasant task for most medical men. But much help may be gained for the task by a study of what has been written by men of experience in such cases. A valuable paper on the subject, by Dr. Dercum, of Philadelphia, is in the department of the *Reporter* for pamphlet notices, No 296. In this pamphlet Dr. Dercum describes the classes of injury which are likely to follow blows or falls upon the region of the spinal column, and gives a very instructive review of the principles which should guide a medical witness in deciding upon the actual condition of a person who claims damages for such injuries. We cannot repeat, or even summarize, his conclusions, but would call attention to one point in particular in regard to "railway spine," and this is, that there are not a few cases in which, with no gross lesions whatever, a person who has never been nervous, or timid, or hypochondriacal, develops all these characteristics after a railway injury. In women, as Dr. Dercum points out, this alteration of character sometimes takes the form of hysteria, while in the case of men precisely the same condition sometimes follows participation in a railway accident. To give the condition the name of hysteria may be—except for the etymological error of the term—scientifically correct; but to permit this to blind one to the realness of the misfortune would be a grave injustice to the subject of it. Here is the most delicate question which can arise in the mind of a medical witness; and we believe that it is not untimely to say this word, to fortify any of our readers who may find it hard to meet the objections of counsel for railroad companies, who often honestly think medical men too prone to testify to the existence of evils which are not actually present. The medical witness ought not to ignore the possibility that a claimant for damages may be assuming or exaggerating the appearances of real nervous disorders; but no more ought he to permit himself to be deterred from doing justice to the victim of a railway accident, because there is a natural prejudice against charging whatever follows such an accident to it.—*Med. and Surg. Reporter.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

July.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Pigeon, chicken, duck.

FISH.—Anchovy, bass, bluefish, blackfish, cod, eels, clams, flounder, haddock, halibut, herring, lobster, mackerel, mussels, perch, porgie, prawn, salmon, shad, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Beans, cucumbers, carrots, cauliflower, egg-plant, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, radish, rhubarb, corn, beets.

FRUITS.—Cherries, strawberries, raspberries, huckleberries, melons, gooseberries, blackberries, peaches, pears, tamarinds, bananas, pineapple.

PRACTICAL RECIPES.

CALF'S HEAD, SOUSED.—Scald and bone a calf's head. Soak it for seven or eight hours, changing the water twice, then dry it. Season it with salt and finely minced sage and onions. Roll it up, bind it very tight, and boil it in salt and water, to which a pint of white wine may be added. When done put it with the liquor in a deep dish. Serve it whole or in slices, with oil, vinegar, pepper, and lemon.

LAMB CHOPS.—Cut a loin or neck into chops, dip them in beaten egg and bread-crumbs, mixed with minced parsley and lemon peel, and seasoned with pepper and salt. Fry them a light brown, in good dripping. Make a sauce with the trimmings, thicken it with butter and flour; add a little lemon-juice and mushroom ketchup. Garnish with fried parsley. They may be served with or without the gravy.

ICE-CREAM CAKE.—Make a good sponge cake; bake it in layers of one-half an inch thick; let them get quite cold. Beat a pint of thick, sweet cream, till it is very stiff; make very sweet and flavor with vanilla; blanch and chop a pound of almonds, stir them lightly into the cream, and put this very thick between the layers.

JENNY LIND TEA CAKE.—Take four cups of flour, two-thirds of a cup of sugar, one egg, one tablespoonful of butter and two heaping teaspoonfuls of Horsford's Baking Powder; mix with sweet milk the usual thickness for cake. To be eaten hot with butter.

SAUCE PIQUANTE.—Pound together, in a mortar, a tablespoonful of capers and a tablespoonful of parsley; then a tablespoonful of freshly made mustard, and the yolks of three hard-boiled eggs; pound these until they are properly mixed; wash, bone and force through a sieve half a dozen anchovies; to this add a tablespoonful of vinegar, two of olive oil, a shallot chopped very fine; add these to the former ingredients, and when about to be used stir them all into half a pint of drawn butter or strong beef gravy.

CHOCOLATE ICE CREAM.—Take two quarts of cream, one pound of sugar, one-half pound of chocolate grated, one vanilla bean, and two fresh eggs well beaten; mix all the ingredients together, stir all well, place on the fire and bring it to the boiling point; then strain, cool, and freeze.

CHERRY ICE CREAM.—Take two quarts of cream, or one pint of cream and one of soft custard, one pound of sugar, and a pound and a half of ripe cherries, (stoned and mashed), or one pint of cherry juice. Freeze the sweetened cream, and when well frozen add and work in the cherry juice or pulp with a long-handled spoon.

ALDEN'S MANIFOLD CYCLOPEDIA.

Volume XIV. takes this important work from Excluded to Floyd. In general make-up it resembles the preceding numbers of the series. We also notice the same skill in the selection and treatment of topics and the same careful editing which has characterized the work from the beginning. In fact, as it progresses its great merits become still more conspicuous. The combination of a dictionary and a cyclopedia is an excellent idea and is being well carried out. The judicious use of illustrations is a helpful feature, and the treatment of subjects is clear, direct, and practical. Thus, while it is of great value to professional men, it is also a thoroughly serviceable and helpful work for the masses of the people. Among the subjects treated in this volume are Excommunicate; Eye, 20 pages; Factory Acts; Faith and Faith Cure; Fallacy; Falling Bodies; Faraday, 2 pages; Fashion; Federal Government; Fertilizers; Festivals, 6 pages; Firearms; Fishery Treaties; Fishes; Flax; Flint Implements; Florida; Flowers. Covering the various fields of agriculture, manufacture, commerce, science, art invention, history, religion, law, biography, and politics, the work is truly *manifold* in character as well as name.

HOW TO KEEP COOL.

It is certainly tiresome to be met at every step and have the same question, "Is it hot enough for you?" propounded. Philosophically considered, the object of the questioner is to obtain the poor consolation of a corroboration of the old saying that misery loves company. Much better would it be to be told how best to keep cool. There are various ways generously provided by nature by which the human body can be kept cool, even during the most torrid and long-continued spell; and we ourselves can do much, not only to prevent our bodies from becoming overheated, but, when heated by any necessary exertion, to cause it quickly and safely to resume its normal temperature. The means provided by nature are through the lungs, the skin, and the kidneys. The lungs, by constantly supplying fresh oxygen to the blood, keep the circulation in a normal condition and thus prevent an increase of temperature by unequal circulation or clogging of the venous system. The skin, by performing its normal function of perspiration and consequent evaporation, tends to cool the surface of the body, directly by this evaporation and indirectly by carrying off, with the perspiration, the effete matter as fast as it is brought to the surface. The kidneys perform very similar offices to the skin and lungs. Laying aside for a moment nature's provision, let us look at what man can do for himself to assist nature in keeping his body cool. He can do as much, if not more, by omission as by commission. All unnecessary exercise of body as well as excitement of mind should be avoided. Overindulgence in eating and especially in drinking, by overloading the stomach and overworking the digestive organs, produce an unusual and unnecessary flow of the circulation to the effected organs and thus increase the temperature. Spirituous drinks of any kind have a tendency always to increase the surface circulation. Our clothing also has a direct influence upon our bodily temperature. It is not always the kind of material which seems the thinnest and lightest which is coolest. The fabric which will allow moisture to evaporate quickly is the best. As cottons absorb and hold moisture, and, therefore, keep a moist and clinging substance on the body, while woollens allow evaporation and keep the surface next the skin dry, the latter are to be preferred. Bathing the skin, to keep the pores open, and thus enable it to perform its functions, and also to relieve the lungs and kidneys from having its work to perform, is a very necessary help to keeping cool. Above all, it is well to remember that none of these organs will properly perform their respective functions if clogged up or obstructed, and they are all very apt to become so, even in the healthiest subject. The best and safest way to prevent this clogging and to remedy it when

it has taken place is by the continued and judicious use of a carefully prepared alterative, having cleansing and at the same time tonic properties, such as no other preparation possesses to as high a degree as Ayer's Extract of Sarsaparilla, which is scientifically compounded of the best ingredients, after an approved formula, by the old and well-known firm of Dr. J. C. Ayer & Co., of Lowell, Mass. This preparation positively maintains the system in such perfect order that, with ordinary care as to the other rules, you may be enabled to keep cool, even in the hottest season.

KELGUM.

A PROPOSED SUBSTITUTE FOR INDIA-RUBBER.

A substitute for rubber to be known as "kelgum" has been invented by Henry Kellogg, of New Haven. It is produced from vegetable oils, which are treated so as to remove all the unctuous matter, leaving a residuum of a gummy character, very much resembling india-rubber gum, though not possessing so much of the elastic quality. As kelgum is a product of oil it is unaffected by oil. As it does not retain any unctuous matters it possesses an advantage over rubber. Neither is it affected chemically or changed by the action of heat or light. It can be vulcanized exactly as rubber is, except that it is not necessary to use sulphur. Another peculiarity of the substance is that it increases in weight instead of diminishing, as is the case with rubber. It is more durable than rubber under many conditions, as when exposed to light and heat, and also in many cases where rubber is injured by heat kelgum is not. The new substance is especially applicable to beltings, both for all kinds of machinery as well as for tapes for printing presses. It is available for sail covers or bonnets, awnings, tents, mail pouches, carriage coverings and linings, canvas shoes, trunk covers, bags and reticules, book covers and binding, packing cloths and papers, cart sheeting, tarpaulin, shoe linings, telegraph and telephone wires and cables, under ground or in water, and insulators, roof covering, shoe soles, and numerous other purposes for which rubber is now used. A joint stock company has been organized in New Haven for the manufacture of kelgum.

MUMM SQUELCHED.

AN OPEN LETTER FROM MR. ARPAD HARASZTHY.

At a regular meeting of the Grape Growers and Wine Makers' Association of California, held in San Francisco June 18th, Mr. Arpad Haraszthy, in speaking of champagnes, referred to the interview with G. H. Mumm, recently published, in which Mr. Mumm stated that no good champagnes could be made in this country because our soil does not possess the necessary factors, the principal one of which was said by Mr. Mumm to be chalk. Mr. Haraszthy dissected Mr. Mumm's statements, and showed conclusively that Mr. Mumm, in the words of the speaker, did not know what he was talking about. So gross were the mis-statements of Mr. Mumm, Mr. Haraszthy said, he considered him merely a figurehead who left all his business to peasants and cellar-men. In the interview Mumm stated that in California champagne and Madeira were grown in the same vineyard on the same hillside. "Whoever told Mumm that filled up him to the crop," said the speaker. Mr. Haraszthy said he felt called upon, not only in his own interests, but in those of all the wine-makers he dealt with, to defend as far as he could the possibilities and the continued possibilities of champagne-making in California. Mr. Mumm also claimed that the American production did not possess sufficient effervescence by reason of the

lack of soil containing chalk. "Now," said Mr. Haraszthy, with a smile, "I would just like to have a contract with Mr. Mumm, by which he would pay for all the bottles that explode daily in my establishment through effervescence." Another statement of Mr. Mumm needs correction. He says that our wines are not old enough. "The older the vine, the better the wine," says he. "Now that is ridiculous, and I defy Mumm or anybody else to show me a bearing vine twenty years old. He makes other equally absurd statements that are not worth referring to. The whole amount of the thing is this: Mr. Mumm don't know anything about champagne."

Mr. Haraszthy concluded his remarks by reading to the Association, the following open letter which he has addressed to Mr. Mumm, in regard to his alleged allegations regarding California champagnes.

OPEN LETTER TO MR. G. H. VON MUMM.

Sir: Referring to a statement credited to you by the Eastern press that it is impossible to make champagne in California, I beg to ask you a few questions, to ascertain if possible, where your disinterested opinion ends, and where the desire to advance the interests of your firm begins: And as you have, without provocation, deliberately gone out of your way to injure the champagne interest of our State, I take the liberty of giving a *point* to my questions. Do you not know that climate exercises greater influence on the character of wine, than soil itself? Do you not know that while parts of California are covered with snow half the year, others have a perennial spring the year around, and still other parts vary between these extremes? Do you not know that we have whole counties lying on carbonate of lime formations, covered with light clay, mingled with silica and oxide of iron, and that this character of soil is practically the same as that existing in the champagne district. Do you really not know that the effervescence of champagne is created solely by the fermentation of sugar, and not by the character of the soil? If you knew this, as you should, then what motive induced you to say to the contrary? Have you ever studied the characteristic differences of any one of our three hundred grape varieties, in different parts of our State? If not, how can you know of our possibilities? Have you ever made a comparison of the wines of all, or any, of our different wine districts? If not how can you presume to judge of their future? Now, is it not a fact that you have never set your foot on our soil, and therefore you really know nothing whatever of the matter in question? Is it not a fact that while the champagne district produces a limited quantity of fine wine, that other parts produce large quantities of inferior, thin, acid, flavorless wines and that you yourself have admitted that these all go into the blends of the

various champagne firms? Is it not a fact that low, cheap grade wines from other parts of France are also very largely used in those covers or blends? And is it not also a fact that these wines, at the time of shipment are sweetened with syrups, artificially flavored with materials not coming from the grape nor grown on your much vaunted chalky soil? Is it not also a fact that the claim of superiority of most French champagne is owing more to the cleverness of artificially flavoring the syrups, than to your grapes, your climate or your talk? If this is not so, will you explain how certain brands take so strongly the green tea, pineapple, pear, spitzberg apple, and other flavors not natural to any grape, and never found in any pure champagne wine, until *after the syrup has been added*. In other words tell us plainly whether or not it is the flavoring of the syrup in French champagne artificially, that gives the high quality you desire our people to believe comes solely from your chalky soils? Very respectfully,

ARPAD HARASZTHY.

THE INQUISITIVE SEX.—The appointment of women on school boards does not meet with approval in all quarters. A janitor in one of the public schools thus relates his grievances: "Here I have been janitor of this school for fifteen years, and not a soul has ever been in the basement but myself, and now this woman comes to inspect the school, and the first thing she does is to ask to see the basement. And that basement," he added, plaintively, "wasn't in a fit condition for any one to see."

PRINTERS' INK.

A JOURNAL FOR ADVERTISERS.

PRINTERS' INK is just what it purports to be, "a journal for advertisers." It is issued on the first and fifteenth days of each month, and is the representative journal—the trade journal, so to speak—of American advertisers. It tells the intending and inexperienced advertiser in plain, comprehensive articles how, when, and where to advertise; how to write an advertisement; how to display one; what newspapers or other media to use; how much to expend—in fact, discourses on every point that admits of profitable discussion. If you advertise at all, PRINTERS' INK can help you. Perhaps you expend but Ten Dollars a year in advertising; if so, PRINTERS' INK may show you how to obtain double the service you are now getting for one-half the money. A year's subscription costs but One Dollar; a sample copy costs but Five Cents. Advertising is an art practised by many but understood by few. The conductors of PRINTERS' INK understand it thoroughly. Surely their advice, based on an experience of more than twenty-five years, will help you. Address:—

GEORGE P. ROWELL & CO'S

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,
By MISS M. E. BRADDON.

THE GIRL AT THE GATE,
By WILKIE COLLINS.

A BRIDE'S TRAGEDY,
By MISS MULOCK.

THE RECTOR'S DAUGHTER,
By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,
By MARY CECIL HAY.

GABRIEL'S MARRIAGE,
By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,
By ETTA W. PIERCE.

THE RIGHTFUL HEIR,
By M. T. CALDOR.

THE DOUBLE HOUSE,
By MISS MULOCK.

TWICE SAVED,
By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, profusely and handsomely illustrated, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the AMERICAN ANALYST.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

LATEST ACHIEVEMENT IN

Celluloid

Collars,

Cuffs

and

Bosoms.

GEO. CLEMENT & CO.

The Celluloid Company confidently assert that they have attained the highest improvement in their Waterproof Collars, Cuffs, and Bosoms, which has ever been reached in this line of waterproof goods. We have examined their latest improvements, and tested them by every means at our command. We are convinced that they have never been excelled, and we are ready to give them our heartiest indorsement. They are pliable, most durable of any goods on the market, and resemble linen more perfectly than any waterproof imitation. Some strangers who have little acquaintance with these goods are under the impression that celluloid is an explosive material. This is an entirely erroneous idea. We can hold celluloid upon the hottest argand burner, and it will melt, but never ignite. The linen interlining makes it much stronger than any other goods in this line. We shall be glad to have any and all of our former patrons try these goods and write us their opinion of the same.

A full assortment of Celluloid Collar Buttons at 5 cents each by mail, post paid; and Cuff Buttons from 25 cts., to \$1.00 per pair by mail. These buttons are durable and never tarnish the Collars and Cuffs.

CELLULOID COLLARS and CUFFS cost no more than linen—look better and wear longer. They never wilt from perspiration, are always white, clean and fresh; require no laundrying—are manufactured in all the leading styles for both Ladies and Gents, Girls and Boys. When soiled, simply wipe them off with soap and water. They save their cost in a week's wear. Try them.

Be sure this trade mark appears on the all goods you purchase.

Address: GEO. CLEMENT & CO., 33 East 22d Street, New York City.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

P. O. Box 1574. **THE NEW YORK PHARMACAL ASSOCIATION, NEW YORK.**

A CHARMING BOOK, INVALUABLE TO EVERY LADY.

ALL ABOUT HORSES, CATTLE, SHEEP AND HOGS.

The American Live Stock Manual.

No subject is of greater importance to the farmer than that of Live Stock, and few there are who have not much to learn regarding it. Many a man has lost a valuable animal for no other reason than that he did not know how to take care of it when well or to treat it when sick. THE AMERICAN LIVE STOCK MANUAL is a book the cost of which is but trifling, but it is simply worth its weight in gold to every man in America who owns a horse, a cow, a sheep or a hog, for it is a complete text-book, containing the fullest information regarding the care and management, feeding and rearing, of live stock, likewise directions for the cure of all diseases peculiar to these animals and of all unruly and vicious habits, for the construction of necessary buildings and conveniences, etc., etc. The following are only a small portion of the topics treated in this book: How to Judge a Horse; Feeding Horses; Raising a Colt; To Bit a Colt; To Break Horses from Pulling at the Halter; Warts on Horses; Stumbling Horses; Cure for Balty Horses; Kicking Horses; Training Vicious Horses; Galls and Sores on Horses; Raining Horses; Colic; Bots; Founder; Hay fever; Epizootic; Shying; Scratches; Ringbone; Spavin; Cribbing; Bruises and Bruises; Hide-Bound Horses; Avoiding Indigestion; Windgalls; Brittle Feet; Worms; Over-Reaching; Sprains and Grooming; Shoeing; To Make the Mane and Tail Grow; Box Stalls; Stables and Stabling; Breeding Horses upon Farms; Horse Education; Ringing a Bull; Relieving Choked Cattle; Bone Disease in Milch Cows; Marks of a Good Cow; Cattle Racks and Feed Boxes; Feeding Cattle; How Good Cows are Ruined; To Prevent Hooking Fences; Black Tongue; Lice; To Prevent Kicking; Contagious Cattle Diseases; Feeding Stock; Milking; Cooking; Feed for Live Stock; The Soiling System; Raising Calves; To Break a Heifer or Vicious Cow to Milk; Wintering Live Stock; How to Take Off a Hide; Assistance at Birth; Hollow Horn; Obstructed Teats; Black Leg; Caked Udder; Jumping Cattle; Garget; Care and Management of Hogs; Pigeries; Troughs; Pig Raising; Over-Feeding; Sanitary Management of Swine; Hoz Cholera; Paralysis; Scurvy Pigs; Preparing Food for Swine; Butchering; Fattening Hogs; Driving Hogs; To Prevent Hogs Becoming Diseased; Raising Sheep; Washing Sheep; Sheep Rot; Hurdling Sheep; To Tell the Age of Sheep; Sheep Ticks; Early Lamb; How to Make Sheep Pay; Shearing of Sheep; The Treatment of Lamb; Increasing the Growth of Wool. THE AMERICAN LIVE STOCK MANUAL is a large book of 122 pages, 12mo, with handsome cover, and is profusely illustrated. It will be sent to any address by mail post-paid upon receipt of only **Twenty-Five Cents**. Send for it! The price is but a trifle compared to its real value to every farmer.

Four Books in One! No Household is Complete Without It!

THE COMPLETE BOOK OF HOME AMUSEMENTS.

What most lives need is more sunshine. Let us banish care, have a good time, enjoy ourselves while we may. How much happier—how much better off—are those homes wherein the father and mother, and even the gray-haired grandparents, join with the children after tea in merry game or other amusement, than those wherein reticence and reserve and chilly demeanor prevail. "But," you say, "what shall we do? We read until we are tired; and we know of no amusement that we care for. How shall we employ the long winter evenings?" We have published a book to answer this question, and a wonderful book it is. It contains 64 large 3-column quarto pages, neatly bound in handsome covers, and is filled to the brim with every conceivable thing for the enlivenment of home. It is in reality four books in one, for it covers the ground usually occupied by four distinct volumes, and contains four times as much matter as any book published at the same price. It is a complete text-book for Public and Private Entertainments, Private Theatricals, Parlor Exhibitions, Social Gatherings, School Exhibitions and Evenings at Home. It is a book for old and young, grave and gay—a veritable storehouse of good things for all. It contains a number of ACTING CHARADES, with full directions how to perform them. It gives some very excellent PARLOR DRAMAS, easily acted yet very amusing. It tells all about SHADOW PANTOMIMES, and this alone we think you will say is worth the price of the book. It contains nearly fifty beautiful TABLEAU VIVANTS, and gives full and explicit directions for performing them. In it are so many amusing PARLOR GAMES that we have not attempted to count them, but we think we have almost everything, new and old, that was ever thought of in the game line. Then we come to a lot of wonderful ILLUSTRATED FRIZZES—lambent, perplexing, apparently intricate, but so easy when you turn to the proper place and learn the answers. Here also is a savory dish of RIDDLES, ENIGMAS, CHARADES, ETC.—a nice large lot of them. How young and old heads will puzzle and study over them, and how proud you will feel when you have solved one correctly. As to CONUNDRUMS, there are nearly a bushel of them, some so funny you will want to hold your sides with laughter, and what fun it will be for one of the company to read the questions and see who can guess the answers! A considerable portion of the book is allotted to PARLOR MAGIC, and here you will find hundreds of wonderful and amusing tricks, easily performed, yet exceedingly mystifying to your audience. Then there are a lot of amusing and instructive CHEMICAL EXPERIMENTS, showing how the combination and manipulation of the simplest agents will produce the most surprising results. Following these are a number of excellent DIALOGUES, comic and serious, suitable either for school exhibitions or parlor entertainments. Last, but not least, the book contains nearly fifty of the finest RECITATIONS, dramatic, pathetic, sentimental, and comic, ever written. It is handsomely illustrated, and is indeed a splendid book. THE COMPLETE BOOK OF HOME AMUSEMENTS will be sent by mail, post paid, to any address, upon receipt of only **Twenty-Five Cents**.

HOW THE READERS

OF THE

AMERICAN ANALYST

MAY OBTAIN ANY ONE OR MORE OF
THE ABOVE BOOKS

FREE.

TO any one who will send us **One New Subscriber** to the AMERICAN ANALYST for one year, at \$1, we will send, **Free**, any one of the above books, to compensate him for his trouble; to any one who will send us two new subscribers, we will send any two of the books; and for three new subscribers, we will send the three books. This will be good pay for little work, for it is a simple and easy matter to get one or more new subscribers to the AMERICAN ANALYST. Show the paper to your friends and neighbors, and you will have little difficulty in inducing one or more of them to subscribe for one year. And when you have received your book or books you will feel doubly repaid for what trouble you have taken. If the parents do not wish to try it, let the little boys and girls do so after school hours. We feel sure that every one of our present subscribers and readers can readily secure for us one or more new subscribers, and we offer this special inducement in order to stimulate effort in this direction. The books will be found well worth the slight effort that will be required to secure them. Try it, and see how easy it will be.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the **AMERICAN ANALYST** a good advertising medium. Why should not you?

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose sycorious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar, we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING Co.,
19 Park Place, N. Y.

AMERICAN * ANALYST

WANTED ON LIBERAL TERMS.

WE ARE CONFIDENT that we have Reached the HIGHEST DEGREE OF PERFECTION in Solving the INFANT FOOD PROBLEM.

LACTO-PREPARATA.

A Prepared Human Milk perfectly Sterilized and especially designed for Children from birth to six or eight months of age.

Made wholly from cow's milk with the exception that the fat of the milk is partially replaced by cocoa butter. Cocoa butter is identical with milk fat in food value and digestibility, being deficient only in the principle which causes rancidity. The milk in LACTO-PREPARATA is treated with Extract of Pancreas at a temperature of 105 degrees, a sufficient length of time to render twenty-five per cent. of the casein soluble, and partially prepare the fat for assimilation. In this process the remaining portion of the casein not peptonized, is acted upon by the pancreatic ferment in such a manner as to destroy its tough, tenacious character, so that it will coagulate in light and flocculent curds, like the casein in human milk.

Composition :	ALBUMINOIDS.....	19 Parts.
	MILK SUGAR.....	64 "
	FAT.....	10 "
	MINERAL MATTER.....	3 "
	CHLORIDE of SODIUM added.....	1/2 "
	PHOSPHATES of LIME added.....	1/2 "
	MOISTURE.....	3 "

SEND FOR SAMPLE and
compare it with every other
food used in artificial feeding of
Infants.

LACTO-PREPARATA is not designed to replace our SOLUBLE FOOD but is better adapted for Infants up to eight months of age.

CARNRICK'S SOLUBLE FOOD

Is the Nearest Approach to Human Milk that has thus far been produced, with the exception of Lacto-Preparata.

During the past season a large number of Physicians and eminent Chemists visited our Laboratory at Goshen, N. Y., and witnessed every detail connected with the production of Carnrick's Soluble Food. This invitation to witness our process is continuously open to Physicians and Chemists. All expenses from New York to Goshen and return will be paid by us. The care used in gathering the milk, its sterilization, and the cleanliness exercised in every step, cannot be excelled. Soluble Food has been improved by increasing the quantity of milk sugar and partially replacing the milk fat with cocoa butter.

PHOSPHO-CAFFEIN COMP. A SEDATIVE, NERVE AND BRAIN FOOD.

(GRANULAR EFFERVESCENT.)

This preparation has been thoroughly tested, and found to produce the happiest effects in Headaches, Neuralgia, Sleeplessness and General Nervous Irritability. We are confident that the above combination will be found superior to any of the various preparations that are used in nervous affections. It is not only a nerve sedative but a Brain and Nerve Food. The depressing effects of the sedative ingredients are fully overcome by its reconstructive constituents.

As a harmless and positive remedy in Headaches and Insomnia we are certain it has no equal. It is far more palatable than any of the preparations used for similar purposes.

PUT UP IN FOUR, EIGHT AND THIRTY-TWO OUNCE BOTTLES.

REED & CARNRICK, New York.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. **THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE** is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar.** It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

ADDRESS ANALYST PUBLISHING CO.,

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making Bi-CARB. Soda from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

PRICE BAKING POWDER CO., New York. Chicago. St. Louis.

COLDEN'S LIQUID BEEF TONIC.

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of
Beef and Tonic Invigorator."

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fused Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No 2."

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)". It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

ANNULLING ABSURD LEGISLATION.

Following speedily upon the recent decision of Judge Johnston, of Indiana, declaring the beef inspection bill in that State unconstitutional, the courts of Minnesota have been appealed to for a determination of the same point within the limits of their jurisdiction. The result can be confidently predicted. The *N. Y. Commercial Bulletin* of July 17 says on the subject: "The Minnesota law prohibiting the sale of beef that was not inspected on the hoof within the State is to be tested by a case carried directly to the highest court for decision as to its constitutionality. The ground on which the validity of the law is questioned is that the exclusion of beef killed in other States is an unlawful restriction on Interstate commerce. An Indiana court has already sustained this claim, and it can scarcely be doubted that the Minnesota court will take the same view. From present appearances, the Legislatures that adopted this measure at their last session will not have time to reassemble before the enactment has been wiped from the statute books as a gross violation of the fundamental principles of our Government. The Meat Inspection bill was one of a number of measures urged on the Leg-

islatures similar in purpose and equally pernicious. The results of the experiment already tried should serve to ensure the defeat of the others."

A RUSSIAN FISH INQUIRY.

The Russian Academy of Sciences offers a prize of \$2,500 for the best inquiry into the nature and effects of the poison which develops in cured fish. The objects of competitors must be: "To determine, by means of exact experiments, the physical and chemical nature of the poison which develops in fish; to study, by experiments on animals, its action upon the heart, the circulation of the blood, the organs of digestion, and the nervous system; to determine the rapidity of its absorption by the digestive organs; and to study and describe the characteristics which may serve to distinguish contaminated fish from such as are not contaminated." The fifth and sixth questions, with which it may be impossible for any one to deal satisfactorily, relate to the means of preserving fish from the development of the poison, and to the question of counter-poisons and the medical treatment of poisoned persons. The competition is open to all. The memoirs must be sent in, either in manuscript or printed, before January 1, 1893, and may be written in Russian, Latin, French, English, or German. If none of the papers is deemed worthy of the full prize, the accumulated interest upon the above named sum may be handed over to the author who presents the best solution of some part of the problem.

STATISTICS OF AMERICAN LIFE.

One of the leading life insurance companies of this city has recently issued a book containing a statement of actuarial and medical statistics collected by its officers during the past twenty-six years. We condense herewith some of the results of general interest contained in this summary of a quarter of a century. The readers of the *AMERICAN ANALYST* will, perhaps, be somewhat surprised to learn from this authority that the period of life is greater with native Americans than among the foreign-born members of our population. Of these latter the natives of Ireland have the best record, then come the natives of Great Britain, after them the Germans, and last of all the Canadians. Among the foreign born it is the natives of Canada that suffer most from consumption, and those of Great Britain that suffer least. Relatively few Germans or natives of Great Britain die of apoplexy. Germans furnish the highest percentage of suicide of any nationality, while the deaths from this cause among the native-born Americans are very few. Native Americans are also, as a class, singularly free from diseases of the liver, which among all other nationalities give a high death rate. This comparative immunity from such disease is shared by Canadians. In the Northwestern States the mortality from zymotic diseases, including typhoid fever,

is very great, and the percentage of accidents and suicides is also greater there than in any other part of the country. The mortality from typhoid fever in the Southern States is low compared with that from other zymotic diseases, which cause there a large percentage of the deaths, while diseases of the liver are more common, and diseases of the kidneys comparatively rare. The conditions in the Southern States are apparently less favorable to life than in the other parts of the Union. The occupation most conducive to longevity is that of merchants. Next to these in expectation of life come farmers, then follow in succession doctors, lawyers, clergymen, shopkeepers and hotel keepers. It may be mentioned that among hotel and saloon keepers, brewers and wholesale liquor dealers, the deaths from consumption, heart disease, and zymotic diseases are comparatively few, while the rate for nervous diseases and diseases of the liver is extremely high. Brokers follow next to hotel keepers as regards average length of life, and then mechanics; while the very last on the list, ranking even after those engaged in occupations which are classed as "hazardous and unhealthy," are clerks and persons engaged in similar wholly sedentary occupations. The statistics show that one of the chief causes of the short duration of insurance for this class is the prevalence among them of consumption, which causes the death of almost one-third of the total number.

CHERRY GARDENING.

It is a novel proposition to us in America, notwithstanding the well-known fact that peaches are cultivated in England under glass, to learn that cherries are also grown there in this manner. A correspondent of the *Gardener's Chronicle* recently described the cherry-house at Gunnersbury Park, where many different varieties afford fruit at different times during the season. "When the trees are started into growth," he says, "a temperature of 45 deg. by day, and 40 deg. by night, is maintained. When they are in flower, plenty of air is given, and the bees are encouraged to work among the blossoms as much as possible. Scarcely any fire-heat is employed; indeed, it had been employed only once or twice in order to keep out frost. At the time of flowering, plenty of ventilation is given, top and bottom. As soon as the fruit has set, the house is closed up somewhat, and the temperature kept quite cool until the stoning process is over; then it is kept a little closer, as when the fruit has stoned it ripens quickly. It is a little difficult to thin out the fruit previous to the stoning stage, as it is uncertain which fruit will mature, and which will fail. A good watering is given to the trees before they get into flower, and then water is applied with moderation until the fruit has set. Cherries appear to do best, and set their fruit more freely, when somewhat dry at the roots, whether the trees are planted out or in pots, and it appears to be quite certain that all flower more freely when worked on the mahaleb than when on the cherry stock."

For use at the Soda Fountain and in all Pharmaceutical preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

DRYDEN & PALMER,

HEALTH HINTS.

SOME COMMON SENSE IDEAS FOR PRACTICAL USE.

One of the best ways to keep in good health is not to think or worry too much about it. If you feel strong and well, don't imagine that some insidious disease may be secretly attacking your constitution. Many people are like the inexperienced traveller, who anxiously inquired about the symptoms of seasickness, and how he should know when he had it. One generally knows when he is sick, and frequently many supposably alarming symptoms prove, upon investigation, to be either perfectly natural occurrences or of very slight importance. Eat and drink what you desire, as long as it agrees with you. Your stomach knows pretty well what it can digest. Plain, simple food is desirable, as a general thing, but the luxuries of the table, in moderation, will do no harm. Alcoholic beverages are not fit for habitual use. They are true medicines, and should only be used like any other medicines—under the advice of a physician. As a regular beverage they can do no good, but will almost certainly do harm. Take all the sleep you can get, but remember that the necessary amount varies greatly for different persons. Some must sleep at least nine hours, while others thrive under six. Only don't rob yourself of what you really need. The "midnight oil" is a terribly expensive illuminant to burn, either for purposes of labor or study. Avoid sudden changes of temperature. You cannot avoid them in New England, but you can guard against them by always wearing flannel underclothing. The lightest grade of flannel sold especially for summer wear, is a great life-preserver, and not oppressively warm, even in the hottest weather. Always treat a common cold with great respect. Ninety-nine times out of a hundred it will get well anyway, but the hundredth cold, if neglected, may lead to bronchitis, pneumonia or consumption. It is best to take no such chances. Don't trifle with patent medicines. If you are sick enough to need any medicine at all, beyond the simple household remedies familiar to all, you are sick enough to need the attendance of a physician. If your watch is out of order, you do not fuss over it till it goes, but send it to a watchmaker; but too many people, when their infinitely more delicate bodily machinery goes wrong, think they are fully equal to the task of setting it right again. They are the undertakers' best friends. Whatever else you do, don't employ any physician who advertises. There is nothing criminal in advertising, but, by common consent and agreement, all reputable physicians leave such methods of business to the traveling quacks, mind-healers, "Indian" physicians, "medical institutes," and a thousand and one other

forms of ignorance and rascality which prey upon a long-suffering people. The so-called regular physicians are not omniscient or omnipotent, but they know more about disease than anybody else, and will do all that anybody can to cure you. Don't read medical works, unless you are prepared to have all the different diseases therein described. It takes a strong mind to read a minute description of any disease without discovering some of the symptoms in himself. The quacks know this well, and their so-called "medical" books consist principally of descriptions of every imaginable symptom, appended to the most painful and fatal diseases. Remember, that if you think you have undoubted symptoms of Bright's disease, consumption, cancer, insanity, or paralysis, that you probably haven't a trace of any such disease about you. The favorite prescription of a very successful physician was "to be little lazy." This remedy ought to be used with judgment. He once recommended it to a government official, but, with most people, rest and quiet are the best possible means of cure, and a change of occupation is usually better than a total cessation of activity. By all means take as much exercise as you can, and be in the open air as much as possible. Out-door life is the natural condition of mankind, and the more one can have of it the better. The practice must not be carried to extremes, however. There are many days when one is much better off in a warm, comfortable, well-ventilated house, than trying to take out-door exercise in a mid-winter storm, or under a July sun, and no one ever strengthened his constitution by sleeping with his bed-room window open, with the outside temperature at zero, or allowing the snow to drift in upon his pillow. Fresh air, sunlight, good and sufficient food, pure water, out-door exercise, temperance in all things, and a cheerful disposition, are the chief remedies in Nature's pharmacopoeia, and are worth more than all the drugs and medicines of the shops. Dr. Holmes has truly said that if nine-tenths of all the medicines in the world were poured into the ocean, it would be all the better for mankind and all the worse for the fishes; and the best physician can do little more than to provide good nursing, and aid nature in throwing off disease.—*Pop. Science News.*

CONTAGIOUS CONSUMPTION.

IMPORTANT RULES FOR AVOIDING THE CONTAGION.

The following report on consumption as a contagious disease, was approved July 9, by the Health Department of New York City, and 10,000 copies were ordered printed for distribution:

"Pulmonary tuberculosis (consumption) is directly communicated from one person to another. The germ of the disease exists in the expectoration of persons afflicted with it. The following extract from the report of the pathologists of the Health Department explains the means by which the disease may be transmitted:

"Tuberculosis is commonly produced in the lungs (which are the organs most frequently affected) by breathing air in which living germs are suspended as dust. The material which is coughed up, sometimes in large quantities, by persons suffering from consumption, contains these germs often in enormous numbers. . . . This material when expectorated, frequently lodges in places where it dries, as on the street, floors, carpets, handkerchiefs, etc. After drying in one way or another, it is very apt to become pulverized, and float in the air as dust."

"By observing the following rules, the danger of catching the disease will be reduced to a minimum:

"1. Do not permit persons suspected to have consumption to spit on the floor or on cloths, unless the latter be immediately burned. The spittle of persons suspected to have consumption should be caught in earthen or glass dishes containing the following solu-

tion: corrosive sublimate, one part; water, one thousand parts.

"2. Do not sleep in a room occupied by a person suspected of having consumption. The living rooms of a consumptive patient should have as little furniture as practicable. Hangings should be especially avoided. The use of carpets, rugs, etc., ought always to be avoided.

"3. Do not fail to wash thoroughly the eating utensils of a person suspected of having consumption as soon after eating as possible, using boiling water for the purpose.

"4. Do not mingle the unwashed clothing of consumptive patients with similar clothing of other persons.

"5. Do not fail to catch the discharges of consumptive patients with diarrhoea in a vessel containing, corrosive sublimate, one part; water, one thousand parts.

"6. Do not fail to consult the family physician regarding the social relations of persons suffering from suspected consumption.

"7. Do not permit mothers suspected of having consumption to nurse their offspring.

"8. Household pets (animals or birds) are quite susceptible to tuberculosis; therefore do not expose them to persons afflicted with consumption; also do not keep, but destroy at once, all household pets suspected of having consumption, otherwise they may give it to human beings.

"9. Do not fail to thoroughly cleanse the floors, walls and ceilings of the living and sleeping rooms of persons suffering from consumption at least once in two weeks."

AMERICAN MEAT PRODUCTS.

OUR DOMESTIC AND FOREIGN TRADE.

DESCRIPTION OF A TYPICAL PACKING HOUSE.

The production of meat in the United States annually amounts to 3,770,000 tons of which 3,260,000 tons were consumed. Of hog products, including lard, the annual gross weight is 3,837,623,000 pounds. Although owing to unfriendly legislation in some foreign countries our exports of meats have largely decreased since 1881; they are now again on the increase, which is due to the well-known superiority of our products. One of the large producers and exporters of meats is The Jersey City Packing Company.

When a business enterprise is started, and after having erected what they considered a very large building to enable their business to be conducted satisfactorily, finds that in less than a year the building does not afford room enough, it shows that their success has been beyond expectation. Such is the condition in which the Jersey City Packing Company, G. F. and E. C. Swift, Proprietors, find themselves. They occupy a five-story brick building covering six city lots, on Ninth Street, Jersey City. No mere description could give the reader an adequate idea, we, therefore, illustrate this article. This large building is plentifully supplied with the latest improved machinery in the way of steam engines, pumps, dynamos, elevators, and two of the very best Myer's anhydrous ammonia ice machines, of a capacity each of fifty tons of ice a day. By aid of these machines a circulation of brine is maintained through iron pipes of one and a quarter inches diameter, running throughout the building, enabling the employés to maintain at will a temperature of from zero to the ordinary temperature of the air in any of the numerous rooms through the building. The encrustations on these pipes from the condensation and freezing, enlarges their outer circumference to about eight inches, and is a wonderful sight in itself. The

AMERICAN MEAT PRODUCTS.—BUILDING OF THE JERSEY CITY PACKING COMPANY

two cellars running under the entire building contain upwards of 350 pickling tanks. Each tank has a capacity of about four thousand five hundred pounds of beef or pork. The first floor contains the offices, and the cutting and packing rooms. The upper story is used for storing salt and other raw materials. Here are also the sausage meat cutters, drying and smoke houses, cooperage and general storage rooms. The other floors are used exclusively for cold storage, varying in temperature according to the kinds of goods kept therein, some goods requiring a much colder temperature than others. The variety of provisions made by this company is something quite large in itself. It is impossible for an outsider casually allowed to inspect the establishment, to remember all that was shown, but some items may be of interest. India Mess beef, extra plate, extra packet, dried beef, sausages of every kind, hams, bacon, boneless ham and bacon, pressed ham, sides, backs, shoulders, all kinds of barrelled beef and pork, lard and tallow. Two steam elevators in the building, endless overhead tramways for the rapid and easy handling of heavy goods, and railroad tracks alongside of the building connecting with every railroad terminating on the New Jersey shore, gives this firm the best facilities for handling their business.

By way of general remark, it may be added that electric lights in every part of the building, perfectly dry refrigerators, and the most scrupulous cleanliness of the floors, walls of the buildings, and clothing of the employes, gives the whole an appetizing inviting appearance. On every package sent out is put the brand of this firm, which is a guarantee taken and accepted by the community and commercial world, that the goods within the package are just what the label represents them to be. At a short distance from this packing house is the stable, another magnificent brick building, having accommodation for seventy-five horses. Most of these are of the heavy Norman Percheron breed, who, in two, three, four and six horse teams, haul the heavy trucks and wagons of the firm. Here, too, perfect cleanliness and system prevail. Everything seems to have its place and be in it. The horses look well fed and groomed, and most remarkable part of all, attesting great kindness and care, there is not a vicious

or tricky horse among them, a biting or kicking horse being unknown. A blacksmith and horseshoer are kept constantly employed to shoe the horses and make light repairs to the vehicles. A harnessmaker is employed for a similar purpose, and two men are constantly engaged in washing and oiling the harness. By a perfect fire-alarm system, every man on the premises can be instantly called to any part of the building, water buckets and other fire apparatus being kept on every floor. It may also be interesting to learn that experience has taught the superintendent that he can best keep up the health, strength and beauty of the horses

under his care, by feeding nothing but the best hay and oats.

With all this careful management, it is no longer any wonder that the brands of G. F. & E. C. Swift, have attained a world-wide reputation in every commercial city of the world, and that the present large capacity of this establishment has already been exceeded by the rapidly growing demands upon it. But such has always been the history of G. F. & E. C. Swift, in every enterprise they have undertaken; they have always done their best to do all they agreed; they have been moderate in demands of profit; they have rigidly maintained the standard and quality of their output, and above all have been businesslike and gentlemanly in all their dealings and correspondence. Having the good judgment to employ only the best men, they constantly verify the old adage, "Like priest, like people."

It would indeed be strange if they did not succeed.

BRITISH STATISTICS.—The total area in square miles of the British Empire is 9,416,032. Of this 121,248 miles are in Europe, 1,706,569 in Asia, 768,841 in Africa, 3,172,040 in Australasia, 437 in Oceania, 3,523,489 in North America, 7,913 in the West Indies, and 115,500 in South America. The total population is 312,940,710, of which 261,314,826 are in Asia, and 37,781,714 in Europe. The total public revenue is £206,608,065, and the total public expenditure £190,543,974 per annum. The aggregate value of the imports is £594,389,637, and of the exports £516,401,680, or a total trade yearly of the enormous amount of £1,110,891,317. The public debts aggregate £1,123,390,071, or a trifle more than the total of one year's trade.

NEW APPLICATION OF PLASTER.—A new process of hardening plaster, so as to make it available for the construction of floors in place of wood, has been brought before the French Academy of Sciences by M. Julte. A mixture of six parts plaster of good quality and one part of finely-sifted, recently-slacked white lime is employed like ordinary plaster. After it has become thoroughly dry, the object manufactured from it is saturated with a solution of any sulphate whatever whose base is precipitated in an insoluble form by lime. The sulphates especially recommended for the purpose are those of iron and zinc. In order to obtain the maximum of hardness and tenacity, it is necessary to temper the limed plaster well in as brief a space of time as possible, and with no more water than is strictly necessary.

AMERICAN MEAT PRODUCTS.—REFRIGERATING MACHINE PUMP, SHOWING INCrustation OF ICE.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

July.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Pigeon, chicken, duck.

FISH.—Anchovy, bass, bluefish, blackfish, cod, eels, clams, flounder, haddock, halibut, herring, lobster, mackerel, mussels, perch, porgie, prawn, salmon, shad, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Beans, cucumbers, carrots, cauliflower, egg-plant, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, radish, rhubarb, corn, beets.

FRUITS.—Cherries, strawberries, raspberries, huckleberries, melons, gooseberries, blackberries, peaches, pears, tamarinds, bananas, pineapple.

PRACTICAL RECIPES.

CARAMEL FOR SOUPS.—Two teaspoonfuls of water, one teacupful of sugar; put in a saucepan over the fire, and stir constantly till it has become dark; add half a teacupful of water and season with a little salt. Boil for a few moments, take off, and bottle for use.

ROAST BEEF WITH YORKSHIRE PUDDING.—Bake the beef as any ordinary roast; half an hour before it is done take it from the pan and lay it on the grating in the oven, putting in the pan directly under it a smooth batter made of a pint of milk, three eggs, three cupfuls of flour, salt. Cook for half an hour, and serve the pudding in slices arranged around the meat.

HORSFORD GRAHAM MUFFINS.—Two cupfuls of Graham flour, two cupfuls of white flour, two heaping teaspoonfuls of Horsford's baking powder, two table-spoonfuls of sugar and a teaspoonful of salt, mixed thoroughly together dry. Then add one quart of sweet milk, making a thick batter. Bake immediately in muffin rings.

CURRENT PIE.—Line a pie plate with some good rich pastry, fill with ripe currants from which the stems have been removed, sprinkle plentifully with sugar, add a little water, over the top put a sprinkling of flour, put on the top crust and bake to a good brown.

LIMA BEAN SALAD.—Cover a pint of lima beans with water, add a little salt and let them cook for forty minutes; then drain and put them in a salad bowl with three or four small freshly boiled potatoes cut into slices, add a few stalks of celery, chopped, and over all pour a plain dressing. Let the salad get quite cold before serving.

ASPARAGUS OMELET.—Four eggs, two-thirds of a cupful of milk, half a cupful of cold boiled asparagus tops, or cauliflower chopped fine; beat whites and yolks together, add the milk and vegetable, season with pepper and salt, and turn into a hot, well buttered or oiled pan. Fold over double when done and serve at once.

JELLIES FROM BERRIES AND CURRANTS.—Pick over your fruit, crush it and put it in a stone jar, which set in a vessel of boiling water. Let the fruit heat slowly till you can express the juice; add an equal amount of water to the juice and boil it for twenty minutes. Dry in the oven as many pounds of sugar as there are pints of juice, add to the juice and let it heat till the sugar is entirely dissolved, when the jelly is ready to put into the glasses.

LUXURIES OF SERVICE.

HOW THE SERVANTS OF NEW YORK MILLIONAIRES ARE PROVIDED FOR.

In Mr. W. K. Vanderbilt's house the social life of the servants has been considered even luxuriously, a *Star* writer has discovered. The basement is theirs exclusively. Their entrance is by a special door. In front is a billiard room for the men, and a parlor and sitting room for the maids. Their sleeping rooms are in the mansard. These are finished in hard wood and attractively furnished. In the mansard also is a large room given over for their entertainment, where at times they may hold a servants' ball. In Mr. Marquand's house the humanities are still further regarded. A servants' elevator extends from the basement to the living rooms on the top floor. Here they have prettily appointed bedrooms and bathrooms lined with enamel tiles and answering to the most scrupulous demands of cleanliness. The house-keeper has here her suite of rooms, including a parlor. The square hall in the Marquands' house is carried to the roof and gives place on each floor to a balcony and corridor. This is not omitted on the servants' floor, where through perforated carvings they can look down on any gala scene below. Another instance of Mr. Marquand's thoughtfulness is in a stairway leading to the roof, which has been terraced. Here, instead, in the cool nights, of hanging over the area to get a breath of air, the servants can sit and enjoy the famous southwest wind that so seldom fails, and look down on the myriad-lighted town—a view in every season full of beauty. Many mistresses take pride in the servants' rooms and make show places of them. In this case the servants are obliged to keep them tidy. I was in a servant's room the other day in one of the magnificent apartments in the Central Park. A velvet carpet covered the floor and the furniture was in keeping. This degree of luxury was merely incidental. The tasteful but cheap ash bedroom sets are chosen for servants' rooms, and the clean and comely bedsteads of black enameled iron. Some mistresses go further and add book-shelves, and, possibly, a few books, according to their zeal. The prints from the illustrated papers are saved for their adornment. Young housekeepers particularly take delight in giving their personal attention to establishing their servants. In this case their shock at the ingratitude of servants who walk off in the midst of the ironing or dinner is proportionately great.

ARTIFICIAL WINE.

THE UTILIZATION OF BERRIES TO AVOID DECEPTION.

There are numerous factories in Germany which introduce beverages into the market under the name of "artificial wine" (kunstwein). But these factories of artificial wine have, says the *Victualling Trade Review*, their very doubtful point, inasmuch as great quantities of their production, when they get into the second or third hand, are sold as genuine. In order to avoid paying a good price for an inferior article, the farmer may, with some attention and industry, prepare himself his own domestic beverage, and have thus a much better and cheaper article than he can buy in the factory under the name of artificial wine, or as wine if he buys it from an agent. For the manufacture of a good domestic beverage different sorts of fruits, the residuum of pressed grapes, wine lees, berry fruits (also kernel fruits, as cherries and plums), and dried grapes may be used. Currants and gooseberries yield almost every year a good crop, and even on a small area of land they furnish so much fruit that, by adding the necessary water and sugar, a great quantity of wine can be produced. Whortleberries are very abundant in some districts. The price of sugar being rather low, the expenses are but small. For one hectolitre (nearly 26

gallons wine measure) of good domestic beverages, sugar for only about seven or eight marks is wanted. The berries contain too little sugar, and, with the exception of thoroughly ripe blackberries and sweet cherries, too much acidity. The acidity must, therefore, be attenuated and sugar added. If too little water is used, the wine becomes too sour. At the exposition in Bruchsal, Baden, in April of last year, all the new sorts of prize wines, and seven of twelve wines having received diplomas, were attenuated with water in certain proportions. The wine becomes stronger or weaker according to the quantity of sugar added. By adding too little sugar the wine becomes weak and not durable.

REASONABLE FOOD.

THE VALUE OF FRUIT AS A CORRECTIVE AGENT.

What shall we eat? This question confronts us daily. Upon its wise solution depends, to a great extent, the health and happiness of the human race. A judicious dietary is an evidence of a high state of civilization; for brain and brawn are in a general sense the outcome of the kind of food eaten, its method of preparation, and the style in which it is served and introduced into the human economy. Americans are a little astray in the matter of diet. The average table is a strange mixture of English, Dutch, French and everything else beside. There seems to be a strong tendency in human nature towards the consumption of food that is too concentrated. The old Indian chief complained that the pale faces, especially women, were dying of too much house. The modern civilized world is dying of too much eat. Some people are afraid to eat fruit, thinking that fruit and diarrhoea are always associated, when, if they understand the true cause of diarrhoea they would know that it is caused by eating meat. In hot weather meat putrefies very quickly, and during this process alkaloids are formed which are very poisonous, acting as emetics and purgatives. It is true that fruit eaten green or between meals will interfere with digestion and cause bowel troubles; but use fruit that is perfectly ripe at meal-time, and only beneficial results will follow. Acids prevent calcareous degenerations, keeping the bones elastic, as well as preventing the accumulation of earthy matters. Fruit is a perfect food when fully ripe, and if it were in daily use from youth to age there would be less gout, gall-stones and stone in the bladder. Taken in the morning, fruit is as helpful to digestion as it is refreshing. The newly awakened function finds in it an object of such light labor as will exercise without seriously taxing its energies, and the tissues of the stomach acquire, at little cost, a gain of nourishment which will sustain those energies in later and more serious operations. It is an excellent plan, with this object in view, to add a little bread to the fruit eaten. While admitting its possession of these valuable qualities, however, and while also agreeing with those who maintain that, in summer, meat should be less and fruits and vegetables more freely used as a food, we are not prepared to allow that even then an exclusively vegetarian regimen is that most generally advisable. Meat provides us with a means of obtaining albuminoid material, which is indispensable in its most easily assimilable form. It affords us in this material not only an important constituent of tissue growth, but a potent excitant of the whole process of nutrition. It has a definite and important place in the ordinary diet of man, and the wholesomeness of fruit, combined with farinaceous food as an alterative dietary, is not so much an argument in favor of the vegetarian principle, as proof that seasonable changes in food supply are helpful to the digestive processes and to nutritive changes in the tissues generally. With proper eating and drinking, there would be fewer broken-down nervous wrecks, and far more vigorous intellects. There is far too much meat eaten. Meat three times a day is more than

average town-dwelling human nature can endure. Functional disturbances of the liver, gall-stones, renal calculi, diseases of the kidneys, dyspepsia, headache, fits of ill-temper or of the blues, irritability and general absence of the joys of life are largely due to an excess of meat and other highly concentrated food. These conditions, like attacks of gout and dyspepsia, are the unfortunate possession of those who will have them. Ignorance of the law is no excuse. What shall we eat? As a preliminary answer we reply—eat more fruit.—*Medical Classics.*

MOSQUITOES.—To expel mosquitoes, take of gum camphor a piece about one-third the size of a hen's egg, and evaporate it by placing it in a tin vessel and holding it over a lamp, taking care that it does not ignite. The smoke will soon fill the room and expel the mosquitoes, and they will not return, even though the windows should be left open all night.

HOW TO DRINK SODA WATER.—"Soda-water is good," said a physician, "provided that you do not get too much of the syrup. That is not always wholesome. But if you want a good morning drink, tell the soda boy to sprinkle a little salt in a glass, say enough to cover the bottom, then pour in a little Horsford's acid phosphate, and next fill up with the pure soda. It will bite your tongue, but it will do your stomach good."

THE CHAMBERMAID CURE.—The Queen of Sweden is undergoing peculiar treatment to restore her nerves to a normal condition. Her doctors have ordered her to rise early, make her own bed, and dust and sweep the room. She has to take a walk in the garden before breakfast, work among the flowers afterwards, and lead an active out-door existence all day long. Already the Queen has been benefited by this curious cure—the chambermaid treatment, as it is called. It is not likely to become popular.

THE BANANA.—The true eating banana, or "madura," is said to be unknown in northern countries, the varieties we import being simply those which are used in the land of their growth for cooking-purposes. *Garden and Forest* states that many varieties of the madura are recognized, each of which is distinct in flavor. The smaller are the more delicious; and the smallest of all, the so-called "lady-finger banana," with a skin hardly thicker than paper, is the most highly prized. Green cooking-bananas are peeled, and roasted in the ashes, and eaten with butter; partially ripe ones are boiled for a few minutes with the skin on, and eaten with syrup or honey; and ripe ones are sliced lengthwise, and fried in olive-oil or butter.

ANTHONY OECHS,
SOLE AGENT.

See Clubbing Rates of AMERICAN ANALYST with Medical Journals, and study their advantages.

PASTEUR'S METHOD.—In his brief report for the year ending May 1, 1889, the director of the Pasteur Institute, Paris, announces the treatment of 1,673 subjects, of whom six were seized with rabies during, and four within a fortnight after, the process. But three only succumbed after the treatment had been completely carried out, making one death in 554, or, including all the cases, one in 128.

UNDERGROUND BACTERIA.—Underground water and bacteria were the theme of a recent lecture delivered by Dr. C. Fraenkel, assistant to the famous bacteriologist, Dr. Robert Koch, in the Hygienic Institute at Berlin. The gist of the lecture was that the underground water of Berlin is free from bacteria, that this surprising fact is due to the great filtering power of the ground, and that consequently the water drawn from the artesian wells is perfectly wholesome. These results do not correspond with those obtained in New York, where the water from artesian wells has in many, if not in all, cases proved to be impure.

BUSINESS NOTES.

NIEDER-SELTERS SPRING MINERAL WATER.

The Nieder-Selters Spring, beyond question the most famous mineral spring in the world, is located in the lovely Valley of Emsbach, in Prussia, about thirty miles from Frankfort-on-the-Main, and about an equal distance from the beautiful city of Mayence. The curative properties of its water have been famous since as early a period as the ninth century. In those primitive days the spring was a popular resort for invalids, though its reputation, naturally was limited to the immediate vicinity of its locality. During the calamitous Thirty Years War, which caused such devastation in Germany, the spring was closed, but in 1681 it was opened again, for the benefit of suffering humanity. About the beginning of the eighteenth century, that important epoch when medical science received a fresh impulse concurrently with the increasing diffusion of human intelligence, the fame of the Nieder Selters water became established in the popular estimation, and from that time to the present day it has maintained its reputation, until now it is in constant demand in every portion of the civilized world. One of the best evidences that can be cited as to its excellent qualities is the fact that it loses none of its efficient properties by transportation to the most distant points, or the most opposite climates. It may seem a little singular

too, that no small part of the high reputation it commands is due to the constant efforts that have been made to flood the market with artificial imitations, which in every instance have proven so vastly inferior to the genuine article that no intelligent invalid requiring its curative benefits will partake of any brand of Nieder-Selters water, excepting that which comes direct from the world-renowned spring, and which bears the official label that attests its genuineness. The most brilliant achievements of constructive science must always fall far short of the productions of nature. Another and more insidious opposition has been encountered in the dishonest effort neighboring rivals have made, with envious persistence, to insinuate upon the public the products of several natural springs to which names have been given imitating that of the Nieder-Selters. This system of substitution, however, has been so thoroughly ventilated that the public is no longer likely to be misled by the transparent device. The medicinal spring whose beneficial qualities are of world-wide fame is now known by everybody to be the Nieder-Selters, and to have no other name or designation whatever.

SHOES.

There is nothing that conduces more to the comfort of every human being than a good easy shoe that fits snugly, looks well, endures fair wear, and that can be bought at a reasonable price. There are many people who have found by bitter experience that getting shoes

PRINTERS' INK.

A JOURNAL FOR ADVERTISERS.

PRINTERS' INK is just what it purports to be, "a journal for advertisers." It is issued on the first and fifteenth days of each month, and is the representative journal—the trade journal, so to speak—of American advertisers. It tells the intending and inexperienced advertiser in plain, comprehensive articles how, when, and where to advertise; how to write an advertisement; how to display one; what newspapers or other media to use; how much to expend—in fact, discourses on every point that admits of profitable discussion. If you advertise at all, PRINTERS' INK can help you. Perhaps you expend but Ten Dollars a year in advertising; if so, PRINTERS' INK may show you how to obtain double the service you are now getting for one-half the money. A year's subscription costs but One Dollar: a sample copy costs but Five Cents. Advertising is an art practised by many but understood by few. The conductors of PRINTERS' INK understand it thoroughly. Surely their advice, based on an experience of more than twenty-five years, will help you. Address:—

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,
By MISS M. E. BRADDON.

THE GIRL AT THE GATE,
By WILKIE COLLINS.

A BRIDE'S TRAGEDY,
By MISS MULOCK.

THE RECTOR'S DAUGHTER,
By MRS. ANN S. STEPHENS.
UNDER LIFE'S KEY,
By MARY CECIL HAY.

GABRIEL'S MARRIAGE,
By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,
By ETTA W. PIERCE.

THE RIGHTFUL HEIR,
By M. T. CALDOR.

THE DOUBLE HOUSE,
By MISS MULOCK.

TWICE SAVED,
By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, *profusely and handsomely illustrated*, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the AMERICAN ANALYST.

ANALYST PUBLISHING CO.,

19 PARK PLACE, NEW YORK.

made to order and paying high prices does not necessarily insure a good fit or comfort. The writer of this has long since become convinced that he fares better by buying a good quality of ready-made shoe, and one of the reasons for this is that long experience in catering for that trade, large purchases and heavy sales enable such manufacturers to furnish a better average quality at a much lower price. Such a house is that of Packard & Field, successors to Burt & Packard, of Brockton, Mass., whose shoes for men, women and children are for sale by all large dealers in every part of the United States. We would advise our readers, who would like a guaranteed shoe that will give satisfaction, to give the goods of this firm a trial. They will be sure to please.

BROMO-SODA.

I have used effervescing bromo-soda very extensively and can cheerfully recommend it to my professional brethren. It is of great value to those practitioners making a specialty of nervous and mental diseases. The addition of the grain of caffeine hydrobromate to the thirty grains of sodium bromide, I think a most happy idea. I recommend your bromo-soda, because I have used sodium bromide for years instead of the potassium bromide. Sodium bromide is not a foreign salt in his system, is much less depressant, can be used where the heart is extremely weak, and does not impair the integrity of the muscular tissue. Does not cause bad breath, neither does it cause acne, nor impair pharyngeal sensibility. It is much more palatable, and

has the happy faculty of agreeing with the stomach, where the corresponding potassium salt often gives us so much trouble. I find effervescing bromo-soda very valuable in cases superinduced by over-work of a mental kind. In fact, at times when over-worked, I have refreshed myself with a little in water. I use effervescing bromo-soda in dessertspoonful, rather than teaspoonful doses, desiring to spare myself the necessity of repeating. I put this quantity in a glass not quite half full of water, order it drunk while effervescing, and find it to operate as if by magic.

J. K. BAUDUY, M.D., L.L.D.,
Professor of Nervous and Mental Diseases,
Missouri Medical College, St. Louis, Mo.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

ADDRESS ANALYST PUBLISHING CO.,

—19 PARK PLACE, NEW YORK.—

Hotter the Weather Bigger the Proof.

As the weather grows warm, the sale of James Pyle's Pearline Washing Compound rapidly increases. This proves that many women recognize the fact that Pearline makes washing and cleaning very much easier than when done with the ordinary means. Proves also that summer clothing, being of delicate texture and color, will not stand the rough usage necessary when washed with soap, and establishes the fact that PEARLINE, in doing away with the rubbing, lessens the wear and tear and fills a very important place. Delightful for bathing in fresh or salt water. Its ingredients

render it harmless to the most delicate skin. Especially during the hot weather it is to your advantage to use Pearline, and only humane to supply your servants with it, and thus lighten their labors; besides you insure much better results.

Beware Peddlers and some unscrupulous grocers are offering imitations which they claim to be Pearline, or "the same as Pearline." IT'S FALSE—they are not, and besides are dangerous.
106 Pearline is manufactured only by JAMES PYLE, New York.

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose spurious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING Co.,
19 Park Place, N. Y.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

A BOOK THAT EVERY LADY NEEDS.

THE LADIES' GUIDE TO FANCY WORK.

How to make the Home Beautiful at small cost is a subject now uppermost in the mind of every lady of good taste. This book is a complete practical instructor in every description of Ladies' Fancy Work, and the only first-class work of the kind ever published at a low price. It contains nearly 300 illustrations, and the instructions given are so plain and simple that by their aid even a child may make the many beautiful things which the book describes. It gives plain and practical instructions in Drawing, Oil Painting, and making Wax Flowers; likewise all kinds of Fancy Needle Work, Artistic Embroidery, Lace Work, Knitting, Tatting, Crochet and Net Work. It contains designs for Monograms, Initials, Cross Stitch Patterns, Knit Edgings, Embroidered Borders and Corners, Macramé Work, Applique Embroidery, Berlin Work, Java Canvas Work, Tricot and Buriaps, Antique Lace, Beaded Lace, Darned Net Work, Tildies, Lambrequins, Ottomans, Counterpanes, Rugs, Carriage Robes, Brackets, Wall Pockets, Waste Paper Baskets, Work Boxes, Work Baskets, Work Bags, Pen Wipers, Hanging Baskets, Catchalls, Pin Cushions, Footstools, Handkerchief Boxes, Glove Boxes, Card Baskets, Sofa Pillows, Table Covers, Table Scarfs, Screens, Scrap Bags, Hand Bags, Table Mats, Toilet Mats, Lamp Mats, Lamp Shades, Pillow Shams, Pillow Sham Holders, Curtains, Toilet Stands, Picture Frames, Slipper Cases, Letter Cases, Toilet Sets, Clothes Brush Holders, Cigar Boxes, Hassocks, Sachets, Fancy Purses, Slippers, Dressing Gowns, Music Portfolios, Knife Cases, Fans, Flower Baskets, Plant Stands, Flower Pot Covers, Shawls, Dress Trimmings, Window Shades, Feather Work, Spatter Work, Leaf Photographs, and many other things. It is a book that should be in every American household. With it as a guide you may make hundreds of beautiful things for the adornment of your home and for presents to your friends at the most trifling expense, and no employment for ladies is more fascinating and useful. The book will repay its small cost many times over in a very short time. Every lady will be delighted with it. It is a large book of 64 large 3-column pages, with handsome cover, is finely printed, and, as above stated, contains nearly 300 illustrations. It will be sent by mail, post-paid, upon receipt of price, only **Twenty-five Cents**.

INVALUABLE TO EVERY HOUSEWIFE!

THE MODERN COOK-BOOK AND MEDICAL GUIDE.

This is practically two books in one—a perfect cook-book and a perfect medical book—and there is so much in it, and so much care and pains have been taken in its compilation, that we feel perfectly safe in asserting that the Cooking department is fully the equal, in quantity and quality of contents, of any low-priced cook-book published, and the same as to the medical department, herein as compared with any low-priced medical work on the market. It is a complete encyclopaedia of domestic information, and we fully believe that no lady, after having it in the house a short time, would willingly do without it for ten times its cost. The cooking recipes number 627, and include Breakfast Dishes, Soups, Meats and Poultry, Fish, Vegetables, Salads and Relishes, Bread and Rolls, Jellies and Preserves, Puddings and Pies, Fancy Dishes, Cakes, Confectionery, Ice Cream and Summer Drinks. The compilation of this department was superintended by a practical housekeeper, every recipe will be found reliable, and it has been pronounced one of the best, most complete, and practical cook-books published. The Medical Department will be found fully the equal of any doctor book published at one dollar or less. It tells you how to cure, by simple means, available in every home, Malaria, Pneumonia, Poisons (antidotes for), Nervousness, Measles, Rheumatism, Toothache, Wounds, Sprains and Bruises, Weak and Inflamed Eyes, Dust in the Eye, Sore Throat, Scauld Head, Whooping Cough, Neuralgia, Earache, Worms, Warts, Burns and Scalds, Offensive Breath, Bleeding (to stop), Cancer, Consumption, Felons, Dyspepsia, Dysentery, Diphtheria, Diarrhoea, Croup, Corns, Liquor Appetite, Coughs and Colds, Cold in the Head, Catarrh, Scarlet Fever, Nose Bleed, Baldness, Smallpox, Sleeplessness, Ringworm, Chills, Chills, Cholera, Cholera Morbus, Bright's Disease, Convulsions, Mumps, Superfluous Hair (to remove), Hysterics, Colic, Sciatica, Biliousness, Nettle Rash, Typhoid Fever, Ingrowing Toe Nails, Abscess, Stammering, Hemorrhage, Asthma, Hydrophobia, Scrofula, Bronchitis, Lockjaw, Erysipelas, Hoarseness, Chills and Fever, Dropsy, Bunions, Fits, Dandruff, Scurf, Quinsey, Heartburn, Styes, Liver Complaint, Cramps, Corpulence, Sunstroke, Knock-knees, Indigestion, Jaundice, Gout, Prickly Heat, Ulcers, Salt Rheum, Fainting, Boils, Tobacco Habit, Gray Hair (to prevent), Cholera Infantum, Deafness, Stiff Neck, Piles, Choking, Freckles, Pimples, Sunburn, Chapped Hands, and many other ailments. It will save you many dollars annually in doctors' bills and patent medicines. Who can doubt that twenty-five cents is a small sum for such a valuable book as this would be the best and most profitable investment that could possibly be made of so small a sum? **THE MODERN COOK BOOK AND MEDICAL GUIDE** is a large book of 128 pages, neatly bound in colored covers. It will be sent by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

AVOID LITIGATION! BE YOUR OWN LAWYER!

EVERYBODY'S LAW BOOK.

Litigation is a very expensive luxury; avoid it, for it doesn't pay. Thousands of lawsuits are brought because people do not understand the simple principles of law and their own and others' rights, and there are plenty of lawyers always ready to take advantage of this lack of knowledge. The object of this volume is to impart, in a simple, concise manner, the fullest information regarding legal matters. It is to be used as a work of reference, and in all ordinary emergencies will save employing a lawyer. It is a complete compendium of business and domestic Law, by a prominent member of the New York bar, containing concise explanations of the general laws and the laws of the several States, regarding Administrators and Executors, Affidavits, Agency, Agreements, Apprentices, Arbitration and Award, Assault and Battery, Assignments, Attachments, Banks, Bills of Exchange, Checks and Promissory Notes, Bills of Sale, Chattel Mortgages, Citizens and Aliens, Common Carriers, Contracts, Corporations, Deeds and Mortgages of Real Estate, Descent and Distribution, Lower, Easement, Exemptions, Farmers' Law, Fences, Fixtures, Garnishment, Gifts, Guaranty, Guardian and Ward, Heirs and next of Kin, Homestead Exemptions, Husband and Wife, Infants, Interest and Usury, Landlord and Tenant, Libel and Slander, Liens, Limitation of Actions, Marriage and Divorce, Rights of Married Women, Master and Servant, Parent and Child, Partnership, Payment and Tender, Personal Property, Power of Attorney, Principal and Agent, Privileged Communications, Railroads, Railroad Real Estate, Receipts and Releases, Replevin, Right of Way, Seduction, Trustee Process, Warranty, Water Rights, Wills and Codicils. Together with complete forms of Acknowledgments, Agreements, Articles of Co-partnership, Assignments, Award of Arbitrators, Bills of Sale, Bonds, Chattel Mortgages, Contracts, Deeds, Executors' and Administrators' Accounts, Interest Table, Liens, Mortgages of Real Estate, Powers of Attorney, Releases, Satisfaction Pieces, Wills and Codicils, etc., etc., specially adapted for the daily use of those who are not lawyers, with directions for their preparation. Every farmer, mechanic, manufacturer, business man, professional man, merchant and householder will find the information contained in this book of great value, and will have occasion to refer to it nearly every day. It is the cheapest book of the kind ever published, and is quite as complete and valuable as other works for which four times the amount, or more, is asked. **EVERYBODY'S LAW BOOK** is a large volume of 128 pages, 12mo, with handsome cover. It will be sent by mail, post-paid, upon receipt of only **Twenty-five Cents**. Send for it! It is worth ten times the amount asked for it to any man, young or old, in America.

For School Exhibitions and Public and Private Entertainments.

The Complete Book of Recitations and Dialogues.

This book contains, so far as we know, the best and most complete collection of recitations ever published in a single volume. All the popular recitation books of the day have been consulted and the cream selected, and the result is a mammoth collection of recitations which cannot fail to answer every requirement. There are hundreds of them, and they embrace every kind and character of recitations, adapted to every need, humorous, dramatic and pathetic—from short juvenile pieces for the little boys and girls on Friday afternoons to pretentious dramatic works for the professional elocutionist. We have space for the titles of only a very few of them, as follows: "The Little Joe," "Asleep at the Switch," "The Last Hymn," "The Deadman's Journey," "The Engineer's Story," "Cripple Ben," "Two Loves and a Life," "The Mother-in-Law," "The Old Parson's Story," "Taking Toll," "The Engineer," "The Trump," "Tim's Daisies," "John Darryll's Dream," "Too Late," "The Book-keeper's Dream," "Saving Mother," "Curfew must not Ring To-Night," "The Palmetto and the Pine," "The Polish Boy," "Drafted," "The Blacksmith's Story," "The Burning Prairie," "Guilty or Not Guilty," "The Foreclosure of the Mortgage," "The Clown's Baby," "Bill Mason's Ride," "How we tried to Whip the Teacher," "Driving Home the Cows," "Somebody's Mother," "When the Tide Goes Out," "The Old Farmer's Elegy," "Widder Spriggins' Daughter," "The Light-keeper's Daughter," "How the Parson Broke the Sabbath," "Which Shall it Be?" "Somebody's Darling," etc., etc. In addition to the Mammoth collection of Recitations contained in this book, it also contains a number of fine Dialogues, mostly humorous, among which are: "Marrying a Poetess," "What's in a Name?" "The Train to Mauro," "The Graduates," "The Female Astrologer," "Proposing by Proxy," "Story-Telling," "The Morning Call," etc. Those who have sent for books of this character and been disappointed in them, owing to the meagreness and inferiority of their contents, will be happily surprised in this book, for not only is it the largest collection of Recitations and Dialogues ever sold at a low price, but great care has been taken in the selection of its contents, the aim being to include only the best. It is a splendid book, guaranteed to give satisfaction. **THE COMPLETE BOOK OF RECITATIONS AND DIALOGUES** is a large book of 64 large 3-column pages, with handsome colored cover. It will be sent by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

HOW THE READERS

OF THE

AMERICAN ANALYSTMAY OBTAIN ANY ONE OR MORE OF
THE ABOVE BOOKS**FREE.**

TO any one who will send us **One New Subscriber** to the **AMERICAN ANALYST** for one year, at \$1, we will send, **Free**, any one of the above books, to compensate him for his trouble; to any one who will send us two new subscribers, we will send any two of the books; and for three new subscribers, we will send the three books. This will be good pay for little work, for it is a simple and easy matter to get one or more new subscribers to the **AMERICAN ANALYST**. Show the paper to your friends and neighbors, and you will have little difficulty in inducing one or more of them to subscribe for one year. And when you have received your book or books you will feel doubly repaid for what trouble you have taken. If the parents do not wish to try it, let the little boys and girls do so after school hours. We feel sure that every one of our present subscribers and readers can readily secure for us one or more new subscribers, and we offer this special inducement in order to stimulate effort in this direction. The books will be found well worth the slight effort that will be required to secure them. Try it, and see how easy it will be.

CHICAGO, ILLS.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no constructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only three possessed the power of acting on starch. These brands were **MALTINE**, Corby's, Stacey & Co.'s Extract, and Keppier's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity.

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

B. H. GRITTENDEN.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain). **MALTINE** with Phosphates, Iron Quinia, and Strychnia.
MALTINE with Alteratives. **MALTINE** Perfrated.
MALTINE with Cod Liver Oil. **MALTINE** with Hypophosphites. **MALTO-YERBINE**.
MALTINE with Peppones. **MALTO-VIBURNIN**.
MALTINE with Pepsin and Pancreatine. **MALTINE** with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analysis, 'sby 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

COLDEN'S
LIQUID
BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

THE CIGARETTE DOOMED.

Observation in public places gives satisfactory evidence that the use of cigarettes is rapidly on the decline. Whether this is due to the stringent laws passed in many of the States against selling them to minors, or that smokers have come to their senses and have taken warning from their own experience and the unanimous condemnation of smoking cigarettes by the medical profession, or whether the evil practice has begun to be looked upon as a discreditable vice to be only practiced in secret, we know not; but it is certain that, as compared with the past, very few cigarettes are now smoked in public. Cigar dealers say that the sales of cigarettes have fallen off enormously. The manufacturers of these noxious things have been compelled to advertise largely to prevent the entire destruction of their business, and about the only people who can now be seen smoking the paper abominations are a few moon-faced juveniles who imagine that cigarette smoking gives them a literary aspect, or who ambitiously aim at appearing manly and graceful while poisoning the atmosphere about them, or blowing the offensive smoke through the windows of horse-cars until re-

buked by the conductors. Employers and business men generally have arraigned themselves in opposition to those who persist in the objectionable practice, and young ladies have learned to understand that the real reason why their young men smoke cigarettes is that they can smoke twenty of them, vile though they are, for the price of a very cheap cigar. It will be well for our youth when the habit becomes wholly extinct. Dr. William L. Dudley, Professor of Chemistry in the Vanderbilt University, gives the results of recent careful analytical experiments made by him in his laboratory with the smoke of an ordinary cigarette. The tests were thoroughly scientific and conclusive. The fact was demonstrated beyond the chance of doubt or question that carbonic oxide is the chief constituent of cigarette smoke, if not all tobacco smoke, and that its inhalation into the air passages and lungs must, of necessity, be exceedingly deleterious. Prof. Dudley refers to published assertions that the adulteration of tobacco with opium and flavoring drugs, and the alleged presence of arsenic in the paper, are the chief causes of the evil effects of cigarette smoking, but pronounces them unsatisfactory and insufficient as explanations. His chemical tests, he insists, have demonstrated positively the actual cause of the mischief, namely, the cigarette smoker's absorption of the carbonic oxide and other gases, causing deoxidation of the blood, and thereby impairing its power to build up the wasting tissues of the body. The cigarette habit has of late years become very common in this country. It is one of those many European importations which do our people more harm than good. Many of our young men, and some of them are neither young nor inexperienced, are literally burning out of themselves the best element of their manhood by sucking into their systems the poison of physical and mental degeneracy through the filthy cigarette. Cigar smoking and pipe smoking are bad enough and pernicious enough in all conscience, but cigarette smoking is absolutely suicidal.

ADULTERATION OF DRUGS.

The adulteration of food is a subject to which steady attention is paid by scientists; pages are devoted to it in our magazines, the press generally is studying the matter, while practically all men are learning to regard some of the food-products they daily consume with a certain amount of suspicion. The adulteration of medicinal products is a matter of kindred importance, and the regret expressed at its prevalence, by the *Inter-colonial Journal*, is well based. It is indeed "a matter affecting most seriously the reputation of physicians, and, a more important consideration, the welfare of the patients they care for." And yet a mere spasmodic voice is raised now and then in respect thereto, among those to whom the subject is of paramount importance. So feeble is this voice that its preaching reaches but a few, and those few are apt to shake their heads, wonder that there is such sinfulness in this world, and go on in the old tenor of their ways, prescribing sub-

stances which their patients may or may not receive, wondering that they obtain results at variance with their expectations, and often, in the case of new remedies, becoming persuaded that all they have read and heard about the new drug or material was utterly unreliable. It is a great pity that every medical man does not pay individual attention to the matter, ascertaining personally, at whatever cost of time and trouble, that such substances as he orders for his patients are not only pure, but also have not undergone such changes as to render them ineffective. The circle in which we are turning is a vicious one. Expensive substances are placed on the market and retailed at a price corresponding with their first cost, and at once those black sheep which exist in every trade and profession, and from whom the pharmaceutical profession is certainly not entirely exempt, seek to augment their profits by the familiar and deplorable methods of substitution and adulteration. Manufacturers of staple products, entering the list with reliable articles which they have been at great pains to originate and place before the profession, are at once hampered in their efforts and robbed of their just reward by other manufacturers who have had none of the expense of original investigation, and who place on the market articles of lower quality, hence of far less intrinsic value, at a price which tempts the retailers to substitute them for the more expensive products, or to recommend them as being "just as good." Many physicians are compelled to keep on hand and supply to their patients products which they would hesitate to prescribe, not knowing how their orders will be filled.

NEW MEAT PRESERVATIVE.

M. Jules Laroche, a teacher at Labouhere, France, has recently informed the French Minister of War that after twenty years of effort he has succeeded in inventing a valuable process for preserving meat. He declares that his method is simple and cheap and that by it the meat is kept wholesome under all conditions. He says: "By my process twenty workmen can preserve the carcasses of 1,000 oxen in twenty-four hours at an expense of 600 francs. The meat will then remain in a state of perfect preservation for six or eight months, and, in some cases, even longer; it will retain its taste and flavor and all its nutritive qualities. It may be placed anywhere, in the sun, in the rain, in the snow, may be heaped up together or kept separately, and will continue in a state of perfect preservation; whereas, meat which has been preserved by a process of refrigeration needs to be kept cold in order to retain its excellence." The Minister of War has replied by asking the inventor to make his process known in order that it might be submitted to the opinion of expert chemists. This M. Laroche declines to do, but he offers to submit the result of his process to such tests as may seem conclusive to the Department. Thus far no steps have been taken by the authorities toward testing the invention, but those who profess to know vouch for it as a discovery of the highest importance.

A HINT TO THE HEALTH DEPARTMENT.

A vile smell, aside from the nausea and unpleasant effect it produces, is always due to the decomposition of animal or vegetable matter, and therefore renders the contaminated atmosphere unfit for breathing. The Health Department of this city, under its present head, has tried to do its duty by our citizens, and we wish to give its active president a new chance to do a little more duty, and thereby earn the appreciation and gratitude of his fellow citizens. Every morning business men and women, on their way to their several stores and shops, are nauseated in front of almost every eating house and butcher shop in the city by wagons loaded with remnants of meat, fat and bones, which, while loading, are allowed to stand uncovered. As the contents of these wagons are ostensibly not to be used for human or animal food, why could we not be relieved from this stench by compelling the drivers of such vehicles to deodorize and disinfect the contents? Here, Mr. Wilson, is a chance for you.

POSSIBILITIES OF IRRIGATION.

From the western Kansas and Nebraska line to the Pacific there stretches a vast region of 1,100,000 square miles, broken into mountains, valleys and arid plains. It was long supposed that very little of that country would be available for husbandry, but the introduction of irrigation caused a great change. For many years this species of fertilization was confined to the private efforts of land owners in California and New Mexico, but under its fructifying influence the southern part of the former has become a vast garden of flowers and orange trees. It has been tried in Arizona, Colorado and Utah, and wherever the life-giving streams, have been led the result has equalled all the hopes of the experimenters. Probably New Mexico, Arizona, Nevada, Colorado, Utah, Wyoming, Montana and Idaho will yet become great agricultural States. The United States Government is turning its serious attention to the question of irrigation in those regions, and promises to make extensive topographic surveys. Americans have a talent for engineering, and they could ask no finer opportunity for the display of their talents than in solving the problem of irrigation in the land including and beyond the Rockies. That immense regions can be turned into an endless succession of fertile fields by this method, the history of ancient cities, whose ruins are now surrounded by deserts, conclusively proves to us. The plan proposed by Major J. W. Powell, director of the Geological Survey Bureau, for

continuing the irrigation survey of arid lands has met the official approval of Secretary Noble, and a quarter of a million dollars has been appropriated for the work which is to be prosecuted in Montana, Colorado, New Mexico, Idaho, Nevada, Arizona and California. If a general system of irrigation in the West furnishes the fine results hoped, it will be a great thing for the entire country, since it will add fully fifty per cent. to our arable land, and will nourish a hardy and active population.

THE PARIS EXPOSITION.

The arrangements for paying the price of admission to the Paris exhibition are somewhat peculiar. All tickets issued are of the value of one franc or 20 cents each. On week days, from 8 to 10 A. M., two separate tickets must be presented to obtain the right of entrance. From 10 A. M. until 6 P. M., a single ticket is sufficient. After 6 P. M., two tickets are necessary. On Sundays the same arrangement for morning visits is adopted, but from 10 A. M. a single ticket will serve. The regulation is fair, as it is possible to spend twelve hours in the exhibition and enjoy the evening fetes for 20 cents. Few object to paying an extra franc to have the advantage of seeing the objects when the galleries are less crowded.

A DISMAL PROSPECT.

The fight for local inspection will be more difficult next winter than it was last year, because of the blunders which must be explained away.—*Butcher's Advocate*, July 17.

That's refreshing. The whole thing was a blunder of the first magnitude, and the courts are "explaining it away" so rapidly that by the time the Legislatures convene again there will be nothing left of the revolutionary fraud excepting its unsavory memory. The real fight in the matter is that which the retail butchers are waging against the Federal Constitution.

NUTMEGS.

WHERE AND HOW THEY ARE RAISED AND PREPARED FOR MARKET.

An address on spices was delivered before the Grocers' Association, of Boston, recently by Mr. W. D. Bennett, of this city, from which we condense the following interesting particulars concerning the nutmeg:

Nutmegs grow on small trees resembling pear trees, cut down to about twenty feet in height. The flowers are very much like those of the lily of the valley; they are pale yellow and very fragrant. The leaves stand alternately on short foot-stalks; are oblong, pointed, entire bright green, and somewhat glossy on their upper surface, whitish beneath and of an aromatic taste. The fruit, which appears on the tree mingled with the flowers, is round or oval, of the size of a small peach, smooth, at first pale green, but yellow when ripe, and marked with a longitudinal furrow. The external covering, which is at first thick and fleshy and abounds in an austere astringent juice, afterwards becomes dry and leathery, and, separating into two valves from the apex, discloses a scarlet net-like membrane commonly called mace, closely investing a thin brown shining shell, which contains the kernel or nutmeg. The nutmeg tree is a native of the Moluccas and other neighboring islands, and abounds especially in that small cluster distinguished by the name of Banda, whence the chief supplies of nutmegs were long derived. But the plant is now cultivated in Sumatra, Java, Singapore, Penang, Ceylon, and other parts of the East Indies, and has been introduced into the Isles of France, Bourbon, Cayenne, and several of the West India islands. A fine tree in Jamaica has

over four thousand nutmegs on it yearly. The tree begins to bear when ten years old, and goes on improving for a hundred years. The fruit is gathered two or three times a year. Three sorts of nutmegs are distinguished—namely, the male or barren, the royal, and the queen, the last of which is small and round. The nutmeg is propagated from fresh seeds (nutmeg), and these vary in size and shape, just as apples and pears do when raised from seeds. There can hardly be a more profitable crop than the nutmeg at present prices. The annual yield of a good tree of sixteen years' growth is about ten pounds, covering about five hundred square feet surface, which, at an average of forty cents per pound, gives a value of produce per acre per annum of over three hundred dollars, including mace. The fruit of the nutmeg takes nine months to mature, and one hundred pounds of nutmeg produce one pound of mace. A good nutmeg should be round, large and heavy, of a drab or light-brown color, and finely marbled in the cross section. Its virtues are extracted by alcohol and ether. Eighteen ounces of good sound nutmeg will yield four ounces of oil. The volatile oil is obtained by distillation with water. By pressure with heat an oily matter is procured from the kernels, which becomes solid on cooling, and is commonly, though erroneously, called mace. Nutmegs have been punctured and boiled in order to extract their essential oil, and the orifice afterwards closed so carefully as not to be discoverable unless by breaking the kernel. The fraud may be detected by their lightness. The Dutch were formerly said to heat them in a stove in order to deprive them of the power of germinating, and thus prevent the propagation of the tree. The Dutch used to have all the nutmeg trade, as they owned the Banda Islands, and conquered the other traders, and destroyed the trees to keep the price up. They once burned over three piles of nutmegs, each of which was as large as a church. Nature did not sympathize with such meanness. The nutmeg pigeon, found in all India islands, did for the world what the Dutch had determined should not be done—carried these nuts, which are their food, into all the surrounding countries, trees grew again, and the world had the benefit. The practice of liming nutmegs has been sadly abused; it is used principally for making slightly and marketable those nutmegs which at one time would have been altogether rejected. The long or wild nutmeg is distinguished from that just described by its much greater length, the absence of the dark-brown veins, and its comparatively feeble odor and disagreeable taste. It has been called male, wild or long nutmeg, the other being designated as the female, or cultivated nutmeg. The concrete or expressed oil of nutmeg, commonly called oil of mace, is obtained by bruising nutmegs, exposing them in a bag to steam, and then compressing them slightly between heated plates. A liquid oil flows out which becomes solid when it cools. Nutmegs are said to yield from ten to twelve per cent. of this oil. The best is imported from the East Indies in stout jars; it is solid, soft, unctuous to the touch, of a yellowish or orange yellow color, more or less mottled, with the odor and taste of nutmeg. An artificial preparation is sometimes made from genuine oil; it is made by mixing fatty matters, such as suet, palm oil, wax, etc., adding some coloring substance and giving flavor to the mixture by the volatile oil. Nutmeg unites with the medicinal properties of the ordinary aromatics considerable narcotic power. In the quantity of two or three drachms it has been known to produce stupor and delirium; and dangerous, if not fatal, consequences are said to have followed its use in India. It is employed to cover the taste or correct the operations of other medicines, but more frequently as an agreeable addition to farinaceous articles of diet, and to various kinds of drink, in case of languid appetite and delicate stomach. Nutmegs imported to this country are generally limed and packed in cases of piculs and half piculs (a picul being 133½ lbs.), and the mace in half picul cases, and packed very tightly; but the finest and brightest kind is usually shipped to Europe.

SPONGES.

MICROSCOPIC ANATOMY OF SALT WATER SPONGES.

Taking the *Halichondria panicea* as a familiar illustration, hardly describes the anatomy. The surface is smooth, rising into low elevations, which are surmounted by crater-like openings. If the specimen is quite fresh and healthy, the existence of strong currents streaming out of these openings, or "oscula," may be demonstrated by placing a drop of carmine dissolved in sea water in the neighborhood of an osculum, when the upstreaming current will carry the color in, some of the particles being drawn to the surface of the sponge, others penetrating through microscopical apertures or pores, causing a distinct coloration. Under a lens the surface of the sponge is seen to consist of a thin membrane, "dermal membrane," supported by a reticulum of spicules, which, under a low power of the microscope, appears as a network of interlacing bundles of spicules embedded in a gelatinous substance, the sponge-flesh, and lie more or less parallel to the surface of the animal. The spicules of the rest of the sponge are also gathered into interlacing bundles, but lie in all planes. Each of these spicules, which may be straight or slightly curved, has the form of a delicate, elongated, double-pointed rod, which in section appears rounded, with its sides parallel throughout the greater part of their extent. The sponge-flesh will be seen to be pierced by the pores mentioned above. The oscula will be seen in sections to be the orifices of large tubes, into which smaller canals open, the lumen of the large tube being eventually lost in the smaller ones. The pores open into spaces beneath the dermal membrane. The current enters through the pores, passes through a number of delicate canals into larger, and finally into the largest, emerging as exhalent currents of the oscular. These currents are maintained by the lashing movements of flagella which line the walls of the enlargements mentioned.

METROPOLITAN MORTALITY.

MORTUARY STATISTICS OF THE CITY OF NEW YORK FOR 1888.

A preliminary report in relation to the mortality of the City for the year 1888 has just been presented to the Board of Health by Dr. Roger S. Tracy, the assistant sanitary superintendent; and the deductions made in it, are somewhat remarkable. The sanitary police took a census of the tenement-house population during the year, which includes all the houses that are more or less constantly under the supervision of the board of health, but not the better class of apartment houses. The entire population included in this census was 1,093,701 persons, among whom there were 24,842 deaths, while the total number of deaths in the city was 40,175. The highest death-rate, 26.60 per thousand of the population, is in the district south of 14th Street and west of Broadway. The next highest, 23.52, is in the district west of Fifth Avenue and between 14th and 59th Streets, in which are situated a large proportion of the residences of the wealthiest citizens; and the third highest is the district east of Broadway and south of 14th Street, the most densely populated part of the city, and containing almost exclusively a tenement-house population. The general tenement death-rate was 22.71, while the general death-rate of the city in 1888 was 26.33, and this fact would seem to indicate that the population of this city has been underestimated and the quoted death-rate too high, or that all the deaths belonging in tenement-houses had not been credited to them, or else that the death-rate is actually lower for the tenement-house population than for the rest of the city, which would certainly seem most extraordinary. It might be that deaths that should have been credited to the tenement-houses have not been so credited; but of the total number of deaths in institutions, 7,774, the

former place of residence of the individuals was ascertained in 3,444, and these deaths have all been credited to the houses in which they had lived. In all the districts the death-rate of persons five years of age and over, as a rule, decreases as the number of tenants increases; while the death-rate of children under five years of age increases up to a certain point, diminishing when there are more than eighty tenants to a house. The general death-rate is highest in houses containing from sixty to eighty tenants; and this is caused by the higher death-rate among the children, which reaches in these houses 114.04 per 1,000 living. The results of the investigations are summed up by Dr. Tracy as follows: "The death-rate in tenement-houses is less than the general death-rate of the city. The death-rate in large tenement-houses is less than in the smaller ones. While diarrhoeal diseases and diphtheria show a greater death-rate in the larger houses, phthisis and pneumonia show comparatively little difference; that difference, however, being in favor of the larger houses. The greatest general death-rate among persons over five years of age, the next to the highest death-rate from diarrhoeal diseases and pneumonia, and markedly the highest from phthisis, are in the district south of 14th Street and west of Broadway. The excessive mortality in this part of the city is probably connected with the great number of old houses and the dampness of the soil. These results are much at variance with what was expected. It seems to be sufficiently established that people do not live under such extremely bad sanitary conditions in the tenements as they have been supposed to."

TOBACCO SMOKING.

WHERE DID THE HABIT FIRST SECURE ITS HOLD?

It has generally been supposed, says the *New York Sun*, that the uses of tobacco were not known outside of America and some of its islands before the discovery of the western world. While convincing proof to the contrary has not been obtained, the explorations of recent years have raised the question whether the tobacco habit in the fifteenth century was not more widely prevalent than has been believed. It is learned that among many of the Pacific islands the natives used tobacco long before they were visited by white men, and there is no tradition among them of a time when their fathers did not understand the culture and uses of the tobacco plant. Throughout inner Africa also the use of tobacco is universally known and there is every reason to believe that some of the varieties of nicotiana in common use are indigenous. For all we know to the contrary the savages of Central Africa, who were quite unknown at the time Columbus discovered America, were puffing their pipes long before he made himself famous. There is no doubt that the discovery of American tobacco had considerable influence upon the tobacco habit in Africa, if it did not actually introduce it. Our common Virginia tobacco was carried far up the Nile to equatorial Africa long before white men penetrated that region. Schweinfurth was the first to discover that this imported plant is in use among several of the Bahr-el-Ghasal and Welle-Makua tribes, and it is a curious fact that the savages who use this exotic have no native name for it. Each tribe has its own name for the native variety of tobacco, but the appellations the Africans apply to the imported plant show unmistakably that they are derived, one and all from the word tobacco. So far as this large region at least, is indebted to America for an improved quality of the weed, the obligation seems to be acknowledged in the names given to the article. But the indigenous varieties are far more prevalent, and are largely used even where Virginia tobacco is cultivated. And since the foreign source of the exotic has been so easily discovered in the language of the people, it seems not unreasonable to suppose that in the greater regions to which it has not extended, and where no foreign in-

fluence is discernible, the smoking habit had an independent origin. It is not at all certain that the white man has a prior claim even upon the invention of the cigar. In all parts of New Guinea, the largest island in the world, that have yet been visited, tobacco is cultivated, and in some of these districts the humble pipe contributes nothing to the enjoyment of the weed and is not even known. Dr. M.— saw natives with crude looking cigars in their mouths who had never seen a white man before and thought he had dropped from the sky. Dr. Finsch, who some years ago explored the coast for hundreds of miles, says the natives of the whole northeast coast of New Guinea, though inveterate smokers, had never heard of a pipe and returned those which he gave them as articles for which they had no use. He says they roll the partly dried leaves into a rude cigar, and not being blessed with Havana wrappers, they tie around their cigar a large green leaf from a tree. Doubtless the vilest leaves sold on the Bowery are superior to these products of Papuan ingenuity, which hold fire so poorly that a live coal is always at hand to revivify them. But they suit the native taste, and the people seem to regard those who draw tobacco-smoke through a pipe-stem as belonging to an inferior order of human beings.

FEMALE STOCK GROWERS.—Colorado is said to have 1,000 women stock growers.

GREAT MORTALITY.—The news comes from Madras that that portion of the world is ravaged both by famine and cholera. The Province of Ganjam is where the epidemic has reached its greatest intensity. The official figures put the deaths at one thousand per week from cholera.

TO CLEANSE FILES.—To cleanse and sharpen a file which has become clogged, a mechanic recommends removing grease by means of a solution of potash and water, and then dripping in a solution of 8 parts water, 8 parts sulphuric acid and one part nitric acid. The files should afterwards be washed, dried and oiled.

STEEL HOOPS.—A corrugated steel hoop has been invented which is said to be elastic and firm, hugging a package tightly. Four steel hoops will take the place of ten wooden hoops on a flour barrel. They are cheaply produced by the aid of electricity, a hoop being welded in two seconds. They are made at Worcester, Mass.

OVER-EDUCATION.—During a discussion over the educational budget in the Belgian Senate recently, a member attracted attention to the constant increase in the number of students at the universities—an increase which showed, in his opinion, that the examinations were too easy, and which threatened to overload the liberal professions.

CHOKING THE EYES.—Professor Dr. Foster, director of the University Ophthalmic Clinique at Breslau, has recently drawn the attention of parents and pedagogues to what he believes is often the cause of shortsightedness in the young—namely, that they are allowed to wear collars which are too tight for them. In three hundred cases that had come under his notice, the patients were suffering from a chronic complaint brought on by a disturbance in the regular and normal flow of blood, caused by the wearing of collars which were not large enough.

ELECTRICITY AND LIGHT.—Dr. Moser (*Eder's Jahrbuch für Photographie*) draws attention to the following curious phenomena: The leaves of an electroscope are caused to diverge by charging with, say, 150 cells. On allowing a ray of direct sunlight to fall on the instrument, the divergence is increased, and it returns to its original amount when the light is cut off. A common match (sulphur with phosphorous tip) will glow in the dark when brought close to a charged body such as the cover of an electrophorus. The mercury in a capillary electrometer falls when a ray of sunshine falls on it, just as it does when connected to the zinc of a battery. The effect is distinctly electrical, not thermal, as it vanishes when the upper and lower mercury columns are short-circuited by a wire.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

August.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal, venison.

GAME AND POULTRY.—Pigeon, chicken, duck, woodcock.

FISH.—Anchovy, bass, bluefish, blackfish, cod, eels, crabs, clams, flounder, halibut, herring, lobster, mackerel, mussels, porgie, prawn, salmon, turtle, trout, sturgeon, whiting, weak-fish, rockfish.

VEGETABLES.—Beans, beets, cucumbers, cabbage, carrots, cauliflower, corn, egg-plant, lettuce, onions, parsley, parsnips, potatoes, squash, shallots, spinach, turnips, radish, rhubarb, tomatoes.

FRUITS.—Cherries, raspberries, huckleberries, melons, gooseberries, blackberries, peaches, pears, tamarinds, bananas, pineapple, grapes, plums.

PRACTICAL RECIPES.

CREAM PASTE FOR MEAT PIES.—Three cupfuls of white and Graham flour mixed in equal parts, one cupful of sweet cream, two teaspoonfuls baking powder. Keep the ingredients in a cold place until ready for use. Take out a little of the flour for rolling the paste, and to the rest add the baking powder and a little salt, sifting it with the flour three or four times. Wet with the cream, stirring lightly until it can be rolled out, but avoid much kneading. As soon as the paste will hold together roll it out.

VENISON SOUP.—Take four pounds of freshly-killed venison cut off from the bones, and one pound of ham in small slices. Add an onion minced, and black pepper to your taste. Put only as much water as will cover it, and stew it gently for an hour, keeping the pot closely covered. Skim it well, and pour in a quart of boiling water. Add a head of celery cut small, and three blades of mace. Boil it gently two hours and a half; then put in quarter of a pound of butter, cut small and rolled in flour, and half a pint of Port or Madeira. Let it boil quarter of an hour, and send it to the table with the meat in it.

MUTTON KIDNEYS BROILED.—Skin and split, without parting asunder; skewer them through the outer edge and keep them flat; lay the opened sides first to the fire, which should be clear and brisk; in four minutes turn them, sprinkle with salt and cayenne, and when done, which will be in three minutes afterwards, take them from the fire, put a piece of butter inside them, squeeze some lemon juice over them, and serve as hot as possible.

RICE MUFFINS.—One pint sifted flour, two heaping teaspoonfuls Horsford's baking powder, and a little salt. Thoroughly mix together; then add one cupful cold boiled rice, two eggs, one tablespoonful butter and enough sweet milk to make a thick batter. Bake immediately.

CANNED OYSTERS.—Choose large fresh oysters, just from the shell if possible. Split and toast Boston crackers, or pieces of stale bread cut round to fit the bottom of "patty pans." Put the liquor from the oysters in a stew-pan on the stove, boil and skim, season with pepper, salt and butter. Put the crackers or toasted bread into the "patty pans," moisten with the hot liquor, fill the pans with the oysters, putting on each oyster as it is placed in the pan a bit of butter, a little salt and pepper, and, if you choose, a drop of lemon juice. Bake fifteen minutes in a very hot oven, set the "patty pans" on plates and serve.

CURRY OF TRIPE.—Boil two pounds of double tripe until every part of it is very tender; cut it into slips. Peel two large onions and cut them into slices, and stew them until brown with three tablespoonfuls of fresh butter; stir frequently, and mix in a heaping tablespoonful of curry powder. Add a cup of milk and the tripe. Stew altogether for an hour or so, skimming carefully. Serve in a deep dish with a dish of rice.

COOKED MAYONNAISE DRESSING.—Put four tablespoonfuls of vinegar in an earthen bowl and let it come to a boil; add to it the well-beaten yolks of four eggs. Set in a pan of boiling water and let cook until stiff, stirring well. Take from fire; add four ounces of butter, and stir until cold and well mixed; season with pepper, salt, mustard, etc., and thin with sweet cream as much as desired—or oil may be used instead of the cream. If the dressing is not perfectly smooth, rub it through a hair sieve.

PACHYDERMATOUS TOUGHNESS.

THREE YEARS REQUIRED FOR THE TANNING OF AN ELEPHANT'S HIDE.

As an example of the tannage of huge hides, the following is a detailed account of the process, step by step, of tanning the skin of an elephant, weight about 8 cwt., or 896 lbs., and having a thickness of 1½ inches. The skin had been felled in a tank of pure water in order to make it green again; every day it was felled for an hour with the bickern, and every other day it was struck with the iron. After soaking for ten days in pure water it was put for ten days into water to the degree of 4 per cent., and soaked again for twenty days in pure water. The skin had thus been soaking forty days, and nevertheless it had only just again reached the green stage. The head and feet portions weighing about 1 cwt., were then removed and the skin taken to the unhairing stove. After being there for the space of a day it was placed in a pit containing lime, to which had been added some caustic soda and a little soda of sodium in the following proportions: Water, 1,000 parts; slack lime, 25 parts; caustic soda, 3 parts, and sulphur of sodium, 2 parts. After remaining two days in this bath the skin was rinsed in pure water at 20 degrees of temperature, then remitted to the stove for a day and replaced in the pit. After this double operation had been repeated three times the skin was ready for depilation. This operation took nearly a day to perform, and about 27 lbs. weight of hair was removed. Another day was spent in the fleshing and trimming, and by this time the hide had lost 30 per cent. of its weight. The operations of dressing lasted two months. They were carried on in absolutely the same way as in the case of an ox hide, with only this difference—that each operation took treble the amount of time. The skin was laid in the tan-pit with ox hides, being placed in the middle; six powderings were given—two firsts, two seconds and two thirds. On the whole, the tanning of the hide took 1,066 days, or three years to complete, the time being divided as follows: Re-greening, 40 days; river work, 16 days; dressing, 50 days; repeats, 60 days; first pit (double), 200 days; second pit (double), 300 days; third pit (double), 400 days; total, 1,066 days.

HUMANITY'S GROWTH.—The human race is increasing 30,000,000 yearly.

HAIR LOTION.—A solution of chloral hydrate, five grains to the ounce of water, will clear the hair of dandruff, prevent its falling out from that cause. It is also claimed that partial baldness may be cured by this means.

IVY POISONING.—The plant, *Grindelia robusta*, bruised and applied as a cataplasm, is said to relieve the pain, and cure the affection in poisoning by the ivy oak. A strong decoction is almost equally efficacious, locally.

TREATMENT OF CORNS.—Dr. C. McDermott writes to the *British Medical Journal* that a saturated solution of salicylic acid in flexible collodion is an excellent remedy for corns. The corns should be painted twice a day. It takes about twelve days for their complete removal.

IRON RAILS.—There should be much encouragement for American steel rail-makers in the fact that there are nearly eighty thousand miles of iron rails to be taken up and relaid with steel rails. The iron rails are rapidly wearing out, and it is only a question of time when they will be taken up.

OUR BOUNDARIES.—The most eastern point of the United States is Quoddy Head, Me.; the most northern point is Point Barrows, Alaska; the most western is Alton Island, and the most southern Key West. Working from these four points, many will be surprised when they locate the geographical centre of the United States.

SURE SIGN.—*Citizen* (to physician)—I say, doctor, do you know anything about Brown's financial standing in the community. Is he prompt?

Physician—Well, all I know is that I have been his family physician for seven years, and he's always paid me; and a man who will pay his doctor's bill will pay anything.—*N. Y. Sun.*

PREVENTING TUBERCULOSIS.—The German war minister has decided that the chest of every soldier shall be examined once a month. If the chest does not reach a certain breadth, and does not develop with drill and athletic exercises, the soldier will be disqualified, and regarded as predisposed to phthisis, and, moreover, likely to infect his comrades.

THE LUCKY ONES.—It is estimated that there are at least 5 American citizens who are worth \$100,000,000 each; 5 worth \$50,000,000 each; 10 worth \$30,000,000 each; 10 worth \$20,000,000 each; 50 worth \$10,000,000 each; 100 worth \$5,000,000 each; 200 worth \$3,000,000 each; \$500 worth \$1,000,000 each, and 1,000 worth \$500,000 each.

SHOOTING FLIES.—A Louisville druggist kills the swarms of flies about his soda fountain in a novel way. He discovered that insect powder is of almost as rapid combustion as gunpowder, though the flame lives several seconds. By a further investigation he discovered that a portion of the powder, thrown from the bellows through the flame of a lighted match held six inches away, produced the required flame, and was capable of destroying flies by the million. He therefore puts out some bait for them every morning. When they have collected in sufficient numbers he gets his powder and match, and the work of destruction is sure and swift. No guilty fly escapes the scorching of the wings. By this means all the flies in the store can be destroyed in a few minutes.

THE SECRET OF THE SEA.

From time immemorial the sea has been regarded a source of health. Long before the time of Christ wealthy invalids from inland cities sought its shores to regain the strength and life they could not find at home. Physicians, from Esculapius down to Willard Parker, have ever advised their patients to utilize its benefit, whether by ocean voyage, living in coast resorts, crossing from continent to continent, or bathing in some sacred gulf, it mattered not. The virtue of the sea, in this regard, has been more and more appreciated with the flight of years. Of this our own sea-board affords abundant evidence. From Maine to Florida, upon the Atlantic coast, and from Vancouver's Island to Lower California, on the Pacific, are long lines of summer and winter resorts where millions flock to recuperate and grow strong. Many were the theories advanced to explain the healthfulness of sea air and sea water. Most of these to-day, in the broad light of modern science, seem puerile and even ludicrous. Classical scholars declared that Hygeia, the Goddess of Health, was a blood relation of Neptune, the great ocean divinity. Astrologers preached that the ocean was influ-

enced by the moon, especially when in the celestial house of health and strength. Alchemists taught that the sea contained the secret elements of life, and that in fish and seaweed, ocean breezes and salt water lay the ingredients of the fountain of immortal youth. The force of these theories can be easily seen by anyone who will take the trouble to read the prolix medical authorities of the past. Everywhere he will find a blind idolatry of the sea and its numberless products. Despite science this still exists to-day. People still call fish "brain food." Byron alludes to oysters as "amatory food." Consumptives consume cod-liver oil in vast quantities, and the Irish and Scandinavians use Irish moss as an anti-scorbutic and febrifuge. Beneath all this is a substratum of truth which is made manifest by chemical science. In the sea and its products is a minute quantity of iodine which appears in its most benignant form, iodide of potassium. In a diffused state it forms part of every waft of air that blows across the ocean, and in larger quantity it enters every fish and creeping thing that inhabits the great waters of the earth. Its action upon the human system is simplicity itself. It merely stimulates the secretive functions and, in all probability, exercises a tonic influence upon the pneumogastric system. In doing this it has no equal and no superior. In expelling from the body injurious and poisonous elements and compounds, such as mercury, arsenic, antimony, lead, zinc and silver, it stands alone. These disease and death-producing substances are terribly unlike those of the vegetable kingdom. Once introduced into the human organization they remain working evil until expurged. Workmen in white lead works, miners in the mercury deposits of Almaden and New Almaden, manufacturers of zinc, paints and founders in type metal and other antimonial alloys, all suffer from painful, and even loathsome complaints, produced by these maleficent metals. The poison, once in, remains, and the consequent illness continues indefinitely. In the infancy of medicine these disorders were considered incurable, and the luckless victim suffered until death put an end to all. The discovery of the power of iodide of potassium worked a pathological revolution. It enabled the physician to effect cures before undreamed of, and marked a new period in the history of the curative art. To-day iodide of potassium is a standard remedy in every school of medicine. Its use has been developed to a marked extent. When formerly it was employed chiefly to expel metallic and mineral poisons from the constitution, it is now used to drive out all impurities from the body. This development is due mainly to the efforts of Dr. Ayer in his experimentation upon the manufacture of an ideal sarsaparilla. Years ago he found that the famous Honduras product effected its best results only when combined with other vegetable principles, and with the iodide

of potassium. The success of Ayer's Sarsaparilla is largely due to this fact. While the vegetable elements of the preparation act upon all the vital organs and restore their tone and efficiency, the iodides attack the heavier and deadlier causes of disease and expel them from the system. It is this fact which has made Ayer's Sarsaparilla a necessity to white lead workers, type-founders, looking-glass makers, corrosive-sublimate manufacturers, zinc paint makers, plumbers, type-setters, and the hundred and one vocations which employ the death-dealing metals and metalloids. And it is this fact, likewise, which makes Ayer's Sarsaparilla so efficient in expelling the humors of the human body and in destroying the minute impurities of the blood which, left to themselves, are bound to produce pain, sickness, and even death.

BUSINESS NOTES.

HORSFORD'S ACID PHOSPHATE

Relieves the feeling of lassitude so common in mid-summer, and imparts vitality.

NO TRUST.

One of the manufactured articles that has not gone into a "trust" is steel pens. You may, however, always trust an Esterbrook Steel Pen for its good reliable qualities.

PRINTERS' INK.

A JOURNAL FOR ADVERTISERS.

PRINTERS' INK is just what it purports to be, "a journal for advertisers." It is issued on the first and fifteenth days of each month, and is the representative journal—the trade journal, so to speak—of American advertisers. It tells the intending and inexperienced advertiser in plain, comprehensive articles how, when, and where to advertise; how to write an advertisement; how to display one; what newspapers or other media to use; how much to expend—in fact, discourses on every point that admits of profitable discussion. If you advertise at all, PRINTERS' INK can help you. Perhaps you expend but Ten Dollars a year in advertising; if so, PRINTERS' INK may show you how to obtain double the service you are now getting for one-half the money. A year's subscription costs but One Dollar; a sample copy costs but Five Cents. Advertising is an art practised by many but understood by few. The conductors of PRINTERS' INK understand it thoroughly. Surely their advice, based on an experience of more than twenty-five years, will help you. Address:—

GEO. P. ROWELL & CO'S
Newspaper Advertising Bureau
10 Spruce St., New York.

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,

By MISS M. E. BRADDON.

THE GIRL AT THE GATE,

By WILKIE COLLINS.

A BRIDE'S TRAGEDY,

By MISS MULOCK.

THE RECTOR'S DAUGHTER,

By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,

By MARY CECIL HAY.

GABRIEL'S MARRIAGE,

By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,

By ETTA W. PIERCE.

THE RIGHTFUL HEIR,

By M. T. CALDOR.

THE DOUBLE HOUSE,

By MISS MULOCK.

TWICE SAVED,

By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, profusely and handsomely illustrated, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the AMERICAN ANALYST.

Delicious Drink

Horsford's Acid Phosphate

Makes a healthful and invigorating drink with water and sugar only. It harmonizes with such stimulants as may be necessary to take. A desirable substitute for lemons or lime juice. Alays the thirst, aids digestion, and relieves lassitude.

"Dr. T. C. Smith, Charlotte, N. C., says:

"An invaluable nerve tonic, a delightful beverage, and one of the best restorers when the energies flag and the spirits droop."

Dr. J. S. Niles, Pownal, Vt., says:

"Excellent as a tonic, and refreshing as a substitute for lemonade."

DESCRIPTIVE PAMPHLET FREE.

RUMFORD CHEMICAL WORKS,

PROVIDENCE, R. I.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it.

Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

P. O. Box 1574. **THE NEW YORK PHARMACAL ASSOCIATION,** NEW YORK.

A CHARMING BOOK, INVALUABLE TO EVERY LADY.

ARTISTIC EMBROIDERY.

By ELLA RODMAN CHURCH.

Such a multiplicity of books upon the subject of Fancy Work are now offered for sale, it is often difficult for ladies to discriminate between the good and the bad. In the case of this work, however, the name of the author, Ella Rodman Church, should be a sufficient guarantee of its excellence, for a lady so well and favorably known could hardly afford to lend her name to anything not strictly first-class. This book is a complete text-book—a thorough instructor in every branch of Artistic Embroidery. With it as a guide all may become proficient in this beautiful and fascinating art, and those who are already skilled therein will find the many useful suggestions and the numerous beautiful new designs shown of the utmost value to them. The following is a partial summary of the contents: WORSTED EMBROIDERY—Crewel Work; the Crewel Stitch; Articles to be Worked in Crewels; an Embroidered Frieze; a Dag in Crewels; a Worsted Work Portiere; Curtains with Sprays of Sumac; a Sweet-Pea Table Cover; Screens in Crewel Work; Carriage Wraps; SIMPLE IDEAS OF COLORS; SILK EMBROIDERY—the Stitch; Group of Flowers; French or Flat Embroidery; the French Knot; Stalk Stitch; Point Russe; Herring Bone or Feather Stitch; Chain Stitch; Ladder Stitch; Chinese Embroidery; DESIGNING AND TRANSFERRING DESIGNS; ARTICLES IN SILK EMBROIDERY—A Screen of Peacock Feathers; Banner Screen; Embroidered Table Top; Window-Curtain Border; Embroidered Dresses; Panels; Small Curtains or Hangings; an Embroidered Room; a Fan Table Cover; a Chair Cover; Fire Screens; a Child's Afghan; PRINT WORK; SILK EMBROIDERY WITH GOLD—Materials Used; Gold Cord; Gold Braid; Bullion; Spangles; Gold Thread; EMBROIDERED BOOKS AND OTHER ARTICLES; APPLIED WORK WITH EMBROIDERY—A Lambrequin in Applique; Silk Applique Work; Cretonne Work; Grape Pictures in Applique; Linen Applique; EMBROIDERY IN CHENILLE; SILK EMBROIDERY ON LINEN—Embroidered Fruit Doyleys; HOBEN WORK; CHARTER EMBROIDERY; LINEN LACE WORK—Point Counts; Rosettes, Insertions, etc.; Point Coupe; Point Tire; Imitation of Antique Lace. ARTISTIC EMBROIDERY is a large 12 mo. book of 128 pages, handsomely bound in paper covers, and profusely and elegantly illustrated. It will be sent by mail post-paid upon receipt of only **Twenty-Five Cents**, and is guaranteed to be the best book of the kind ever offered at this low price.

ALL ABOUT HORSES, CATTLE, SHEEP AND HOGS.

The American Live Stock Manual.

No subject is of greater importance to the farmer than that of Live Stock, and few there are who have not much to learn regarding it. Many a man has lost a valuable animal for no other reason than that he did not know how to take care of it when well or to treat it when sick. THE AMERICAN LIVE STOCK MANUAL is a book the cost of which is but trifling, but it is simply worth its weight in gold to every man in America who owns a horse, a cow, a sheep or a hog, for it is a complete text-book, containing the fullest information regarding the care and management, feeding and rearing, of live stock, likewise directions for the cure of all diseases peculiar to these animals and of all unruly and vicious habits, for the construction of necessary buildings and conveniences, etc., etc. The following are only a small portion of the topics treated in this book: How to Judge a Horse; Feeding Horses; Raising a Colt; To Bit a Colt; To Break Horses from Pulling at the Halter; Warts on Horses; Stumbling Horses; Cure for Balky Horses; Kicking Horses; Training Vicious Horses; Galls and Sores on Horses; Reining Horses; Colic; Bots; Founder; Heaves; Epizootic; Shying; Scratches; Ringbone; Spavin; Cribbing; How to Save Oats in Feeding; Watering Horses; Care of Horse's Legs; How to Tell a Horse's Age; Neck Yokes; Good Grooming; Shoeing; To Make the Mane and Tail Grow; Box Stalls; Stables and Stabling; Breeding Horses upon Farms; Horse Education; Ringing a Bull; Relieving Choked Cattle; Bone Disease in Milch Cows; Marks of a Good Cow; Cattle Racks and Feed Boxes; Feeding Cattle; How Good Cows are Ruined; To Prevent Hooking Fences; Black Tongue; Lice; To Prevent Kidding; Contagious Cattle Diseases; Fattening Stock; Milking; Cooking Feed for Live Stock; The Soiling System; Raising Calves; To Break a Heifer or Vicious Cow to Milk; Wintering Live Stock; How to Take Off a Hide; Assistance at Birth; Hollow Horn; Obstructed Tests; Black Leg; Caked Udder; Jumping Cattle; Garget; Care and Management of Hogs; Pigerles; Troughs; Pig Raising; Over Feeding; Sanitary Management of Swine; Hog Cholera; Paralysis; Scurvy Pigs; Preparing Food for Swine; Butchering; Fattening Hogs; Driving Hogs; To Prevent Hogs Becoming Diseased; Raising Sheep; Washing Sheep; Sheep Rot; Hurdling Sheep; To Tell the Age of Sheep; Sheep Ticks; Early Lambs; How to Make Sheep Pay; Spring Feeding of Ewes; Treatment of Lambs; Increasing the Growth of Wool. THE AMERICAN LIVE STOCK MANUAL is a large book of 128 pages, 12mo, with handsome cover, and is profusely illustrated. It will be sent by mail post-paid upon receipt of only **Twenty-Five Cents**. Send for it! The price is but a trifle compared to its real value to every farmer.

Four Books in One! No Household is Complete Without It!

THE COMPLETE BOOK OF HOME AMUSEMENTS.

What most lives need is more sunshine. Let us banish care, have a good time, enjoy ourselves while we may. How much happier—how much better off—are those homes wherein the father and mother, and even the gray-haired grandparents, join with the children after tea in a merry game or other amusement, than those wherein reticence and reserve and chilly demeanor prevail. "But," you say, "what shall we do? We read until we are tired; and we know of no amusement that we care for. How shall we employ the long winter evenings?" We have published a book to answer this question, and a wonderful book it is. It contains 64 large 3-column quarto pages, neatly bound in handsome covers, and is filled to the brim with every conceivable thing for the enjoyment of home. It is in reality four books in one, for it covers the ground usually occupied by four distinct volumes, and contains four times as much matter as any book published at the same price. It is a complete text-book for Public and Private Entertainments, Private Theatricals, Parlor Exhibitions, Social Gatherings, School Exhibitions and Evenings at Home. It is a book for old and young, grave and gay—a veritable storehouse of good things for all. It contains a number of ACTING CHARADES, with full directions how to perform them. It gives some very excellent PARLOR DRAMAS, easily acted yet very amusing. It tells all about SHADOW PANTOMIMES, and this alone we think you will say is worth the price of the book. It contains nearly fifty beautiful TABLEAU VIVANTS, and gives full and explicit directions for performing them. In it are so many amusing PARLOR GAMES that we have not attempted to count them, but we think we have almost everything, new and old, that was ever thought of in the game line. Then we come to a lot of wonderful ILLUSTRATED PUZZLES—tantalizing, perplexing, apparently intricate, but so easy when you turn to the proper place and learn the answers. Here also is a savory dish of RIDDLES, ENIGMAS, CHARADES, ETC.—a nice large lot of them. How young and old heads will puzzle and study over them, and how proud you will feel when you have solved one correctly. As to CONUNDRUMS, there are nearly a bushel of them, some so funny you will want to hold your sides with laughter, and what fun it will be for one of the company to read the questions and see who can guess the answers! A considerable portion of the book is allotted to PARLOR MAGIC, and here you will find hundreds of wonderful and amusing tricks, easily performed, yet exceedingly mystifying to your audience. Then there are a lot of amusing and instructive CHEMICAL EXPERIMENTS, showing how the combination and manipulation of the simplest agents will produce the most surprising results. Following these are a number of excellent DIALOGUES, comic and serious, suitable either for school exhibitions or parlor entertainments. Last, but not least, the book contains nearly fifty of the finest RECITATIONS, dramatic, pathetic, sentimental, and comic, ever written. It is handsomely illustrated, and is indeed a splendid book. THE COMPLETE BOOK OF HOME AMUSEMENTS will be sent by mail, post paid, to any address, upon receipt of only **Twenty-Five Cents**.

HOW THE READERS

OF THE

AMERICAN ANALYST

MAY OBTAIN ANY ONE OR MORE OF
THE ABOVE BOOKS

FREE.

TO any one who will send us **One New Subscriber** to the AMERICAN ANALYST for one year, at \$1, we will send, **Free**, any one of the above books, to compensate him for his trouble; to any one who will send us two new subscribers, we will send any two of the books; and for three new subscribers, we will send the three books. This will be good pay for little work, for it is a simple and easy matter to get one or more new subscribers to the AMERICAN ANALYST. Show the paper to your friends and neighbors, and you will have little difficulty in inducing one or more of them to subscribe for one year. And when you have received your book or books you will feel doubly repaid for what trouble you have taken. If the parents do not wish to try it, let the little boys and girls do so after school hours. We feel sure that every one of our present subscribers and readers can readily secure for us one or more new subscribers, and we offer this special inducement in order to stimulate effort in this direction. The books will be found well worth the slight effort that will be required to secure them. Try it, and see how easy it will be.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the AMERICAN ANALYST a good advertising medium. Why should not you?

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are wide-spreading.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cook-book, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose purious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING Co.,
19 Park Place, N. Y.

AMERICAN * ANALYST

WANTED ON LIBERAL TERMS.

WE ARE CONFIDENT that we have Reached the HIGHEST DEGREE OF PERFECTION in Solving the INFANT FOOD PROBLEM.

LACTO-PREPARATA.

A Prepared Human Milk perfectly Sterilized and especially designed for Children from birth to six or eight months of age.

Made wholly from cow's milk with the exception that the fat of the milk is partially replaced by cocoa butter. Cocoa butter is identical with milk fat in food value and digestibility, being deficient only in the principle which causes rancidity. The milk in LACTO-PREPARATA is treated with Extract of Pancreas at a temperature of 105 degrees, a sufficient length of time to render twenty-five per cent. of the casein soluble, and partially prepare the fat for assimilation. In this process the remaining portion of the casein not peptonized, is acted upon by the pancreatic ferment in such a manner as to destroy its tough, tenacious character, so that it will coagulate in light and flocculent curds, like the casein in human milk.

Composition :	ALBUMINOIDS.....	19 Parts.
	MILK SUGAR.....	64 "
	FAT.....	10 "
	MINERAL MATTER.....	3 "
	CHLORIDE of SODIUM added.....	1/2 "
	PHOSPHATE of LIME added.....	1/2 "
	MOISTURE.....	3 "

SEND FOR SAMPLE and compare it with every other food used in artificial feeding of Infants.

LACTO-PREPARATA is not designed to replace our SOLUBLE FOOD but is better adapted for Infants up to eight months of age.

CARNRICK'S SOLUBLE FOOD

Is the Nearest Approach to Human Milk that has thus far been produced, with the exception of Lacto-Preparata.

During the past season a large number of Physicians and eminent Chemists visited our Laboratory at Goshen, N. Y., and witnessed every detail connected with the production of Carnrick's Soluble Food. This invitation to witness our process is continuously open to Physicians and Chemists. All expenses from New York to Goshen and return will be paid by us. The care used in gathering the milk, its sterilization, and the cleanliness exercised in every step, cannot be excelled. Soluble Food has been improved by increasing the quantity of milk sugar and partially replacing the milk fat with cocoa butter.

PHOSPHO-CAFFEIN COMP. A SEDATIVE, NERVE AND BRAIN FOOD.

(GRANULAR EFFERVESCENT.)

This preparation has been thoroughly tested, and found to produce the happiest effects in Headaches, Neuralgia, Sleeplessness and General Nervous Irritability. We are confident that the above combination will be found superior to any of the various preparations that are used in nervous affections. It is not only a nerve sedative but a Brain and Nerve Food. The depressing effects of the sedative ingredients are fully overcome by its reconstructive constituents.

As a harmless and positive remedy in Headaches and Insomnia we are certain it has no equal. It is far more palatable than any of the preparations used for similar purposes.

PUT UP IN FOUR, EIGHT AND THIRTY-TWO OUNCE BOTTLES.

is the most reliable substitute known for mother's milk. Its superiority rests on the test of 30 years use in Great Britain and the U. S. A. sustaining, strengthening diet for Invalids; nutritious, easily digested, and acceptable to the most delicate stomach. Four sizes, 35c. up. Pamphlet, "Healthful Hints," sent free. WOOLRICH & CO., Palmer, Mass.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. **THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE** is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

ADDRESS ANALYST PUBLISHING CO.,

—19 PARK PLACE, NEW YORK.—

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

PRICE BAKING POWDER CO., New York. Chicago. St. Louis.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M.D., F.R.S., and an endorsement by SIR ERASMUS WILSON, F.R.S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No 2."

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

NINETEENTH CENTURY ALCHEMY.

Considerable ridicule has been bestowed lately upon the experiments reported by Dr. Brown-Sequard aiming at the discovery, in a qualified degree, of an elixir of life. The scientific gentleman named obtained a substance by triturating in distilled water the living tissues of certain animals—rabbits and guinea-pigs, we believe—and claimed to have produced wonderful rejuvenating effects by the hypodermic injection of the product into the human system, he himself being one of the subjects experimented upon. The results reported were regarded by his associates, and the general public, as the emanations of an enthusiastic imagination rather than sober scientific verities. But it turns out that they have received verification from other sources. A member of the French Biological Society, Dr. Variot, a hospital physician of Paris, reports that he has made a series of experiments with Brown-Sequard's liquid, with results entirely confirmatory of the latter's claim. Dr. Variot states that he took for the purpose of experiment three

day laborers, who were respectively fifty-four, fifty-six and sixty-eight years old, and all of whom were in a greatly debilitated and reduced physical state. He made in each case a hypodermic injection of the liquid, using with it ten cubic centimetres of water. In each case the invalids reported next day a most marked and extraordinary improvement of condition, declaring that they had never felt so well for many years. In each case, too, Dr. Variot was able to perceive certain recovery from the particular trouble from which the man was suffering. Encouraged by his success, Dr. Variot continued his injections, allowing forty-eight hours to lapse between the administerings of the liquid. The improvement in all cases was so marked that chronic troubles which had resisted all previous treatment were apparently cured; and those men, Dr. Variot says, "who had previously merely existed, dull, languishing, broken down, are now full of gayety and force. Their muscular strength has sensibly augmented, and their appetite has returned." All this reads like the advertisements of some patent cure-all, whose proprietor is able to get all the "testimonials" he wants to the miraculous properties of his preparation. But these physicians are not quacks, and have everything to lose, it would seem, and nothing to gain, by the discovery of such an elixir. But what is it that they have discovered, if they have discovered anything? Dr. Brown-Sequard himself suggested the possibility that what the French call "auto-suggestion," and what may be described as a combination of hypnotism and the mind-cure, might be the explanation of the action of the liquid. But Dr. Variot's experiments seem to make even this not very satisfactory theory untenable. In three cases in which he operated he told the men—all of whom were ignorant men, knowing nothing of therapeutics, and never having heard of Dr. Brown-Sequard and his elixir—that he was injecting into their veins a "strengthening liquid." He then administered the "elixir," with the effects that have been described. Then he took three more just such men, told them exactly the same things, and administered—cold water. The men reported no effect whatever. This seems to bar out the supposition that the substance operates by means of its effect on the imagination of the subject.

A YEAR OF CONFERENCES.

Three great international conferences toward which the United States bear a most dignified relation, are to be held in October of this year. All three are the outgrowth of American doctrines and influences. The Congress of American Nations, which meets in Washington, October 2, will be the outcome of plans urged for many years by leading statesmen in this country and in "the States south of us." A large and dignified attendance is assured, and the conference is authorized to take into consideration all matters tending to promote better trade relations between the United States and Central and South America. The trade which "the

States south of us" now have with Europe would be a rich prize for the United States. Another international conference, called to meet in Washington in October, will be devoted to the consideration of ways and means to harmonize the marine codes of different nations "on the basis of modern needs, sentiment, usages, and civilization, so that the perils of ocean travel may be reduced and the laws affecting navigation reformed in accordance with National rights and the conditions of modern commerce." That the United States should be selected as the meeting place for such a conference shows the commanding position this country is getting in international affairs. The third international conference, which meets in Paris, was called by a number of members of the French and British Parliaments, respectively, and its purpose is to "bring about between their nations and the Republic of the United States of America the conclusion of treaties of arbitration of such nature as to insure, by the amicable settlement of difficulties between them, the maintenance of their friendly relations." Asking the aid of this country, some of the ablest English and French statesmen propose to extend and establish firmly the great principle of arbitration as followed by the United States in the settlement of the Alabama claims.

LARD IN CANADA.

Under the date of February 14, 1889, the laboratory of the Inland Revenue department of Canada issued a bulletin giving the results of some analyses of lard bought in Canada. These examinations were made, the Chief Analyst states, because numerous prosecutions for selling adulterated lard in England have called attention to the subject. As the methods employed were admittedly only for the purpose of finding the addition of any foreign substance to the lard, the results do not inform us as to the cleanliness nor the source of the pure lard found. The names of the manufacturers having been furnished by the venders cannot therefore be always entirely reliable. Of the 109 different samples of lard examined 38 were of native, 11 unknown, and 60 of American origin. Thirty-two are reported as free from adulteration, 8 as adulterated with water, 3 as simply adulterated and the remaining 66 as adulterated with cotton-seed oil. Only one of the samples from the United States is credited with being unadulterated. The report adds that in many cases beef tallow was also present and that it is difficult to say to what extent these substances are substituted for lard, or indeed, to be certain that they do not replace it entirely. The Analyst states that neither Fairbank's nor Armour's lard contained any water which was found in the lard supplied from New York, especially that bearing Tietjen's brand in varying proportions of from 5 to 24 per cent. He also admits that Canadian lard-makers are beginning to imitate the American manufacturers. The report concludes by recommending as the only available remedy, the imposition of a higher duty on

For use at the Soda Fountain and in all Pharmaceutical preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

DRYDEN & PALMER,
19 Hudson St., New York.

lard imported from the United States. How this remedy will prevent Canadian refiners from making cotton seed and tallow lard the Chief Analyst does not say. Neither does he seem to have thought of the much simpler and much fairer remedy of compelling manufacturers to brand their product truthfully. It has worked satisfactorily here, why not in Canada?

INSPECTION JUDICIALLY INSPECTED.

Our friend of the *AMERICAN ANALYST* is so elated by the recent decision of Judge Johnson, of Indiana, that, in speaking of the test case brought up in Minnesota to determine the validity of the inspection law, he is moved to say "the result can be confidently predicted," but here he drops the matter and leaves himself on the fence, from which position he can fall on either side and still claim to be a prophet. We are of the same mind as far as feeling confident that the result can be predicted, and we unhesitatingly predict that the law will be upheld by the State Supreme Court and the Supreme Court of the United States, if the case is carried there. Brother *ANALYST*, please be a little more explicit in your statements and leave less to inference.—*Butchers' Advocate*, July 28.

The result that we "confidently predicted" was that the inspection cranks represented by the *Advocate* would be thrown out of court as soon as their case was stated. That is just what happened. Judge Manwaring last week at Stillwater, Minnesota, discharged William Fee, the Wisconsin farmer who had been arrested for selling dressed beef in that city which had not been inspected on the hoof, as required by the State inspection bill, giving his decision on the ground "of the unconstitutionality of the law, inasmuch as it infringes upon the domain of Congress, which regulates the commerce between the States." If there is anything "left to inference" in that language, the *Advocate* is at liberty to supply the deficiency. How the obstructionists "kick" over the repudiation of their conspiracy by the courts!

A MOSQUITO WAR.

There is a gentleman in this community who has a settled desire to render himself a benefactor of his race. His name is Lamborn, and his scheme is to effect the destruction of all noxious insects that disturb the comfort of domestic life, and especially house flies and mosquitoes. Scientific investigation favors the belief that tuberculosis and ophthalmia are carried from diseased persons to healthy ones by the house fly, and German experimenters have shown that serious blood maladies may be transmitted by the mosquito. In view of these facts and the general personal discomfort, occasioned by both of those pests, Mr. Lamborn has

been studying out some method for their destruction. After observing that harmless dragon flies feed on mosquitoes, it occurs to Mr. Lamborn that dragon flies may be propagated by scientific methods in such numbers and in such places as to materially decrease both the danger and discomfort produced by mosquitoes. He also thinks that some innoxious insect may be found and bred to destroy the noxious house fly. At any rate, he has made an appeal to all entomologists to take the matter under serious consideration and to make known the result of their researches. In order to stimulate scientific investigation in this direction Mr. Lamborn has offered prizes of \$150, \$30 and \$20, to be paid respectively for the first, second and third essays, on the subject. The money has been placed in the hands of Morris K. Jesup, President of the American Museum of Natural History, New York, and the judges of award are Dr. Henry C. McCook, Vice-President of the Academy of Natural Science of Philadelphia and Vice-President of the American Society of Entomologists, and Dr. J. S. Newberry, President of the New York Academy of Sciences, Professor of Geology in Columbia College, and lately Chief of the Geological Survey of Ohio. In awarding the prizes clearness of statement obtained by accompanying sketches and new and purely scientific facts in the life history of the *Libellulidae*, of which so little is known, will be duly considered. The essays should be forwarded by December 1, 1889, to Mr. J. H. Winsor, at the American Museum of Natural History, Seventy-seventh Street and Eighth Avenue, New York City, to whom all communications should be addressed.

THE DEFEATED INSPECTION BULLIES.

Everybody has observed how ridiculous the boy looks who having bullied over a smaller boy whom he thought unable to defend himself, finally aroused him and got himself well trounced. This seems to be exactly the plight of the *Stock Grower* of Los Vegas, N. M. Judging from the subjoined extracts from last issue, they sound very much like the boy's expostulation: "I only meant it in fun." But all the same the boy got his licking and he could not give it back again, and so it is with the butcher's combination.

The big four has scored another victory in defeating the local meat law in Indiana. It is impossible to overcome such vast, concentrated capital by unorganized effort and there is no use of one per cent. of the stock owners of the West getting gray-headed and scheming themselves to death for the benefit of the other ninety-nine. Let us wait and see how the over-productionists come out.

It will be remembered that this paper while using every means in its power to break up any monopoly in beef products, has never attacked the dressed beef business as a system. As an economical way of handling fresh meat, the refrigeration method is bound to prevail by reason of the saving that is bound to result. The *Stock Grower* will be found consistent, for it still believes that the packers are doing up the producers and that the best thing that could happen for the cattle business would be for the big four crowd to have lively competition in the dressed meat trade. The Chicago packers are not doing business on a very small margin but the fact remains that they could take the hoofs, horns and offal alone for their share and still make a big thing. A Chicago dressed meat man is credited with having said that he can ship 1,000 head of cattle from Denver to Kansas City, slaughter them, reship the meat back to Denver and undersell the local butchers. This secret lies in making use of the hair, hoofs, horns and every part of the animal which Denver butchers waste.

CURIOUS RESULTS.—The Mannesmann process of manufacturing steel tubes by rolling is now well-known, and by it it is easy to form a cylinder closed at both ends, in which case the interior of the tube, on cutting into it, is found to be full of some gas. This gas has recently been analyzed, with the result that it was found to consist of 99 per cent. of hydrogen and 1 per cent. of nitrogen. The steel which was made was found to have the following composition in parts per 100: Carbon, .42; silicon, .25; phosphorus, .022; sulphur, .01; manganese, .23; with traces of copper.

ELECTRICAL APPLIANCES.

HOW THE MYSTICAL FLUID IS BEING AVAILED OF FOR PRACTICAL PURPOSES.

The application of electricity to the performance of work in the arts and sciences, formerly done by other means, is constantly increasing, the field widening with each new venture until it seems as though there were scarcely a department of human industry in which it will not soon play an important part. The following are among the later advances in this direction:

THE LIQUEFACTION OF GASES BY ELECTRICITY.

The following method of liquefying gases has recently been discovered: Strong hydrochloric acid is introduced into a combustion tube, bent at right angles, so as to cover two small platinum plates fused into the closed end of the tube; a plug of asbestos, saturated with concentrated sulphuric acid, is placed at the bend; the open and shorter arm is then fused up and immersed in a freezing mixture. On the passage of a current through the plates, gas is evolved and liquefies at the other end; but on removing the tube from the freezing mixture and discontinuing the current the liquefied hydrogen chloride is reabsorbed by the water. The experiment may then be repeated. Other compound gases behave in a similar manner. When acidified water is decomposed in this apparatus, and a platinum plate covered with platinum-black has been fused in the short end, explosions occur there at intervals, and small quantities of water form, containing hydrogen peroxide, and having an ozonized odor. With chromic acid and water the blue oxide of chromium is obtained.

NEW ELECTRIC WELDING PATENTS.

Two patents have recently been granted to Mr. Elias E. Ries, of Baltimore, Md., for welding together sections of pipe and other hollow metallic articles by electricity. In the process applicable to the electric welding of tubes and pipes of all kinds the sections of the pipe preferably, though not necessarily, have the ends to be united slightly tapered or reduced in thickness in order to increase the electrical resistance at this point and promote the fusion of the metals under the heating action of the current. This method is especially applicable to the welding of tubes of curved and irregular form, into which it would be difficult to introduce a solid core.

ELECTRIC WEIGHING MACHINE.

An electric weighing machine, invented by Mr. William Snelgrove, will be exhibited at the Paris Exhibition. It is operated and controlled by the current of a small constant battery concealed in the base. The machine is of the knife-edged lever type, and is provided with three movable poises or slides. As the goods to be weighed are placed on the platform, these poises automatically start and travel backward and forward on the steelyard until they exactly balance the goods; the correct weight is then shown by the machine in a single group of figures. As the goods are removed from the platform all the poises automatically return to zero, the last one breaking the battery circuit and preventing any waste of current.

ELECTRICAL PIANO.

Dr. Eisenmann, of Berlin, Germany, has invented what has previously been attempted by other experts—namely, a piano which, by the aid of electro-magnetism, can sustain, increase, and diminish sound. One of the special features of this invention, it is said, is that by moving the electro-magnets the timbre of the tone is changed, for example, from that of a violoncello to a piccolo. In this same direction an exhibition of an interesting application of electric power was recently given at the warerooms of the Aeolian Organ and Music Company, of New York. It consisted of an automatic piano playing by means of a patent electric attachment, which, it is claimed, can be applied to any make of pianoforte, the current being supplied from

the underground wires in the street. The musical composition to be rendered is inscribed upon a scroll wound upon a cylinder and placed in an inclosed space behind the music rack. A spring is touched, the circuit is completed, and the music begins. The same patent, which belongs to the Edison Company, can also be applied to an organ.

MEAT FOR FOOD.

EXTENSIVE INCREASE OF ANIMAL PRODUCTS IN THE UNITED STATES.

The question whether the people of this country are learning to use less animal food, milk, butter and cheese than in former years excites some attention, and not wholly without reason. The official returns, at all events, seem to indicate that the supply of these products has not increased during the past ten years in proportion to the increase in population. It is generally conceded that, on account of the enormous immigration, the population has grown during the last nine years more than during the preceding ten years. For ten years ago the growth was about 1,500,000 yearly, but the increase in immigration has been more than 1,900,000—from 1870 to 1880 the number of immigrants was about 2,800,000, and from 1880 to 1889 it has been about 4,700,000. An increase of fully 30 per cent. in population during these nine years must be taken as a basis of comparison, and the increase in number of animals for food supply has been much smaller. The figures which follow are those of the census of 1880, compared with the report of the Agricultural Bureau for January, 1889, with percentages of increase added:

	1889.	1880.	Inc. PER CT.
Horses.....	13,663,294	10,357,488	30
Mules.....	2,257,574	1,812,808	24
Milch cows.....	15,298,625	12,443,120	23
Other cattle.....	35,032,417	28,462,891	50
Sheep.....	42,599,079	35,192,074	20
Swine.....	50,301,592	47,681,700	5

The one exceptional increase largely exceeding that in population is in oxen and other cattle, so that the consumption of beef appears to have increased per capita, while the consumption of pork and mutton must have decreased. Part of the difference is due to the change in exports, which were about 247 million pounds of fresh and salt beef and live cattle in 1879-80, against about 375 millions during the past year; while of pork, bacon and hams the exports this year have been about 461 million pounds, against 854 million pounds in the census year. But after allowance for the difference in exports, the consumption of beef in this country would appear to have increased fully 10 pounds per capita, while the consumption of pork would appear to have decreased 11 pounds per capita. At the same time there must have been a decrease in the quantity of mutton used, as the number of sheep has increased less than population. The comparative cheapness of beef, since the organization of many expensive cattle companies, probably explains the shifting of consumption from beef to pork, though it does not account for the apparent decrease in quantity of all meats used for each inhabitant. The number of milch cows affords the only indication of the supply of dairy products, and no reason is known for believing that the quantity of milk yielded per cow is greater than it was nine years ago. But if not, the supply has relatively diminished so much that, at the rate of consumption existing in 1880, more than four millions of the present population would be without any supply of milk whatever. The exports of butter and cheese have indeed increased about one-half, or not far from 90 million pounds. But this would account for only a fraction of the difference in the supply. The large increase in population of foreign birth and recent immigration, accustomed in other lands to different habits from those prevailing here, may be a most potent

cause of change; but more potent still, possibly, is the increase in civic population as compared with rural, and the advancing cost of land for pasture in the more thoroughly settled States.—*Daily Commercial Bulletin.*

WHAT IS A FIRE?

IMPORTANT DECISION IN AN INSURANCE CASE.

A curious point of law, bearing upon the responsibility of insurance companies, has just been decided in the Paris Law Courts (5th Chamber of the Civil Tribunal of the Seine), at the suit of the Countess Fitz-James vs. the Union Fire Insurance Company, of Paris, by which it is ruled that insurance companies must indemnify all losses sustained by an assured caused by fire, even in cases where no destruction of premises has been caused by conflagration. The Countess Fitz-James insured against fire, in the above company, all her furniture and effects for 558,000 francs, and in her policy, under Art. 7, were mentioned her jewels, among which figured specially a pair of earrings, composed of fine pearls, valued at 18,000 francs. On April 17, 1887, one of these earrings, which had been placed on the mantelpiece, was accidentally knocked down by the countess and fell into the fire, where it was consumed, notwithstanding every effort made to save the jewel. Expert jewelers were called in by both parties to estimate the intrinsic value of the property destroyed, and 9,000 francs was stated to be the amount, less 60 francs for molten gold rescued from the ashes. The insurance company refused to pay for the burnt pearl on the ground that there was no conflagration, that the fire which consumed the object was an ordinary fire; in other words, that there was no fire, and that the company was not responsible where combustion had only occurred by the ordinary use of a grate for heating purposes. The court, however, rejected this, and ruled that "the word *fire*, in matters of assurance, applied to every accident, however unimportant such accident may be, so long as it is caused by the action of fire." It was, therefore, ordered that the Union Company should pay to the Countess Fitz-James the value of the jewel, less than of the gold recovered, viz.: 8,940 francs and costs.

HYPERBOREAN HEAT.

REMARKABLE WARMTH OF THE SIBERIAN SUMMER.

Siberia is commonly regarded as a region of ice and cold, but according to Mr. George Kennan it is, in summer time, about as hot a country as there is on the face of the globe. In one of his remarkable Siberian narratives, given in the *Century Magazine*, Mr. Kennan thus relates one of his hot weather experiences:

"The farther we went up the Irtes'h the hotter became the weather, and the more barren the steppes, until it was easy to imagine that we were in an Arabian or a north African desert. The thermometer ranged day after day from 90 to 103 deg. in the shade; the atmosphere was suffocating; every leaf and every blade of grass, as far as the eye could reach, had been absolutely burned dead by the fierce sunshine; great whirling columns of sand 100 to 150 feet in height swept slowly and majestically across the sun-scorched plain; and we could trace the progress of a single mounted Kirghis five miles away, by the cloud of dust which his horse's hoofs raised from the steppe. I suffered intensely from the heat and thirst, and had to protect myself from the fierce sunshine by swathing my body in four thicknesses of blanket and putting a big down pillow over my legs. I could not hold my hand in that sunshine five minutes without pain, and wrapping my body in four thicknesses of heavy woolen blanketing gave me at once a sensation of coolness. Mine was the southern or sunny side of the tarantas, and I finally became so exhausted with the fierce heat, and had such a strange feeling of faintness, nausea and suffocation that I asked Mr. Frost to change

sides with me and give me a brief respite. He wrapped himself up in a blanket, put a pillow over his legs, and managed to endure it until evening. Familiar as I supposed myself to be with Siberia, I little thought, when I crossed the frontier, that I should find in it a north African desert, with whirling sand columns and sunshine from which I should be obliged to protect my limbs with blankets. I laughed at a Russian officer in Omsk who told me that the heat in the valley of the Irtes'h was often so intense as to cause nausea and fainting, and who advised me not to travel between eleven o'clock in the morning and three o'clock in the afternoon, when the day was cloudless and hot. The idea of having a sunstroke in Siberia, and the suggestion not to travel there in the middle of the day, seemed to me so preposterous that I could not refrain from a smile of amusement. He assured me, however, that he was talking seriously, and said that he had seen soldiers unconscious for hours after a fit of nausea and fainting, brought on by marching in the sunshine. He did not know sunstroke by name, and seemed to think that the symptoms which he described were peculiar effects of the Irtes'h valley heat, but it was evidently sunstroke that he had seen."

AMERICAN NOBILITY.

A REMARKABLE RECORD OF A REMARKABLE FAMILY.

The principle of heredity has received a most striking illustration in the case of family and kinsmen of ex-President Theodore Dwight Woolsey of Yale College, who died at New Haven, recently, at the age of eighty-eight. Dr. Woolsey was a descendant of James Pierpont, the famous native of Roxbury, who, having become dissatisfied with the liberal tendencies of Harvard College, induced Elihu Yale to found a more conservative school at New Haven. The present president of Yale, Timothy Dwight, is also a descendant of the same founder; and the history of the families of Dwight is interwoven with that of the families of Edwards and Pierpont, who have given many illustrious names to American history and letters. It is no mere coincidence that both Woolsey and Dwight, nineteenth-century presidents of Yale, should both have been great-grandsons of the principal founder of the college; for the "high thinking and plain living" of the early families who were closely associated with the institution, developing themselves into a hereditary impetus of ability, were quite likely to supply the qualities needed in future presidents. These allied families have not been merely Yale families, by any means; they have given the world, since Jonathan Edwards whose fame as a theologian and metaphysician is world-wide, men and women who are eminent in many lines; such men, for instance, as Tryon Edwards the theologian, Pierpont Edwards the lawyer, and Henry Pierpont Edwards the judge; John Pierpont the poet; William Constable Pierpont, astronomer, mathematician and politician; Edwards Pierpont, jurist and diplomatist; Timothy Dwight, president of Yale College in the eighteenth century; Theodore Dwight, senior and junior, journalists and authors; Benjamin Woolsey Dwight, physician; Benjamin Woodbridge Dwight educator; Theodore William Dwight jurist; Timothy Dwight the present president of Yale College; Sereno Edwards Dwight, author; William Theodore Dwight, preacher; Henry Edward Dwight, author; Theodore Dwight Woolsey, just deceased; Theodore S. Woolsey, professor of international law in Yale College; and Sarah Chauncey Woolsey (Susan Coolidge), the authoress. Perhaps there should be mentioned in this category, Aaron Burr, the grandson of Jonathan Edwards, in whom inherited genius seems to have taken a most erratic turn, quite indistinguishable in other branches of these allied families.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

August.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal, venison.

GAME AND POULTRY.—Pigeon, chicken, duck, woodcock.

FISH.—Anchovy, bass, bluefish, blackfish, cod, eels, crabs, clams, flounder, halibut, herring, lobster, mackerel, mussels, porgie, prawn, salmon, turtle, trout, sturgeon, whiting, weak-fish, rockfish.

VEGETABLES.—Beans, beets, cucumbers, cabbage, carrots, cauliflower, corn, egg-plant, lettuce, onions, parsley, parsnips, potatoes, squash, shallots, spinach, turnips, radish, rhubarb, tomatoes.

FRUITS.—Cherries, raspberries, huckleberries, melons, gooseberries, blackberries, peaches, pears, tamarinds, bananas, pineapple, grapes, plums.

PRACTICAL RECIPES.

CHESHIRE SOAP.—Let two pounds of beef, put over the fire in a quart of cold water, come to the boiling point, then allow it to simmer for six hours, skimming well. While cooking add a bunch of thyme, sweet marjoram and celery, also two chopped onions. Remove the fat, season to taste and serve with slice of toasted bread.

SHRIMPS FOR BREAKFAST.—Put a pint of fresh shrimps in a saucepan, cover with a half pint or so of stock and thicken with browned flour, add a piece of

butter, salt, pepper and pounded meal. Simmer gently for three or four minutes till the shrimps are very hot and tender. Serve hot and garnish the dish with small pieces of toasted bread.

GOOSEBERRY SOUFFLE.—Stew the gooseberries with a good quantity of sugar until the fruit is quite tender. Press the gooseberries through a coarse sieve, and put the pulp into a glass dish. Let it become quite cold, and if possible set the dish in some ice. When cold, pour over it a good custard. This may be made with the yolks of eggs, and the whites beaten to a firm froth and laid over the souffle just before sending it to table. Color half the white of the eggs with a few drops of cochineal.

WHOOVERS.—Mix two heaping cups sifted flour with one heaping teaspoonful Horsford's baking powder; then add two eggs, one large spoonful sugar, a piece of butter as large as a walnut, two cups sweet milk, a little nutmeg and salt; melt the butter. Bake in cups in a quick oven.

CURRIED POTATOES.—Slice a good-sized onion and fry it with 2 ounces butter, cut up one pound boiled potatoes, put them into the frying-pan with the onion, dredge them well with curry powder, add quarter-pint gravy, a little salt, and a squeeze of lemon juice. Shake the whole on the fire for ten minutes, and serve hot.

FROZEN COFFEE.—Add half a pound of ground Java coffee to two quarts of boiling water. Stir well, cover and set on the side of the range to infuse. Stir occasionally for ten minutes and then set in a warm place and let settle. When settled pour the coffee through a fine strainer, carefully, so as not to take the dregs. Add enough cold water to make two quarts. Make very sweet and freeze. Serve in glasses. Part cream may be used with clear strong coffee and a bit of vanilla bean put in and steeped with the coffee, adds to the flavor.

PINEAPPLE PIE.—One grated pineapple, one cupful of sweet cream, five eggs, one cupful of sugar, and half cupful of butter; beat butter and sugar to a cream, add beaten yolks of eggs, then the pineapple and cream, and lastly the beaten whites whipped in lightly. Bake with under crust only.

CAVIARE.

HOW THE RUSSIAN DELICACY IS PREPARED.

This aliment, which is considered a great delicacy in Russia, Germany and Italy, is made from the prepared roe of the sturgeon. Its origin is in Russia, where it is consumed in immense quantities. The Americans have also of late years taken a liking to it, and have started large establishments for its manufacture on the shores of the great lakes where the sturgeon abounds. The roe of this fish is very different from that of other fish; it is so very much larger and very thin-skinned, containing only an oily jelly which melts away in the mouth, having little or no residuum, and is held together by a network of cellular tissues, fat and muscle in large quantities, and exceeds in size the head of the largest man. A net or very small mesh spread over a frame does duty as a kind of coarse sieve, and the roes being lightly pressed and kneaded over this, the eggs are detached, and fall into wooden tubs placed below, each grain being quite distinct from the others, and of a very dark-brown color. "Grained caviar" is made by sprinkling the eggs with very finely-ground salt, of which 5 lbs. to 36 lbs. of eggs are used in the hotter months, while only 1½ to 2½ are sufficient in cold weather, the least possible quantity of salt being a great desideratum. To stir in the salt a wooden fork with eight prongs is used. The eggs become first doughy, then swell, and finally give out a noise like a string of broken glass, which proves the process is completed.

BUFFALO LITHIA WATER

In the Uric Acid Diathesis, Bright's Disease, Chronic Inflammation of the Bladder, etc.

JAMES L. CABELL, M. D., A. M., LL. D., Professor of Physiology and Surgery in the Medical Department in the University of Virginia, and President of the National Board of Health.

"The Water of Buffalo Spring No. 2 contains in notable quantities two of the ALKALIES which are accredited as extremely valuable in the treatment of GOUT, LITHIASIS, and Liver Affections. I refer to the CARBONATES of POTASH and LITHIA.

"I have recently read with interest a paper in 'The New York Medical Journal' on the Buffalo Lithia Water in Diseases of the NERVOUS SYSTEM, in which the writer, Dr. Boyland, citing his own observations and those of other eminent physicians, ascribes to this water a special virtue as a direct tonic for the NERVOUS SYSTEM in cases of CEREBRAL exhaustion. I have only had occasion to test its effects in this direction in cases in which the NERVOUS SYMPTOMS may have been due to LITHÆMIC conditions. In these cases the relief following the use of the remedy was very decided."

Dr. WM. A. HAMMOND, of New York, Surgeon-General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the Buffalo Lithia Water in cases of affections of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION OF THE LITHIA SALTS, and is, moreover, better borne by the Stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from over-mental work—in which the condition called NERVOUS DYSPEPSIA EXISTS—and generally with marked benefit."

Dr. ROBERT BATTEY, of Georgia, SUGGESTOR OF BATTEY'S OPERATION.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of CHRONIC INFLAMMATION of the BLADDER, whether induced by STONE, by enlarged PROSTATE in the aged or by NEGLECTED GONORRHEA, and HAVE SECURED EXCELLENT RESULTS, which encourages me to prescribe it for the future."

HUNTER McGUIRE, M. D., LL. D., late Professor of Surgery, Medical College of Virginia, Richmond.

"BUFFALO LITHIA WATER, Spring No. 2, as an ALKALINE DIURETIC, is invaluable. In URIC ACID GRAVEL, and, indeed, in diseases generally dependent upon a URIC

ACID DIATHESIS, it is a remedy of extraordinary potency. I have prescribed it in cases of RHEUMATIC GOUT, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. WM. B. TOWLES, Professor of Anatomy and Materia Medica in the Medical Department of the University of Virginia.

"BUFFALO LITHIA WATER, No. 2, belongs to the ALKALINE or, perhaps, to the ALKALINE-SALINE Class, for it has proved far more efficacious in many diseased conditions than any of the simple ALKALINE waters.

"I feel no hesitancy whatever in saying that in GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE in the BLADDER, and in all Diseases of URIC ACID DIATHESIS, I know of no remedy at all comparable to it.

"Its effects are marked in causing a disappearance of ALBUMEN from the urine. In a single case of BRIGHT'S DISEASE OF THE KIDNEYS I witnessed decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of the disease."

Dr. THOMAS H. BUCKLER, of Paris (formerly of Baltimore), SUGGESTOR OF LITHIA as a Solvent for Uric Acid.

"Nothing I could say would add to the WELL-KNOWN REPUTATION OF THE BUFFALO LITHIA WATER. I HAVE FREQUENTLY USED IT WITH GOOD RESULTS IN URIC ACID DIATHESIS, RHEUMATISM, AND GOUT, and with this object I have ordered it to Europe, from Coleman & Rogers, of Baltimore. Lithia is in no form so valuable as where it exists in the Carbonate (the form in which it is found in the BUFFALO LITHIA WATER), Nature's mode of solution and division in water which has passed through Lepidolite and Spondamine Mineral formation."

Dr. GRAEME M. HAMMOND, of New York, Professor of Diseases of the Mind and Nervous System in the New York Post-Graduate Medical School and Hospital.

"In all cases of BRIGHT'S DISEASE of the KIDNEYS I have found BUFFALO LITHIA WATER of the greatest service in increasing the quantity of urine and in eliminating the ALBUMEN. In certain cases of Melancholia, accompanied by excessive eliminations of URATES and URIC ACID, it is often the only remedy necessary. In GOUT and RHEUMATISM it is highly beneficial, and in many cases of Impotence its restorative qualities have been of undoubted assistance. I have long regarded BUFFALO LITHIA WATER as the most valuable mineral water in use."

Water in cases of one dozen half-gallon bottles, \$5.00 per case at the Springs.

THOMAS F. GOODE, Proprietor, Buffalo Lithia Springs, Virginia.

Then the caviar is closely packed in hard-wood kegs. To make "grain caviar" the eggs fall into brine stirred as before, and in quantities of about 1 cwt., subjected to heavy pressure in coarse sacks till the brine is expelled, and the whole compressed into a sticky, soft mass. Nearly one-third of the contents of the eggs are squeezed out with the brine, and the caviar is now packed in large casks lined with damask linen, from whence it is called "Caviare à la Serviette." "Caviar à sac," as its name shows, is very choice caviar pressed and put into linen sacks, and shipped in hermetically-sealed cans and boxes.

WHY WE ARE RIGHT-HANDED.

PROTECTION OF THE VULNERABLE PART OF THE BODY.

Primitive man, being by nature a fighting animal, fought for the most part at first with his great canine teeth, his nails and his fists, till in process of time he added to those early and natural weapons the further persuasions of a club or shillalah. He also fought, as Darwin has conclusively shown, in the main for the possession of the ladies of his kind, against other members of his own sex and species. And if you fight you soon learn to protect the most exposed and vulnerable portion of your body. Or, if you don't, natural selection manages it for you, by killing you off as an immediate consequence. To the boxer, wrestler or hand-to-hand combatant, that most vulnerable portion is undoubtedly the heart. A hard blow, well delivered on the left breast, will easily kill, or, at any rate, stun even a strong man. Hence, from an early period men have used the right hand to fight with, and have employed the left arm chiefly to cover the heart and to parry a blow aimed at that specially vulnerable region. And when weapons of offense and defense supersede mere fists and teeth, it is the right hand that grasps the spear or sword, while the left holds over the heart for defense the shield or buckler. From this simple origin, then, the whole vast difference of right and left in civilized life takes its beginning. At first no doubt the superiority of the right hand was only felt in the manner of fighting. But that alone gave it a distinct pull, and paved the way at last for the supremacy elsewhere; for when weapons came into use the habitual employment of the right hand to grasp the spear, sword or knife made the nerves or muscles of the right side far more obedient to the con-

trol of the will than those of the left. The dexterity thus acquired by the right—see how the word "dexterity" implies this fact—made it more natural for the early hunter and artificer to employ the same hand preferentially in the manufacture of flint hatchets, bows and arrows, and all the other manifold activities of savage life. It was the hand with which he grasped his weapon; it was therefore the hand with which he chipped it. To the end, however, the right hand remains especially "the hand in which you hold your knife;" and that is exactly how your own children to this day decide the question which is which, when they begin to know their right hand from their left for practical purposes.

SALT.

THE SEVERAL PROCESSES OF ITS PRODUCTION.

Common salt is either procured in the solid crystalline state, called rock salt, as a natural brine from wells or springs, or by the evaporation of sea water. Rock salt almost always contains impurities, and therefore is dissolved in water, and the insoluble matters mixed with it are deposited at the bottom. The brine is then drawn off, and evaporated by artificial heat in large iron pans. Natural brine is obtained in Western and Central New York. A shaft is sunk and the brine rises to the surface, and overflows if not pumped. There are reservoirs made for it, into which it is pumped, and from which it is distributed to the various works, which are little more than large sheds, with numerous openings in their roofs to allow the steam free egress. Flues run from end to end of the floors, and on these rest the iron evaporating pans, which are about 65 feet long by 25 feet broad, and about 18 inches in depth. In other places very deep shafts have been sunk, and the brine requires to be pumped from a great depth. The flues heat the brine nearly to boiling point, and, as a large surface is exposed, the evaporation is very rapid, and the crystals are small, as in fine table salt. If, however, the heat is more gentle, the salt is coarser, and is fit for curing meat, fish, etc.; and when very slow, a much coarser kind called bay salt is produced. Salt is obtained from sea water in many parts of the world, and this is effected by simply evaporating it in brine pits or shallow square pools dug on the shore for the purpose. When the evaporation has proceeded to a certain ex-

tent, the liquid assumes a reddish color; a pellicle of salt forms on its surface, which soon breaks and sinks down, to be followed by another; and the crystallization then proceeds rapidly. When complete, the salt is removed to sheds open at the sides and piled in heaps, in order that the chloride of magnesium may be removed. This is very easy, for it is extremely deliquescent—that is, it liquefies by exposure to the atmosphere, absorbing the moisture therein, and runs out. The salt is then re-dissolved and crystallizes, if great fineness is required.

MOSQUITO CURE.—Take a small quantity of a 2-per cent. carbolic acid solution and sprinkle sheets, coverlets, pillows and bolsters on both sides, the edges of bed curtains and the wall next to the bed. The face and neck may also be slightly wetted with the solution. Not a single gnat or mosquito, it is said, will come near.

ELECTRIC PROSPECTS.—At some future day, not far distant, we hope, when the public are sufficiently aroused to the importance of this question, a certain width of our great thoroughfares all over the city will be given up to an iron roadway on which self-propelled electric vans may noiselessly carry on the great traffic which now offends our ears, wears out horse flesh, and has been but little improved up to the present day since the days of the Cæsars. In fact, we aver that with our boasted improvements of the nineteenth century it requires more expenditure of horse-power to draw a ton of merchandise a mile in the streets of New York than it did in Rome in the early days of the empire.—*Electrical Review.*

PRINTERS' INK.

A JOURNAL FOR ADVERTISERS.

PRINTERS' INK is just what it purports to be, "a journal for advertisers." It is issued on the first and fifteenth days of each month, and is the representative journal—the trade journal, so to speak—of American advertisers. It tells the intending and inexperienced advertiser in plain, comprehensive articles how, when, and where to advertise; how to write an advertisement; how to display one; what newspapers or other media to use; how much to expend—in fact, discourses on every point that admits of profitable discussion. If you advertise at all, **PRINTERS' INK** can help you. Perhaps you expend but Ten Dollars a year in advertising; if so, **PRINTERS' INK** may show you how to obtain double the service you are now getting for one-half the money. A year's subscription costs but One Dollar; a sample copy costs but Five Cents. Advertising is an art practised by many but understood by few. The conductors of **PRINTERS' INK** understand it thoroughly. Surely their advice, based on an experience of more than twenty-five years, will help you. Address:—

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,
By MISS M. E. BRADDON.

THE GIRL AT THE GATE,
By WILKIE COLLINS.

A BRIDE'S TRAGEDY,
By MISS MULOCK.

THE RECTOR'S DAUGHTER,
By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,
By MARY CECIL HAY.

GABRIEL'S MARRIAGE,
By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,
By ETTA W. PIERCE.

THE RIGHTFUL HEIR,
By M. T. CALDOR.

THE DOUBLE HOUSE,
By MISS MULOCK.

TWICE SAVED,
By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, *profusely and handsomely illustrated*, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the AMERICAN ANALYST.

ANALYST PUBLISHING CO.,

19 PARK PLACE, NEW YORK.

HEALTH REFORM.—On the 15th of June the inauguration of improving the sanitary condition of Naples took place. King Humbert, accompanied by the Queen and Crown Prince, took part in the inauguration. According to the plans adopted, the poorer districts, where, in 1888, the cholera epidemic spread to such an alarming extent, will be thoroughly renovated. It is stated that 17,000 houses will be torn down, new streets constructed, and the main street from the central depot will pass through the district which now contains the most pestilential dwellings. It will require about ten years to complete the work.

A GREAT FUTURE.—Thomas A. Edison said in an interview with a reporter of the *Pittsburgh Dispatch*: "You ask me about the future of electricity. It is the coming motive power. It will be used on all railroads some day, but the point is to get an economical engine. My theory is to have immense dynamos located

all along the line of the road, and have the electricity conveyed from these stationary engines to the locomotives by wires through the rails. For example, I would put two big engines between New York and Philadelphia, and enough power could be furnished to whisk the limited at the rate of 100 miles per hour.

Two New Colors.—Two new colors are described in various recent technical journals. The first is apparently a reproduction of color known to the ancients, and made by them with sand and lime, heated with roasted copper. The pigment, on analysis, appears a compound silicate of lime and copper. It is now made with exact proportions of the materials, so that the product is uniform. The color is a bright greenish blue. The other color is black, which has been made by treating camphor with sulphuric acid. By steeping camphor in strong sulphuric acid a jelly-like mass is formed of a reddish color. When this is heated it boils, giving

off fumes of sulphuric acid, and turns intensely black. By evaporation the unconverted excess of acid and camphor is driven off and a black mass remains which seems to have the qualities of India ink. Like India ink, it can be apparently dissolved in water, and remains suspended for a long time.

SUEZ TRAFFIC.—It appears that the number of vessels which passed through the Suez Canal last year was 3,440, with a gross burden of 9,439,957 tons. The corresponding number of vessels which passed through the canal in 1887 was 3,437, with an aggregate burden of 8,430,043 tons; and in 1886 there passed 3,100 vessels, with an aggregate burden of 8,183,313 tons. The transit revenue collected last year was £2,593,291 compared with £2,314,494 in 1887, and £2,261,095 in 1886. Of the vessels which passed through the canal last year 2,625 were British, 187 French, 146 Italian, 163 German and 121 Dutch. No other country figured in the list for 100 ships.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

Pyle's
Pearline
Possesses
Peculiar
Purifying
Properties

Hot Weather

is the very best time to try PYLE'S PEARLINE. Then the wash is largest, and a saving of time and toil is best appreciated. Think of doing a large wash with little or no rubbing. Consider how much longer your delicate summer clothing

will last if not rubbed to pieces on a washboard. A saving is a gain. You'll be surprised and pleased with the cleanliness, satisfaction and comfort which comes of the use of PEARLINE. Simple—any servant can use it. Perfectly harmless—you can soak your finest linen and laces in Pearline and water for a month, with safety. Delightful in the bath—makes the water soft. Perhaps you have been using some of the imitations and have sore hands and find your clothing going to pieces. Moral—use the original and best. Pearline is manufactured only by JAMES PYLE, N. Y.

OUR MISSION.**WHAT THE AMERICAN ANALYST IS DOING.****FIGHTING ADULTERATION.**

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose spurious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar, we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING Co.,
19 Park Place, N. Y.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

MRS. F. M. G. PENDER,

STUDIO:

47 WEST 22d STREET, NEW YORK.

A BOOK THAT EVERY LADY NEEDS. THE LADIES' GUIDE TO FANCY WORK.

How to make the Home Beautiful at small cost is a subject now uppermost in the mind of every lady of good taste. This book is a complete practical instructor in every description of Ladies' Fancy Work, and the only first-class work of the kind ever published at a low price. It contains nearly 300 illustrations, and the instructions given are so plain and simple that by their aid even a child may make the many beautiful things which the book describes. It gives plain and practical instructions in Drawing, Oil Painting, and making Wax Flowers; likewise all kinds of Fancy Needle Work, Artistic Embroidery, Lace Work, Knitting, Tatting, Crochet and Net Work. It contains designs for Monograms, Initials, Cross Stitch Patterns, Kalt Edgings, Embroidered Borders and Corners, Macrame Work, Applique Embroidery, Berlin Work, Java Canvas Work, Tricot and Burlaps, Antique Lace, Beaded Lace, Darned Net Work, Tulle, Lambrequins, Ottomans, Counterpanes, Rugs, Carriage Robes, Brackets, Wall Pockets, Waste Paper Baskets, Work Boxes, Work Baskets, Work Bags, Pen Wipers, Hanging Baskets, Catchalls, Pin Cushions, Footstools, Handkerchief Boxes, Glove Boxes, Card Baskets, Sofa Pillows, Table Covers, Table Scarfs, Screens, Scrap Bags, Hand Bags, Table Mats, Toilet Mats, Lamp Mats, Lamp Shades, Pillow Shams, Pillow Sham Holders, Curtains, Toilet Stands, Picture Frames, Slipper Cases, Letter Cases, Toilet Sets, Clothes Brush Holders, Cigar Boxes, Hassocks, Sachets, Fancy Purses, Slippers, Dressing Gowns, Music Portfolios, Knives, Cases, Fans, Flower Baskets, Plant Stands, Flower Pot Covers, Shawls, Dress Trimmings, Window Shades, Feather Work, Spatter Work, Leaf Photographs, and many other things. It is a book that should be in every American household. With it as a guide you may make hundreds of beautiful things for the adornment of your home and for presents to your friends at the most trifling expense, and no employment for ladies is more fascinating and useful. The book will repay its small cost many times over in a very short time. Every lady will be delighted with it. It is a large book of 64 large 3-column pages, with handsome cover, is finely printed, and, as above stated, contains nearly 300 illustrations. It will be sent by mail, post-paid, upon receipt of price, only **Twenty-five Cents**.

INVALUABLE TO EVERY HOUSEWIFE!

THE MODERN COOK-BOOK AND MEDICAL GUIDE.

This is practically two books in one—a perfect cook-book and a perfect medical book—and there is so much in it, and so much care and pains have been taken in its compilation, that we feel perfectly safe in asserting that the Cooking department is fully the equal, in quantity and quality of contents, of any low-priced cook-book published, and the same as to the medical department herein as compared with any low-priced medical work on the market. It is a complete encyclopedia of domestic information, and we fully believe that no lady, after having it in the house a short time, would willingly do without it for ten times its cost. The cooking recipes number 627, and include Breakfast Dishes, Soups, Meats and Poultry, Fish, Vegetables, Salads and Relishes, Bread and Rolls, Jellies and Preserves, Puddings and Pies, Fancy Dishes, Cakes, Confectionery, Ice Cream and Summer Drinks. The compilation of this department was superintended by a practical housekeeper, every recipe will be found reliable, and it has been pronounced one of the best, most complete, and practical cook-books published. The Medical Department will be found fully the equal of any doctor book published at one dollar or less. It tells you how to cure, by simple means, available in every home, Malaria, Pneumonia, Poisons (antidotes for), Nervousness, Measles, Rheumatism, Toothache, Wounds, Sprains and Bruises, Weak and Inflamed Eyes, Dust in the Eye, Sore Throat, Scald Head, Whooping Cough, Neuralgia, Earache, Worms, Warts, Burns and Scalds, Headache, Offensive Breath, Bleeding (to stop), Cancer, Consumption, Felons, Dyspepsia, Dysentery, Diphtheria, Diarrhea, Croup, Corns, Liquor Appetite, Coughs and Colds, Cold in the Head, Catarrh, Scarlet Fever, Nose Bleed, Baldness, Smallpox, Sleeplessness, Ringworm, Chilblains, Costiveness, Cholera Morbus, Bright's Disease, Convulsions, Mumps, Superfluous Hair (to remove), Hysterics, Colic, Sciatica, Biliousness, Nettle Rash, Typhoid Fever, Ingrowing Toe Nails, Abscesses, Stammering, Hemorrhage, Asthma, Hydrophobia, Scrofula, Bronchitis, Lockjaw, Erysipelas, Hoarseness, Chills and Fever, Dropsy, Bunions, Fits, Dandruff, Scurf, Quinsey, Heartburn, Styes, Liver Complaint, Cramp, Rheumatism, Onanism, Sunstroke, Knock-knees, Indigestion, Jaundice, Gout, Frick Heat, Salt Rheum, Fainting, Boils, Tobacco Habit, Gray Hair (to prevent), Cholera Infantum, Deafness, Stiff Neck, Piles, Choking, Freckles, Pimples, Sunburn, Chapped Hands, and many other ailments. It will save you many dollars annually in doctors' bills and patent medicines. Who can doubt that twenty-five cents invested in such a useful and valuable book as this would be the best and most profitable investment that could possibly be made of so small a sum? **THE MODERN COOK BOOK AND MEDICAL GUIDE** is a large book of 128 pages, neatly bound in colored covers. It will be sent by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

AVOID LITIGATION! BE YOUR OWN LAWYER!

EVERYBODY'S LAW BOOK.

Litigation is a very expensive luxury; avoid it, for it doesn't pay. Thousands of lawsuits are brought because people do not understand the simple principles of law and their own and others' rights, and there are plenty of lawyers always ready to take advantage of this lack of knowledge. The object of this volume is to impart, in a simple, concise manner, the fullest information regarding legal matters. It is to be used as a work of reference, and in all ordinary emergencies will save employing a lawyer. It is a complete compendium of business and domestic Law, by a prominent member of the New York bar, containing concise explanations of the general laws and the laws of the several States, regarding Administrators and Executors, Affidavits, Agency, Agreements, Apprentices, Arbitration and Award, Assault and Battery, Assignments, Attachments, Banks, Bills of Exchange, Checks and Promissory Notes, Bills of Sale, Chattel Mortgages, Citizens and Aliens, Common Carriers, Contracts, Corporations, Deeds and Mortgages of Real Estate, Descent and Distribution, Lower, Easement, Exemptions, Farmers' Law, Fences, Fixtures, Garnishment, Gifts, Guaranty, Guardian and Ward, Heirs and next of Kin, Homestead Exemptions, Husband and Wife, Infants, Interest and Usury, Landlord and Tenant, Libel and Slander, Liens, Limitation of Actions, Marriage and Divorce, Rights of Married Women, Master and Servant, Parent and Child, Partnership, Payment and Tender, Personal Property, Power of Attorney, Principal and Agent, Privileged Communications, Railroads, Railroad Real Estate, Receipts and Releases, Replevin, Right of Way, Seduction, Trustee Process, Warrant, Water Rights, Wills and Codicils. Together with complete forms of Acknowledgments, Agreements, Articles of Co-partnership, Assignments, Award of Arbitrators, Bills of Sale, Bonds, Chattel Mortgages, Contracts, Deeds, Executors' and Administrators' Accounts, Inventory Table, Liens, Mortgages of Real Estate, Powers of Attorney, Releases, Satisfaction Pieces, Wills and Codicils, etc., etc., specially adapted for the daily use of those who are not lawyers, with directions for their preparation. Every farmer, mechanic, manufacturer, business man, professional man, merchant and householder will find the information contained in this book of great value, and will have occasion to refer to it nearly every day. It is the cheapest book of the kind ever published, and is quite as complete and valuable as other works for which four times the amount, or more, is asked. **EVERYBODY'S LAW BOOK** is a large volume of 128 pages, 12mo, with handsome cover. It will be sent by mail, post-paid, upon receipt of only **Twenty-five Cents**. Send for it! It is worth ten times the amount asked for it to any man, young or old, in America.

For School Exhibitions and Public and Private Entertainments.

The Complete Book of Recitations and Dialogues.

This book contains, so far as we know, the best and most complete collection of recitations ever published in a single volume. All the popular recitation books of the day have been consulted and the cream selected, and the result is a mammoth collection of recitations which cannot fail to answer every requirement. There are hundreds of them, and they embrace every kind and character of recitations, adapted to every need, humorous, dramatic and pathetic—from short juvenile pieces for the little boys and girls on Friday afternoons to pretentious dramatic works for the professional elocutionist. We have space to enumerate the titles of only a very few of them, as follows: "Ostler Joe," "Asleep at the Switch," "The Last Hymn," "The Deadman's Journey," "The Engineer's Story," "Cripple Ben," "Two Loves and a Life," "The Mother-in-Law," "The Old Parson's Story," "Taking Toll," "The Engineer," "The Tramp," "Tim's Daisies," "John Darry's Dream," "Too Late," "The Book-keeper's Dream," "Saving Mother," "Curfew must not Ring To-Night," "The Palmetto and the Pine," "The Polish Boy," "Drafted," "The Blacksmith's Story," "The Burning Prairie," "Guilty or Not Guilty," "The Foreclosure of the Mortgage," "The Clown's Baby," "Bill Mason's Ride," "How we tried to Whip the Teacher," "Driving Home the Cows," "Somebody's Mother," "When the Tide Goes Out," "The Old Farmer's Elegy," "Widder Spriggins' Daughter," "The Light-keeper's Daughter," "How the Parson Broke the Sabbath," "Which Shall it Be?" "Somebody's Darling," etc., etc. In addition to the Mammoth collection of Recitations contained in this book, it also contains a number of fine Dialogues, mostly humorous, among which are: "Marrying a Poetess," "What's in a Name?" "The Train to Mare," "The Graduate," "The Female Astrologer," "Proposing by Proxy," "Story-Telling," "The Morning Call," etc. Those who have sent for books of this character and been disappointed in them, owing to the meagerness and inferiority of their contents, will be happily surprised in this book, for not only is it the largest collection of Recitations and Dialogues ever sold at a low price, but great care has been taken in the selection of its contents, the aim being to include only the best. It is a splendid book, guaranteed to give satisfaction. **THE COMPLETE BOOK OF RECITATIONS AND DIALOGUES** is a large book of 64 large 3-column pages, with handsome colored cover. It will be sent by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

HOW THE READERS

OF THE

AMERICAN ANALYST

MAY OBTAIN ANY ONE OR MORE OF

THE ABOVE BOOKS

FREE.

TO any one who will send us **One New Subscriber** to the **AMERICAN ANALYST** for one year, at \$1, we will send, **Free**, any one of the above books, to compensate him for his trouble; to any one who will send us two new subscribers, we will send any two of the books; and for three new subscribers, we will send the three books. This will be good pay for little work, for it is a simple and easy matter to get one or more new subscribers to the **AMERICAN ANALYST**. Show the paper to your friends and neighbors, and you will have little difficulty in inducing one or more of them to subscribe for one year. And when you have received your book or books you will feel doubly repaid for what trouble you have taken. If the parents do not wish to try it, let the little boys and girls do so after school hours. We feel sure that every one of our present subscribers and readers can readily secure for us one or more new subscribers, and we offer this special inducement in order to stimulate effort in this direction. The books will be found well worth the slight effort that will be required to secure them. Try it, and see how easy it will be.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no constructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. VANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wit's end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only THREE possessed the power of acting on starch. These brands were **MALTINE**, Corbyn, Stacey & Co.'s Extract, and Keppeler's Malt Extract. **WILLIAM ROBERTS, M.D., F.R.S.**

I have subjected "**Maltine**" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity.

The results demonstrate conclusively the far greater diastatic value of **Maltine**, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined. **R. H. CRITTENDEN.**

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to **Maltine** by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that **Maltine**—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that **Maltine**, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that **Maltine** will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alternatives.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Fermented.
MALTINE with Hypophosphites.	MALTO-YEBERNE.
MALTINE with Peptones.	MALTO-VIBURNIN.
MALTINE with Pepsin and Pancreatine.	MALTINE with Cascara-Sagrada.

Physicians may obtain **Maltine** from all druggists in every part of the world. In cases where the physician intends to prescribe **Maltine**, the word "**Maltine**" should be written, and not simply the words "**Malt Extract**," or "**Extract of Malt**."

Send for Pamphlet giving comparative analysis by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three **Maltine** compounds that may be selected from our list, providing he will agree to pay express charges on same.

COLDEN'S
LIQUID
BEEF TONIC.

ORIGINAL LABEL:

"Colden's Liebig's Liquid Extract of Beef and Tonic Invigorator."

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.

Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2."

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

ADULTERATED COFFEE.

The laboratory of the Canadian Inland Revenue Department has lately had analyses made of eighty-five samples of coffee purchased from various dealers throughout the Dominion. Of these forty-one, or 48 per cent., were found to be adulterated. It is not to be supposed that this proportion represents the exact amount of adulteration which prevails. In many of the stores where the samples were purchased the purchasers were known as revenue officers, and may have been intentionally furnished with articles very much better in quality than those usually sold. There is good reason for supposing that even when pure coffee is asked for by ordinary purchasers they do not always obtain it. Among the forty-one samples of adulterated coffee nineteen were mixed with chicory or other substances free from starch; while twenty-two, besides nearly all containing chicory, had considerable amounts of roasted grain, peas or beans in their composition as well. Whatever some persons may say in favor of using chicory for that purpose, it is plain that the use

of roasted peas can have no defenders. Nor does it bring to the working man such a reduction in the price as would justify his purchasing a mixed coffee containing it. The price of the adulterated coffee is almost as much as the pure article. But taking even the lowest prices of 26c. to 30c. per pound, it is evident that such are high rates to pay for roasted peas. As much as 60 per cent. of chicory has been found in some of these cases. When it is considered that roasted chicory contains nothing in the shape of nutriment except sugar, and that it is owing to the presence of the latter, in a burned condition, that it is useful in coloring the decoction, it is difficult to see why any one should persist in using it. The truth is, that its addition is no improvement to the coffee; and if inquiry be made at those hotels and restaurants where a cup of good coffee is obtainable, it will be found that only the pure article is used in preparing it. There can be no justification for the sale of an article consisting of 60 per cent. of roasted grain with chicory and a little coffee. There can be no doubt that if good coffee were everywhere readily obtainable the consumption of alcoholic liquors would be very considerably lessened. There is here a good example to follow for those having the supervision of food products in the United States.

THOSE ENGLISH BREWERY SYNDICATES.

An advertisement in a recent number of the London edition of the New York Herald throws considerable light upon the methods employed to make the purchasing syndicates profitable to the promoters. Some time since Lyman's ale brewery in New York and Kaster's lager beer brewery in Newark were reported as having been sold to an English syndicate. From the advertisement mentioned it would seem that the proposed capitalization is \$1,400,000, with an additional \$950,000 so-called debentures, or altogether \$2,350,000—part at 8 per cent. and some at 4 per cent. Some of the statements of the abridged prospectus published would form interesting reading in any of our American daily papers, if the projectors dared to publish them; for to any one conversant with the facts they give little hope that the investors will realize any such profits as the alluring inducements of the prospectus hold out. It is only necessary to point out one or two of the most prominent features. The Lyman brewery is said to have been established in 1871, and therefore is one of the oldest in the city of New York. Of course, compared with England, New York is young, but she is not so young as to cause a brewery founded in 1871 to be classed among the oldest breweries. It is also said to have an artesian well giving an ample supply of the purest water. The artesian well may be there, but so far the Board of Health of this city has not been convinced sufficiently of the purity of any artesian well water in New York to allow its being used in breweries excepting for washing out barrels and kegs. The next statement is the most remarkable. The Lyman brewery is said to have "over 90 licensed houses or saloons tied to the brewery for

their ale and porter supplies by lease or mortgage." By uniting this ale brewery with the lager beer brewery, which latter also has 78 saloons "tied" to it, the hope is expressed that these "tied" saloons can be compelled to purchase their supplies from these breweries exclusively. The wonder is how the owners of these "tied" saloons will enjoy this peremptory method of dealing with them. Moreover, as Mr. Lyman is heavily interested in the Budweiser Brewing Company, which way will his pecuniary interests lead him?

CALIFORNIA BRANDY.

On the 2d inst. a number of prominent San Francisco capitalists met a committee of the Grape Growers' Association, and discussed a plan for relieving the wine industry of the State by distilling the surplus wines into a good uniform quality of brandy. It was agreed to organize a company with a capital stock of \$1,000,000, divided into ten thousand shares of \$100 each. One thousand shares were subscribed for at the meeting. The company is to be known as the California Brandy Union. Distilleries will be leased and constructed in those parts of the State where cheap grapes and wines are found in excess. A central bonded warehouse will be established in San Francisco. Agencies will be located in all the large Eastern cities, and in Hamburg and London. Of this year's surplus the company will buy 2,500,000 gallons, which it will distill into 500,000 gallons of brandy. Under such auspices, California brandy will soon gain a strong foothold. Great injury has been done to this industry by the too frequent practice of distilling the pomace of grapes for brandy instead of the wine. This dishonest method gives a spirit without any one of the characteristics of brandy. There is no reason why California brandy should not become a valuable export commodity, as well as a good pure spirit for domestic use.

A DESPAIRING WHIMPER.

The Butchers' Advocate has forgotten the old proverb about a cobbler sticking to his last, and in a recent issue attempts to argue law points about the constitutionality of the State inspection bills. With the usual result of such dabbling, our esteemed contemporary makes itself very ridiculous. It starts out with a wrong proposition or rather tries to make the basis of the argument, the false and exploded statement that the object of these inspection laws is the protection of the health of the people. The very fact that the Butchers' Advocate is so much interested in the bill disproves that assertion. It then goes on to prepare a brief for its counsel and in this again commits the fatal blunder of admitting that to make the inspection bills legal, it must be proved "that there are diseases to which cattle are subject—and which may be transmitted to man through eating of the flesh impregnated with such diseases—which cannot be detected after the animal

has been killed and dressed." It further admits that until this assertion is proven no court will decide in favor of the constitutionality of the law. For this very reason the decision of the learned Judge in Indiana, whom the *Butchers' Advocate* tries to belittle, will stand. He completely pricked the protection-to-health bubble and exposed the selfish motives of the local butcher monopolists in trying to use the fingers of our lawmakers and courts of Justice to pull their chestnuts out of the fire. We nevertheless readily concede that the *Advocate* is correct when it says that we will not have long to wait for an authoritative settlement of the question, but the question will not be settled in the way it fondly imagines. It will be settled on the side of common sense and Justice, and that is the side on which the *AMERICAN ANALYST* has stood all through the controversy.

STEAM'S ACHIEVEMENTS.

A very interesting calculation has recently been made by the Statistical Bureau in Berlin. Four-fifths of the power machines at present in activity in the world have been erected during the past twenty-five years. The country which possesses the highest amount of horse power is the United States, with 7,500,000 horse power; then follow England, with 7,000,000; Germany, with 4,500,000; France, with 3,000,000; and Austro-Hungary, with 1,500,000. These figures do not include locomotives, of which there are 105,000 at work, with a total horse power of 3,000,000. Thus the total horse power of the world is 46,000,000. A steam "horse power" is equivalent to three actual horses' strength, and each living horse represents the strength of seven men. Thus the total horse power of the entire world represents the work of 1,000,000,000 men, or more than twice the total working population of the earth. Steam has thus tripled the entire human work power of the earth.

BOARDING-HOUSE ANALYSIS.

The Chicago Health Officer who, according to the *Leavenworth Times*, resigned because he found the maintenance of health there too onerous at the price, has accepted, it is said, a situation as consulting chemist for a large hotel. It will be his duty to analyze all the food used in the hotel, and ascertain whether it has been adulterated or not. The idea is a capital one, and ought to be adopted by every hotel in the country. The *Times* suggests as an improvement that the result of the

analysis be published on the bills of fare, with the chemist's certificate. What a blessing it would be to know to a fraction—on the authority of an expert—just how much chicory there is in the morning coffee, how much sand in the sugar, how much water or chalk in the milk, how much sulphuric acid in the syrup! In the matter of "made" dishes, too, what revelations might not be expected! How charming it would be to know just what the chemical constituents are of hash and croquettes and chicken salad and the thousand and one compounds which appear on the menu under beautiful French names! Yet there are hotels, no doubt, which would rather not go to the expense of keeping a chemist and printing his analyses on the bills of fare.

THE METRIC SYSTEM EXTENDING.

At a recent meeting of the French Academy of Science, M. De Malarce, speaking of the extension of the metric system of weights and measures, gave some interesting figures. In 1887 the aggregate population of the countries in which the metric system was compulsory was over 302,000,000, being an increase of 53,000,000 in ten years. In 1887, in countries with a population of close on 97,000,000, the use of the system was optional; and the countries where the metric system is legally admitted in principle and partially applied (as in Russia, Turkey, and British India) had in 1887, a population of 395,000,000, being an increase of 54,000,000 in ten years. The increase is due to the growth of population in countries which had already adopted the system and to its adoption by new countries. The systems of China, Japan, and Mexico are decimal, but not metric. The metric system is thus legally recognized by 794,000,000 of people, and the three last named countries have a population of about 474,000,000. So that only about 42,000,000 of inhabitants of the civilized world have systems which are neither metric nor decimal.

CLOTHES AND THEIR CHEMISTRY.

A FEW SUGGESTIONS REGARDING THE MATERIALS WE CLOTHE OURSELVES WITH.

The first articles of clothing worn by mankind were, undoubtedly, made from the skins of animals, but, as civilization advanced, the arts of spinning and weaving became known at an early period, and wool, flax, and other animal and vegetable products were used to form fabrics of constantly increasing fineness and beauty. Wool the most important animal product used for clothing, is really the hair of the sheep, and has an analogous structure to the true hairs of other animals. Like hair, the wool fibres consist of an epithelium or outer coating, a rind or body, and the pith or marrow filling the hollow interior. The epithelium consists of small, thin plates, which overlap each other like the shingles of a roof, and to these plates or scales the wool owes its valuable felting quality. A microscope of moderate power will show this structure very plainly. Wool, when clean and pure, consists principally of an albuminoid sulphur-containing substance termed *keratin*, but, as it occurs on animals, it contains much dirt and suint. The suint contains a large proportion of greasy matter and potash, and is of considerable value as a source of potash. Silk is another animal product, but is not an organized structure, but simply a secretion of the silk-worm, the larva of the *Bombix mori*. The worm is produced from the egg in the spring, and, after casting its skin three or four times, spins a thread from a liquid secreted by two glands situated near its head, which immediately coagulates on coming into the air. This thread is double and completely, covers the worms, forming a cocoon intended to protect it during the change from larva to butterfly. The silk raisers, however, do not allow the transformation to take place, but kill the imprisoned worm, or *pupa*,

by the application of heat. The cocoon is composed of a single continuous thread but it is much too fine to manipulate, so the fibres of from three to twenty cocoons are unwound at one time and united into a single thread. This unwinding of the cocoons is a very delicate operation, and requires great care and skill. From 250 to 900 yards of raw silk fibre are obtained from each cocoon. Raw silk consists of two parts—the fibre or body, known as silk fibroin, and the gum-like substance with which it is covered, known as silk-glue or sericin. Only fibroin is secreted by the worm, but this is superficially oxidized to sericin when discharged into the air. For most purposes the sericin must be removed before the silk is spun and woven, but, when it is to be made into crape or gauze, it is allowed to remain. Silk is quite soluble in hydrochloric acid, and this reaction may be used to discover the presence of cotton or linen fibres when mixed with it. A microscopical examination is, however, the best and simplest test, as the smooth, solid, unorganized appearance of the silk fibre is very characteristic, and cannot be mistaken for cotton, flax, or wool. The silk-worm feeds almost exclusively on the leaves of the white mulberry tree, *Morus alba*, and their culture and rearing form a most important branch of agriculture in Europe. Other silk-producing insects are known and cultivated in China and India, but their product is small and unimportant. The culture of silk-worms in this country has not yet passed the experimental stage, although there seem to be no great difficulties to be overcome. The most important vegetable fibre is cotton, and the magnitude and value of this crop in the Southern States is well known. It consists of the fine plant hairs which surround the seed of the cotton plant, and is principally composed of cellulose. The seeds are separated from the cotton by machinery, and the fibres spun and woven into an endless variety of textile fabrics, with which a majority of the world's inhabitants are clothed. The microscopical appearance of cotton is very characteristic. It has the form of a flat, twisted band, and cannot be easily mistaken for other fibres. The cotton plant is cultivated in many other countries, especially India and Egypt, but the United States is still the principal source of the world's supply. Flax is the fibre of the flax plant, *Linum usitatissimum*, and its textile value has been known for a long time. The fibre lies under the bark, and is surrounded by a gummy pectose substance, which was formerly removed by soaking in water and exposing to the air till it rotted away, but acid and alkaline baths are now used for the purpose, with much more satisfactory results. The fibre is then separated from the woody matter of the stem by a process of beating and combing, known as *scutching*, and, after being cleaned, is ready to be bleached, spun, and woven into the beautiful fabric known as linen. Under the microscope, linen fibres appear cylindrical and strait, being thus easily distinguished from the flat-twisted fibres of cotton. The microscopical examination of the different animal and vegetable fibres is very interesting, and only requires an instrument of moderate power. Once seen, the characteristic form cannot be forgotten, and the knowledge is often useful in determining the quality of a piece of dress goods. Linen, like cotton, is principally composed of cellulose. Clothing possesses no warmth in itself, but, as it is a more or less poor conductor of heat, it prevents the escape of the bodily warmth. Woolen fabrics contain a large quantity of air entangled in their meshes, which, being a poor conductor of heat, adds considerably to the warmth of clothing made from them. In hot weather we wear light cotton or linen clothing, so as to allow as much of the bodily heat to escape as possible. There is a prejudice in favor of light-colored clothing for summer wear, but it is hardly based on scientific grounds. Dark-colored cloth is the best radiator, allowing the bodily heat to escape freely, while white clothing absorbs less of the heat radiated directly from the sun. Therefore, to dress scientifically in summer, one should wear dark clothing in the shade and light clothing

when exposed to the sun's rays. Practically, the matter of appearance is the only one to be considered, as the warmth or coolness of clothing is not appreciably affected by its color.—*Pop. Science News.*

THE CHEF AND HIS DOMAIN.

SOME OF THE KITCHEN MYSTERIES OF AN ENGLISH HOTEL.

The conspicuous fact about the kitchen of a good English hotel is its exquisite neatness. To produce this condition there is an army of scrubwomen with mops and pails and cleaning cloths, and from the big copper cauldrons at one side of the room, where soups are brewed, past the great row of shining tins suspended in the middle of the room, to the bank of glowing ranges at the other side—from the scrubbed floor beneath your feet to the white apron and black eyes of the chef at your side, everything shines. This is the chef's province. The chef not infrequently combines the sensibility of the artistic temperament with a good degree of education, and he will tolerate nothing unclean. He has been trained in Paris. Before acquiring the diploma of the French Cooking School, which he found necessary to the pursuit of his art at home, he was a pot-washer in the kitchen of some other artist, and he has served the long apprenticeship which most modern Americans consider themselves smart enough to do without. The opportunity of the French chef comes because we are willing to pay munificently for imported cooks, while our own sons starve genteelly in dry-goods stores. Even the cooks in many second and third-class hotels can boast of a Paris training. For, as not every actor can play Hamlet, so not every Parisian who goes to cooking-school becomes an artist. Many a Frenchman, who at home would be compelled to twirl the humble saucepan, is able to lord it over the kitchen of an English hotel, where he is endured because he is less extravagant and, on the whole, more useful than the cook from the provinces, who never saw even the outer wall of a cooking-school. The most widespread misconception of the duties of a chef is the notion that he cooks. He can cook of course, but he could do nothing else if he would never be a chef. His prime importance in the kitchen comes from the fact that he can make five or six other men cook at the same time. Of these assistants he requires everything except the composition of the sauces and the flavoring of the soups. No chef with the true artist-soul will admit that any "second"—as his first assistant is technically known—can make a fine sauce or give the proper savour to a consomme-royale or a Julienne. These be the inner mysteries of the temple, and profane hands must not be laid on them. If at your favorite hotel, the consomme is clear as amber, and nearly as strong as bouillon, while the flavor of the salad dressing inspires thrills of appreciation, your chef is an artist, and life under his ministrations is not likely to be resigned. If at the same time your chop is sometimes charred and your egg made stringy by exposure to too great heat, these are the blunders of the subordinates, and may be remedied by politely-phrased complaints to the chef. If, on the other hand, greasy globules float on the top of the soups, and the beef and mutton gravies taste suspiciously alike, then there is something fundamentally wrong with the kitchen, and the quicker you move the better. The trouble may be too few stock-pots, for these great copper tanks, with sizzling steam pipes running through them, hold a place in the kitchen economy hardly second to the ranges. The largest of them will hold a barrel, while the smaller sizes look like the domestic tin wash-boilers reproduced in copper. There are always three of these and frequently six. The largest is devoted to consomme, or plain beef stock, the foundation of all good soups. Into it are thrown great shanks of beef, the bones being broken so as to release the marrow, together with cuttings from various inferior parts of the animal,

but with the fat carefully removed. The pot is then filled with water, the steam turned through the pipes, and the mass boiled eight or nine hours, until all the nutriment is extracted from the meats. The liquid is then drawn off, strained, and allowed to cool, when it becomes a solid beef jelly. This is put away in the ice box, afterwards being cut and taken out in great "chunks" like cheese, and thinned and flavored for next day's needs. This second pot, equally large, is not so exclusive in its associations. Into it are thrown veal, ham, mutton, and poultry bones, trimmings from all these sorts of meat, the ends of raw tomatoes, celery tops and various vegetables. The resultant stock is finally flavored, but it is not clear, and so it is used for a bases for all the thick soup and vegetable purees. Though there are usually from one to four other stock pots, it is possible to supply all the soups of an extended bill of fare from these two cauldrons—with the aid of a French menu-card and a chef with an artistic taste for flavoring. In a first-class hotel, a third steam pot is devoted to poultry soups, a fourth to bisques or fish soups of various sorts, and a fifth to Espagnol, a soup that is the basis of all meat sauces, and for the flavoring of which various vegetables, including onions and garlic are carefully fried in butter. Ox-tail, mulligatawny, mock-turtle and special soups are made on a range as wanted. But "there are tricks in all trades," and the hotels where beef, mutton, veal and chicken soups are made from the plain beef stock, with the addition of a little meat of the required flavor at the last boiling, are far more common than those where the name which the soup is to bear on the bill of fare is kept in view during the earlier stages of its composition. Even in the houses of fine reputation, Espagnol and the puree of peas have been known on occasion to part company less than an hour before being sent to the dining-room.

PREVENTION AND CURE.

THE RELATIVE IMPORTANCE OF THE PHYSICIAN AND THE PLUMBER.

The question: "Does the plumber have the same confidence reposed in him as the family physician?" has been discussed. This question, of course, relates to the profession of each, and not to personalities, or to the character of each as men. The facts in the case must be presented and viewed as they exist. The practice of medicine is old, that of sanitary science comparatively young. Preventive medicine has not yet established its claim in all the habitations of men, while the practice of medicine—the art of curing disease—is coeval with man's history. So the plumber, as a sanitary agent, is new compared with the physician as a healer of disease. It is quite natural that our confidence is more thoroughly established in an old profession than in a new one. Besides, new ideas and new claims for old ideas grow slowly into common favor. There are many who will express belief in a new thing tardily just because it is new. There are tribes still existing in which civilization has not succeeded in replacing the ignorant sorcerer with the intelligent and learned physician. Houses right in our midst are built with utter disregard for all sanitary conditions, and the idea of constructing a building in conformity with even the simplest rules of hygiene is laughed at. Plumbing is, in many places, looked upon as a convenience and not as a necessity in the promotion of good health. The physician has grown into an age educated up to a proper consideration of his services. There are other facts to be regarded: When people fall ill they know it. When they are well they do not think of conditions apt to bring disease. When they are sick they desire to get well, or their fear of death leads them to secure the services of a physician. When they are well they have no such desire or such fear. They do not take time to think of a possibility

of inviting disease, and never take the precaution to have any one remove unsanitary conditions. In sickness the physician is a necessity. In health the plumber is considered a convenience. Here is where education is needed—that kind of education that will instruct in the practical rules of good health, and the means of securing healthful conditions. It is one of the duties now before plumbers and a part—and an important part—of the duties of every sanitarian and health officer in the country who wish to advance the cause of sanitation in a material and substantial way. The question relates most clearly and directly to the subject of sanitation. Were one to take from the physician his medicine chest and leave him equipped as the sanitarian he would hold the same relation to the public as the plumber does. His counsels and advice would be held in about the same light as the sanitary services of the plumber now are. Narrowed down to the actual point of differences, we would find that the medicine of the physicians and not so particularly the physician is the main object in which the confidence is placed. We would not destroy or weaken this confidence, but we feel that if we can in any way aid the public in placing the same confidence in the agencies that prevent disease as they do in those that cure them, we will be rendering them the greatest service it is possible to give. It is as proper and profitable to consult the plumber in his capacity before disease makes its appearance as it is to consult the physician afterward. The one, in the province of the plumber, means the prevention of disease, the other, curing it.—*Sanitary News.*

THE NEGRO'S SKIN.—The function of a negro's black skin is supposed to be the conversion of the sun's light into heat. The heat thus generated remains in the skin and does not penetrate to the deeper tissue. Being thus provided with a sun-proof armor, the negro can stand an amount of heat that would be fatal to a white man, and he runs hardly any risk of sun-stroke.

GEORGIA DISTILLERIES.—The number of applicants for fruit distilleries in the state of Georgia is reported by the collector to be unprecedented. Indications are that there will be in operation this year the largest number of fruit distilleries ever known in Georgia. The increase is attributed to the recent act of Congress, putting these distilleries on the same footing with grain distilleries in reference to the payment of the tax, extending the time from four months to three years. The outlook is that there will be a very large amount of Georgia fruit brandy on the market for some time.

HOME-MADE ICE.—In view of the threatened ice famine the following recipe for home-made ice given by the *Colliery Engineer* may be found of use: Take a cylindrical vessel and pour three and one-third ounces of commercial sulphuric acid and one and three-quarter ounces of water into it, and then add one ounce or powdered sulphate of soda. In the centre of this mixture place a smaller vessel containing the water to be frozen; then cover the vessel, and, if possible, revolve the whole with a gentle motion. In a few minutes the water in the small vessel will be converted into ice. The same mixture can be used a second or third time for making a block of ice. The operation should, if possible, be performed in a cool place—in a cellar, for example.

A MODERN FABLE.—There was once a Long-Headed Man, who invented a Household Utensil of such general Utility that instead of giving it a Name, setting forth an Intelligible Idea of its Character, he called it simply a Good Thing. So Proud was he of his Good Thing that he would not make its Existence known in the Press. "If People will not come in and ask for the Good Thing," he would say, "I don't Propose to go to the Trouble of Telling Them about It. If People don't Know It when they see It, they must Suffer the Consequences of their Blindness." When a Mortgage was Foreclosed on him a Little Later, the Successful Bidder Advertised the Good Thing in Several Papers, and he had Difficulty in Employing a Sufficient number of men to Fill the Red Wagons that Backed Up at his Door. The Moral of this Fable is in the Possession of our Advertising Agent, who will Disclose it in all its Variegated Beauty to all inquirers on receipt of Stamp for Return Postage.—*Puck.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

August.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal, venison.

GAME AND POULTRY.—Pigeon, chicken, duck, woodcock.

FISH.—Anchovy, bass, bluefish, blackfish, cod, eels, crabs, clams, flounder, halibut, herring, lobster, mackerel, mussels, porgie, prawn, salmon, turtle, trout, sturgeon, whiting, weak-fish, rockfish.

VEGETABLES.—Beans, beets, cucumbers, cabbage, carrots, cauliflower, corn, egg-plant, lettuce, onions, parsley, parsnips, potatoes, squash, shallots, spinach, turnips, radish, rhubarb, tomatoes.

FRUITS.—Cherries, raspberries, huckleberries, melons, gooseberries, blackberries, peaches, pears, tamarinds, bananas, pineapple, grapes, plums.

PRACTICAL RECIPES.

BONE SOUP.—Break up about three pounds of beef or mutton bones and put them in a saucepan, with a tablespoonful of salt, a bunch of sweet herbs, and a little celery seed; cover with two or three quarts of cold water; skim it when it comes to a boil, and then let it simmer for about four hours. When done, strain and thicken with a small lump of butter, rolled in flour, rice or oatmeal.

BEEF HASH, WITH POACHED EGG.—Make a hash of boiled fresh or salt beef left from the preceding day, with one-half meat, one-quarter each of potato and apple, and a little minced celery; cook nicely, season, and serve on toast with a poached egg.

CENTENNIAL GEMS.—Take one quart sifted flour, loosely put in, two heaping teaspoonfuls Horsford's baking powder, a little salt, then sift, and add sufficient sweet milk and water, or milk alone, to make a thick batter, and drop with a spoon into the Gem baking pan. The mixing should be done with a spoon, and the batter should be as thick as can be conveniently stirred; do not mould it; use no shortening. Before mixing set the Gem pan on the stove, and let it get hot before filling.

CANDIED GINGER.—Put into a preserving pan one ounce of finely-grated ginger, one pound of sifted loaf sugar, and no more water than enough to dissolve the sugar; put the pan over a slow fire until the sugar begins to boil; add another pound of finely-sifted sugar, stirring it till it thickens, then drop it in cakes or plates, and dry them in a slow oven. When done they will be hard, brittle and white.

ASPARAGUS SALAD.—Cut off the points or heads of boiled asparagus and drain them. Put in a bowl one cabbage lettuce shred, but not too small; then add the asparagus heads neatly. Chop two hard-boiled eggs, whites and yolks separately; sprinkle the yolks in the centre of the salad, and the whites round the border. Serve with plain dressing.

DEVILED ONIONS.—Take four good-sized Spanish onions, skin and boil them, but not too much; when done, place them on a hot water dish; cut each onion into four parts; spread some made mustard and a dash of Cayenne on each portion, which should be replaced to the form of a whole onion; have ready a frying pan with boiling lard, to which some butter has been added; thoroughly dip each onion in egg and bread crumb, and put it carefully into the frying pan; fry till nicely browned, and serve smoking hot, with or without gravy.

BROILED LOBSTER.—Split the tail and chine; crack

the claws, pepper and salt them; take the body out of the shell, and clear the head of the part called the lady; replace the body within the shell, and then, with the claws and tail, put them on the gridiron; while broiling baste them with butter, and serve with melted butter.

DINNER ABSURDITIES.

FESTIVE SUGGESTIONS OF EDEN MUSEE HORRORS.

The London correspondent of the *Confectioner's Journal* relates the following incident, which illustrates the crowning absurdity of dinner table displays that has come to our notice: "A friend of mine was at dinner the other evening, which was quite unique, where the courses were punctuated with odd surprises that gives zest to the most appetizing sance in the universe—cheerful conversation. Standing beside the table was a life-size figure in wax of a pretty peasant girl carrying a basket. At the moment when a course of roast lamb was being served to the guests, attention was called to the figure by a slight noise. Then the lid of the basket opened and out popped a lamb's head, which uttered a plaintiff "ba-a-a-a." The girl then touched the head with her disengaged hand, whereupon the lamb retired and the lid of the basket closed. This incident excited conversation, as the *mecanique* worked wonderfully, and the effect was admirable. A plateau of flowers in the middle of the table seemed objectionably high, because it obstructed the line of vision between those sitting on either side of it. When the dessert was reached strains of music were suddenly heard emerging from the heart of the flowers. Slowly the plateau opened, the roses falling back right and left, and in the opening arose the figure of a fairy, which danced in tune to the music. These are certainly new accessories to dinner tables. I do not think the mechanical contrivances have been generally adopted yet."

SENSE INTELLIGENCE.

THE INTELLIGENT SENSE OF SMELL IN THE HORSE.

The horse will leave musty hay untouched in his bin, no matter how hungry. He will not drink of water objectionable to his questioning sniffs or from a bucket which some other odor makes offensive, however thirsty. His intelligent nostril will widen, quiver, and query over the daintiest bit offered by the fairest of hands. A mare is never satisfied by either sight or whinny that her colt is really her own until she has certified the fact by means of her nose. Blind horses, as a rule, will gallop wildly about a pasture without striking the surrounding fence. The sense of smell informs them of its proximity. Others will, when loosened from the stable, go directly to the gate or bars opening to their accustomed feeding grounds; and when desiring to return, after hours of careless wandering, will distinguish the one outlet and patiently await its opening. The odor of that particular part of the fence is their guide to it. The horse in browsing, or while gathering herbage with his lip, is guided in its choice of proper food entirely by his nostrils. Blind horses do not make mistakes in their diet. In the temple of Olympus a bronze horse was exhibited, at the sight of which six real horses experienced the most violent emotions. *Ælian* judiciously observes that the most perfect art could not imitate nature sufficiently well to produce so perfect an illusion. Like *Pliny* and *Pausanias*, he consequently affirms that "in casting the statue a magician had thrown hippomanes upon it," which, by the odor of the plant, deceived the horses, and therein we have the secret of the miracle. The scent alone of a buffalo robe will cause many horses to evince lively terror, and the floating scent of a railroad train will frighten some long after the locomotive is out of sight and hearing.—*Horse and Stable*.

PEANUTS.

EXTENSIVE CONSUMPTION OF CIRCOUS SEED IN THE UNITED STATES.

According to a correspondent of the *New York Evening Post*, 3,200,000 bushels of peanuts are consumed in this country every year. They come chiefly from Virginia and North Carolina, although Tennessee also produces a small crop. Peanuts are planted at corn-planting time. Each kernel produces a running vine, like crab grass, and each root produces about twenty pods. When ripe, the plow is run through the loamy soil on a dry day, just before frost. The nuts are dried and shocked up like corn to keep dry before housing. When marketed, they go to a cleaner, where they are put through steam power machines and polished, after which they are graded according to size and variety. This year there is but two-thirds of a crop, and they are higher in price than since 1884. The crop begins to come into the market about the first of September. The Virginia nut is the largest and finest. The Wilmington is a smaller sort, and the Spanish nut, a still smaller variety, is one whose kernels peel perfectly clean, thus making it valuable for confectionery.

IODINE AS A CURATIVE.

The more that remarkable substance iodine is studied the greater does its medicinal value appear to be. Every one is familiar with its extraordinary power when applied as a paint upon the surface of the body, and almost every one knows that when combined with an alkaline, as in the well-known form of iodide of potassium, it is the most efficient and beneficent alterative known to medical science. There are numerous other qualities and properties which have been discovered by savants that are not as well known to the public at large. Thus it has been determined that the hygienic value of sea water and of the ocean air is largely due to minute quantities of iodine held by the one in solution and by the other in suspension. Seekers after health tried for years to get the good effects of sea bathing in their bath-tubs by dissolving common salt in the water. The results were nearly inappreciable. They next tried rock salt, which contains among its other impurities very small amounts of iron, iodine and lime, and succeeded far better. Last of all, they used the salt obtained by evaporating the ocean brine, and then obtained the best results of all. Careful investigations into the nature and properties of the ancient and popular remedial cod liver oil, show that much of its virtue is due to the minute percentage of iodine which that substance contains. They also show, strange to relate, that the values of the different kinds found in the market bear a very close relationship to the varying percentage of that element. Two results of these inquiries are worthy of record. One was the experiment of a distinguished German chemist and physician, who charged vegetable oils, such as olive, peanut and cotton-seed oil, and animal fats, such as butter and beef drippings, with iodine of potassium, and obtained the same relief for his patients from their use as from the cod liver oil for which they had been substituted. Another was the now common practice of reinforcing or strengthening cod liver oil with small quantities of iodide. This process enables a skillful pharmacist to make the poorest grade equal to the best importation from Norway. A series of novel uses, consequent upon these investigations, has been the manufacture and introduction of combinations of iodine with other elements and organic radicals that were unheard of fifty years ago. It is now chemically combined with potassium, sodium, ammonium, lithium, iron, zinc, bismuth, and with at least fifty organic radicals. The physician has gone even further and mixed different iodides into one body, obtaining more certain, efficient and powerful action in at least a dozen cases. Thus today the iodide of zinc is universally acknowledged to be one of the best and most trustworthy antiseptics and

germicides known in surgery; and the "double iodides" have been adopted as the most efficacious simple alterative in the *materia medica*. Another and vital property is the power of the iodides to increase the medicinal action of many vegetable remedies, of which sarsaparilla, stillingia, yellow dock, podophyllin, and many varieties of the solanum family are the best illustrations. Some of these are rendered twice as potent by the addition of an inappreciable amount of iodide of potassium, while each and all have their potency materially enhanced. In the utilization of these great discoveries, one famous medicine and one great pharmacal manufacturer have led the world. Dr. J. C. Ayer & Co. were the first to perceive the importance of these scientific investigations, and, joining in the work, added largely to our knowledge of the curative properties of the iodides. Their labors found practical expression in their distinguished preparation, Ayer's Sarsaparilla, which from the start was adopted by the faculty in every civilized land as the sovereign blood purifier, and which holds its own to-day despite numberless followers and imitations wherewith the market has been flooded. In this celebrated remedy, the health-giving power of Honduras sarsaparilla, stillingia and yellow dock were largely increased by a quantity of the double iodides just sufficient in amount to give the former their highest efficiency and beneficence. This in itself was enough to earn the approval of every physician and scientist, as well as to gain the good-will of the general public. But beyond this they introduced the practice of buying the ingredients in vast quantities, at the very centres of production, so as to insure the best and purest material, and of employing the newest machinery, the latest processes of science and mechanics, and the highest grade of skilled labor. These, combined, enabled the great house to produce the best goods at the lowest prices, and to offer to the world in Ayer's Sarsaparilla an article which, for purity, uniformity and excellence, has never been approached in the history of medicine.

BUSINESS NOTES.

AN ENORMOUS TEA HOUSE.

When it is considered that the consumption of tea in the United States amounts to nearly two pounds yearly for every man, woman and child of the population the magnitude of the trade in that soothing herb can be conjectured. Among the large business houses that make a speciality of handling this commodity the great American Tea Company of 31 Vesey street, in this city, stands conspicuous. They claim that thirty years ago they organized the plan they have ever since followed of supplying consumers with tea at wholesale cargo prices by giving to their customers the profits usually secured by middlemen. The public have recognized the advantage of the new method that operated so effectively in their favor. One of the managers in a recent interview summed up the matter in the following words. "By taking into consideration the immensity of our business, and also the fact that we have very extensive connections with all the principal ports of

China and Japan, and that we import our teas direct from the place of growth, after having them selected by our agents in the best tea districts, expressly for our own trade, our customers can easily perceive that we can sell them better goods and at lower prices than any other tea house in the country." The result has been the business of the house has risen to very extensive proportions, comprising all the choice varieties of tea imported of all grades, besides the best coffees and baking powders. The housekeeper will do well to investigate the claims of the great American Tea Company before buying elsewhere.

STEEL HOOPS.—A corrugated steel hoop has been invented, which is said to be elastic and firm, hugging a package tightly. Four steel hoops will take the place of ten wooden hoops on a flour barrel. They are cheaply produced by the aid of electricity, a hoop being welded in two seconds.

MINIATURE EARTH.—One of the novel and interesting exhibits at the Paris Exposition is a model of the earth accurately made to a scale of one millimetre to the kilometre, or the one millionth part of its natural size. It is a sphere 12.732 m., or nearly 42 feet in diameter, having painted on its surface all the details of the earth's surface.

PRINTERS' INK.

A JOURNAL FOR ADVERTISERS.

PRINTERS' INK is just what it purports to be, "a journal for advertisers." It is issued on the first and fifteenth days of each month, and is the representative journal—the trade journal, so to speak—of American advertisers. It tells the intending and inexperienced advertiser in plain, comprehensive articles how, when, and where to advertise; how to write an advertisement; how to display one; what newspapers or other media to use; how much to expend—in fact, discourses on every point that admits of profitable discussion. If you advertise at all, PRINTERS' INK can help you. Perhaps you expend but Ten Dollars a year in advertising; if so, PRINTERS' INK may show you how to obtain double the service you are now getting for one-half the money. A year's subscription costs but One Dollar: a sample copy costs but Five Cents. Advertising is an art practised by many but understood by few. The conductors of PRINTERS' INK understand it thoroughly. Surely their advice, based on an experience of more than twenty-five years, will help you. Address:—

The Edge Hill Wine Co.,
10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.
STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it.

Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

THE COMPLETE BOOK OF HOME AMUSEMENTS.

correctly. As to CONJURUM, there are nearly a bushel of them, some so funny you will have to hold your sides with laughter, and what fun will be for one of the company to read the questions and see who can guess the answers! A considerable portion of the book is allotted to PARLOR MAGIC, and here you will find hundreds of wonderful and amusing tricks, easily performed, yet exceedingly mystifying to your audience. Then there are the most interesting and profitable of all, the MAGIC OF THE STREET, and the MAGIC OF THE CIRCUS. The illustration of the simplest agents will produce the most surprising results. Following these are a number of excellent DIALOGUES, comic and serious, suitable either for school exhibitions or parlor entertainments. Last, but not least, the book contains nearly fifty of the finest RECITATIONS, dramatic, pathetic, sentimental, and comic, ever written. Send for your copy of this book, and you will be able to perform the most interesting and profitable magic sent by mail, post paid, to any address, upon receipt of only Twenty-five Cents.

What most life we need is *more sunshine*. Let us banish care, have a good time, enjoy ourselves while we may. How much happier—how much better off—are those homes wherein the father and mother, and even the gray-haired grandparents, join with the children after tea in the gay games of amusement, than those wherein reticence and reserve so coldly demand that the children should ask, "What are we to do?" We really don't weary; and we know of no amusement that we care for. How shall we employ the long winter evenings?" We have published a book to answer this question, and a wonderful one it is. It is a book of 100 pages, in a large, handsome, and in handsome covers, and is filled to the brim with good, conceivable things for the enlivenment of home. It is in reality *four books in one*, for it covers the ground usually occupied by four distinct volumes, and contains four times as much matter as any book published at the same price. It contains *ACTING CHARADES*, with full directions how to act them, and some of the most recent and the most amusing, easy, and acted yet very amusing. It tells all about the new "ACTING," and this alone we think you will say is worth the price of the book. It contains nearly fifty beautiful *TABLEAUX VIVANTS*, and gives full and explicit directions for performing them. In it are so many amusing things that you will be tempted to consult it, to read it, but we think we have almost everything new and old that you could want in it of the game line. Then come to a lot of wonderful *ILLUSTRATED*

OF THE

AMERICAN ANALYST

THE ABOVE BOOKS

FREE.

TO any one who will send us **One New Subscriber** to the **AMERICAN ANALYST** for one year, at \$1, we will send, **Free**, any one of the above books, to compensate him for his trouble; to any one who will send us two new subscribers, we will send any two of the books; and for three new subscribers, we will send the three books. This will be good pay for little work, for it is a simple and easy matter to get one or more new subscribers to the **AMERICAN ANALYST**. Show the paper to your friends and neighbors, and you will have little difficulty in inducing one or more of them to subscribe for one year. And when you have received your book or books you will feel doubly repaid for what trouble you have taken. If the parents do not wish to try it, let the little boys and girls do so after school hours. We feel sure that every one of our present subscribers and readers can readily secure for us one or more new subscribers, and we offer this special inducement in order to stimulate effort in this direction. The books will be found well worth the slight effort that will be required to secure them. Try it, and see how easy it will be.

ADVANTAGES TO ADVERTISERS OFFERED BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond doubt that they have found the **AMERICAN ANALYST** a good advertising medium. Why should not you?

OUR MISSION.**WHAT THE AMERICAN ANALYST IS DOING.****FIGHTING ADULTERATION.**

The steadily growing favor which the **AMERICAN ANALYST** is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the **AMERICAN ANALYST** has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the **AMERICAN ANALYST** is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the **AMERICAN ANALYST** also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the **AMERICAN ANALYST** does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose spurious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar we believe the day is approaching when the **AMERICAN ANALYST** will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING Co.,
19 Park Place, N. Y.

AMERICAN * ANALYST

WANTED ON LIBERAL TERMS.

WE ARE CONFIDENT that we have Reached the HIGHEST DEGREE OF PERFECTION in Solving the INFANT FOOD PROBLEM.

LACTO-PREPARATA.

A Prepared Human Milk perfectly Sterilized and especially designed for Children from birth to six or eight months of age.

Made wholly from cow's milk with the exception that the fat of the milk is partially replaced by cocoa butter. Cocoa butter is identical with milk fat in food value and digestibility, being deficient only in the principle which causes rancidity. The milk in LACTO-PREPARATA is treated with Extract of Pancreas at a temperature of 105 degrees, a sufficient length of time to render twenty-five per cent. of the casein soluble, and partially prepare the fat for assimilation. In this process the remaining portion of the casein not peptonized, is acted upon by the pancreatic ferment in such a manner as to destroy its tough, tenacious character, so that it will coagulate in light and flocculent curds, like the casein in human milk.

Composition :	ALBUMINOIDS,.....	19 Parts.
	MILK SUGAR,.....	64 "
	FAT,.....	10 "
	MINERAL MATTER,.....	3 "
	CHLORIDE of SODIUM added,.....	1/4 "
	PHOSPHATE of LIME added,.....	1/8 "
	MOISTURE,.....	3 "

SEND FOR SAMPLE and compare it with every other food used in artificial feeding of Infants.

LACTO-PREPARATA is not designed to replace our SOLUBLE FOOD but is better adapted for Infants up to eight months of age.

CARNRICK'S SOLUBLE FOOD

Is the Nearest Approach to Human Milk that has thus far been produced, with the exception of Lacto-Preparata.

During the past season a large number of Physicians and eminent Chemists visited our Laboratory at Goshen, N. Y., and witnessed every detail connected with the production of Carnrick's Soluble Food. This invitation to witness our process is continuously open to Physicians and Chemists. All expenses from New York to Goshen and return will be paid by us. The care used in gathering the milk, its sterilization, and the cleanliness exercised in every step, cannot be excelled. Soluble Food has been improved by increasing the quantity of milk sugar and partially replacing the milk fat with cocoa butter.

PHOSPHO-CAFFEIN COMP. A SEDATIVE, NERVE AND BRAIN FOOD.

(GRANULAR EFFERVESCENT.)

This preparation has been thoroughly tested, and found to produce the happiest effects in Headaches, Neuralgia, Sleeplessness and General Nervous Irritability. We are confident that the above combination will be found superior to any of the various preparations that are used in nervous affections. It is not only a nerve sedative but a Brain and Nerve Food. The depressing effects of the sedative ingredients are fully overcome by its reconstructive constituents.

As a harmless and positive remedy in Headaches and Insomnia we are certain it has no equal. It is far more palatable than any of the preparations used for similar purposes.

PUT UP IN FOUR, EIGHT AND THIRTY-TWO OUNCE BOTTLES.

A VALUABLE BOOK FOR NOTHING.

The **AMERICAN ANALYST** will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. **THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE** is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar.** It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

ADDRESS ANALYST PUBLISHING CO.,

— 19 PARK PLACE, NEW YORK. —

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making Bi-CARB. Soda from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

COLDEN'S LIQUID BEEF TONIC.

ORIGINAL LABEL:
"Colden's Liebigs Liquid Extract of
Beef and Tonic Invigorator."

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, (Inchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No 2."

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

ANOTHER DRESSED BEEF TRIUMPH.

In the case of the anti-law beef conspirators, the "mills of the gods" have recently been grinding not only "exceeding fine," but with cheerful rapidity. Little by little, but with unintermitting regularity, their absurd pretenses are being wiped out by the courts in every State in which the legislatures last winter were bamboozled into connivance with the schemers. The most recent case reported was at Duluth, Minnesota, that being one of the States that had been apparently captured. A dispatch from that city, which, by the way, is the place immortalized by Proctor Knott some years ago as "the umbilicus of the world," dated August 13, says: "Yesterday Alfred F. Christian, the local manager of the Armour Company, acting under orders from Chicago, began selling Chicago dressed meats. He was at once arrested and fined \$50. Refusing to pay this fine, he was committed to the county jail, but later was permitted to give bond until a writ of habeas corpus could be argued and a decision rendered, the argument

being set for this morning. When the case came up to-day both Judges Stearns and Ensign were on the bench. City Attorney Smith presented the argument in favor of the law and of holding the prisoner, while John P. Williams appeared for Christian and the dressed meat company. The Court said that the law was plainly unconstitutional, infringing both on the right of inter-State commerce and of trade, and ordered the release of Christian.* Possibly, by this time the *Butchers' Advocate* appreciates the significance of what it claimed lately the AMERICAN ANALYST left "open to inference."

TO TEST COFFEE.

The Chief Analyst of the Dominion Department of Inland Revenue publishes the following directions to his collectors of coffee samples for making their preliminary tests. It is Hager's method modified by Mr. McGill, and is very simple:

"Prepare a saturated solution of common salt. Shake up a small quantity of the coffee to be tested with ten times its bulk of the brine, in a test tube at least three-quarters of an inch in diameter. Repeat the shaking twice, so that the coffee may be thoroughly wetted and then allow the tube to stand for half an hour. Observe then the color of the brine, and the quantity of the sample floating on the surface, as well as the amount deposited at the bottom of the tube. If the color is a very pale amber, and nearly the whole of the coffee floats, the sample may be assumed to be pure. A decidedly darker or yellow tint indicates admixture of chiccory, etc., in which case there is also a larger deposit. This increases and the color of the brine grows darker with the impurity of the coffee. With 30 per cent. chiccory the brown color is very marked, and with a still larger percentage of adulterant the brine becomes dark brown."

AMERICAN CORN IN FRANCE.

The effort, which the AMERICAN ANALYST suggested and which at one time bade fair to succeed, to bring the special advantages of Indian corn to the attention of the European world through the instrumentality of the Paris exposition, failed through the apathy of persons in this country most interested in its success. Mr. Charles J. Murphy, who proposed to erect a corn palace at the Paris exposition to be devoted to a display of the various uses of Indian corn as a food article, writes from Paris to a friend in this city, under date of August 1, explaining why the exhibition failed of success. Mr. Murphy says:

"Ever since the Paris Exposition of 1878, when the United States made a very poor agricultural showing, I have waited for an opportune time to exemplify to the world what could be done with our Indian corn as a human food. I concluded the time had come for this display at the Paris Exposition. I laid my plans before the New York Produce Exchange, the President of which appointed a committee, with ex-Mayor Franklin

Edson as chairman to further my project. I then went West and made strong appeals to the produce exchanges of the corn States to help the movement with subscriptions. Circulars were also sent by the New York committee to some eighteen of these commercial bodies, including Baltimore and New Orleans, urging assistance. The principal produce exchanges and boards of trade in the West appointed committees to solicit subscriptions, and the only money raised was \$360 at Buffalo, which was afterward returned. New York City subscribed \$1,050. Congressman Townsend, of Illinois, introduced a bill in Congress proposing to grant a special appropriation, but Congress adjourned without action. Similar bills were introduced in the Legislatures of Ohio and Illinois, but they too failed of passage. I then came to Paris in hope that General Franklin, the United States Commissioner, would at least erect the building at a cost of \$2,500 out of the \$250,000 appropriated by Congress; but he refused to give one dollar for this exhibit, which would have been of more practical value to the farming interests of the United States than all the other American exhibits (such as they are) combined. The French authorities generously gave the site without a charge, which they valued at \$12,000. It is to be regretted that a movement should fail, which, if successful, to use the words of the United States Commissioner of Agriculture, would enhance the value of every acre of land in the corn belt. In conclusion, I would like to make my most grateful acknowledgments to the press of the whole country, who gave the movement their heartiest support."

CHEMISTRY'S CREATIONS.

One of the most promising of scientific investigations is that which is directed to the work of accomplishing by synthesis organic results similar to those produced by nature. We know, for example, that many mineral, vegetable and animal substances are the results of compounds made in the laboratory of nature. The scientist can take a vegetable or animal product and by analysis determine the quantity, and even the quality, of the various substances which have entered into its composition. But when he has determined that there is so much of this, that or the other, and has attempted, following out this formula, to blend these substances together for the purpose of producing results similar to those found in nature, he has learned that the operation will not work. There has been something wanting, something that has defied analysis, and yet so essential that without it the desired material could not be produced. Of late the science of chemistry has made some very marked advances in the direction of solving this difficulty. It has been found, for example, possible to manufacture glucose in the laboratory out of the simple elements in the same manner that glucose might be produced by making use of vegetable matter, and this is doubtless but the beginning of a long series of chemical discoveries which may permit us to make, not only in laboratories, but in factories, many materials without being compelled to wait for the slow processes of nature. The time may come when, by combination of gases and other simple elements, the chemist will be able to turn out, with but slight labor, the various materials that are needed for the food of man. But before

ROCK CANDY and ROCK CANDY SYRUPS.

For use at the Soda Fountain and in all Pharmaceutical preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

DRYDEN & PALMER,
19 Hudson St., New York.

this plan can be fully developed it will be necessary, perhaps, to discover that at present greatest of all mysteries, what it is that constitutes life? And yet there is this to be said, that while chemical science is able to produce chemical isomerics, so far it has utterly failed to make these isomerics practically useful.

DISEASE, MODERN AND ANCIENT.

We observe that a number of our contemporaries are adopting and pursuing the line of argument presented by the *AMERICAN ANALYST* recently in repudiating the notion that the greater differentiation of diseases of the present day indicates an actual increase in the maladies to which humanity is subject, over those known by our ancestors. The *Popular Science News* of Boston says truly that there "are no more real diseases than there were a hundred years ago, but, with our increasing knowledge, we are able to observe differences not then noted, and to separate into distinct diseases, each requiring different treatment, certain affections which were formerly grouped together under one general name. Pneumonia, for instance, was rarely heard of in former times, but "lung fever" was none the less fatal, and even more to be dreaded in the absence of any rational method of treatment. Before the general use of the microscope and chemical reagents for testing the urine, diabetes, Bright's disease, and many others were not thoroughly differentiated, but were called by the general name of kidney trouble, and were just as common as in these modern times when "safe" and infallible cures are advertised for sale at every drug store. The forms of brain disease accompanied by paralysis were in existence long before the term paresis was introduced into the medical vocabulary, and the victim of alcoholic dementia is not favored with the sight of any more zoological curiosities than his predecessor who merely had the common jim-jams. 'Heart failure' is the latest term of this sort employed to indicate the cause of death, and is a most unfortunate one. It really has no meaning at all, for the failure of the heart to do its work always occurs at the end of life. It may be said that death is always caused by the failure of either the heart or lung to perform their duties, and that the various forms of accidents or disease are only indirect causes, including such failure. Heart failure is not a disease, but the result of disease, and there is nothing new about it whatever. When applied to organic or functional diseases of the heart it may have some significance, but such a general term had best be used only in a very general sense.

WIVES IN INDIA.

The *Bombay Guardian* calls attention to an extraordinary book which is being distributed broadcast as a prize book in the Government girls' schools in the Bombay Presidency. The following quotations are given as specimens of the teachings set forth in the book:

"If the husband of a virtuous woman be ugly, of good or bad disposition, diseased, fiendish, irascible, a drunkard, old, stupid, dumb, blind, deaf, hot-tempered, poor, extremely covetous, a slanderer, cowardly, perfidious and immoral, nevertheless she ought to worship him as God with mind, speech and person. The wife who gives an angry answer to her husband will become a village pariah dog; she will also become a female jackal and live in an uninhabited desert. The woman who eats sweetmeats without sharing them with her husband will become a hen owl, living in a hollow tree. The woman who walks alone without her husband will become a filth-eating village sow. The woman who speaks disrespectfully to her husband will be dumb in the next incarnation. The woman who hates her husband's relations will become from birth to birth a muskrat living in filth. She who is always jealous of her husband's concubine will be childless in the next incarnation." To illustrate the blessed results of a wife's subservieny, a story is told of the great reward that came to the wife of an ill-tempered, diseased and wicked Brahmin, who served her husband with a slavish obedience, and even went the length of carrying him on her own shoulders to visit his mistress. The British Government in India, says the *Woman's Journal* of Boston, has bound itself not to interfere with the religion of the natives, but it certainly ought not to inculcate in Government schools the worst doctrines of heathenism.

BRANDING BEES.

The general term of the Supreme Court in the central part of this State has decided that it is trespass for honey bees to go upon lands not belonging to their owner. This may be good law, but the wonder is how this law is to be carried out. It perhaps will offer a new field for the rubber stamp men to affix the owner's initials to the bees' feet, or Mr. Edison might invent some electric appliance by which trespassing bees could be made to leave their mark, or nature, perhaps, would be sufficient if the bees would notify the owner of the land where the trespass is committed by presenting their business end as a sort of card of identification, or the owners of the bees might brand them. Otherwise we cannot see how this decision will help those who are trespassed upon.

FAMOUS CLARETS.

WHERE THEY COME FROM AND HOW THEY ARE NAMED.

A writer in the current number of the *Universal Review* of London gives a description of some of the actual castles which have given their names to the most familiar clarets. Chateau-Margaux, he says, stands at a short distance from the little town of Margaux, built at a careful distance from the sometimes turbulent Gironde. The present structure is a massive pile that dates back not further than the second or third year of the century. It stands on the site of an ancient castle built in the fifteenth century, which played its part in any little war going forward in the neighborhood. It was only in the middle of the eighteenth century that the then proprietor discovered in the pebbly black earth peculiarly favorable conditions for the culture of the vine. He began to plant, and gradually, through a hundred years, the wines of the Chateau-Margaux grew in fame. In 1802, when chateaux were going cheap, this was bought by one of the new Emperor's new Marquises, who pulled down the old chateau and built the modern-looking pile which now

stands in its place. In 1879 the chateau and the vineyard came into the possession of Count Pillet-Will. Chateau-Lafite he describes as near Pauillac, a quaint old port on the Garonne, whence is shipped the produce of the teeming vineyards divided by the marsh of Pibran. It has escaped the hand of the demolisher, and stands as it did in pre-revolutionary days. When Louis XVI. was parleying with the angered populace of Paris the chateau belonged to M. de Pichard, President of the Parliament of Guienne. But there were too many Presidents about; so M. de Pichard was taken to Paris and there guillotined. The next step was to write on the walls of the chateau the magic words "Propriété Nationale." House and vineyard were put up for sale, and brought into the national coffers a trifle over 1,000,000 francs. In 1818 they were sold for something less than was given in the revolutionary days, and in 1868 Baron James de Rothschild gave upward of 4,000,000 francs for the property. It now belongs to the heirs of Baron James, Barons Alphonse, Gustave, and Edmond de Rothschild. Like Chateau Margaux and others of the more famous chateaux, the stately rooms of Lafite are tenantless. Not so the cellars, the private cave of the Rothschilds containing 80,000 bottles of the finest wines, not only of Medoc, but of Spain, Germany, and Italy. After describing some other less famous chateaux, he says of some of the secrets of viniculture: "We islanders have a vague impression that the chief thing necessary for a vine-growing country is plenty of sun. The heat and life-giving properties of the sun are undoubtedly essential; but the soil is everything. In the Medoc the limits of the most famous vineyards are marked with strange arbitrariness. Here, where an irregular line is arbitrarily drawn, grow the vines that make the wine of Chateau-Margaux or Lafite. A handsbreadth outside its vines truly grow, but produce wine of quite a different quality. What the vine likes is that stony ground scorned in the parable of the seed scatterer. It loves above all things the crevices of a rock into which its roots penetrate, hardening the plant and imparting a special flavor to the wine. A Medoc wine-taster can tell at a sip what sort of ground a bottle of wine has grown in. A stony subsoil imparts a distinct fineness of taste to the wine, while that grown on a stony layer is marked by greater body and vinosity. While vast quantities of wine in the Medoc are bottled at the end of the second year, the fine wines are kept in casks until the third or fourth year. Once in bottle, well corked, the mind of man may be at rest about his wine, which, up to a certain limit of time, goes on improving. Where occasion for care again presents itself is in getting the wine out of the bottle without shaking. Most wine pantries are furnished with a small basket in which the wine bottle may rest while the wine is drawn into the decanter. Wine merchants, wine tasters, and experienced wine drinkers in the Medoc do not trouble themselves about these contrivances. They carefully lift the bottle from a horizontal to an upright position some three or four hours before it is wanted for the table. At the same time they carefully mark the side of the bottle that has lain uppermost, and in decanting pour out the wine from that, as it is sure to be free from crust. With steady hand they draw from a bottle a maximum quantity of absolutely clear, bright wine. Any one who desires to drink a good glass of Medoc or Burgundy will not decant it till almost the moment it is required, thus preserving the freshness of the aroma. Good wine needs no bush; but in our climate (which, by the way, the experts of the Medoc declare to be the best possible for storing fine wines) it is better for a little warmth. Rather than drink red wine in the winter months drawn from a cellar in which the temperature has not been maintained at a desirable pitch, it is better to put the wine where it may feel the fire. A better way still is to leave it on the mantelpiece of the dining-room for four or six hours before it is to be decanted, when it will have had an opportunity of acquiring something like the temperature

of the room. It is well worth while warming the decanter before pouring in the wine, so that it may not receive the shock of contact with the cold glass. Some hosts possessing red wines that deserve a better treatment brutally serve them up cold out of the cellar, a barbarity equaled only by bringing in the fish half done or the soup lukewarm. In such emergency Providence has supplied man with an effectual remedy for the oversight. The palm of the hand closed round the filled glass will—if the glass is thin, as it should be—speedily bring the wine to the desired temperature. The best wine year in the records of the Gironde is the year which saw the battle of Waterloo and the downfall of Napoleon; 1864 and 1875 are the wines now in bottle which stand highest in the appreciation of the wisemen of Medoc. It is not always that a good year for champagne turns out a favorable season for red wines; but the year 1874—a year spoken of reverentially by champagne drinkers—was not less happy for red wines. The proprietors were fortunate in enjoying a time of peace, and got big prices for their products. The years 1877 and 1878 were excellent ones for the Medoc, and 1888, another fine year for champagne, was, for the Medoc, a season of only ordinary vintage. The 1881 crop was well harvested, and on the whole a good year. Eighteen hundred and eighty-four was not so good for red wine as for champagne; but 1887 was on the whole fair, but not likely to be memorable. The 1888 crop, I hear upon highest authority, 'has come on splendidly since the vintage.' Contemporary interest in these dates is sorely limited. It is said that some wines of Medoc, notably those of the Chateau-La Lagune, a wine little known in this country, preserve all their virtues after being forty years in bottle. But for the best wines and the ordinary palate thirty years in bottle is long enough. A bottle of Chateau-Margaux of 1869, Chateau-Lafite of 1864, or Chateau-Latour of 1875, may be warranted to fulfill the highest aspirations of the nicest and most exalted palate."

HOT WEATHER.

WHAT CAUSES IT, AND WHEN IT OCCURS.

The original source of the summer's heat is the sun, but many local causes tend to modify and vary the action. The earth is really farther from the sun in summer than in winter, so that the warm weather does not depend upon the greater proximity of the source of heat. It is due to the fact that in summer the northern hemisphere is turned more directly towards the sun, so that it receives its rays in a more vertical direction, while in winter it is turned farther away, and the more oblique heat rays are unable to raise the temperature to any great degree. The varying length of the days is also an important element, as the long days of summer allow the earth to be exposed for a longer time to the influence of the source of heat. The thermal summer—that is the period of the greatest heat—does not correspond with the astronomical summer. On June 21st the sun's rays are most nearly vertical, and the earth is exposed to their influence for a greater proportion of the twenty-four hours, but the hottest weather is not generally experienced till about a month later, and similarly, the greatest cold does not occur until after the winter solstice. A certain amount of time is necessary for the increasing heat of the approaching summer to counteract the cold of the preceding winter, and *vice versa*. A similar delay is noticed in the daily fluctuations of temperature; the hottest part of the day is not at noon, but about three o'clock, while the lowest temperature of the night is reached in the early morning hours. As might be expected, the highest temperatures of summer are accompanied by southerly or southwesterly winds, blowing from the heated lands to the south of us, or from the tropical waters of the Gulf of Mexico. The oppressive nature of this heat is largely due to the high percentage of moisture which the air contains. This tends to

check the insensible perspiration, which the body is continually throwing off and produces a general feeling of lassitude and discomfort, familiar to everyone. In the dry light air of mountain regions, a much greater degree of heat may be borne with less discomfort, than is produced by a lower temperature with a higher percentage of humidity. Under all circumstances the temperature of the healthy body is about the same, not varying much from 90 deg. If, from sickness or any cause the temperature rises a few degrees above this point death soon occurs, and one of the most important matters in cases of fever is to reduce the bodily temperature; but, usually, the wonderful vital processes regulate the internal fires very accurately, and the bodily temperature is constant, whether exposed to the rigors of an Arctic winter, or to the extreme heat endured by the iron-smelters in their daily toil. After a longer or shorter period of hot weather the wind changes, and a current of cool air comes from the far northwest, bringing comfort and strength once more. These northwesterly breezes are the same which produce the "cold waves" of winter, and their exact origin is uncertain. They are however invariably dry and cool and are always accompanied by fair weather. They are a quite peculiar feature in the American climate, and the most agreeable and delightful one. The sea breezes of the coast are a local phenomenon, and are due to the difference in the temperature, and consequently to the specific gravity, of the air over the land and water. The land absorbs much more heat than the water, and, towards the middle of the day, the overlying air becomes so warm and light that it is forced by the heavier air over the water, and a steady current of the cooler air flows inland. The waters of the New England coast, north of Cape Cod, being cooled by the current from the Arctic ocean, produce this phenomenon very frequently. The dog-days are an indefinite period of time, when hot, sultry weather is supposed to be especially common. The date is given differently in different almanacs, but usually includes the time from the last of July to the first week in September. In ancient times it was supposed to be governed by the time when Sirius, or the dog-star, arose at the same time as the sun, but the dates are now widely separated and, in fact, the dog-days have no more real existence than the Indian summer, the equinoctial storm, and many other meteorological superstitions. In many seasons we have found from actual observations a larger number of hot, sultry days in June than in August. It is often said that a thunder-storm clears the air, but this is a common error, where cause and effect are confused. Cool, clear weather does not by any means invariably follow a thunder-shower, but, at the end of a period of heat, the current of cooler air which brings a change of weather is also very likely to develop such a disturbance. The clearing of the air, therefore, is not the result, but the cause of the thunder-shower, or, rather, the cool weather and the storm are both due to the same cause—a sudden inrush of cooler air. After all, the American summer is certainly a trying and disagreeable season, but as it is one of the things that must be endured, the only way is to make existence as easy as possible during its continuance. Over-exertion and exposure to the direct rays of the sun should be avoided as much as possible, and cooling drinks and light, nutritious food should take the place of the heavier viands needed during the more bracing winter season. Ice is an excellent thing, but must be used with judgment; too much ice-water or frozen food is bad as a moderate amount is healthful and refreshing. Fortunately, the heated term is a comparatively short one, and the cooler winds of fall and winter come all too soon to those who have made the most of the opportunities for out-of-door life and exercise which the summer has brought them.—*Pop. Science News*.

THE BROWN-SEQUARD ELIXIR.

ITS MERITS BEING CAREFULLY TESTED IN THIS CITY.

At the Loomis Laboratory, an annex to the New York University Medical College in East Twenty-sixth Street, the most extensive experiments with the Brown-Sequard elixir of life made in this city are now going on. Dr. Loomis and his associate, Dr. Byron, intend to inoculate fifty, and perhaps a hundred, before they publish the results of their experiments. Dr. Byron said last week that thus far they did not consider that they had arrived at any definite result. Although nearly all of the seven patients that had been inoculated profess to feel very much better, the doctors do not consider their protestations worth much. For, while none of them knows that it is Dr. Brown-Sequard's elixir which has been injected into their veins, they were all persuaded to submit to the operation by being told that it would do them good, and, naturally, are likely to imagine such a result. All but one of the patients are aged men. The exception is a young man who is very deaf. He has had but one injection, and is as deaf as ever. An old man suffering from asthma, who has had three injections, says that he breathes much more easily, and considers himself, if not cured, at any rate on the high road to recovery. The other five patients, who have lung troubles of some sort, take an almost equally sanguine view of their cases since their inoculation with the elixir. The experimenters, however, not only do not accept the patients' description of their sensations, but endeavor by examination, with the aid of the proper appliances, to ascertain their true condition. Thus far their examinations have not corroborated the patients' accounts of themselves sufficiently to make Drs. Loomis and Byron think any great improvement has taken place, and what improvement there is the two doctors ascribe to the effects of anticipation. They will continue to consider any improvement to be due to the imagination, as in the case of faith cures, until the contrary is proved and the improvement is shown beyond doubt to be due to the elixir. Dr. Byron says that the efficacy of the elixir can only be demonstrated by experiments. Medical science cannot tell *a priori* whether it is really valuable or not. While he does not know that it will do good, he says that an injection with it cannot do harm. Care, however, must be used, or evil results may follow. Only a skilled physician accustomed to the use of antiseptics should perform the operation, which is quite painful. A perfectly healthy animal must also be chosen. Drs. Loomis and Byron have been experimenting about a fortnight. Several months may elapse before they will be prepared to publish their conclusions. Two of their seven patients are inmates of Bellevue. The others are dispensary patients.

CURIOUS EXPERIMENTS.—Take two eggs of equal size. Carefully dissolve the shell of one with dilute hydrochloric acid, and immerse it into pure water. In the course of a day or two enough water will pass through the outside membrane to cause it to nearly double its volume as may be shown by comparison with the second egg, which is used as a standard.

INTERESTING FACT.—If sodium sulphate is allowed to crystallize between plates of unglazed porcelain in the open air, and if the crystallization is reproduced two or three times by sprinkling with water, the plates fall into powder. The same phenomenon is observed with very hard stones. This crystallization may be a cause of the comminution of rocks which resist water.

USE FOR THE PHONOGRAPH.—While the deepest tone that our ears are capable of recognizing is one containing sixteen vibrations a second, the phonograph will record ten vibrations or less, and can then raise the pitch until we hear a reproduction from them. Similarly, vibrations above the highest rate audible to the ear can be recorded on the phonograph, and then reproduced by lowering the pitch until we actually hear the record of those inaudible pulsations.

NEW BOOKS.

A MANUAL OF CHEMISTRY, for the Use of Medical Students. By BRANDRETH SYMONDS, A. M., M. D. Blakiston, Son & Co., Philadelphia. Price \$2.00.

This is an exceedingly handy and useful little work, and we welcome it the more cordially because it is addressed to that class of students who, more than any other followers of science, should devote some share of their attention to modern chemistry. While we cannot, of course, credit the author with any great degree of originality, we nevertheless admire the concise, distinct and rational manner in which he has arranged his subjects, seeking to give everything that is necessary, while omitting that "ballast" or padding to which we are unfortunately so much accustomed. There are, of course, some minor inaccuracies, but where is the book of the kind in which they are not to be found? One of these—excusable only on the grounds of *lapsus calami*—is the statement that sea water contains 2.138 grains of solid residue to the gallon—the fact being that it contains from 3 to 3½ percent. Another—much more serious—occurs on page 111, where Dr. Symonds teaches that dextrose may be prepared under the influence exerted upon starch by diastatic ferments. Such a statement might have passed unnoticed twenty years ago, but to-day all chemists worthy of that name are well aware that the species of sugar produced by diastase is not glucose, but maltose, which, to use a rough colloquialism, is a "horse of a totally different color." Taken as a whole—despite the little faults, to be corrected in a subsequent edition—the perusal of the volume has given us much pleasure, and we commend it unhesitatingly to those for whom it has been compiled.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

August.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal, venison.

GAME AND POULTRY.—Pigeon, chicken, duck, woodcock.

FISH.—Anchovy, bass, bluefish, blackfish, cod, eels, crabs, clams, flounder, halibut, herring, lobster, mackerel, mussels, porgie, prawn, salmon, turtle, trout, sturgeon, whiting, weak-fish, rockfish.

VEGETABLES.—Beans, beets, cucumbers, cabbage, carrots, cauliflower, corn, egg-plant, lettuce, onions, parsley, parsnips, potatoes, squash, shallots, spinach, turnips, radish, rhubarb, tomatoes.

FRUITS.—Cherries, raspberries, huckleberries, melons, gooseberries, blackberries, peaches, pears, tamarinds, bananas, pineapple, grapes, plums.

PRACTICAL RECIPES.

CALF'S-HEAD SOUP.—Wash clean a calf's head, stew it with a bunch of sweet herbs, an onion stuck with cloves, mace, pearl barley and Jamaica pepper, when it is very tender add to it some stewed celery. Season with pepper, and serve with the head in the middle of the tureen.

CAPER SAUCE.—One tablespoonful capers, two teaspoonfuls vinegar; mince one-third of the capers very fine and divide the others in half; put them in a quarter of a pint of melted butter or good thick gravy; stir it always the same way or it may oil. Sometimes half a Seville orange or lemon or parsley, chervil or tarragon are added.

CURRY POWDER.—Three ounces coriander seeds, two ounces tumeric, one ounce each of black pepper, mustard, ginger, half an ounce allspice, and lesser cardamoms, one quarter of an ounce of cummin seed; put ingredients in a cool oven for the night; thoroughly pound and mix together and bottle close for use.

STEWED CELERY.—Wash six or eight heads of celery and take off the outer leaves, cut the heads up in bits three or four inches long, stew them till tender in half a pint of veal broth or white gravy, then add two spoonfuls of cream and an ounce of butter rolled in flour; season with pepper, salt and nutmeg, and simmer the whole together. The leaves will do to flavor soup that is to be strained.

STEWED CUCUMBERS.—They may be stewed in the same way as celery with the addition of some sliced onions, or the cucumbers and onions may be first floured and fried in butter, then add the gravy and stew till tender; skim off the fat.

ICELAND WHITE FRUIT LOAF.—The whites of twelve eggs, two cups powdered sugar, one cup butter, one cup sweet cream, one-fourth cup brandy, one quart flour, two tablespoonfuls Horsford's baking powder, two pounds chopped almonds, two cups cut citron, two cup grated cocoanut, two teaspoonfuls lemon extract. Bake until thoroughly done, in a moderately hot oven.

TO CAN TOMATOES.—Of course, to make a success the tomatoes must be in good condition. Have ready a porcelain-lined kettle, a sharp knife, a large pan to hold the tomatoes while preparing them, the cans with their fixtures, the jars with porcelain-lined tops are perhaps the best, a large plate and coffee cup. Pare the tomatoes, and cut out the hard piece at the blossom end, without putting water upon them. Throw them into the kettle, and set it over the fire. Do not add either pepper or salt. The matter of the length of the time of boiling is of no consequence, except that they must cook until the whole mass is not only hot but in a boiling state whether it takes thirty, sixty, or more minutes. Place a can upon the plate after putting the rubber around the neck; with the cup dip out and pour into the can the boiling tomatoes, hold the cover in your left hand, and when the liquid overflows clap on the cover, and screw it down quickly. Set the can aside, and several times see if you can screw it a little tighter, for as the steam condenses it will leave a little space at the neck of the can.

TOMATO CATSUP.—Remove the blossom end and such green spots as are near it; place the tomatoes in a porcelain-lined kettle, boil until very soft, strain through a colander if the seeds are desired, through a sieve if not. Measure the liquid; to every quart add one quart of vinegar, half a teaspoonful of cloves, cinnamon, black pepper, a pinch of red pepper, salt to the taste, half a tablespoonful of dry mustard, and the same of celery seed. The best way to mix the spices is to moisten them with a little of the tomato juice. Bottle when cold.

BEER AT HOME.

A WESTERN EXPERT DECLARES IN FAVOR OF THE AMERICAN PRODUCT.

Murat Halstead who has just returned from a European trip, writes as follows in the *Cincinnati Commercial Gazette*:

Beer is forbidden in the usual "cures" at the German Springs, but invalids are in the habit of sampling a little of it as they come and go, and are likely to have a general idea of the quality thereof. To get along without it is really troublesome sometimes, for the water is largely bad, even dangerous, and one cannot be quite sure even of seltzer and other bottled waters. Chemical analysis has shown more than once that polluted water was used in seltzers and sodas. It may be employed in manufacturing beer, also, but pub-

lic opinion is powerful against water and in favor of beer, and hard to resist—especially where milk is scarce. From the experience with those whom I was familiar I feel able to say that the average beer in Berlin is no better than that of Cincinnati and Milwaukee. It is apt to be too light or too heavy, but the Bavarian beer has a good reputation of its own, which I believe is justified. The price of beer is nearly equal in Germany to what it is in America, and they know even in Berlin and at the railway stations how to fill the glasses with froth. The price of beer in Germany is from 15 to 30 pfennigs per glass. The German champagne is, by the Germans themselves admitted to be inferior to the French. It is slightly acidulous, and the doctors do not seem to be of the judgment that there is danger that invalids will drink too much of it, for only in special cases is it forbidden. One of the surprises is since we are speaking of the fluids that show their color in the cup and move themselves aright and are otherwise seductive, that the price of champagne is about the same in France that it is in the United States. A friend paid 18 francs for a bottle of champagne on the Eiffel, and assured me there was nothing extraordinary about it except that it happened to be rather dry and he had to have it because it was good to go with roast chicken. It is the fashion in France to drink sweet champagne, and in England to take it dry. The consummate thing at a French dinner is for the servants pouring the champagne to carry a bottle with a napkin about its neck in each hand, and to ask, before filling a glass, "Sweet or dry?" The legend goes that the dry article assimilates with chicken in France and terrapin in America.

PINS.

THEIR ANCIENT HISTORY AND MODERN MANUFACTURE.

Not the modern pin, but its less delicate predecessor we hear of in old world tales. The Egyptians themselves used something of the kind, and among the Romans, so the records say, there were pins of bronze, with ornamented head, from one to eight inches long; and, also they were made of ivory, bone or wood. In England, up to the middle of the sixteenth century, people made use of skewers, of wood for this purpose, though there were pins of gold, silver and brass. But it was not until about 1626 that the pin manufacture in England became a settled thing. In 1483, that such an industry might best be fostered, the importation of pins was prohibited by public statute. But the law became very much of a dead letter, and as late as 1540 there is evidence that at least one of the royal family was in the habit of receiving her pins from France. For at that time a very large proportion of those of English manufacture were made of iron wire, blanching or whitening, and passed off as the good quality brass pin. Three years later this act was declared.

"No person shall put to sale any pinnes but only such as shall be double-headed, and have the heads soldered fast to the shank of the pinnes, well smoothed, the shank well shapen, the points well and round filed, canted and sharpened."

To-day England is the greatest pin-making country of the world. Its product is something like fifty million pins a year, and Birmingham is the center, with an output of 37,000,000. There are made the pins of the old trade marks and the great reputations, and it matters not that America is able to produce exactly as good; very many papers of these are always salable here. The old form of pin, fortunately obsolete, spoken of nowadays as the "pin of the old German head," was what was made in the early days of the industry in the United States. The era of the solid headed pin of now dates from somewhere in the eighteen thirties. The old pin has been wisely described as "a shank with a separate head of fine wire twisted around it." This head variously known as a "spun head" or a

"wound head," would sometimes fit on tightly and then again loosely. So apt was it to come entirely away from the shank that among the old women of early in the century this popular warning to children arose: "Don't scratch your ear with the head of a pin, if you do the head'll come off and make you deaf." In this country the first attempt at pin manufacturing was made soon after the war of 1812. Then, with war-time prices a paper of pins sold for \$1, and they were of inferior quality to pins bringing now but six cents. The first place of manufacturing was in the old State's prison in that part of New York known as Greenwich Village. This enterprise was soon abandoned, but the plant was used elsewhere. In 1824 the first solid-headed pin machinery was invented, but it was several years later before it was actually put into operation. Beyond mechanical improvements in execution and finish the difference between the old and the present pin is thus in the heads. The "spun" head was of a finer wire than the shank. It was wound around a lathe into a spiral. Three turns of the spiral cut off furnished the head for one pin. The heads when annealed, were shaped by a hammer. Each taken up upon a pin-wire—this introduced point downwards, in a hole, the centre of a die—was secured by a hammer's blow. Nowadays the pin machine, the bit of wire having been sharpened and filed, by a carrier takes it to the first heading die. Here a steel punch forces one end of it into a recess, where the head is partially formed, and another heading die a little further on completes the work. Thus the making of the head of the solid-headed pin. Brass is now, as ever, the most approved material. Iron and steel have been tried, but iron and steel will rust. After the filing and the heading the brass pins go into a bath or solution of tin, from which they come of silvery appearance. Many of the mourning pins one sees, however, are of iron wire japanned. And thereby is all their temper, or "spring," as a pin man puts it, gone. And no wonder, for the japanning process in its latter stages is that of baking in an oven. Quite recently, however, a new method has been devised. A brass pin is coated over with a black nickel wash. No quality of temper is destroyed, and the necessary luster is obtained. But the pin trade isn't growing. Appreciably, it has no greater volume than in 1880. The calculation was then made that every man, woman and child in America used 144 pins a year. Why no more are used now is explained by the fact of there being so very many

safety pins to take their place. These latter, in fact form a separate business, and since their invention eighteen years ago have popularized rapidly. The making up of the paper of pins—entirely by machinery it is—is in two ways, The American "stuck" is fourteen rows of twenty pins each, the English "stuck" twelve rows of thirty each.

THE IDEAL FOUNTAIN PEN.

The steadily accelerating pace of the period we live in makes its impress upon even the commonplaces of daily occupation. Our fathers, for example, wrote with quill pens, carefully sharpened to make an ink mark so heavy that they had to use building sand to absorb it, as we use blotting paper. Now, besides the tons of iron annually consumed in the manufacture of steel pens, a large proportion of penmen use gold pens on account of their greater durability and smoothness. But even those qualities do not now suffice unless there is a perpetual ink supply attached, and accordingly fountain pens are everywhere used by persons whose duties involve any great amount of writing. There are several kinds in the market, but, whatever the merits of the others, it may be said in behalf of the Waterman Ideal Fountain Pen that there is nothing to be said to its disparagement. It is always ready, and with trifling care is always in order, and writes with easy freedom.

WEIGHING MENTAL PROCESSES.—According to recent statements an Italian inventor has constructed a machine which "registers in pounds and ounces the amount of brain-power expended in mental effort and tells you just how much a dream weighs, or how many pounds of brain-cells you consumed in reading a book, or writing a poem, or listening to a sermon."

TO SPLIT PAPER.—There are two ways of splitting a piece of paper. One is to lay the sheet of paper on a piece of glass, soak it thoroughly with water and then press it smoothly all over the glass. With a little care the upper half of the sheet can be peeled off, leaving the under half on the glass. Let this dry and it will come off the glass easily; of course the glass must be perfectly clean. The second way is a better one, but it requires some good practice. Paste a piece of cloth or strong paper on each side of the sheet to be split. When it has thoroughly dried pull the two pieces of cloth apart suddenly and violently. The paste can then be softened with water, and the two halves of the sheet easily taken off the cloths."—*Newspaper Union*.

A GREAT BORE.—The Pabst Brewing Company of Milwaukee, is boring what is intended to be the largest artesian well in Milwaukee. A beginning has been made by sinking a cistern twenty feet in diameter and twenty feet deep, lined with brick. Below this is a well 200 feet deep and eight feet in diameter, lined with boiler-iron three-eighths of an inch thick. From the bottom of this a shaft is to be sunk to as great a depth as may be necessary to get an ample supply of water for the use of the brewery.

CHROME IRON.—A Norwegian engineer, Herr O. Olsen, Christiania, has obtained a ten years' patent for a new process for the manufacture of chrome iron. In his process, a well-mixed proportion of finely pulverized chrome ore, powdered charcoal and tar are heated to red heat in a closed vessel, then allowed to cool, and finally remelted in a crucible, together with a certain proportion of pulverized iron ore, powdered charcoal, borax, ground glass and cyanide of potassium. The proportions of the mixture are naturally kept a secret.

PRINTERS' INK.

A JOURNAL FOR ADVERTISERS.

PRINTERS' INK is just what it purports to be, "a journal for advertisers." It is issued on the first and fifteenth days of each month, and is the representative journal—the trade journal, so to speak—of American advertisers. It tells the intending and inexperienced advertiser in plain, comprehensive articles how, when, and where to advertise; how to write an advertisement; how to display one; what newspapers or other media to use; how much to expend—in fact, discourses on every point that admits of profitable discussion. If you advertise at all, PRINTERS' INK can help you. Perhaps you expend but Ten Dollars a year in advertising; if so, PRINTERS' INK may show you how to obtain double the service you are now getting for one-half the money. A year's subscription costs but One Dollar: a sample copy costs but Five Cents. Advertising is an art practised by many but understood by few. The conductors of PRINTERS' INK understand it thoroughly. Surely their advice, based on an experience of more than twenty-five years, will help you. Address:—

A BOOK FOR EVERY LOVER OF FICTION!
Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,
By MISS M. E. BRADDON.

THE GIRL AT THE GATE,
By WILKIE COLLINS.

A BRIDE'S TRAGEDY,
By MISS MULOCK.

THE RECTOR'S DAUGHTER,
By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,
By MARY CECIL HAY.

GABRIEL'S MARRIAGE,
By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,
By ETTA W. PIERCE.

THE RIGHTFUL HEIR,
By M. T. CALDOR.

THE DOUBLE HOUSE,
By MISS MULOCK.

TWICE SAVED,
By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, *profusely and handsomely illustrated*, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the AMERICAN ANALYST.

For particulars address The Great American Tea Co., 31 and 33 Vesey St., New York, N.Y. P. O. Box 287.

A HOUSE-FLY EPIDEMIC.—A common appearance upon window panes in autumn is that of dead flies, each surrounded by a cloudy spot. These insects are the victims of a bacillus or microscopic fungus, whose scientific name is *Empusa musca*, which is nearly related to the mould which attacks bread, and also to the silk-worm fungus so much dreaded by silk culturists. In the autumn the spores of *Empusa musca*, floating in the air, come in contact with the soft bodies of the flies, into which they sink their roots, or, rather, develop that branching, net-like growth known as mycelium. As the growth extends through the body the insect loses the power of flight and settles down to die on the window pane. The fungus continues its growth in the dead body and scatters its spores in all directions forming the cloud-like spot which surrounds the insect. Other flies visit the pane and the spores find lodging between the abdominal rings and in other unprotected parts of their bodies, and thus the disease spreads, sometimes to an enormous extent.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

ADDRESS ANALYST PUBLISHING CO.,

—19 PARK PLACE, NEW YORK.—

Hot Weather

is the very best time to test the wonderful labor and time saving and economical qualities of

Pyle's Pearline.

Because then the wash is largest, and a saving of time and toil is best appreciated. Think of doing a large wash with little or no rubbing. Consider how much longer your delicate summer clothing will last if not rubbed to pieces on a washboard. A saving is a gain. You'll be surprised and pleased with the cleanliness, satisfaction and comfort which comes of the use of PEARLINE. Simple—any servant can use it. Perfectly harmless—you can soak your finest linen and laces in Pearl-line and water for a month, with safety. Delightful in the bath—makes the water soft. Perhaps you have been using some of the imitations and have sore hands and find your clothing going to pieces. Moral—use the original and best. ¹⁵⁴ Pearline is manufactured only by JAMES PYLE, New York.

OUR MISSION.**WHAT THE AMERICAN ANALYST IS DOING.****FIGHTING ADULTERATION.**

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are wide-spreading.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose spurious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar, we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING CO.,

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

A BOOK THAT EVERY LADY NEEDS.

THE LADIES' GUIDE TO FANCY WORK.

printed, and, as above stated, contains nearly 300 illustrations. It will be sent by mail, post-paid, upon receipt of price, only **Twenty-five Cents**.

How to make the Home Beautiful at small cost is a subject now uppermost in the mind of every lady of good taste. This book is a complete practical instructor in every description of Ladies' Fancy Work, and the only first-class work of the kind ever published at a low price. It contains nearly **300 Illustrations**, and the instructions given are so plain and simple that by their aid even a child may make the many beautiful things which the book describes. It gives plain and practical instructions in Drawing, Oil Painting, and making Wax Flowers; likewise all kinds of Fancy Needle Work, Artistic Embroidery, Lace Work, Knitting, Tatting, Crochet and Net Work. It contains designs for Monograms, Initials, Cross Stitch Patterns, Knit Edgings, Embroidered Borders and Corners, Macramé Work, Applique Embroidery, Berlin Work, Java Canvas Work, Tricot and Burlaps, Antique Lace, Beaded Lace, Darned Net Work, Ties, Lambrequins, Ottoman, Counterpanes, Rugs, Carriage Robes, Brackets, Wall Pockets, Waste Paper Baskets, Work Boxes, Work Baskets, Work Bags, Pen Wipers, Hanging Baskets, Catch-alls, Pin Cushions, Footstools, Handkerchief Boxes, Glove Boxes, Card Baskets, Sofa Pillows, Table Covers, Table Scarfs, Screens, Scrap Bags, Hand Bags, Table Mats, Toilet Mats, Lamp Mats, Lamp Shades, Pillow Shams, Pillow Sham Holders, Curtains, Toilet Stands, Picture Frames, Slipper Cases, Letter Cases, Toilet Sets, Clothes Brush Holders, Cigar Boxes, Hassocks, Sachets, Fancy Purses, Slippers, Dressing Gowns, Music Portfolios, Knife Cases, Fans, Flower Baskets, Plant Stands, Flower Pot Covers, Shawls, Dress Trimmings, Window Shades, Feather Work, Spatter Work, Leaf Photographs, and many other things. It is a book that should be in every American household. With it as a guide you may make hundreds of beautiful things for the adornment of your home and for presents to your friends at the most trifling expense, and no employment for ladies is more fascinating and useful. The book will repay its small cost many times over in a very short time. Every lady will be delighted with it. It is a large book of 64 large 3-column pages, with handsome cover, is finely

INVALUABLE TO EVERY HOUSEWIFE!

THE MODERN COOK-BOOK AND MEDICAL GUIDE.

This is practically two books in one—a perfect cook-book and a perfect medical book—and there is so much in it and so much care and pains have been taken in its compilation, that we feel perfectly safe in asserting that the Cooking department is fully the equal, in quantity and quality, of any low-priced cook-book published, and the same as to the medical department herein as compared with any low-priced medical work on the market. It is a complete encyclopædia of domestic information, and we fully believe that no lady, after having it in the house a short time, would willingly do without it for ten times its cost. The cooking recipes number 627, and include Breakfast Dishes, Soups, Meats and Poultry, Fish, Vegetables, Salads and Relishes, Bread and Rolls, Jellies and Preserves, Fuddings and Pies, Fancy Dishes, Cakes, Confectionery, Ice Creams and Summer Drinks. The compilation of this department was superintended by a practical housekeeper, every recipe will be found reliable, and it has been pronounced one of the best, most complete, and practical cook-books published. The Medical Department will be found fully the equal of any doctor book published at one dollar or less. It tells you how to cure, by simple means, available in every home, Malaria, Pneumonia, Poisons (antidotes for), Nervousness, Measles, Rheumatism, Toothache, Wounds, Sprains and Bruises, Weak and Inflamed Eyes, Dust in the Eye, Sore Throat, Scald Head, Whooping Cough, Neuralgia, Earache, Worms, Warts, Burns and Scalds, Headache, Offensive Breath, Bleeding (to stop), Cancer, Consumption, Felons, Dysepsia, Dysentery, Diarrhoea, Croup, Corns, Liquor Appetite, Coughs and Colds, Cold in the Head, Catarrh, Scarlet Fever, Nose Bleed, Baldness, Smallpox, Sleeplessness, Ringworm, Chills, Costiveness, Cholera Morbus, Bright's Disease, Convulsions, Mumps, Superfluous Hair (to remove), Hysterics, Colic, Sciatica, Biliousness, Nettle Rash, Typhoid Fever, Ingrowing Toe Nails, Abscess, Stammering, Hemorrhage, Asthma, Hydrophobia, Scrofula, Bronchitis, Lockjaw, Erysipelas, Hoarseness, Chills and Fever, Dropsy, Bunions, Fits, Dandruff, Scurf, Quinsey, Heartburn, Styes, Liver Complaint, Cramps, Corpulence, Sunstroke, Knock-knees, Indigestion, Jaundice, Gout, Prickly Heat, Ulcers, Salt Rheum, Fainting, Boils, Tobacco Habit, Gray Hair (to prevent), Cholera Infantum, Deafness, Stiff Neck, Piles, Choking, Freckles, Pimples, Sunburn, Chapped Hands, and many other ailments. It will save you many dollars annually in doctors' bills and patent medicines. Who can doubt that twenty-five cents invested in such a useful and valuable book as this would be the best and most profitable investment that could possibly be made of so small a sum? **THE MODERN COOK BOOK AND MEDICAL GUIDE** is a large book of 128 pages, neatly bound in colored covers. It will be sent by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

AVOID LITIGATION! BE YOUR OWN LAWYER!

EVERYBODY'S LAW BOOK.

Litigation is a very expensive luxury; avoid it, for it doesn't pay. Thousands of lawsuits are brought because people do not understand the simple principles of law and their own and others' rights, and there are plenty of lawyers always ready to take advantage of this lack of knowledge. The object of this volume is to impart, in a simple, concise manner, the fullest information regarding legal matters. It is to be used as a work of reference, and in all ordinary emergencies will save employing a lawyer. It is a complete compendium of business and domestic Law, by a prominent member of the New York bar, containing concise explanations of the general laws and the laws of the several States, regarding Administrators and Executors, Adjudication, Agency, Agreements, Arbitration and Award, Assault and Battery, Assignments, Attachments, Banks, Bills of Exchange, Checks and Promissory Notes, Bills of Sale, Chattel Mortgages, Citizens and Aliens, Common Carriers, Contracts, Corporations, Deeds and Mortgages of Real Estate, Descent and Distribution, Lower, Easement, Exemptions, Farmers' Law, Fences, Fixtures, Garnishment, Gifts, Guaranty, Guardian and Ward, Heirs and next of Kin, Homestead Exemptions, Husband and Wife, Infants, Interest and Usury, Landlord and Tenant, Libel and Slander, Liens, Limitation of Actions, Marriage and Divorce, Rights of Married Women, Master and Servant, Parent and Child, Partnership, Payment and Tender, Personal Property, Power of Attorney, Principal and Agent, Privileged Communications, Railroads, Railroad Real Estate, Receipts and Releases, Replevin, Right of Way, Seduction, Trustee Process, Warranty, Water Rights, Wills and Codicils. Together with complete forms of Acknowledgments, Agreements, Articles of Co-partnership, Assignments, Award of Arbitrators, Bills of Sale, Bonds, Chattel Mortgages, Contracts, Deeds, Executors' and Administrators' Accounts, Interest Table, Liens, Mortgages of Real Estate, Powers of Attorney, Releases, Satisfaction Pieces, Wills and Codicils, etc., etc., specially adapted for the daily use of those who are not lawyers, with directions for their preparation. Every farmer, mechanic, manufacturer, business man, professional man, merchant and householder will find the information contained in this book of great value, and will have occasion to refer to it nearly every day. It is the cheapest book of the kind ever published, and is quite as complete and valuable as other works for which four times the amount, or more, is asked. **EVERYBODY'S LAW BOOK** is a large volume of 128 pages, 12mo, with handsome cover. It will be sent by mail, post-paid, upon receipt of only **Twenty-five Cents**. Send for it! It is worth ten times the amount asked for it to any man, young or old, in America.

For School Exhibitions and Public and Private Entertainments.

The Complete Book of Recitations and Dialogues.

This book contains, so far as we know, the best and most complete collection of recitations ever published in a single volume. All the popular recitation books of the day have been consulted and the cream selected, and the result is a mammoth collection of recitations which cannot fail to answer every requirement. There are hundreds of them, and they embrace every kind and character of recitations, adapted to every need, humorous, dramatic and pathetic—from short juvenile pieces for the little boys and girls on Friday afternoons to pretentious dramatic works for the professional elocutionist. We have space to enumerate the titles of only a very few of them, as follows: "Ostler Joe," "Asleep at the Switch," "The Last Hymn," "The Deadman's Journey," "The Engineer's Story," "Cripple Ben," "Two Loves and a Life," "The Mother-in-Law," "The Farmer's Story," "Taking Toll," "The Engineer," "The Tramp," "Tim's Daisies," "John Derrill's Dream," "Too Late," "The Bootkeeper's Dream," "Savin' Mother," "Curfew must not Ring to Night," "The Palmetto and the Pine," "The Pollah Boy," "Drafted," "The Blacksmith's Story," "The Burning Prairie," "Guilty or Not Guilty," "The Foreclosure of the Mortgage," "The Clown's Baby," "Bill Mason's Ride," "How we tried to Whip the Teacher," "Driving Home the Cows," "Somebody's Mother," "When the Tide Goes Out," "The Old Farmer's Elegy," "Widder Spriggins' Daughter," "The Light-keeper's Daughter," "How the Parson Broke the Sabbath," "Which Shall it Be?" "Somebody's Darling," etc., etc. In addition to the Mammoth collection of Recitations contained in this book, it also contains a number of fine Dialogues, mostly humorous, among which are: "Marrying a Poetess," "What's in a Name?" "The Train to Mauro," "The Graduates," "The Female Astrologer," "Proposing by Proxy," "Story-Telling," "The Morning Call," etc. Those who have sent for books of this character and been disappointed in them, owing to the meagerness and inferiority of their contents, will be happily surprised in this book, for not only is it the largest collection of Recitations and Dialogues ever sold at a low price, but great care has been taken in the selection of its contents, the aim being to include only the best. It is a splendid book, guaranteed to give satisfaction. **THE COMPLETE BOOK OF RECITATIONS AND DIALOGUES** is a large book of 64 large 3-column pages, with handsome colored cover. It will be sent by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

HOW THE READERS

OF THE

AMERICAN ANALYST

MAY OBTAIN ANY ONE OR MORE OF
THE ABOVE BOOKS

FREE.

TO any one who will send us **One New Subscriber** to the **AMERICAN ANALYST** for one year, at \$1, we will send, **Free**, any one of the above books, to compensate him for his trouble; to any one who will send us two new subscribers, we will send any two of the books; and for three new subscribers, we will send the three books. This will be good pay for little work, for it is a simple and easy matter to get one or more new subscribers to the **AMERICAN ANALYST**. Show the paper to your friends and neighbors, and you will have little difficulty in inducing one or more of them to subscribe for one year. And when you have received your book or books you will feel doubly repaid for what trouble you have taken. If the parents do not wish to try it, let the little boys and girls do so after school hours. We feel sure that every one of our present subscribers and readers can readily secure for us one or more new subscribers, and we offer this special inducement in order to stimulate effort in this direction. The books will be found well worth the slight effort that will be required to secure them. Try it, and see how easy it will be.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only three possessed the power of acting on starch. These brands were **MALTINE**, Corbyn, Stacey & Co.'s Extract, and Keppler's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity.

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

E. H. GRITTENDEN.

Professor of Physiological Chemistry in Yale College.
At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alteratives.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Fermented.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peptones.	MALTO-VIBURNIN.
MALTINE with Pepsin and Pancreatine.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract" or "Extract of Malt."

Send for Pamphlet giving comparative analysis, by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

COLDEN'S

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of
Beef and Tonic Invigorator."

LIQUID

BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.

Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, (inchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D. F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

A PERSONAL EXPLANATION.

Our esteemed contemporary, the *Butcher's Advocate*, dropping for the moment the general discussion of the beef inspection conspiracy, rises to a point of order. Referring to the fact that the AMERICAN ANALYST recently alluded to the ridiculous attitude our esteemed contemporary, above mentioned, occupied, when it forsook the block and cleaver to "dabble" in the law relative to the illegal effort it was advocating, it says:

We merely desire to remark, as to the "dabbling," that we have had many years of experience in the highest order of legal practice, and have been associated with, and publicly commended by, some of the ablest lawyers in the United States Senate and the National House of Representatives.

The point is not well taken. At least, not wholly. Our esteemed contemporary fails to explain in what manner its experience with "the highest order of legal practice" was gained—whether as plaintiff or defendant. In fact, its ambiguous assertion may relate to a post-conviction effort for securing a new trial—or an ultimate appeal to executive clemency. We should like

to have our minds set clear on that point—and we pledge ourselves to implicit secrecy if the situation turns out to be even half as bad as we suspect. We don't approve of conspiracies, but we would rather see the conspirators succeed in raising the price of beef ten cents a pound, than even intimate a hint to the prejudice of our esteemed contemporary, whose "experience" has brought it into such lofty, prolonged, and perhaps, uncomfortable relationship. The latter portion of the above quoted personal explanation, is, however, luminously correct. The bamboozling of a handful of rustic legislators in two or three States, into passing the local inspection absurdity, has already produced such fruit, in the shape of litigation in order to disencumber those States of the unconstitutional burden, that the lawyers have reaped a rich harvest—and if they are true to the traditions of their profession, they are not nearly through yet. It is not every year that a new issue is concocted, like this local inspection scheme, wholly for the emolument of lawyers, and even laymen as we are, we can readily conceive the depth of obligation which that fraternity must feel toward the *Advocate* and its co-conspirators for thus playing into their hands. That the Bar of the Nation, through its representatives in the two Houses of Congress, had embodied their sense of gratitude in a public testimonial to our esteemed contemporary, we were not previously aware—owing, doubtless, to the envy of the daily press, or to the innate modesty of the recipient of that distinction, which prevented his alluding to the subject until forced, as he fondly believed, to disclaim the epithet of "dabbler."

THE PURE FOOD MOVEMENT.

Despite the efforts of the Philadelphia "crusading" cranks, the pure food movement is not wholly crushed in this country. The National Association is still conducting its campaign, with quiet earnestness that augurs favorably for the accomplishment of good results. It has branch organizations in several States, and is steadily extending its operations, while the public are being systematically enlightened through meetings and lectures conducted by specialists in the several side issues involved in the subject. It is manifestly a great task to develop the faculty of discrimination in the matter of food, but with adequate and well-enforced legislation like that prohibiting the sale of fraudulently adulterated food in other nations, its accomplishment is not unimaginable. It is admitted by the promoters of the movement that much has been gained for the general good through the activity of the Boards of Health, limited as their official powers are to a single line of inquiry. As, however, it is not their business to enforce trade morality, anything may be sold unless the article is essentially injurious to health. The main fault in the premises lies, of course, with the consumer, who seems ever ready to seek the cheapest commodity, though common sense shows plainly enough that beyond a cer-

tain point cheapness must necessarily imply lack of purity. Worth and cost must always go hand in hand together. But the responsibility of the public would be greatly diminished if the retail grocery trade did not so earnestly cater to the public desire for cheap food materials, thereby further fostering the demand for their manufacture. How far that trade will honestly assist in the practical carrying out of pure food principles is a very dubious question. They are quick enough always in lending their voices to pure food advocacy, but in the eagerness of competition their pretended principles evaporate in talk. If a law could be enacted and enforced compelling manufacturers to label every package so as to display its composition or character, the burden would fall exclusively upon the consumer, who alone would be to blame for the selection of inferior articles. The AMERICAN ANALYST has for five years been educating the consumer as to the character of the food he eats, but the interested antagonism of the retailer has steadily and unscrupulously interposed itself to counteract our teachings and advice, and thus far that interest has succeeded in quashing every organized effort for food reform through statutory measures. The National Association, we understand, has formulated a law which it will endeavor to have introduced in Congress next month. With a Bureau on Adulteration in one of the Government departments, as proposed, each mixture will be labelled. No substance is to be coated or colored or polished or powdered to appear better or of greater value than it really is. A line is not to be drawn at the poisonous ingredient, but everything is to be brought down to the level of purity.

HOW TO EAT A SHADDOCK.

An article that has recently been going the rounds of the newspapers, entitled "The Rise of the Shaddock," has inspired Miss Gilder, of this city, to instruct the public, through the medium of the *Boston Transcript*, as to the proper method of eating that fruit. The writer says: "The shaddock, as you may not know, is that abnormally large and very light yellow orange seen in the windows of fancy fruiterers or on the stands of Italian vendors. When cut open the likeness to the orange is still there, but when tasted all likeness to that sweetest of fruits is gone. The shaddock, or grape fruit, as it is stupidly called, is rather bitter than otherwise, but it is a pleasant bitter, and if you once know how to eat it you will be as devoted to it as I am. Select a thin-skinned shaddock, and if you are going to eat it in the morning put it on ice at night. When you take it out cut it in halves, and with a sharp knife cut out the core. Make the cut so that it is larger at the top than at the bottom. Then run the knife around the edge of the shaddock to loosen the pulp from the skin. Put a teaspoonful of powdered sugar into the hole where the core was, and pour a teaspoonful of Jamaica rum or arrac into the same cavity; take the teaspoon and eat."

DR. BROWN-SEQUARD.

The name of Dr. Brown-Sequard having lately been brought before the public eye more frequently than heretofore, considerable curiosity has been expressed as to his nativity. To satisfy this very natural desire, we will state that the doctor was born in 1818 in the island of Mauritius, where his father, Edward Brown, a native of Philadelphia, and previously master of a merchant vessel, was engaged in business. His mother was a French woman named Sequard, who lived on the island. All of young Brown's preliminary studies were made in Mauritius, and it was not until he had reached the age of twenty that he went to Paris to complete his medical course and take his degree. The language of his family and his youth is French, and he speaks it better than English, although in writing he has an equal command of either tongue. He has been married three times—first, to a Miss Fletcher, of Boston; secondly, to a Miss Carlisle, of Cincinnati; and his third wife, who is still living, is an English woman, the widow of an Irish engraver named Doherty.

MEXICAN TRADE IN AMERICAN BEEF.

A dispatch from the City of Mexico, dated August 20th, says: "A large business is now being done in the way of importing American cattle and hogs to this city, and the trade is rapidly increasing. Fully 500 head of Texas cattle are brought here every month for city consumption alone, and for sometime past E. C. Swift, the prominent packer of Chicago and Kansas City, and Dr. Carothers, of San Antonio, Tex., have been bringing here several thousand American hogs monthly. They are now erecting near the yards of the Mexican Central Railroad in this city, refrigerating works of large dimensions, in which the curing, pickling and smoking of hams and bacon will be done. The enterprise is the first of its kind ever attempted in the Republic, and for its success several hundred thousand dollars will be invested. Hogs for its supply will be dressed in Kansas City, at Swift's works, and be sent here in refrigerator cars. The shipment of dressed steers will not as yet be attempted, but it will soon follow.

ROLLED METAL.—A Chicago firm has patented an invention which "comptent judges say will revolutionize the tin and steel industry of the world," a process by which molten metal may be rolled into any desired shape, "thus saving all intermediate processes." It was invented originally to roll molten solder into thin plates, but the process is pronounced by experts to be equally applicable to iron and steel in its various forms of plates, structural iron and rails.

DRIED GRAPES.

A GROWING CALIFORNIA INDUSTRY WITH A SIGNIFICANT FUTURE.

At a meeting of the Grape Growers and Wine Makers' Association of California, held at Platts' Hall, San Francisco, in June, 1889, a committee was appointed to call the attention of the grape growers of California to the subject of drying wine grapes, and also to collect and disseminate such information regarding the same as could be obtained; at the same time to ascertain, as far as possible, the probable and possible markets for such products and the estimated prices to be obtained. We condense from the committee's report the following points of interest to the readers of the *AMERICAN ANALYST*:

The drying of wine grapes on a large scale was begun during the vintage season of 1887, in which season about eight carloads in all were made and sold, the bulk of which came from the vicinity of Fresno; that year, the committee are informed, the growers netted about three and a half cents per pound. During the season of 1888 about 112 carloads were dried, packed and sold, netting the growers from two and a half to three and a half cents per pound, depending on the quality of the fruit. The great bulk of that year's product has entered into consumption, but there yet remains unsold to consumers, we are informed, about ten carloads, which, it is expected, will be sold during the next three months. It has been observed by those handling this product that the largest sales of dried wine grapes in 1888 and '89 took place at those points to which the first lots were shipped in 1887, which would show that as the product becomes better known it finds a readier market. Dried wine grapes are prepared in a similar manner to raisins; that is, they are dried in the sun, but do not require the same care in handling that are given to raisins. Wooden trays 2 x 3 are sometimes used, but it is by no means necessary to go to the expense of procuring trays, as it has been found that a good quality of coarse brown paper will answer every purpose, and this, with care, may be made to last two or three seasons. The drying was last season principally done on the bare ground, but there is much loss by shelling, as those dried are required to be turned; a pitchfork is used for that purpose. Brown building paper can be procured of city paper dealers in large rolls at four and a half cents per pound; according to the thickness it will cost from one and three-quarters to three and a half cents per square yard. A thin, tough, waterproof paper is also made in rolls at about six cents a square yard. Wine grapes dry in from ten days to three weeks, according to variety and weather, and, with the exception of Malvoisie, Rose of Peru and Black Hamburg, from three and a half to four and a half tons of the green fruit are required to make one of the dried; these three varieties, however, being large, meaty and of a firm pulp, do not require more than from three to three and a half tons of the green fruit to produce one ton of dried, and are, therefore, the most profitable for drying; they also command better values in the market. The grapes are sufficiently dried when, on being rolled between the thumb and finger, no moisture exudes, and also when the stems are found to be dry and brittle, so that they can be separated readily from the berries. After the grapes have reached the proper state of dryness, they are taken in boxes or sacks to the packing house, where they are stemmed and cleaned, after which they are packed in white cotton sacks, holding from fifty to seventy-five pounds each, and when marked are ready for shipment. The stemming and cleaning of the dried grapes is done by special machines designed for that purpose, which leaves the fruit in a bright, clean condition attractive to purchasers. These machines are at present built only by James Porteous, Fresno, and are operated either by hand or power. The cost of a stemmer and cleaner complete is \$80, f. o. b. cars at Fresno. Where several producers can do so, it would be advisable to club together

and get the machine in this way. Much extra expense could be avoided and one set of machinery would serve several vineyards, possibly an entire district where time was not a great object; or some one person in a district could purchase an outfit and do the work by contract, going from place to place. The capacity of the stemmer and cleaner is from five to eight tons per day, when the grapes are in proper condition; and the cost or charge for stemming, cleaning, sacking and sewing up the sacks is from four to five dollars per ton when the producer furnishes the sacks. Good cotton sacks, holding about seventy-five pounds, cost from eight to ten cents each, including the necessary twine. Last year dried grapes were generally sold for cash, f. o. b., but it is probable that other markets could be secured by selling on consignment. As to the advisability of such a course, each producer must himself be the judge. It is, however, quite certain that until consumers have an opportunity to try this product, the sales will necessarily be more or less limited, unless vigorously pushed by merchants and others interested in extending the markets for California products in the eastern cities not yet tried. The varieties most suitable and profitable for drying, and especially for consumption in the eastern markets, are the Malvoisie, Rose of Peru, Black Hamburg, Mission, Zinfandel, Charbono, Grenache, and in some localities the Carignan, of the dark varieties, and the Feher Zagos and Golden Chasselas of the white grapes; there are many other white grapes that are excellent when dried, but are too valuable for wine-making purposes, or are too small or deficient in sugar for use as dried grapes. The same is true of the dark grapes, some of which ripen so late that it would be impossible to dry them in the sun, and the use of artificial heat is, at present prices, too expensive. Therefore, the varieties mentioned, which generally mature early, are found to be the most suitable for this purpose. This product is sold by dealers in the eastern cities for cooking purposes, and as a substitute for dried fruits such as peaches, apples, apricots, etc., in comparison with which it is usually much cheaper; while for stewing and for puddings and pies it answers the same purpose. The demand for this product will probably be gauged by the eastern fruit crop; that is, the quantity that can be disposed of will depend upon the quantity of eastern fruit in the market, and the prices will be largely dependent upon that of dried fruit.

DRESSED BEEF WINS.

THE MINNESOTA INSPECTION LAW DECLARED UNCONSTITUTIONAL.

The Duluth correspondent of the *Chicago Tribune* under date of August 13, gives the following details of the beef inspection decision referred to in the editorial columns of the *AMERICAN ANALYST* last week:

A month or so ago a Wisconsin farmer sold in Stillwater, meat he had killed in Wisconsin. He was arrested and the court there held the law unconstitutional. But it did not give the matter so thorough a test as the big packing companies wanted, so it was decided to go ahead with the case in this city. The Armour Packing Company, therefore, shipped meat here from Kansas City and yesterday the local manager made the first sale in the State by an outside packing company since the law was passed. The manager here, A. F. Christian, was promptly arrested and fined \$50 and committed to jail in default thereof. A writ of habeas corpus was issued by Judge Ensign, made returnable to-day, and sentence was suspended pending the hearing of the writ. To-day both Judges Stearns and Ensign of the district court, in view of the importance of the case and the questions involved, sat on it, and they united in the decision that the law was unconstitutional. The State was represented by County Attorney Sherwood and City Attorney Smith and the prisoner and packing companies by Cash & Williams of this city, with H. C. Vedder of Chicago as counsel. The consti-

tutionality of the law and the legality of the arrest and imprisonment under it were argued in full, every point being gone into at length. The courts sustained the arguments of the defence in every way. The decision was as follows:

THE COURT'S DECISION.

The question to be determined is as to the validity of Chap. 238, general laws of Minnesota, 1889, entitled: "An Act for the Protection of the Public Health by Providing for Inspection before Slaughter of Cattle, Sheep, and Swine." The act provides for the methods of inspection, appointment of inspectors, and punishment by fine or imprisonment for the sale of or offering for sale of any dressed meat not inspected on the hoof. The effect of the act is to prohibit wholly for sale in this State any fresh meat whatsoever, and the question arises whether such a prohibition is not a violation of the provisions of the federal constitution. First—We believe that this act violates the provisions of Sec. 8, Art. 1, of the constitution which gives Congress the power among other things: "To regulate commerce with foreign nations and among the several States and with the Indian tribes." Second, it violates the provisions of Sec. 2, Art. 4 of the Constitution: "The citizens of each State shall be entitled to all privileges and immunities of citizens in the several States." The first clause above mentioned has been called by the courts the "commercial clause" of the Constitution. There are certain principles that have been established by the courts in constructing it. The word "commerce" as used in the clause, whether "with foreign nations," "among the several States," or "with the Indian tribes," embraces all transportation purchase, sale, and exchange of all such commodities as are transported, bought, and sold by the usage of the commercial world. The power to regulate commerce as above defined is vested in Congress exclusively, and if Congress has failed to regulate any branch of such commerce it indicates its will that the same shall be left free, and not that the several states may regulate it. In *Welton vs. Missouri*, 91 U. S., page 275, the court on page 282 says: "The fact that Congress has not seen fit to prescribe any specific rules to govern interstate commerce does not affect the question. Its inaction on this subject when considered with reference to its legislation with respect to foreign commerce is equivalent to a declaration that interstate commerce shall be free and untrammelled." The question under consideration in the Missouri case was the validity of a Missouri statute declaring that whoever deals in the sale of goods or merchandise, the products of any other State, should be deemed a peddler, and provided for licensing such peddlers. The plaintiff in error was a dealer in sewing machines, manufactured in another State, and was convicted and fined for selling the same without license. The act was held void, being an interference with matters confided solely to Congress.

Naturally flowing from the two propositions above-mentioned is a third, viz.: Any act of a State legislature interfering in any manner with the free transportation, sale, or exchange between citizens of different States, of or in any article of commerce, is an attempted regulation of such commerce and therefore beyond the power of the State and void. There are, it is true, certain regulations of commerce that a State may make where their operation is from their nature local and where Congress has made no general regulation of the subject. But these regulations are considered more as an aid to than as a regulation of commerce. But counsel for the State claims that this act is valid as an exercise of the police power of the State, and as such ought to be upheld. In order to the correct disposition of this claim it is indispensable to have a clear understanding of the nature and extent of this power as given by courts and writers. Blackstone defines it to be "the due regulation and domestic order of the kingdom, whereby the inhabitants of a State, like members of a well governed family, are bound to conform

their general behavior to the rules of propriety, good neighborhood, and good manners, and to be decent, industrious, and inoffensive in their respective stations."

POLICE POWER.

The court then cites a large number of decisions on the nature and intent of police power and regulation and says:

The above definitions clearly disclose the great principle upon which the power rests—viz.: public safety. Any law which goes beyond this principle, which undertakes to abolish rights, the exercise of which does not infringe on the rights of others, or to limit the rights beyond what is necessary to provide for the public welfare and general security, cannot be in the police power of a government. The question has frequently arisen whether State acts, ostensibly as police regulations, do not intrude on the exclusive right of Congress to regulate commerce among the States under the constitutional provision above considered. The Supreme Court of the United States in considering this question has established certain well defined principles to ascertain what is and what is not an interference on the part of a State with interstate commerce. First: The police power of a State cannot be exercised with respect to a subject matter beyond its control. Regulation of interstate commerce is beyond State control, being confided exclusively to Congress. In the case of *Henderson vs. The Mayor of New York*, in a case under an act of the legislature of New York requiring every carrier of a passenger to give bond that they would not become a public charge for four years, the law was sought to be sustained under the police power to protect the State from paupers. But it was held void, being an attempted invasion of the rights of Congress. Justice Miller held that "this power frequently referred to in the decision of this court has been in general terms somewhat loosely called the police power. Whatever may be the nature and extent of that power, where not otherwise restricted, no definition of it and no urgency for its use can authorize a State to exercise it in regard to a subject matter which has been confided exclusively to the discretion of Congress by the Constitution. But however difficult it may be, it is clear from the nature of our complex form of government that whenever the statute of a State invades the domain of legislation which belongs exclusively to the Congress of the United States it is void, no matter under what class of powers it may fall or how closely allied to powers conceded to belong to the States."

It follows that if fresh meats, the sale of which are prohibited by this act, are articles of commerce, the act must be held void.

Second—In the exercise of police power over subject matters within their power the States cannot establish unnecessary or unreasonable regulations, and the courts will judge whether an act is a proper exercise of police power from its purpose and effect, notwithstanding its language or its ostensible affect. Such a right can only arise from a vital necessity for its exercise, and cannot be carried beyond the scope or that necessity.

DRESSED MEAT IS WHOLESOME.

A long array of decisions is given on this point.

Now, applying these well established principles to the act under consideration, we can see no reasonable theory upon which it can be upheld. First, there is no question, that fresh, wholesome meat is an article of extensive commerce among the States at the present time. Of late years its use has greatly increased and its shipment has been facilitated by the device of refrigerator cars. Meat is transported hundreds of miles in a short space of time, and when it reaches its destination it is as fresh and wholesome as when placed in the car. It is one of the greatest and most important articles in interstate commerce. And it is not in the power of this State to prohibit commerce in it. Justice Field, in *Bowman vs. Railway*, on page 501 says: "What is an article of commerce is determinable by

the uses of the commercial world and does not depend upon the declaration of any State." This consideration alone would seem decisive of the question. Fresh meat is an article of interstate commerce, its regulation is vested exclusively in Congress, therefore a State law regulating it is void. It is not an inspection law. It will not examine fresh meat to see whether or not it is wholesome. It puts all—the good and bad alike—under the ban of destruction. It utterly destroys interstate commerce in this article under the guise, it is true, of protecting the public health. But the public health does not demand for its protection that wholesome fresh meats, the products of other States, be destroyed. A State cannot exercise such arbitrary power, no matter under what guise. It is not necessary to enlarge. There is no mode of reasoning by which the act can be sustained, and the prisoner is discharged.

The whole decision takes up about 6,000 words and is rich in citations from the United States Supreme Court and State court decisions of such judges as Chief Justice Marshall, Justices Field, Miller, Matthews, and others. No step has yet been taken to appeal the case, and it is believed this will be the end of the Scheffer inspection law.

OLD MADEIRA.

JELLY MADE OF \$1,000 A BOTTLE WINE.

The most disgusted householder in the modern Athens just at present, so a special correspondent to the *Tribune* writes, is a Bacon street gentleman, whose family in the summer time resides at Nahant—"that slice of cold-roast Boston," as the exclusive watering place in question has been appropriately called. The other day, upon returning to his seashore villa from his daily avocation in the city, he remarked to his wife with some alarm that, having had some occasion to visit his town house for the purpose of assuring himself that everything was safe, he had sought in vain for six bottles of priceless old Madeira which were stowed away in a small cupboard by themselves for safekeeping.

"The cupboard in the corner near the bookshelf?" inquired the lady.

"Yes, indeed; that was the place."

"I'm sorry, my dear," said she, "but the fact is that I used those six bottles to make jelly with just before we came away. It was uncommonly good jelly, too, though of course I regret it much if I have taken any wine that you desired particularly to keep. But indeed there was none other handy."

"Could you not find some for your jelly that was worth less than \$1,000 a bottle?" asked the husband with a groan.

"A thousand dollars a bottle! Why, what can you mean?"

"Simply that I cannot replace those six bottles at that or any other price. They were my especial treasure, never intended to be drank save possibly at events in a lifetime. It was a brag of mine to say that I had that quantity of real old Madeira in my house; now it is gone and for jelly. Ye gods!"

"It was remarkably good jelly," was all the poor woman could think of saying by way of apology.

And it is no wonder that the gentleman of Beacon street was distressed. How many bottles of old Madeira do you suppose there are at present in the United States? About 100, perhaps, and connoisseurs in wine can tell you who owns pretty nearly every quart of it. Years ago a dreadful bug attacked the vines and exterminated them. The insect was subdued at length, and slips of the same varieties were planted, but alas! the new grape produced a different juice. The Madeira of to-day comes from the same island and the same vegetable, but it is no more like the original than chalk is like cheese. Hence the enormous value possessed by the small remnant of the ancient product. It can-

not be said that there is any quotation in the market for it. Simply it is not for sale. The few bottles of it that still exist are owned by persons in well-to-do circumstances who do not care to sell it at any price. A generation ago there was an old gentleman in Philadelphia who had the good fortune to possess a half a pipe of this precious wine, probably the largest amount owned at that time by any individual living; for even then its value had grown to be fabulous. He figured it up that the supply would last him, if he used one pint at dinner daily, precisely so many years, months and days. So, like a mariner in distress of water, he placed himself on an allowance of that much per diem, never on any account to be exceeded. Life was not worth living, he said, without Madcira at dinner, and when his little stock should come to an end, it was his intention to die with as little delay as possible. And so curiously enough, he did, within twenty-four hours of the time when the last small bottle of the "Crisis" vintage was wiped out.

THE KANGAROO IN COMMERCE.

EXTENSIVE UTILIZATION OF THEIR HIDES IN THIS COUNTRY.

There are 6,000 kangaroo skins received in Newark, N. J., every week. They are all tanned in one large establishment on Sussex avenue and are then made into fine shoes. Australia and New Zealand furnish kangaroo hides for the world. The kangaroos are killed in Australia about three hundred miles back from the coast, and are shipped from Melbourne, Sydney and Newcastle, in Australia, and from Masterton, in New Zealand. Up until 1869 the kangaroos were killed and eaten in Australia and their hides were cut into shoe-strings. But an Englishman named Brown in that year discovered the remarkable character of the leather and brought several thousand skins to this country. He tried to sell the hides to tanners, but they were shy of the novelty, and he had to sell them at a sacrifice to a bookbinder. The bookbinder made triangular corner pieces in ledgers and commercial books out of the skins, and so ascertained the good quality of the leather. It was in this way that the large leather factories were first attracted to kangaroo hide. The skin was found to be very tenacious and the compactness of the grain prevents its absorbing water, while the acids in blacking meet with an almost impervious substance. It was hard work for years to get the kangaroo skins. It was not until the Newarker, who now tans them, sent agents to Australia three years ago that the demand could be supplied. The characteristic climate of Australia and the pugnacity of the kangaroo makes hunting the hides dangerous. Winter starts in May and ends in December in that country. The rest of the year the heat is intense, the thermometer frequently reaching 140 degs. Eight men hunt together for kangaroos. They are called a "set." When brought to bay the kangaroo jumps like a flash for a hunter's chest and tries to crush it in with his forefeet. To prevent this each man wears across his breast a two or three inch thick matting. Armed with a spear, with a club attachment at the other end, they ride upon swift horses into a herd. With the agility and equispe of circus riders they stand erect upon their horses and use their spears and clubs. The kangaroo is able to jump clear over a horse. As the game is bagged it is skinned, and the skin is stretched on the ground and pegged down to prevent shrinkage. The flesh furnishes meat for the camp. Each man places his private mark upon his booty, and when they have 100 skins apiece, they return back to civilization. There are twenty varieties of kangaroos, among them the blue, red Wallaby, black, gray, and Forester, the latter furnishing the best leather, as it lives mainly in wooded sections. When the shipping ports are reached, the hunters dispose of the skins by auction to the highest bidders, and realize about 70 cents a pound. Kan-

garoo hunters make large profits. One man is known to have cleared \$4,500 free of living expenses in a single year. The tanning of kangaroo skins is confined to men employed by Americans, as other dealers cannot afford to pay the high prices for the raw material. The result is that Parisian and London shoe manufacturers buy their stock of kangaroo leather directly from Newark, and prominent dealers in Germany, Greece, Spain, and even Australia itself, obtain their supplies from the same. The manufacturer here scouts the idea that the original seven-league boots were made from the skin of the great Australian leapers.—*Exchange.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

August.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal, venison.

GAME AND POULTRY.—Pigeon, chicken, duck, woodcock.

FISH.—Anchovy, bass, bluefish, blackfish, cod, eels, crabs, clams, flounder, halibut, herring, lobster, mackerel, mussels, porgie, prawn, salmon, turtle, trout, sturgeon, whiting, weak-fish, rockfish.

VEGETABLES.—Beans, beets, cucumbers, cabbage, carrots, cauliflower, corn, egg-plant, lettuce, onions, parsley, parsnips, potatoes, squash, shallots, spinach, turnips, radish, rhubarb, tomatoes.

FRUITS.—Cherries, raspberries, huckleberries, melons, gooseberries, blackberries, peaches, pears, tamarinds, bananas, pineapple, grapes, plums.

PRACTICAL RECIPES.

HERB SOUP.—Slice three large but young cucumbers, a handful of spring onions, and six lettuces; cut the last small. Put into a stewpan eight ounces of butter, and with it the above vegetables; when the butter has melted, cover, and let it stand over a slow fire an hour and twenty minutes. Add as much stock as may be required for the quantity of soup intended to be served; let it boil and simmer for an hour, then thicken with flour and butter, or three tablespoonfuls of cream. If desired to be colored, use spinach juice.

LAMB DRESSED WITH RICE.—Half roast a small fore-quarter of lamb, then cut it into steaks. Season them with pepper and salt; lay them into a dish, and pour in a little water. Boil a pound of rice with a blade or two of mace, a whole pepper; strain it, and stir in a good piece of fresh butter and a little salt. To it also add the greater part of the yolks of four eggs, well beaten. Cover the lamb with the rice, and with a feather put over it the remainder of the beaten eggs. Bake it in an oven till it has acquired a light brown color.

STICKS.—Sift together one quart of flour, a teaspoonful of salt, three teaspoonfuls of Horsford's baking powder. Mix together two ounces of melted butter, a heaping tablespoonful sugar, and three gills of cold boiled milk; beat it up and add to the flour. Beat the whites of three eggs, work it into the dough, flour the board slightly and turn the dough on the board; divide it in pieces as large as an egg, and with hands slightly buttered, roll them in long thin sticks; bake them hard and crisp in a hot oven.

CHOCOLATE CAKE.—One and a half cups sugar, half cup butter, three-fourth cup sweet milk, three eggs and yolk of one more, two cups flour, two teaspoonfuls baking powder, one full cup grated chocolate. Flavor with vanilla.

WINE OR CIDER JELLY.—Three cups sugar, one cup cold water, one package of Cox's gelatine, juice of three lemons and grated peel of one, one quart boiling water, two or three bits of cinnamon bark. Soak gelatine in cold water one hour, add to this the lemons, sugar and cinnamon, pour over all one quart boiling water, put in one pint of sherry wine or one pint of cider.

ORANGE JELLY.—Use two lemons and the grated peel of two oranges, juice of four oranges, sugar and gelatine as in wine jelly.

SUET PUDDING.—One cup chopped suet, one cup water, one cup N. O. molasses, four scant cups flour, two eggs, one cup chopped raisins, one teaspoonful soda. Boil three hours.

SAIL ON STEAMSHIPS.—Capt. F. Watkins, of the Inman Line Steamship City of Paris, says that fore and aft canvas is of no assistance to a fast steamer, not even for steadying purposes. Instead of increasing the speed he says that the spars and sails frequently retard them as much as a mile an hour. Within a few years he expects to note the absence of both canvas and spars from all the ocean flyers.

TREATMENT OF RABIES.—Dr. Pegrand claims to have discovered an efficient method of treating rabies. By injecting rabbits with the essence of the herb called tansy, he produced what he calls hydrophobic intoxication, or something very similar, and with virus thus obtained he mingled 10 per cent. of chloral. This prophylactic was injected into several animals which had hydrophobia, and two-thirds of the cases were cured.

THE NEW RAILWAY.—The new "slide" railway has been most successfully experimented on in Paris. The invention enables trains to run by means of water power, at a speed hitherto considered impossible. The cars travel on a film of water, and the friction is thus minimized. This system would seem peculiarly adapted for elevated railways in cities, being light, noiseless, smooth, without smoke, and thoroughly under control. A water train running at over one hundred miles an hour could, it is stated, be pulled up within thirty yards, climb up gradients of sixteen inches in the yard, descend with equal safety and run on curves of forty-four yards' radius. The cost of this system is said not to exceed \$40,000 per mile.

IODINE AND THE HUMAN BODY.

The influence of iodine, when presented in the form of iodide of potassium and especially in the form of the "double iodides," upon the human organization cannot be too highly estimated. When a person is in health its action is very small. The body seems to know instinctively that there is no need for the invaluable medicine and does its best to expell it immediately. In ill-health the conduct is exactly the opposite. The iodide is absorbed rapidly and in a short while is exerting itself in every part of the system. It is interesting to watch the changes it effects. Before its introduction, the body is more or less in a condition of lethargy. The stomach is inert and at times foul with secretions which are not carried away as they ought to be; the processes which produce pepsin and pancreatin, the two chief substances whereby digestion is carried on, are weak and inactive; the liver is torpid and shows itself in the yellowish tinging of the white of the eye and the sallow color of the skin; the kidneys lose their tone and act imperfectly in some cases and morbidly in others. Even the pores and glands are affected and yield a transpiration and exudation that are often perceptible and at times unpleasant in character. The blood becomes charged with humors which frequently display themselves in pimples, rashes, eruptions, boils, eczema, fever-sores, water blisters, and other cutaneous disorders; the brain and nerves lose their vitality, the sufferer becoming moody, depressed, and forgetful from the one, and weak, ailing, and painful from the other. In most instances he is said to have malaria or to be "out of sorts;" in others, where the symptoms are more pronounced and definite, he is said to have some specific disease. Chemistry has not yet determined the

exact action of the iodides upon this mass of corruption. When they touch the lining of the mouth, they stimulate the salivary glands and more especially those on the side of the jaw which produce the thin and water-like saliva. One result of this is to wash away some of the abnormal coating of the stomach. When they reach the latter they irritate its walls and excite, in all probability, every tissue in its neighborhood. The consequence is a quick increase in the amount of fluids poured out into the digestive cavity and a still further washing. They pass from the stomach to the small intestines whose absorbing power they augment and which they irritate very slightly. This irritation causes in many instances a mild aperience which is always conducive to physical welfare. They are absorbed at this point and now in liquid form are transferred by the assimilative processes into the blood. Here their direct action though small is appreciable. They seem to promote the breaking-up of the microscopic globules upon which all life depends and to facilitate the generation of infinitesimal amounts of hydrochloric acid, the oxygenation of hydrocarbons and the other exquisitely delicate actions and reactions which go on from birth to death.

In this wise they break up and destroy many of the impurities which float in the blood and others which have been lodged in the fine capillary veins or deposited in out-of-the-way tissues. Thus they act directly as a blood-purifier. Floating in the blood and forming part and parcel of it they rapidly reach every vital organ and every nerve and tissue. Upon the former their influence is well known. With each and all it wields a somewhat exciting action and so stimulates them to renewed activity. This is particularly the case with limphatics and all other functions whose secretion and excretion keep the organization free from humors and morbid elements. They seem to affect the pneumogastric much more than the cerebral nervous system—their action being tonic and strengthening. As a result there is a change in the feelings concomitant with that in the condition. The patient feels stronger, brighter and heartier. When to the iodides are added the great vegetable alteratives, Honduras sarsaparilla, stilingia, yellow dock and podophyllin in scientific proportions, the beneficial results are vastly increased. The blood is quickly purified, the tongue becomes clean, the breath sweet, the eyes bright and the complexion clear. The muscles regain their power, the

nerves their strength and the brain its full activity. This combination occurs at its best in only one preparation, Ayer's Sarsaparilla. This is a simple but scientific combination of the compounds mentioned, made after the formula of Dr. J. C. Ayer. The perfection of its formula and of its manufacture are attested by the fact that Ayer's Sarsaparilla is to be found on the shelves of nearly every drug store upon the globe and in the office-cabinets of many leading physicians, while thousands of human beings bear testimony to its unapproachable virtues.

BUSINESS NOTES.

SOMETHING WORTH KNOWING.

It has been a matter of frequent comment that ARMOUR & Co., of Chicago, the largest manufacturers in the world of all forms of animal food, and with their unrivaled facilities for selecting beef, did not make an Extract of Beef. The reason is now seen to be, that these gentlemen, while convinced for several years that there existed a demand which they were eminently qualified to supply, were determined that an Extract bearing their name should be beyond all peradventure the finest in the world. They took the matter up in a scientific manner, and the results of their long and patient investigations and experiments are now seen in Armour's Extract of Beef, which in solid and fluid form is now offered to consumers. Armour's Extract possesses a delicious, real Beef Flavor, and is entirely free from harsh or burnt taste and smell. It retains in a marked degree the nutritive properties of Beef, and is highly recommended by leading physicians everywhere.

THE HARTSHORN SHADE ROLLERS.

These shade rollers are sold in every city, town and village in the United States and are shipped to every civilized part of the world. Every roller contains a finely tempered steel spring, adjusted so as to perform the maximum work, and strong and not liable to get out of order. Everything used in their manufacture is subjected to careful inspection and every one made is

guaranteed to perform the work noted on the label. Mr. Stewart Hartshorn, the inventor and manufacturer of these shade rollers, keeps two factories running full time in their production, one in East Newark, N. J., and one in Muskegon, Mich. The engraving shows the one in East Newark. All the buildings are of brick and were built for the particular purpose for which they are used. They are well lighted, clean, and every precautionary means has been adopted for safety from fire, etc. Most of the employees entered the factory as boys and have grown up with the business. All receive good treatment and good wages. Mr. Hartshorn was the originator of the spring-stop-roller and the large market for them to-day has been worked up through his exertions. Like all useful things they have their imitators, but as the interior is covered by patents at every point, the imitation is confined to the outside. The principle actuating every department of this establishment is that perfect goods must be turned out, and with the head of the house having an experience gathered in forty years of manufacturing spring rollers, mistakes are not liable to occur.

Fine Table Wines

PRINTERS' INK.

A JOURNAL FOR ADVERTISERS.

PRINTERS' INK is just what it purports to be, "a journal for advertisers." It is issued on the first and fifteenth days of each month, and is the representative journal—the trade journal, so to speak—of American advertisers. It tells the intending and inexperienced advertiser in plain, comprehensive articles how, when, and where to advertise; how to write an advertisement; how to display one; what newspapers or other media to use; how much to expend—in fact, discourses on every point that admits of profitable discussion. If you advertise at all, PRINTERS' INK can help you. Perhaps you expend but Ten Dollars a year in advertising; if so, PRINTERS' INK may show you how to obtain double the service you are now getting for one-half the money. A year's subscription costs but One Dollar: a sample copy costs but Five Cents. Advertising is an art practised by many but understood by few. The conductors of PRINTERS' INK understand it thoroughly. Surely their advice, based on an experience of more than twenty-five years, will help you. Address:—

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,

By MISS M. E. BRADDON.

THE GIRL AT THE GATE,

By WILKIE COLLINS.

A BRIDE'S TRAGEDY,

By MISS MULOCK.

THE RECTOR'S DAUGHTER,

By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,

By MARY CECIL HAY.

GABRIEL'S MARRIAGE,

By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,

By ETTA W. PIERCE.

THE RIGHTFUL HEIR,

By M. T. CALDOR.

THE DOUBLE HOUSE,

By MISS MULOCK.

TWICE SAVED,

By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, profusely and handsomely illustrated, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only **Twenty-five Cents.**

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the AMERICAN ANALYST.

For particulars address The Great American Tea Co., 31 and 33 Vesey St., New York, N.Y. P. O. Box 287.

THREAD DISEASE.—Silk thread is soaked in acetate of lead to increase its weight, and persons who pass it through the mouth in threading needles, then bite it off with the teeth, have suffered from lead poisoning.

BRINE BLEACHING.—It is reported that an Englishman has succeeded in producing from natural brine, by means of electricity, bleaching powder, caustic soda, and a solution to be used in bleaching the most delicate fabrics.

THE NEGRO'S SKIN.—The function of a negro's black skin is supposed to be the conversion of the sun's light into heat. The heat thus generated remains in the skin and does not penetrate to the deeper tissue. Being thus provided with a sun-proof armor, the negro can stand an amount of heat that would be fatal to a white man, and he runs hardly any risk of sunstroke.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar.** It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

Wonder and Satisfaction

will be your experience when you first try Pearlina. You'll wonder at its miraculous cleansing-time-labor-saving properties. Wonder why you had not discovered the truth before. You'll be satisfied that all the good things you have read or heard of Pearlina are true—if you've heard bad, you'll be satisfied 'twas false. There's hundreds of uses for Pearlina beside the laundry and house-cleaning—for washing dishes, china, glassware, silver, straw hats, felt hats, bead trimmings, marble, bronzes, oil paintings, carpets; in fact, everything in the house, from top to bottom—all that's washable—will be far more satisfactory because of the liberal use of Pearlina. It is harmless.

Beware Peddlers and some unscrupulous grocers are offering imitations which they claim to be Pearlina, or "the same as Pearlina." IT'S FALSE—they are not, and besides are dangerous. Pearlina is manufactured only by JAMES PYLE, N. Y.

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose spurious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar, we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING Co.,

19 Park Place, N. Y.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

A BOOK THAT EVERY LADY NEEDS.

THE LADIES' GUIDE TO FANCY WORK.

printed, and, as above stated, contains nearly 300 illustrations. It will be sent by mail, post-paid, upon receipt of price, only **Twenty-five Cents.**

How to make the Home Beautiful at small cost is a subject now uppermost in the mind of every lady of good taste. This book is a complete practical instructor in every description of Ladies' Fancy Work, and the only first-class work of the kind ever published at a low price. It contains nearly **300 Illustrations**, and the instructions given are so plain and simple that by their aid even a child may make the many beautiful things which the book describes. It gives plain and practical instructions in Drawing, Oil Painting, and making Wax Flowers; likewise all kinds of Fancy Needle Work, Artistic Embroidery, Lace Work, Knitting, Tatting, Crochet and Net Work. It contains designs for Monograms, Initials, Cross Stitch Patterns, Knit Edgings, Embroidered Borders and Corners, Macrame Work, Applique Embroidery, Berlin Work, Java Canvas Work, Tricot and Burlaps, Antique Lace, Beaded Lace, Darned Net Work, Tiddies, Lambrequins, Ottoman, Counterpanes, Rugs, Carriage Robes, Brackets, Wall Pockets, Waste Paper Baskets, Work Boxes, Work Baskets, Work Bags, Pen Wipers, Hanging Baskets, Catchalls, Pin Cushions, Footstools, Handkerchief Boxes, Glove Boxes, Card Baskets, Sofa Pillows, Table Covers, Table Scarfs, Screens, Scrap Bags, Hand Bags, Table Mats, Toilet Mats, Lamp Mats, Lamp Shades, Pillow Shams, Pillow Sham Holders, Curtains, Toilet Stands, Picture Frames, Slipper Cases, Letter Cases, Toilet Sets, Clothes Brush Holders, Cigar Boxes, Hassocks, Sachets, Fancy Purses, Slippers, Dressing Gowns, Music Portfolios, Knife Cases, Fans, Flower Baskets, Plant Stands, Flower Pot Covers, Shawls, Dress Trimmings, Window Shades, Feather Work, Spatter Work, Leaf Photographs, and many other things. It is a book that should be in every American household. With it as a guide you may make hundreds of beautiful things for the adornment of your home and for presents to your friends at the most trifling expense, and no employment for ladies is more fascinating and useful. The book will repay its small cost many times over in a very short time. Every lady will be delighted with it. It is a large book of 64 large 3-column pages, with handsome cover, is finely

INVALUABLE TO EVERY HOUSEWIFE!

THE MODERN COOK-BOOK AND MEDICAL GUIDE.

This is practically two books in one—a perfect cook-book and a perfect medical book—and there is so much in it, and so much care and pains have been taken in its compilation, that we feel perfectly safe in asserting that the Cooking department is fully the equal, in quantity and quality, of any low-priced cook-book published, and the same as to the medical department herein as compared with any low-priced medical work on the market. It is a complete encyclopedia of domestic information, and we fully believe that no lady, after having it in the house a short time, would willingly do without it for ten times its cost. The cooking recipes number 627, and include Breakfast Dishes, Soups, Meats and Poultry, Fish, Vegetables, Salads and Relishes, Bread and Rolls, Jellies and Preserves, Puddings and Pies, Fancy Dishes, Cakes, Confectionery, Ice Cream and Summer Drinks. The compilation of this department was supervised by a practical housekeeper, every recipe will be found reliable, and has been pronounced one of the best, most complete, and practical cook-books published. The Medical Department will be found fully the equal of any doctor book published at one dollar or less. It tells you how to cure, by simple means, available in every home, Malaria, Pneumonia, Poisons (antidotes for), Nervousness, Measles, Rheumatism, Toothache, Wounds, Sprains and Bruises, Weak and Inflamed Eyes, Dust in the Eye, Sore Throat, Scall Head, Whooping Cough, Neuralgia, Earache, Worms, Warts, Burns and Scalds, Headache, Offensive Breath, Bleeding (to stop), Cancer, Consumption, Felons, Dyspepsia, Diarrhea, Croup, Corns, Scalds, Lice, Itching, Boils, Tobacco Appetite, Coughs and Colds, Cold in the Head, Catarrh, Scarlet Fever, Rose Bleed, Baldness, Smallpox, Sleeplessness, Ringworm, Chills, Costiveness, Cholera Morbus, Bright's Disease, Convulsions, Mumps, Superfluous Hair (to remove), Hysterics, Colic, Sciatica, Biliousness, Nettle Rash, Typhoid Fever, Ingrowing Toe Nails, Abscess, Stammering, Hemorrhage, Asthma, Hydrophobia, Scrofula, Bronchitis, Lockjaw, Erysipelas, Hoarseness, Chills and Fever, Dropsy, Bunions, Fits, Dandruff, Scurf, Quinsey, Heartburn, Styes, Liver Complaint, Cramps, Corpulence, Sunstroke, Knock-knees, Indigestion, Jaundice, Gout, Prickly Heat, Ulcers, Salt Rheum, Fainting, Indigestion, Boils, Tobacco Habit, Gray Hair (to prevent), Cholera Infantum, Deafness, Stiff Neck, Piles, Choking, Freckles, Pimples, Sunburn, Chapped Hands, and many other ailments. It will save you many dollars annually in doctors' bills and patent medicines. Who can doubt that twenty-five cents invested in such a useful and valuable book as this would be the best and most profitable investment that could possibly be made of so small a sum? **THE MODERN COOK BOOK AND MEDICAL GUIDE** is a large book of 128 pages, neatly bound in colored covers. It will be sent by mail post-paid to any address upon receipt of only **Twenty-five Cents.**

AVOID LITIGATION! BE YOUR OWN LAWYER!

EVERYBODY'S LAW BOOK.

Litigation is a very expensive luxury; avoid it, for it doesn't pay. Thousands of lawsuits are brought because people do not understand the simple principles of law and their own and others' rights; and there are plenty of lawyers always ready to take advantage of this lack of knowledge. The object of this volume is to impart, in a simple, concise manner, the fullest information regarding legal matters. It is to be used as a work of reference, and in all ordinary emergencies will save employing a lawyer. It is a complete compendium of business and domestic Law, by a prominent member of the New York bar, containing concise explanations of the general laws and the laws of the several States, regarding Administrators and Executors, Affidavits, Agency, Agreements, Apprentices, Arbitration and Award, Assault and Battery, Assignments, Attachments, Bills of Exchange, Bills of Lading, Breach of Contract, Notes, Bills of Sale, Chattel Mortgages, Citizens and Aliens, Common Carriers, Contracts, Corporations, Deeds and Mortgages of Real Estate, Descent and Distribution, Lower, Easement, Exemptions, Farmers' Law, Fences, Fixtures, Garnishment, Gifts, Guaranty, Guardian and Ward, Heirs and next of Kin, Homestead Exemptions, Husband and Wife, Infants, Interest and Usury, Landlord and Tenant, Libel and Slander, Liens, Limitation of Actions, Marriage and Divorce, Rights of Married Women, Master and Servant, Parent and Child, Partnership, Payment and Tender, Personal Property, Power of Attorney, Principal and Agent, Privileged Communications, Railroads, Railroad Real Estate, Receipts and Releases, Replevin, Right of Way, Seduction, Trustee Process, Warranty, Water Rights, Wills and Codicils. Together with complete forms of Acknowledgments, Agreements, Articles of Co-partnership, Assignments, Award of Arbitrators, Bills of Sale, Bonds, Chattel Mortgages, Contracts, Deeds, Executors' and Administrators' Accounts, Interest Table, Liens, Mortgages of Real Estate, Powers of Attorney, Releases, Satisfaction Pieces, Wills and Codicils, etc., etc., specially adapted for the daily use of those who are not lawyers, with directions for their preparation. Every farmer, mechanic, manufacturer, business man, professional man, merchant and householder will find the information contained in this book of great value and will have occasion to refer to it nearly every day. It is the cheapest book of the kind ever published, and is quite as complete and valuable as other works for which four times the amount, or more, is asked. **EVERYBODY'S LAW BOOK** is a large volume of 128 pages, 12mo, with handsome cover. It will be sent by mail, post-paid, upon receipt of only **Twenty-five Cents.** Send for it! It is worth ten times the amount asked for it to any man, young or old, in America.

For School Exhibitions and Public and Private Entertainments.

The Complete Book of Recitations and Dialogues.

This book contains, so far as we know, the best and most complete collection of recitations ever published in a single volume. All the popular recitation books of the day have been consulted and the cream selected, and the result is a mammoth collection of recitations which cannot fail to answer every requirement. There are hundreds of them, and they embrace every kind and character of recitations, adapted to every need, humorous, dramatic and pathetic—from short juvenile pieces for the little boys and girls on Friday afternoons to pretentious dramatic works for the professional elocutionist. We have space to enumerate the titles of only a very few of them, as follows: "Ostler Joe," "Asleep at the Switch," "The Last Hymn," "The Deadman's Journey," "The Engineer's Story," "Cripple Ben," "Two Loves and a Life," "The Mother-in-Law," "The Old Parson's Story," "Taking Toll," "The Engineer," "The Tramp," "Tim's Dream," "John Barry's Dream," "Too Late," "The Book-keeper's Dream," "Saving Mother," "Garret must not Ring To Night," "The Palmotto and the Pine," "The Polish Boy," "Drafted," "The Blacksmith's Story," "The Burning Prairie," "Guilty or Not Guilty," "The Foreclosure of the Mortgage," "The Clown's Baby," "Bill Mason's Ride," "How we tried to Whip the Teacher," "Driving Home the Cows," "Somebody's Mother," "When the Tide Goes Out," "The Old Farmer's Elegy," "Widder Spriggins' Daughter," "The Light-keeper's Daughter," "How the Parson Broke the Sabbath," "Which Shall It Be," "Somebody's Darling," etc., etc. In addition to the Mammoth collection of Recitations contained in this book, it also contains a number of fine Dialogues, mostly humorous, which are "Marrying a Pious Man," "The Train in a Tunnel," "What's in a Name," "The Graduate," "The Female Astrologer," "Proposing by Proxy," "Story-Telling," "The Morning Call," etc. Those who have sent for books of this character and been disappointed in them, owing to the meagerness and inferiority of their contents, will be happily surprised in this book, for not only is it the largest collection of Recitations and Dialogues ever sold at a low price, but great care has been taken in the selection of its contents, the aim being to include only the best. It is a splendid book, guaranteed to give satisfaction. **THE COMPLETE BOOK OF RECITATIONS AND DIALOGUES** is a large book of 64 large 3-column pages, with handsome colored cover. It will be sent by mail post-paid to any address upon receipt of only **Twenty-five Cents.**

HOW THE READERS

OF THE

AMERICAN ANALYST

MAY OBTAIN ANY ONE OR MORE OF
THE ABOVE BOOKS

FREE.

TO any one who will send us **One New Subscriber** to the **AMERICAN ANALYST** for one year, at \$1, we will send, **Free**, any one of the above books, to compensate him for his trouble; to any one who will send us two new subscribers, we will send any two of the books; and for three new subscribers, we will send the three books. This will be good pay for little work, for it is a simple and easy matter to get one or more new subscribers to the **AMERICAN ANALYST**. Show the paper to your friends and neighbors, and you will have little difficulty in inducing one or more of them to subscribe for one year. And when you have received your book or books you will feel doubly repaid for what trouble you have taken. If the parents do not wish to try it, let the little boys and girls do so after school hours. We feel sure that every one of our present subscribers and readers can readily secure for us one or more new subscribers, and we offer this special inducement in order to stimulate effort in this direction. The books will be found well worth the slight effort that will be required to secure them. Try it, and see how easy it will be.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no constructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides. It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, ONLY THREE possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract, and Keppel's Malt Extract. WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined. R. H. CRIPPS, M.D., F.R.S.

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alteratives.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Ferrated.
MALTINE with Hypophosphites.	MALTO-VERBINE.
MALTINE with Peptones.	MALTO-VIBURNIN.
MALTINE with Pepsin and Pancreatine.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract" or "Extract of Malt."

Send for Pamphlet giving comparative analysis by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

COLDEN'S
ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of
Beef and Tonic Invigorator."
LIQUID
BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D. F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

THE APPLICATION OF IT.

The *Las Vegas Stock Grower* must have surprised its readers when, a few weeks ago, they found in its columns, sandwiched between an article on fattening cattle and another on spaying cows, a very able sermon by the Rev. F. S. Brush from the text "God has made of one blood all the nations of the earth." The subject was the brotherhood of mankind, and the lesson sought to be conveyed that no man should wrong his brother, and as all men are brothers a liberal interpretation of the text would require all men to be honest. Not a word in the whole sermon as quoted by the *Stock Grower* could by any ordinary means have been applied to the meat dressers of Chicago, any more than to the Shah of Persia, the President of the United States, or to any one particular person whatever. Notwithstanding this, our contemporary, by a lurid headline, "The Big Four touched up in a forcible way," seek to apply the sermon in an impertinent personal manner to those gentlemen. As one of that mythical four is of the Hebrew

faith, and therefore does not believe in St. Paul's teachings, the sermon to reach him might well have been based on the text, "Thou shalt not bear false witness against thy neighbor," which is, as the *Stock Grower* may as well be reminded, one of the ten commandments. But such a sermon as the one referred to might be founded on a hundred different texts and still be misapplied. We are forcibly reminded of an old Nantucket story. A certain sea captain hailing from that ancient port, whom we will call Johnson, was a nominal member of the orthodox church there, and having unfortunately gotten the reputation of being the biggest liar in that neighborhood, his brethren thought that they could perhaps reclaim him by inducing their minister to preach a sermon on the evils of lying, on the first Sunday that Captain Johnson should be present to hear it. Accordingly, a forcible sermon was preached. After service one of the deacons took Captain Johnson by the arm and said: "Well, Captain, what did you think of that sermon?" To his utter astonishment Captain Johnson replied: "It was beautiful; it was such correct word painting; yet I could not help thinking how it must have hurt Captain Ames's feelings." All the good sermon had been preached in vain for Captain Johnson. So it is with the *Las Vegas* sermon. It evidently was preached in vain for the *Stock Grower*. The editor of that paper would not recognize the image in the mirror held before him, but maliciously contorts it to erroneously apply it to the "Big Four." What has the "Big Four" done to the *Stock Grower*? Not many weeks ago that paper was in a fair way to penitence. It virtually admitted that it had been sinful in its malicious attacks upon the dressed beef men, and while commending their businesslike ways, held them up as an example for its readers and promised to mend its own conduct. Alas! that it should have become a backslider so soon. Let the *Stock Grower* again humbly take its place on the anxious seat. Perhaps it yet will have grace enough to correctly apply the text to its own sad and sinful condition.

HORSE-CAR MANNERS.

It has frequently been remarked that in Southern cities one never sees a lady standing in a horse car while men are sitting. These bad manners of men in Northern and Western cities are to be deprecated. A woman is never able to stand up in a street car without serious injury to her health. It is true, in the abstract, that a man who has paid his fare is entitled to a seat; but where the car company fails in its duty to supply sufficient seating capacity, a man should be willing to forego his rights in favor of a woman. Another phase of this question should not be lost sight of. Where we find men willing and ready to relinquish a seat for a woman, we also find women ready and quick to make room for men who are standing up. While in New York street cars it seems to be the practice to let women stand, it is also the general custom among

women to ignore the rights of men and even women to seats by occupying more than their proper share of the seat and will only move, and then grudgingly, when specially requested to do so. A little less selfishness and more courtesy on both sides would work a wonderful change for the better. How would it do for each of our readers to try for a short time a little more regard for the rights as well as comforts of our fellow passengers in horse cars?

OFFAL WAGONS.

Our Health Department has not as yet taken any steps to prevent the gatherers of swill and bones from restaurants and butchers from polluting the atmosphere with the foul odors of decomposition. We made a friendly suggestion to the president of that department a few weeks since. Why has he not acted on it? We renew the matter now, and head this article with the Simon pure Boston name of those odoriferous vehicles in the hope of thus attracting Mr Wilson's attention. We shall be persistent in this effort and hope that the president will devote a few minutes to this pressing demand.

VACATION—RECREATION.

Webster tells us that vacation means being free from a duty or service, freedom from interruption, trouble or perplexity, in one word, leisure. Recreation means the state of being recreated, refreshment of the strength and spirits after toil, sport, amusement, diversion. How far our modern mode of taking a vacation differs from this standard is a problem of great importance. There can be no doubt that we all need rest, and the majority of toilers take this rest, but it is taken in many different ways. We perhaps all work harder than our fathers worked, but we do not work as much as they did. We take our annual summer outing, we have our Saturday half-holiday, the eight hour law, all modern devices which our forefathers would have stigmatized as wasting time. The important question arises, does our modern vacation recreate. If after we return from our vacation we are better fitted for work and do not feel more tired than when we started; if our health and strength has been renewed by our vacation we have been benefited, otherwise it would have been better if we had continued in our old routine of labor. It is a safe assertion to say that many who start out with the real purpose of taking a beneficial vacation entirely fail of the purpose, because they do not apply the same common sense to their vacations as they do to their business. The fatigue of constant travel, dissipation late hours, improper food, over-exertion in walking, riding, or even at play, are not sensible vacation methods. Being bored at some stupid backwoods resort and confined for amusement to reading, all may be changes from our routine ways but do not tend to recreation. A change is necessary, but the ordinary laws of health cannot be included in this change without in-

jury. He who would be benefited by a change and who wishes to return from his vacation refreshed and with renewed strength to resume his duties with greater vigor, must take his vacation in a healthy locality, differing from that where he lives the rest of the year; he must find employment both for mind and body which will amuse and rest, keep regular hours, and eat healthy food, easy of digestion and assimilation. With such vacations as these, vacations will be recreations and a benefit; otherwise they will be failures and an injury.

MILK ANALYSIS.

The *New York World* says:

The chemical analysis of milk by the Board of Health is not looked upon with favor by Police Justices when milk dealers are brought before them for violations of the Sanitary Code. Monday, in the Harlem Court, Justice Weld discharged two dealers charged with selling impure milk. The evidence showed that by chemical analysis the milk was bad, while it still stood the lactometer test.

What else can be expected from New York Police Justices? It is a well-known fact that the lactometer will show a watered milk to be apparently better than pure milk, and the obvious reason for this has been explained so often that it is useless to repeat it here. The lactometer is not infallible but it is a help to a milk inspector; but a milk analysis made by a competent chemist is positive evidence of the character of the milk. If Police Justices, however, prefer to decide a case according to the political pull of the prisoner, our milk inspection will be in vain. The same rule also applies to the appointment of chemists by the Board of Health. A good chemist is seldom a good politician. This rule works both ways.

BICARBONATE OF SODA.

SOME COMPARATIVE ANALYSES WORTH EXAMINING.

This very useful article, perhaps better known as baking soda, may be found in every household throughout the land. It is cheap, but varies considerably in quality. Professor F. P. Dunnington, of the University of Virginia, has made an analysis of those brands which are generally found in the market. His published results, as given below, will be readily understood when it is added that the brand containing the largest percentage of sodium bicarbonate, and the smallest percentage of other matter, is the best.

The specimens which have served for this investigation were furnished by Mr. C. B. Fleet, the Secretary of the Virginia Pharmaceutical Association, and were purchased in open market.

* Also a little ammonia.

MODERN EXPLOSIVES.

DYNAMITE, BLASTING GELATINE, AND BELLITE, AND THEIR POWER.

The chemistry, physics, and practical uses of gunpowder, dynamite, and other explosives, formed the subject-matter of an interesting lecture delivered March 5, before the Philosophical Society of Kilmarnock, by Mr. John Guthrie Kerr, M. A., lecturer on physical science in the E. C. Normal College, Glasgow, reported in the *Iron and Coal Trades Review*. After dealing with the knowledge possessed by the ancients of the properties of saltpetre in relation to bituminous bodies and the experiments of Roger Bacon, the lecturer said that the action of gunpowder, so far as results went, was similar to that of all explosives—out of a small mass a large volume of gas was rapidly developed at a high temperature and there followed a straining, displacement, or shattering of such obstacles as opposed the charge. The problem which had to be solved was the obtaining of an explosive more powerful in its effects, capable of being manufactured, transported, and handled with more safety, having greater resistance to the influence of water, and emitting, on explosion, less baneful gases than gunpowder. The solution of the problem commenced with Sober's discovery of nitro-glycerine in 1846. This explosive, which is an ether obtained from the alcohol glycerine by the action of nitric acid on glycerine in the presence of sulphuric acid, remained a laboratory curiosity for seventeen years. Then came Alfred Nobel, at once scientist, engineer, and enterprising man of business. He took the dangerous liquid, dissolved it in methylated spirit, and found transport

safe. Adding water the nitro-glycerine separates and may be used. The next stage was also an adulteration. Near Hanover are large beds almost wholly composed of diatomaceous relics. This "kieselguhr" has great absorbing gifts, and Nobel found it possible to completely conceal seventy-five parts of the liquid in twenty-five parts of this powder. This mixture—dynamite as now made—he found capable of standing the severest tests. Before a commission of inquiry, one fifty-six pound box of dynamite was burned without explosion. Another was allowed to drop over a cliff 130 feet high to rocks below, and, while the box was smashed, the dynamite was not affected. Nitro-glycerine, however, exudes from dynamite immersed in water, and Nobel's next effort was so to fix the nitro-glycerine that the danger arising from this might be averted. Further, it seemed desirable that the fixing compound should not be inert like "kieselguhr." This was affected by utilizing Pelouze's discovery of gun-cotton (tri-nitro-cellulose) in 1838. This substance, itself an explosive, but with slight defect of oxygen, was found to dissolve in nitro-glycerine, which contains for explosion a slight excess of oxygen, and with these two was formed the theoretically perfect explosive, blasting gelatine. The parts are 3 per cent. of gun-cotton to 97 per cent. of nitro-glycerine. In explosive effect, blasting gelatine is 50 per cent. better than dynamite, and is described by Sir Frederick Abel, our greatest authority on explosives, as the cheapest, the safest, and most perfect. It is entirely unaffected by water, and cartridges which have been immersed for seven years in water have at the end of that time developed their full power when detonated. Gelatine-dynamite is a modification of blasting gelatine, somewhat cheaper in manufacture, and having in use more of a heaving action. It is made of 80 per cent. of blasting gelatine, not quite gelatinous, wood, meal, and saltpetre forming the other 20 per cent., and is largely used in the fiery mines in England as the cartridge in Settle's patent. This invention consists of a water-tight bag in which the cartridge is kept in position in the middle of the water in the bag by tin supports. The charge is exploded by a detonator set off by a current of electricity. No flame follows the explosion and accordingly the risk from fire-damp is minimized. In bellite, the discovery of Carl Lamm in 1887, the proportions are five parts of the ammonia salt to one part of di-nitro-benzol. This explosive is said to be 30 per cent. stronger than dynamite, absolutely safe for transport, and flameless. Regarding entire absence of flame in the explosion of those nitro-benzol compounds, there seemed to be want of evidence as to the effects of other than comparatively small charges under favorable conditions. In the meantime the claim could not be considered as made good, whatever the promise might be. Compared with blasting gelatine, bellite is inferior so far as concerns power of withstanding water, as might be inferred from the presence of such a large proportion of nitrate of ammonia.

TOBACCO CONTRASTS.

WHAT'S ONE MAN'S POISON IS ANOTHER MAN'S FOOD.

SMOKED HIMSELF TO DEATH.

NEWBURG, N. Y., August 15.—William C. Van Wyck, an inveterate smoker, has died from the effects of nicotine poisoning. His last illness had many of the symptoms of a cancer in the stomach. A post-mortem examination revealed the fact that so thoroughly had his system become impregnated with nicotine that the stomach and other organs of the body had become unable to perform their functions.

SHE HAS SMOKED A PIPE FOR FIFTY YEARS.

BOSTON, August 25.—At Manchester-by-the-Sea lives Mrs. Stephen Danforth, who for the past fifty years has indulged in immoderate pipe smoking. The love for tobacco originated in Virginia, of which State she is a

native. Mrs. Danforth does all the domestic work of her husband, upon whom old age has laid a somewhat heavy hand; but in all her avocations the pipe is seldom unlighted, and her average consumption of the weed is twelve bowfuls a day. Mrs. Danforth will be 97 years old on her next birthday, and has lived at Manchester for the past 60 years.

THE POPE'S PUNCH.

THE HISTORY AND COMPOSITION OF ROMAN PUNCH.

The history of *ponche à la romaine* is curious. It had been the summer refreshment of successive Popes for over eighty years, and their *chefs* were threatened with all kinds of horrors and punishments if they ever divulged the secrets of its preparation. When Napoleon invaded Italy in 1796, this terrible interdict was broken through; a son of Pius VI.'s chief confectioner, by name Molas, as soon as he found the French were conquerous, ran away from his father and united his fortunes with them. This young man became the favorite servant of the Empress Josephine, and after her death became cook to the Russian Prince Lieven, whom he accompanied to London when that Prince was appointed Ambassador to the Court of St. James. This Russian first made this Papal beverage in London by introducing it at the Prince's table. The Prince Regent asked for the recipe, and permitted copies to be given to a select few of his friends, and by degrees it became better known, and is now well-known all over the world. The original Vatican recipe is: "Prepare a very rich pineappleade or sherbet; have it a little tart with lemon-juice, taking the greatest care that none of the zest or oil from the yellow rind, or the bitterness from the white underlying pith, be allowed to enter into the composition of this sherbet. In order to be certain of this, it is better first to grate off the yellow rind from the lemons, then to carefully remove all the white pith, and, 'to make assurance doubly sure,' wash the skinned fruit in clear water; after which, press out the juice free from the rind of the fruit; strain the juice so as to remove all the seeds or pips from it; then add it to the pineapple mixture. It must be then very well frozen. This sherbet, being very rich, will not freeze hard, but will be a semi-ice. Just before the punch is to be served, add and work into it, for every quart of the ice, one gill of old Jamaica; and for every two quarts, one pint of the best champagne. Never use the wine from damaged bottles or leaky corks, as it will be sure to deprave, and perhaps entirely spoil, your punch. After you have well-incorporated these liquors, add a cream or meringue mixture." Some of the gourmets of our time have altered this old formula by making the sherbet in the following manner: "Choose three dozen lemons, with very smooth, though not too thin, skins; peel them into a large china pan, being very careful that there be none of the white on the yellow rind; then add two pounds of broken lump-sugar, and stir all together with a wooden spoon for half an hour to extract the essential oil. Next pour boiling water in the basin, and stir till all the sugar is dissolved. Cut and squeeze the lemons, strain the juice, put the pips into a separate pan, and pour boiling water on them. Next throw into the sherbet one-half the lemon-juice, and, as soon as the pips are free from the transparent coating, strain off the liquor, and add it to the mixture. Taste it, and add more sugar or lemon as may be required. For every half-dozen lemons used, beat up the whites of three eggs to a stiff snow, and pour upon them half a pound of simple syrup that has been boiled to the thickness of molasses and cooled; mix well together, and add and work it into the frozen sherbet. Just before serving, add, for every six lemons used, half a pint of old rum, half a pint of brandy, a wineglassful of maraschino, and a pint of the best champagne. Stir these all well up together, and freeze again for a short time.

PUNCH A LA CARDINAL.

The Cardinals' punch used to differ from the Pope's, and was made of the rind of green bitter oranges, cut very thin, which was allowed to dry for a few hours in the air, then roasted to a golden brown color, after which it was put into a bottle and covered with deodorized alcohol corked up tightly, and set in the sun for a week. This infusion was put into the sherbet prepared in the same way as for Roman punch, except that the rum was left out and champagne only used, and sufficient of the bitter orange infusion, which should be the principal flavor. This ice should be tinted a fine red color with a little carmine.

THE DEADLY BATH.

HINTS TO SWIMMERS, SKILLFUL AND OTHERWISE.

A writer in one of our contemporaries, in summing up the causes for so many bathing accidents, concludes that most of them are mainly or entirely personal, and so far preventable. Chief among these, we need hardly say, is cramp. To a large extent this is practically identical with fatigue, for it is not the fresh and vigorous muscle which most readily passes into spasm. It is that which is wearied with over-action, in which effete products are in excess, nutrition consequently impaired, all molecular changes languid; where, finally, the movement of contraction, once initiated, gives way but slowly, and tends to linger and becomes tetanic. The numbing influence of cold is another well-known obstacle to muscular activity, and for this reason it is not, as a rule, advisable, to remain more than a few minutes in the water. Malnutrition of muscles is a factor which ought not to be forgotten. It supplies a reason why bathing very soon after a meal is not advisable, much of the blood required for muscular exertion being then diverted to the digestive organs. So likewise must it impose a check upon the rashness of those, adult and youth alike, who after a period of town life, with little physical exercise, find themselves at the coast, and insist on trying whether with jaded energies they cannot safely accomplish feats of swimming. Yet one more caution. This is that every bather should know the state of the tide, the currents and the ground. Unless he is thus careful, he may find himself at any time confronted by unexpected dangers, the end of which it is impossible to foresee. It may seem ridiculous to urge that only those who really can swim should bathe in deep water, yet neglect of even this precaution is by no means uncommon.

HUMIDITY AND SUNSTROKE.

SOME CURIOUS FACTS REGARDING THEIR RELATION.

Persons who think that the excessive humidity of recent summers is a new departure will discover their mistake on looking at the New York *Medical Journal* for the year 1853. In that year Mr. Lorin Blodget, in charge of the Meteorological Department of the Smithsonian Institution, in a report to the Secretary, says: "The summer of 1853 has been extraordinary in its climatic conditions, and the extremes of temperature and humidity were much more strikingly and clearly defined than usual." The report then proceeds to give an account of the weather for the summer, in which phenomena are described precisely like those with which we have been familiar for the past two or three years. Among them is the increased number of cases of sunstroke. It is by no means clear that there is a necessary connection between a humid atmosphere and sunstroke. Dr. Hunt, of Buffalo, in reviewing the cases of sunstroke which occurred in the humid summer of 1853, said: "The conclusion is irresistible that not dry heat, but a long-continued bath of aqueous vapour was the true cause of this unparalleled mortality." Another authority informs us that in India the chief cause of

sunstroke is "prolonged atmospheric heat, with a dry and rarified state of the air." It has been proved, however, that highly-rarified air is not conducive to sunstroke. There is no proof therefore that either humidity or dryness or rarification is the cause of sunstroke. It would seem, however, that there are facts to show that when the air is charged with moisture the liability to sunstroke is increased. The relation between humidity and sunstroke is due to the fact that people who perspire freely are not likely to be overcome with the malady, and humidity is undoubtedly unfriendly to perspiration. The extent to which the custom of wearing flannel has spread during the present summer shows that people are awake to the importance of dressing to suit the conditions of our climate. Flannel no doubt absorbs and encourages perspiration, but perhaps not enough has been said of the advantage of light-colored materials both for shirts and for outer wear. A surgeon of the British army has given his experience on this point. Being encamped on the shores of the Bosphorus, the surgeon, with some officers, thought it would be well to imitate the example of Leander and try a plunge in those famous waters. In walking to the shore they took off their coats, carrying them on their arms. The surgeon says:

"I wore a cherry-colored flannel shirt, and although all our shoulders were more or less burned by exposure while in the water, I was literally scorched, and for some days suffered greatly from the slightest movement or friction of my coat. We all suffered in exact proportion to the depth of shade of our flannel."

The same principle, if indeed it be a principle, would apply to hats. It should be observed, however, that there is a minority opinion on this point. A well-known officer of the United States army was strongly of the belief, as the result of his military experience, that black hats were cooler than white ones. When Police Commissioner a few years ago this officer caused the adoption of black hats for summer wear by the police. The question of the comparative coolness of garments of different colors may, no doubt, be left to the experience of the individual wearer.

COAL.

SOME SPECULATION AS TO THE WORLD'S CONSUMPTION.

Some statistics on the coal consumption of the world may not be without interest. In 1888 there were about 800,000 steam boilers at work, producing steam for about an equal number of engines, of much over nine million horse-power. At present, therefore, there may well be about ten million at work; of this number the half, or perhaps less, are stationary engines, working at most from ten to twelve to sixteen hours daily, and the remainder are on board steamers working irregularly. On an average six million horse-power per hour may be obtained from the consumption of coal; the coal required per horse-power on an average is four pounds per hour—more for the small boilers, less for the large ones—consequently, the coal consumption for the generation of steam may be estimated at 240,000 centners (a centner is one cwt.) per hour. The requirements of fuel for the gas engines of the world may be estimated at 70,000 ctrs. per hour. We have no information on the consumption of gas for heating purposes. In the United States it is of such importance that 20,000 ctrs. may be put down as the total consumption. For the extraction of metals about 180,000 ctrs. per hour is necessary. The consumption for industrial purposes is estimated at 100,000 ctrs. The requirements for domestic purposes will be covered by 200,000 ctrs. Thus a total consumption of 1,100,000 ctrs. is arrived at; that is to say that over a million centners is consumed hourly, or 25,000,000 centners daily. The coal production of the world may be estimated at 11 or 12 milliard centners annually, which makes 30 to 33 million centners daily, and $1\frac{1}{4}$ to $1\frac{1}{2}$ million centners hourly.

CORRESPONDENCE.

A FASHIONABLE LONDON WEDDING.

LONDON, August 24, 1889.

Editors AMERICAN ANALYST: Here we are on the verge of sporting land, and yet it seems this season's gaieties are barely over. Yachting festivities are now the order of the day, and then comes St. Partridge's reign, when all London will be popping away still, or else sniffing the briny, and the metropolis will be as quiet as any of the quietest nooks in England, leaving no remembrance of the tear, glare, and distraction of this very brilliant and long-lived season. Weddings have been in the majority, and to describe one of these functions will be the pleasant subject of my theme this month. The house at which this very pretty wedding took place was quite a floral exhibition; palms and ferns were arranged in groups everywhere—hall, staircases, landings; blocks of ice, with wreaths of fern, were placed everywhere, for it was one of the most torrid days of the season. On one landing was a block of ice standing close to a fountain, in which were floating water-lilies. Perhaps fountain will not be the right expression; it was a miniature waterfall below which was a miniature lake, in which water-lilies floated and a large white china swan seemed to be swimming. Along the banisters at close intervals, were large bouquets of white roses, white pinks, and other white flowers, tied with large bows, and ends of white watered silk ribbons. The reception-room doors were arched with white flowers and ferns. Garlands of the same were festooned round the walls; in the fire-places were blocks of ice surrounded with small palms and white geraniums. The mantel-pieces were canopies of white flowers, gardenias and stephanotis being most prominent among them. In the centre of the room was a huge bell, entirely composed of the same flowers, white roses, and maidenhair ferns. The clapper was in the shape of a small white plush dove, holding in its beak a spray of orange-blossoms. In the dining-room there was a long buffet at one end of the room and small tables dotted about. Over the sideboard was a banner of white Liberty silk, on which was written in rosebuds the names of the contracting parties and the date, with just the words, "Till death do us part." The buffet, which was a long dining-table, had, of course, the wedding-cake in the centre; it was of three tiers, and covered with centrifugal sugar over the icing, and decorated with natural flowers; there were also some wonderful emblematic figures, which space will not allow me to describe here. The floral decorations were of both kinds, flat and raised. The flat floral decorations represented Cupid's bows and arrows made with small white roses and feathery grasses. Silver baskets in the shape of the wooden baskets carried by children at the seaside, held white iris, white roses, gloxinias, sprays of myrtle, and orange-blossoms. The smaller tables had sprays of white rose garlands of the Louis XIV. period laid on them, and over the dining-room door was a gigantic floral horse-shoe made of white flowers and maidenhair fern; but I cannot dwell too long on this bridal entertainment, but must bid me on to name a few dinner-tables which were considered very *chick*. At one of the houses the table was a very large round one, in the centre were pale mauve, white, and yellow iris, with long grasses, deep-red leaves and maidenhair; an immense bed in the centre composed entirely of these flowers, which, at first sight, looked like the loveliest orchids. At another house in Belgrave square, there were long narrow banks of pale yellow iris with white gladioli intermixed with fern and grasses; silver bowls filled with the same flowers down the centre. At a house in Dover street, the dinner-table was decorated with a centrepiece of moss, which was invisible, in which fairy lights twinkled between the blooms of white and yellow roses. The last new shapes for lamp shades are the academical caps,

which should be of the same tone as the flowers. Floral lamp-shades are also very much in favor, made of lace and lined with silk, tiger lilies and poppies being the reigning favorites. W.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

September.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal, venison.

GAME AND POULTRY.—Pigeon, chicken, duck, woodcock.

FISH.—Anchovy, bass, bluefish, blackfish, cod, eels, crabs, clams, flounder, halibut, herring, lobster, mackerel, mussels, porgie, prawn, salmon, turtle, trout, sturgeon, whiting, weak-fish, rockfish.

VEGETABLES.—Beans, beets, cucumbers, cabbage, carrots, cauliflower, corn, egg-plant, lettuce, onions, parsley, parsnips, potatoes, squash, shallots, spinach, turnips, radish, rhubarb, tomatoes.

FRUITS.—Cherries, raspberries, huckleberries, melons, gooseberries, blackberries, peaches, pears, tamarinds, bananas, pineapple, grapes, plums.

PRACTICAL RECIPES.

BAKED OYSTERS.—Grate a small loaf of stale bread. Butter a deep dish well and cover the sides and bottom with bread crumbs. Put in half the quantity you intend using of oysters, with a little mace and pepper. Cover them with bread crumbs and butter. Then put in the remainder of the oysters. Season them and bake for a short time.

INDIAN PUDDING.—In one quart of nearly hot milk stir five tablespoonfuls of corn meal, one-half cupful molasses, one-half cupful sugar, three eggs, and piece of butter the size of an egg. Bake one and one-half hours.

BOILED FRUIT PUDDING.—One pint sweet milk, two eggs; make a thick batter and add fruit of any kind. Boil one hour.

SPONGE CAKE.—Three eggs and white of one more, three-quarter pounds sugar, one-half pound of flour, one teaspoonful cream tartar, one-half teaspoonful soda, rind and juice of one lemon.

FRENCH ROLLS.—At night take two quarts flour, rub in two tablespoonfuls lard, and make a hole in the middle and put in one pint cold boiled milk, three tablespoonfuls sugar, one tablespoonful salt, one yeast cake. Let this rise till morning without mixing; then mix and let stand till light, then roll out and cut round, spread with a little butter, fold over, raise and bake.

GREEN CORN FRITTERS.—Sift together a pint of flour, a heaping teaspoonful of Horsford's Baking Powder, half a teaspoonful of salt and a dash of white pepper. Cut through the centre of each row of kernels, and press out the inner part of them with the back of a knife; add three half pints of the corn pulp to the flour and four eggs well beaten; mix, and if the corn is not juicy enough to make the batter, add a little milk; drop spoonfuls of it in smoking hot fat, brown them nicely, and serve plain or with the sauce recommended for tomato fritters.

HICKORY NUT COOKIES.—Two cupfuls sugar, one-half cupful melted butter, six tablespoonfuls milk, one and a-half teaspoonfuls Horsford's Baking Powder, two eggs, one cupful chopped hickory-nut kernels stirred into the dough.

WAXED BAGS.—Waxed paper bags are a new idea for holding coffee, fruit, confections, etc. They are also useful for packing furs and woollens away from moths, the paraffine coating rendering them both air and watertight.

ANCIENT PRODUCTS.—Pliny mentions a variety of asparagus that grew in the gardens at Ravenna, three heads of which weighed a pound. Truly, there is nothing new in the way of asparagus, as far as size is concerned.

QUEER FACTS.—It is queer, though it is a fact, that Ohio has 40,373 white voters unable to write; Pennsylvania, 65,985; New York, 76,745. The men who can't read their ballots hold the balance of political power in these important States.

DEAF ANIMALS.—Evidence exists that deaf mutes are not confined to the human race. In a farmer's herd for twelve years was a cow which never gave any sign of hearing, and the evident attempts of which at lowing had only resulted in a feeble guttural. Nothing abnormal could be discovered in the ears or the vocal organs.

GERMANIZING GERMAN.—The Germanization of the language of Germany is continued. A patriotic tobaccoist at Dusseldorf, wishing to banish the word *cigarre* from the German dictionary at any cost, has offered prizes for substitutes that shall be unmistakably Teutonic. Among the first offered were *Glimmstengel* (burning stalk) and *Giftnudel* (poison tubes).

NOT YET EXHAUSTED.—Professor Thurston, of Cornell University, in an article in the *North American Review*, expresses the opinion that the steam engine is still capable of vast improvement; that the next generation will see the American Continent spanned by flying trains in two days, and that ships of 20,000 tons will be propelled at the rate of forty miles an hour.

DOOR TELEGRAPHY.—The London front door wears a great iron breast-plate, or metallic breast-pin, writes Brick Pomeroy, over which hangs a flat sad-iron handle in the name of a knocker. Listen. One solid knock on the door. That means a servant, a tradesman or some one to see a servant. Two knocks, the return of some member of the family. Three regular knocks, a caller. One loud knock, followed by two lighter ones in quick succession, the postman. One loud knock, two light ones and one loud one, a telegraph message, here called a wire. One thundering loud knock, and in about three seconds another one, equally loud and commanding with the first, a policeman, whose call may be to inform you that you have left a lower window open or a front door unlocked.

WALL RESPIRATION.—Prof. B. C. Kedsie, in his lecture when president of the State Board of Health some years ago, advised his audience to forego the pleasure of decorated walls, or to simply whitewash them with lime, rather than stop what he terms "wall respiration" by sealing or strangling the pores in the plaster with paste and paper, kalsomine or paint. He illustrated to his audience, by means of blowpipes filled with dry mortar and some coated with paper, others with paint and kalsomine, how readily air passes through walls of ordinary mortar and with stucco finish, and when simply whitewashed, and how this wall respiration was prevented by all the other modes. That air passes through walls is proven by the dust marks seen on plastered walls, or those that have been only whitewashed and alabastined, indicating the spaces between the lathing caused by the dust being filtered from the air more between the laths than on them.

EVOLUTION OF THE STREET RAILWAY.—The first ancestor of the street railway was the tramway, which was first introduced in the coal mining districts of the North of England between the years 1602 and 1649. It consisted of parallel lines of wooden trams or beams pinned down to the ground, with flanges on them, and not on the wheels, as now. Coal wagons were drawn to and fro along these flanged trams from the coal pits to the shipping ports. The first use of iron on these tramways was in 1767, when cast-iron plates were nailed down on timbers to protect them where they wore out the fastest. The width of the tramway was about four feet eight and a half inches. Horse railroads of a crude type were in use in England in 1805, but it was not until 1832 that the first street car line for passengers was built on Fourth avenue, New York. It was not, however until 1852 that a second line was built, after which the system spread rapidly throughout the United States.

SMOKELESS POWDER.—In the sham fight at Spandau with smokeless powder, no smoke was to be seen at the distance of 300 yards. No sound was heard except a slight noise as of tapping. There was something suggestive in the sight of troops pouring forth a deadly fire without making any noise or appearing to be doing anything. It suggested murder. The roar of cannon and the hissing of small shot has occupied the minds of soldiers in past wars and diverted their attention from the horrors of their position under fire, but the soldier of the future is to fall without warning, as if smitten by pestilence. As Lord Salisbury said in his recent Mansion House speech, war is fast becoming too dreadfully destructive for responsible statesmen to get their own consent to begin it. The alternative, though his lordship did not suggest it, is to go back to nature's weapon's—the fists. A better thing, perhaps, if practicable, would be for nations and individuals to concentrate their minds upon efforts to be perfectly just to each other, kind and sympathetic.

ELECTRIC MOTOR.—The improved electric motor which has been brought forward by a Cincinnati inventor, and for which various advantages have been claimed over all others, has been subjected to repeated exhibitory tests, and it would appear has given very satisfactory evidence of its value. This motor, according to all accounts, possesses a method of speed regulation which fulfills in a remarkable degree the great desideratum of simplicity as well as other desirable qualities. The arrangement consists of two peculiarly constructed coils of wire suitably placed in connection with a centrifugal governor, driven from the armature shaft by means of a rubber belt designed especially for the purpose, and the mechanism is such that, should the governor belt break or fly off, the arms will collapse and close, and the motor be immediately stopped.

INGERSOLL'S EXPLANATION.—Here is the way Ingersoll puts it: "Here is a shoe shop. One man in the shop is always busy through the day—always industrious. In the evening he goes courting some nice girl. There are five other men in the shop that don't do any such thing. They spend half their working evenings in dissipation. The first young man by and by cuts out these others and gets a boot and shoe store of his own. Then he marries the girl. Soon he is able to take his wife out riding of an evening. The five laborers, his former companions, who see him indulging in this luxury, retire to the neighboring saloon and pass resolutions that there is an eternal struggle between labor and capital."

BUSINESS NOTES.

AMERICA AT THE PARIS EXHIBITION.

There is no other exhibit of the class in the United States section to rival that of Wm. R. Warner & Co. From the globe-advertising Philadelphia merchant comes an exhibit which the native pharmaciens can look at with both admiration and wonderment. The display is enough to make any Frenchman curious, and their arrangement such as to be above deprecatory criticism; and those Frenchmen there could not be a people with better taste for the proper and harmonious exhibition of products. A glance through their own magnificent section of pharmacy will verify this. Readers would find superfluous a description in detail of the Messrs. Warner's essentially fine installation covering

all their soluble sugar-coated pills, salts, &c. Suffice it to remark that at the Paris Universelle their exhibit is thoroughly representative, comprises all the makers' fabrications, and is decidedly an honor to the concern. —*Pharmaceutical Record.*

HORSFORD'S ACID PHOSPHATES FOR SEASICKNESS.

Dr. W. W. Blackman, Brooklyn, N. Y., says: "I am very much pleased with it in seasickness. Several cases have been brought to my attention where it afforded prompt and entire relief."

MATCHES AND PENS.

Lucifer matches when first invented in 1827 were sold fifty for twenty-five cents. Now whole forests are made into matches, and the price of a gross, like that of Esterbrook's Steel Pens, is next to nominal.

Delicious Drink

Horsford's Acid Phosphate

Makes a healthful and invigorating drink with water and sugar only. It harmonizes with such stimulants as may be necessary to take. A desirable substitute for lemons or lime juice. Alays the thirst, aids digestion, and relieves lassitude.

"Dr. T. C. Smith, Charlotte, N. C., says:

"An invaluable nerve tonic, a delightful beverage, and one of the best restorers when the energies flag and the spirits droop."

Dr. J. S. Niles, Pownal, Vt., says:

"Excellent as a tonic, and refreshing as a substitute for lemonade."

DESCRIPTIVE PAMPHLET FREE.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill
Vineyard Company and have found them excellent. The Sauterne is
superb—much better than most of the imported that costs five times
as much. The same is true of the Claret and the Riesling. The time
is soon coming when Americans will know enough to appreciate the
wines of their own country. Most people judge of wines, not by what
is in, but by what is on the bottle. They taste the label, and then they
are not positive that they like it until they know the cost. If you
could only manage to have the Edge Hill Wines imported, they would
taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly inter-
esting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,
By MISS M. E. BRADDON.

THE GIRL AT THE GATE,
By WILKIE COLLINS.

A BRIDE'S TRAGEDY,
By MISS MULOCK.

THE RECTOR'S DAUGHTER,
By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,
By MARY CECIL HAY.

GABRIEL'S MARRIAGE,
By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,
By ETTA W. PIERCE.

THE RIGHTFUL HEIR,
By M. T. CALDOR.

THE DOUBLE HOUSE,
By MISS MULOCK.

TWICE SAVED,
By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most
famous names in literature, both American and European. Each of the ten novels is extremely interesting,
though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and
exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book,
profusely and handsomely illustrated, and making a most delightful and very interesting volume. We will send the
book by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new
subscriber to the AMERICAN ANALYST.

ANALYST PUBLISHING CO.,

19 PARK PLACE, NEW YORK.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera
Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands,
and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it.
Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results
when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine
in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive
value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is
prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree
with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

P. O. Box 1574. **THE NEW YORK PHARMACAL ASSOCIATION, NEW YORK.**

A CHARMING BOOK, INVALUABLE TO EVERY LADY.

ARTISTIC EMBROIDERY.

By ELLA RODMAN CHURCH.

Such a multiplicity of books upon the subject of Fancy Work are now offered for sale, it is often difficult for ladies to discriminate between the good and the bad. In the case of this work, however, the name of the author, Ella Rodman Church, should be a sufficient guarantee of its excellence, for a lady so well and favorably known could hardly afford to lend her name to anything not strictly first-class. This book is a complete text-book—a thorough instructor in every branch of Artistic Embroidery. With it as a guide all may become proficient in this beautiful and fascinating art, and those who are already skilled therein will find the many useful suggestions and the numerous beautiful new designs shown of the utmost value to them. The following is a partial summary of the contents: WORSTED EMBROIDERY—Crewel Work; the Crewel Stitch; Articles to be Worked in Crewels; an Embroidered Frieze; a Dado in Crewels; a Worsted Work Portiere; Curtains with Sprays of Sumac; a Sweet-Pea Table Cover; Screens in Crewel Work; Carriage Wraps; SIMPLE IDEAS OF COLORS; SILK EMBROIDERY; the French Knot; Stalk Stitch; Point Russe; Herring Bone or Feather Stitch; Chain Stitch; Ladder Stitch; DESIGNS; ARTICLES IN SILK EMBROIDERY—A Screen of Peacock Feathers; Banner Screen; Embroidered Table Top; Window-Curtain Border; Embroidered Dresses; Panels; Small Curtains or Hangings; an Embroidered Room; a Fan Table Cover; a Chair Cover; Fire Screens; a Child's Afghan; PRINT WORK; SILK EMBROIDERY WITH GOLD—Materials Used; Gold Cord; Gold Braid; Bullion; Spangles; Gold Thread; EMBROIDERED BOOKS AND OTHER ARTICLES; APPLIED WORK WITH EMBROIDERY—A Lambrequin in Applique; Silk Applique Work; Cretonne Work; Grape Pictures in Applique; Linen Applique; EMBROIDERY IN CREWEL; SILK EMBROIDERY ON LINEN—Embroidered Fruit Doilies; HOLBEN WORK; CHURCH EMBROIDERY; LINEN LACE WORK—Point Conté; Rosettes, Insertions, etc.; Point Coupe; Point Tire; Imitation of Antique Lace. ARTISTIC EMBROIDERY is a large 12 mo. book of 128 pages, handsomely bound in paper covers, and profusely and elegantly illustrated. It will be sent by mail post-paid upon receipt of only **Twenty-Five Cents**, and is guaranteed to be the best book of the kind ever offered at this low price.

ALL ABOUT HORSES, CATTLE, SHEEP AND HOGS.

The American Live Stock Manual.

No subject is of greater importance to the farmer than that of Live Stock, and few there are who have not much to learn regarding it. Many a man has lost a valuable animal for no other reason than that he did not know how to take care of it when well or to treat it when sick. THE AMERICAN LIVE STOCK MANUAL is a book the cost of which is but trifling, but it is simply worth its weight in gold to every man in America who owns a horse, a cow, a sheep or a hog, for it is a complete text-book, containing the fullest information regarding the care and management, feeding and rearing, of live stock, likewise directions for the cure of all diseases peculiar to these animals and of all unruly and vicious habits, for the construction of necessary buildings and conveniences, etc., etc. The following are only a small portion of the topics treated in this book: How to Judge a Horse; Feeding Horses; Raising a Colt; To Bit a Colt; To Break Horses from Pulling at the Halter; Warts on Horses; Stumbling Horses; Cure for Balking Horses; Kicking Horses; Training Vicious Horses; Galls and Sores on Horses; Reining Horses; Colic; Botas; Founder; Heaves; Epizootic; Shyness; Scratches; Ringbone; Spavin; Cribbing; Bruises and Blisters; Hide-Bound Horses; Avoiding Indigestion; To Take Off a Hide; Assistance at Birth; Hollow Horn; Obstructed Teats; Black Leg; Oaked Udder; Jumping Cattle; Garget; Care and Management of Hogs; Piggeries; Troughs; Pig Raising; Over-Feeding; Sanitary Management of Swine; Hog Cholera; Paralysis; Scurvy Pigs; Preparing Food for Swine; Butchering; Fattening Hogs; Driving Hogs; To Prevent Hogs Becoming Diseased; Raising Sheep; Washing Sheep; Sheep Rot; Hurdling Sheep; To Tell the Age of Sheep; Sheep Ticks; Early Lambs; How to Make Sheep Pay; Spring Feeding of Ewes; Treatment of Lambs; Increasing the Growth of Wool. THE AMERICAN LIVE STOCK MANUAL is a large book of 320 pages, 12 mo. size, with 1000 illustrations, and is profusely illustrated. It will be sent to any address by mail post-paid upon receipt of only **Twenty-Five Cents**. Send for it! The price is but a trifle compared to its real value to every farmer.

Four Books in One! No Household is Complete Without It!

THE COMPLETE BOOK OF HOME AMUSEMENTS.

What most lives need is more sunshine. Let us banish care, have a good time, enjoy ourselves while we may. How much happier—how much better off—are those homes wherein the father and mother, and even the gray-haired grandparents, join with the children after tea in a merry game or other amusement, than those wherein reticence and reserve and chilly demeanor prevail. "But," you say, "what shall we do? We read until we are tired; and we know of no amusement that we care for. How shall we employ the long winter evenings?" We have published a book to answer this question, and a wonderful book it is. It contains 64 large 8-column quarto pages, neatly bound in handsome covers, and is filled to the brim with every conceivable thing for the enlivenment of home. It is in reality four books in one, for it covers the ground usually occupied by four distinct volumes, and contains four times as much matter as any book published at the same price. It is a complete text-book for Public and Private Entertainment, Private Theatricals, Parlor Exhibitions, Social Gatherings, School Exhibitions and Evenings at Home. It is a book for old and young, grave and gay—a veritable storehouse of good things for all. It contains a number of ACTING CHARADES, with full directions how to perform them. It gives some very excellent PARLOR DRAMAS, easily acted yet very amusing. It tells all about SHADOW PANTOMIMES, and this alone we think you will say is worth the price of the book. It contains nearly fifty beautiful TABLEAU VIVANTS, and gives full and explicit directions for performing them. In it are so many amusing PARLOR GAMES that we have not attempted to count them, but we think we have almost everything, new and old, that was ever thought of in the game line. Then we come to a lot of wonderful ILLUSTRATED PUZZLES—tantalizing, perplexing, apparently intricate, but so easy when you turn to the proper place and learn the answers. Here also is a savory dish of RIDDLES, ENIGMAS, CHARADES, ETC.—a nice large lot of them. How young and old heads will puzzle and study over them, and how proud you will feel when you have solved one correctly. As to CONUNDRUMS, there are nearly a bushel of them, some so funny you will want to hold your sides with laughter, and what fun it will be for one of the company to read the questions and see who can guess the answers! A considerable portion of the book is allotted to PARLOR MAGIC, and here you will find hundreds of wonderful and amusing tricks, easily performed, yet exceedingly mystifying to your audience. Then there are a lot of amusing and instructive CHEMICAL EXPERIMENTS, showing how the combination and manipulation of the simplest agents will produce the most surprising results. Following these are a number of excellent DIALOGUES, comic and serious, suitable either for school exhibitions or parlor entertainments. Last, but not least, the book contains nearly fifty of the finest RECITATIONS, dramatic, pathetic, sentimental, and comic, ever written. It is handsomely illustrated, and is indeed a splendid book. THE COMPLETE BOOK OF HOME AMUSEMENTS will be sent by mail, post paid, to any address, upon receipt of only **Twenty-Five Cents**.

HOW THE READERS

OF THE

AMERICAN ANALYST

MAY OBTAIN ANY ONE OR MORE OF

THE ABOVE BOOKS

FREE.

TO any one who will send us **One New Subscriber** to the AMERICAN ANALYST for one year, at \$1, we will send, **Free**, any one of the above books, to compensate him for his trouble; to any one who will send us two new subscribers, we will send any two of the books; and for three new subscribers, we will send the three books. This will be good pay for little work, for it is a simple and easy matter to get one or more new subscribers to the AMERICAN ANALYST. Show the paper to your friends and neighbors, and you will have little difficulty in inducing one or more of them to subscribe for one year. And when you have received your book or books you will feel doubly repaid for what trouble you have taken. If the parents do not wish to try it, let the little boys and girls do so after school hours. We feel sure that every one of our present subscribers and readers can readily secure for us one or more new subscribers, and we offer this special inducement in order to stimulate effort in this direction. The books will be found well worth the slight effort that will be required to secure them. Try it, and see how easy it will be.

SWIFT AND COMPANY,**UNION STOCK YARDS,****CHICAGO, ILLS.****A BUSINESS BENEFIT.****ADVANTAGES TO ADVERTISERS OFFERED BY THE AMERICAN ANALYST.**

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the **AMERICAN ANALYST** a good advertising medium. Why should not you?

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose purious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING CO.,
19 Park Place, N. Y.

AMERICAN * ANALYST

WANTED ON LIBERAL TERMS.

WE ARE CONFIDENT that we have Reached the HIGHEST DEGREE OF PERFECTION in Solving the INFANT FOOD PROBLEM.

LACTO-PREPARATA.

A Prepared Human Milk perfectly Sterilized and especially designed for Children from birth to six or eight months of age.

Made wholly from cow's milk with the exception that the fat of the milk is partially replaced by cocoa butter. Cocoa butter is identical with milk fat in food value and digestibility, being deficient only in the principle which causes rancidity. The milk in LACTO-PREPARATA is treated with Extract of Pancreas at a temperature of 105 degrees, a sufficient length of time to render twenty-five per cent. of the casein soluble, and partially prepare the fat for assimilation. In this process the remaining portion of the casein not peptonized, is acted upon by the pancreatic ferment in such a manner as to destroy its tough, tenacious character, so that it will coagulate in light and flocculent curds, like the casein in human milk.

Composition:	ALBUMINOIDS.....	19 Parts.
	MILK SUGAR.....	64 "
	FAT.....	10 "
	MINERAL MATTER.....	3 "
	CHLORIDE of SODIUM added.....	1/2 "
	PHOSPHATES of LIME added.....	1/2 "
	MOISTURE.....	3 "

SEND FOR SAMPLE and compare it with every other food used in artificial feeding of Infants.

LACTO-PREPARATA is not designed to replace our SOLUBLE FOOD but is better adapted for Infants up to eight months of age.

CARNRICK'S SOLUBLE FOOD

Is the Nearest Approach to Human Milk that has thus far been produced, with the exception of Lacto-Preparata.

During the past season a large number of Physicians and eminent Chemists visited our Laboratory at Goshen, N. Y., and witnessed every detail connected with the production of Carnrick's Soluble Food. This invitation to witness our process is continuously open to Physicians and Chemists. All expenses from New York to Goshen and return will be paid by us. The care used in gathering the milk, its sterilization, and the cleanliness exercised in every step, cannot be excelled. Soluble Food has been improved by increasing the quantity of milk sugar and partially replacing the milk fat with cocoa butter.

PHOSPHO-CAFFEIN COMP. A SEDATIVE, NERVE AND BRAIN FOOD.

(GRANULAR EFFERVESCENT.)

This preparation has been thoroughly tested, and found to produce the happiest effects in Headaches, Neuralgia, Sleeplessness and General Nervous Irritability. We are confident that the above combination will be found superior to any of the various preparations that are used in nervous affections. It is not only a nerve sedative but a Brain and Nerve Food. The depressing effects of the sedative ingredients are fully overcome by its reconstructive constituents.

As a harmless and positive remedy in Headaches and Insomnia we are certain it has no equal. It is far more palatable than any of the preparations used for similar purposes.

PUT UP IN FOUR, EIGHT AND THIRTY-TWO OUNCE BOTTLES.

REED & CARNRICK, New York.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPEDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar.** It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodrum*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

DEAN'S PATENT

ARDENTER MUSTARD.

BEST IN THE WORLD.

Ardenter Mustard Pellets

— FOR —

Dyspepsia and Indigestion.

UNIVERSALLY recommended and prescribed by physicians. The medicinal property are English mustard seed coated with pepsin and sugar. You will find it will relieve you after using two or three doses. It is very beneficial for Heartburn, Sour Stomach and Headache. They are a beautiful confection for children. Each bottle contains full directions.

W. G. DEAN & SON,

361 and 363 Washington Street, 84, 86 and 88
North Moore Street, New York.

To Subscribers, Readers and
Advertisers.

SUBSCRIBERS' attention is called to the great variety of interesting and instructive subjects treated in this number. We respectfully ask the co-operation of our subscribers in extending our Subscription list, which will enable us still further to increase the value of the AMERICAN ANALYST to them.

The CASUAL READER is specially requested to examine our liberal premium offer.

ADVERTISERS who do not know of this Journal already, are respectfully referred to article headed "A Business Benefit."

ALL are kindly requested to peruse this number thoroughly.

The AMERICAN ANALYST can be had at any news stand in the United States. Any news-dealer will take orders for it, the American News Company being our wholesale agents. All post-masters will receive subscriptions.

Used by the United States Government. Endorsed by the heads of the Great Universities and Public Food Analysts, as the Strongest, Purest and most Healthful. Dr. Price's Cream Baking Powder does not contain Ammonia, Lime or Alum. Dr. Price's Delicious Flavoring Extracts, Vanilla, Lemon, Orange, Almond, Rose, etc., do not contain Poisonous Oils or Chemicals.

[FLUID.]

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M.D., F.R.S., and an endorsement by SIR ERASMUS WILSON, F.R.S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2."

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

A CHAUTAUQUA DISPUTE.

The summer colony at Chautauqua had a treat a couple of weeks ago rather out of the common order of entertainment at that centre of recreation and pedagogy. It seems that some utterances of Dr. George Gunton, of this city, evincing a friendly feeling for the general idea of trusts, brought down upon the speaker the ire of Dr. Washington Gladden, of Columbus, Ohio, who regards these combinations as veritable devices of the Evil One. Both gentlemen are men of learning and economists of distinction. The general sentiment of the listeners was in favor of Dr. Gladden's position, but the plucky manner in which Mr. Gunton advocated his side of the question against the brusque assaults of his adversary, and in the face of great numerical odds, challenged the approval of a large number of champions of fair play, and gained for Mr. Gunton a more than respectful attention. Accordingly, a joint debate by the two disputants was arranged for to be held in the great amphitheatre on August 26, when a large and interested audience was in attendance. A son of Bishop Vincent presided, and the discussion was in every respect as orderly in its details and as decisive in its outcome as

that famous disputation of old presided over and adjudicated upon by the sapient Pantágruel. Dr. Gladden, as the assailant, opened the discussion, his remarks relating almost exclusively to the Standard Oil Company, which comfortable corporation he denounced as "a concern which has as many aliases as a horse thief." He said that trusts and combinations sometimes accomplished good, but that their aim was to suppress competition, and that they were run by grasping and soulless men. Mr. Gunton had the next inning, and declared that trusts were undoubtedly formed to make money, and that is what all men are after. But the fact stands, he said, that since the formation of the big trusts the prices of their commodities had steadily decreased. Dr. Gladden, resuming, stood by his previous assertions, and urged the establishment of a tribunal in each State to keep the great combinations in check. Mr. Gunton denounced the proposition and the discussion closed, each speaker having been granted fifteen minutes alternately during one hour. The upshot was that the audience came away about as wise as they were in the beginning, both the speakers having fallen far short of the opportunity before them. Dr. Gladden's views undoubtedly are those most in accord with popular sentiment, but Mr. Gunton's declarations of approbation for trusts as money-making instruments without doubt struck a sympathetic chord in the minds of many, who would readily renounce their antagonism to monopolies if they could get a respectable chance to share in their advantages.

CALIFORNIA RAISINS.

The viticulturists of California held their seventh annual convention in San Francisco last month. One day's session was devoted to the raisin industry, in the discussion of which some interesting facts were presented. One speaker expressed the opinion that within five years the annual production of raisins in California would amount to 2,500,000 boxes, of which 800,000 would be London Layers. He thought it would pay to plant raisin grape vines in view of the fact that for the season of 1888-9 the United States imported 2,025,000 twenty-pound boxes of raisins from foreign countries, which would make the total consumption for that season 3,275,000 boxes. The area at present devoted to raisin grapes is 21,000 acres, which ought to produce 2,575,000 boxes. California's competitor in raisin production is Malaga, Spain. Malaga produces a large, thin-skinned, finely-flavored raisin. It is practically the only grape that competes with the local product. During the past seven or eight years the importations from Malaga have fallen off materially, on account of the improvement of the California raisin. Yet it is not true that the noticeable decline in the receipt of raisins from Malaga is entirely due to California competition. Our receipts from Spain began to decline seven years ago, when we were importing 1,800,000 boxes. In 1888 the quantity imported was reduced to 1,000,000 boxes. The total crop of the Malaga district for 1878 was 2,100,000 boxes,

of which the United States received 1,185,000 boxes. In 1879 the crop amounted to 2,125,000 boxes, the United States receiving 1,146,000 boxes. In 1880 the crop was 2,015,000 boxes, and the United States received 1,115,000 boxes. At this point the Malaga crop began to fail. In 1881 but 1,800,000 boxes were produced, of which the United States received 1,000,000 boxes. In 1882 the crop was 1,868,000 boxes, of which the United States received 968,000 boxes. These statistics show that for the five years mentioned 9,188,000 boxes were produced, of which the United States received 5,450,000 boxes, proving that we have been consuming more than one-half of the Malaga crop, while England, which claims to be the principal market, has received during the same period but 925,000 boxes.

MR. SPRECKELS' IDEA.

The possibilities of science are astounding. Mr. Claus Spreckels, the Sugar Magnate, has announced, so Dr. Glavis of Washington says, that he has discovered a process of solidifying beet sugar to the hardness of granite, and that this material can be used for every purpose that the finest white marble is called for. Just think of it. Any enterprising boy with a chisel can then supply himself with all the coveted sweets. We have heard of bad tenants burning the fences, stoops and floors for fuel, here we can contemplate such tenants as chipping off the front wall to sweeten their coffee. Any impecunious young man could invite his best girl to gratify her sweet tooth by licking the neighbor's wall. But why should we harass our imaginations? Surely we can never expect to attain the high standard of Mr. Spreckels, whose vivid imagination of the possibilities of American science and skill has led him to tantalize us with this sweet castle in Spain.

A BALLOON HOAX.

A couple of weeks ago a thrilling story was telegraphed to the daily papers from that fountain-head of American sensationalism, Chicago. It describes the wafting away of a two-year-old girl, by a bunch of toy-balloons, and of the wondrous skill of a sharpshooter who pierced some of the balloons so that by the reduced buoyancy the little one came down and was caught, without even wetting her feet by some expert oarsmen in a boat. That in the rush of nightwork in a newspaper office the story should have been permitted to pass into print without question is no wonder. But it reflects little credit on the sagacity or the honesty of the Associated Press agent at Chicago that the statements should have been sent over the country from his office. The dearth of news and the lull in the World's Fair discussion are hardly sufficient excuses. It is now said that the yarn was originally spun in the Philadelphia Record, as an April-fool joke, some eight or nine years ago, and its absurdity is demonstrated

For use at the Soda Fountain and in all Pharmaceutical preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

DRYDEN & PALMER,
19 Hudson St., New York.

mathematically as follows: A toy balloon, inflated will carry about an eighth of an ounce. Therefore to bear up a two-year-old child, weighing say thirty pounds, not less than 3,800 toy balloons would be necessary. And the most confident peddler of these playthings would hardly believe himself capable of selling that number even at a Chicago picnic.

IN A NUT SHELL.

The concluding sentences of the decision of the district judges in Duluth, Minnesota, against the beef inspection law, of which we gave an extended synopsis in our issue of August 29, constitute a tolerably hard nut for the beef conspirators to crack between their teeth. The judges say:

There is no question, that fresh, wholesome meat is an article of extensive commerce among the States at the present time. Of late years it has greatly increased and been facilitated by the device of refrigerator cars that are seen daily by the hundreds on all our trunk lines. Meat is transported hundreds of miles in a short space of time, and when it reaches its destination it is as fresh and wholesome as when placed in the car. It is one of the greatest and most important articles of interstate commerce, and it is not in the power of this State to prohibit commerce in it. Fresh meat is an article of interstate commerce; its regulation is exclusively in Congress, therefore a State law regulating it is void. Under the principles laid down governing police powers it is equally void. It is not an inspection law. It will not examine fresh meat to see whether or not it is wholesome. It puts all—the good and the bad alike—under the ban of destruction. It utterly destroys interstate commerce in this article, under the guise, it is true, of protecting the public health. But public health does not demand for its protection that wholesome fresh meats, the products of other States, be destroyed. A State cannot exercise such arbitrary power, no matter under what guise.

FRUIT FOR FOOD.

SOME TIMELY SUGGESTIONS FOR THE PRESENT SEASON.

Most fruit possesses a good deal of nourishment, but it is principally valuable for its salts and free acids, which are much required by the system at all times, but more especially when the weather is warm. Fruit, owing to these salts and acids, cool and purify the blood, and keep the entire alimentary canal in a healthy condition. These qualities are of special value to children and young people. In fact, if they were fed more liberally on fruit, and such meats as bacon, ham, etc., were tabooed, they would be in far better general health, free from heat rashes, rushes of blood to the head, digestive troubles, etc.; and, of course, vastly improved in temper. The fractiousness of children during

sultry days is a phenomenon well enough known to mothers, schoolmasters and others; but they all seem to ignore the fact that such ebullitions of temper originate, in ninety-nine cases out of a hundred, from digestive troubles, which could mostly be set right by judiciously reducing the meat diet, and allowing a larger proportion of sound fruit, either raw or stewed. The acids and salts contained in most fruits have a wonderfully purifying effect on the blood, and, besides keeping it cool and healthy, eliminate many earthy salts that would otherwise be absorbed into the system, and finally result in chalky gout, biliary and bladder calculi, and other diseases of a similar kind. Acid varieties of fruit are the best. As a rule, the healthy stomach will easily absorb any reasonable amount of fruit, taken at proper seasons. Weak and abused digestive organs will have to be treated more carefully, but will ultimately grow accustomed to a fruit diet, and be all the better for it. To do good, fruit must, of course, be properly ripe, and quite sound, if it is to be eaten raw. If for stewing, many kinds of fruit may be used in an unripe state, but in these cases they do not possess quite the same hygienic value as ripe fruit. Fruit that is fermenting should be rejected, unless it is made into a compôte, being thoroughly boiled and mixed with sugar. Fruit that is warm from exposure to the sun should be allowed to cool before being eaten. Another precaution, and one that is generally set at naught, is not to indulge in much fruit, especially if of a watery nature, after a heavy meat meal. As a general rule, the morning and mid-day meals are the best times for eating fruit, whether raw or stewed. A really wholesome breakfast, and one on which children and young persons would thrive, consists of raw fruit and whole-meal bread, with milk, or stewed fruit and porridge, or milk and farinaceous puddings. During warm weather only a small quantity of flesh food ought to be taken in the morning and at mid-day; and if stewed fruit and blancmanges or farinaceous puddings are made the staple dishes at these meals, much benefit would follow. As a rule, a fruit dessert in the evening and after a mixed meal ought only to be lightly indulged in, for the average stomach will but rarely tolerate a heavy influx of such cold and usually watery aliment as fruit. This is not the case if the fruit is eaten before or between the meat courses. A ripe melon eaten with salt or butter, before or immediately after the soup, can be freely indulged in. Experience teaches us that stewed or raw fruit may be largely taken between the courses. In many parts of the Continent this custom prevails; the Germans eat stewed fruits with many meats, and in warmer climes such fruits as grapes, plums, figs, melons and sweet lemons are habitually eaten with all kinds of dishes, or as palate refreshers between the courses. We might, with advantage, make much more use of stewed fruits with many meats, thereby pleasing the palate and conforming to hygienic laws. While refraining from advising the introduction of raw fruit on our tables between savory courses, we would urge the necessity of a greater appreciation of fruit, at all events for the summer months, as a primary item in family dietetic economy. By eating more fruit—raw when possible, or simply stewed with a little water and sugar—we should not only keep our blood cool and brains clear during the warm weather, but arrest the seeds of many painful diseases, which are only too common with the heavy flesh-eater when mature years are reached. There are few things more delicious than a good peach, pear, or dish of plums or currants in the early morning, immediately after rising; it prepares one for the day's work, and proves an excellent stop-gap until breakfast-time comes round. It is a mistake to add too much sugar when stewing fruit, for, although the sugar makes the compôte more nourishing, the fruit is not so easily digested, and soon satiates both the palate and stomach.—Food.

WIRE WHEELS.—Fly-wheels with rims of steel wire are now made in Westphalia, and may be run at three times the speed of cast-iron wheels, which are limited to forty yards per second for the rim.

SEALSKINS.

WHERE THEY COME FROM AND HOW THEY BECOME GARMENTS.

In any work on natural history, will be found under the head *Mammalia*, being a name applied by zoologists to that class of vertebrated animals who produce their young alive and nourish them by the secretions of the mammary glands; order *Carnivora* or flesh eaters, a sub-order *Pinnipedia*. These differ from the rest of the *Carnivora*, mainly in the structure of their limbs, which are modified for aquatic progression. This order is again subdivided into the *Otariidae* or sea bears, the *Trichechidae* containing the walrus and the *Phocidae* or typical seals. The true seals are the most completely adapted for aquatic life of the pinnipeds. When on land the hind limbs are extended behind them and take no part in progression, which is effected by a series of jumping movements, produced by the muscles of the trunk, in some species aided by the forelimbs only. There are several sub-families but it is only with the *Phocita*, or seals, we have to do. These have five incisors and twenty-nine molars, altogether thirty-four teeth, and their feet have well developed claws with interdigital membranes. Although seals swim and dive with the greatest ease, often remaining as much as a quarter of an hour or more below the surface, and are dependent for their sustenance entirely on living prey captured in the water. All the species frequently resort to sandy beaches, rocks or icefloes, either to sleep or to bask in the sun, and especially for the purpose of bringing forth their young. Strange as it may seem the young seals take to the water at first very reluctantly and have actually to be taught to swim by their parents. The number of young produced is usually one annually, though occasionally two. The true seal, when anything compels it to a rapid mode of progression can move so fast that a man has to step out beyond a walk to keep up with them. Seals are gregarious and especially at the breeding season congregate in immense herds. Seals are remarkably docile, easily trained when in captivity. Their sense of smell is very acute and their voice varies from a harsh bark or grunt to a plaintive bleat. They feed chiefly on fish and crustaceans, also on molluscs, echinoderms and even occasionally on seabirds, which they seize when swimming or floating on the water.

From a commercial point of view seals may be divided into hair-seals and fur-seals. The former are valued for the oil they yield and for their skins which are converted into leather, and the latter for their skins alone. The fur seals are provided with a dense soft under-fur like velvet and a quantity of long loose exterior hair, which has to be removed in dressing the hides. Hair seals are either entirely without under-fur or possess it in too small a quantity to render the skins of much commercial value as furs. These two groups of seals correspond to the divisions of eared and earless seals. The fur-seals occupy two distinct areas. None exist on the shores of the North Atlantic. South of the equator, they extend from near the tropics to the region of Antarctic ice. By far the most important and valuable seal fisheries are those carried on at the Pribyloff group of islands off the coast of Alaska, at the Commander Islands in the Behring Sea, and that in the same sea 700 miles west of the Alaskan seal islets. The species found here is the northern fur seal, *Callorhinus ursinus*. The males attain mature size about the eighth year, when their length is from seven to eight feet, their girth from seven to eight feet, and their weight, when in full flesh from 500 to 700 lbs. The females are full grown at four years old, when they measure four feet in length, two and a half in girth, and weigh from eighty to a hundred pounds. The yearlings weigh from thirty to forty pounds. The seals resort to these islands late in the spring chiefly for reproduction purposes, making their appearance from the southward. The number annually visiting the Pribyloff group is estimated at

five millions. About the middle of April the males begin to arrive and take their places along the shore in "the rookeries," as the breeding grounds are called. The younger males are prevented from landing by the older, and are compelled either to stay in the water or go to the uplands. By the middle of June all the males have assembled and then the females begin to appear. Each old male seal collects from ten to fifteen or more females, whom he guards most jealously. The males fight furiously making an aggregated sound like the noise of an approaching railway train. By the middle of July the family circle is complete. Soon after landing the female gives birth to one pup, weighing about six pounds, which she nurses at wide intervals without any affection. No food is taken by the males while on the rocks, a period of three or four months. When the males leave after this long fast they are reduced to one half their former weight. In the end of October and middle of November all leave the islands, the young males going last and by themselves. The killing of the seal is carefully regulated. No females are killed, and only a certain number of young "bachelor" seals whose skins are of a superior quality. These younger male seals are spread out on the slopes above the rookeries to rest. A party of men armed with clubs of hard wood creep quietly between them and the shore, and at a given signal start up with a shout and drive the seals inland. When they reach the killing grounds near the villages, they select those that are two or three years old and seem likely to yield the most valuable fur. These they despatch with a club. The skins are carefully salted for exportation. Besides the skin each seal yields about a gallon and a half of oil, but this is not used as the rank odor makes refining very costly. The value of the skins in the raw state varies from five to twenty-five dollars each. The quality of the Alaska furs is superior but those obtained in the Antarctic regions are rated best. The roots of the loose exterior hairs penetrate deeper into the skin than those of the fur or short hair, and can readily be cut by parting on the fleshy side without touching the roots of the fur; the long hairs then drop off leaving the valuable fur below in a sheet like pure velvet. The number of seals killed on the Pribyloff Islands is limited to 100,000 annually and with the precaution taken they increase as fast as if left to themselves, for when the number of males is in excess, the continual fighting on the rookeries, destroys many of both females and young which get trampled to death. Alaska was purchased from Russia by the United States in 1867 and in 1870 the Pribyloff Islands were leased to the Alaska Commercial Company for an annual rental of \$55,000 and a tax of \$2.62 on each skin taken. This company also leases the Commander Islands from Russia and about 30,000 fur seals are annually taken here. The South Sea seal fisheries are carried on by American fishermen, principally hailing from New London and Stonington; also by a few Chilians and other South American vessels. About \$50,000 skins are annually secured here. About 10,000 fur seals annually are taken in the Southern Indian Ocean and a few along the south-west coast of Africa and also in the Okhotsk Sea. Nearly all the fur seal skins find their way to London where they are plucked dressed and dyed. A few, however, are prepared in New York. At the seal islands they are salted and baled with the fur inside and in this manner shipped to London. The annual yield of the fur-seal fisheries of the world is about 185,000, the value of which would be about one million and a quarter dollars. There is a popular but very erroneous idea that the skin of the seal has much the same appearance on the back of its rightful owner that it has upon that of the fair creature who eventually wears it. Nothing can be further from the truth. Few skins are less attractive than is the sealskin when first taken from the seal. The fur is not visible, but is concealed entirely by a coat of stiff overhair, dull gray brown and grizzly. The process of dyeing them is tedious and expensive, requiring a great amount of skill and experience. The dye too, is in the main a secret, which is possessed almost entirely by

English houses, although there are two or three American concerns who do splendid work. Their output, however, is so insignificant that London may be said to have a virtual monopoly of the trade. All sales of raw skins are now made in that city. The average price of a raw skin in London is \$10. After they are dressed they will readily bring \$25 each.

The process of dressing them differs, each establishment having its own methods. In the main, however, it is done about as follows: When the skins are received by dressers they are still in the salt. The skins are first placed upon a beam somewhat like a tanner's beam, the salt is washed off and all the fat is removed from the flesh side with a beaming knife, care being taken that no cuts or uneven places are made in the pelt. The skins are next washed in water and placed upon the beam with the fur up, after which the grease and water is removed by scraping with a knife. They are then stretched on frames and dried in a moderate heat, after which they are again plunged in water and thoroughly cleansed with soap. The cleansing process completed, the skins pass to the "picker," who dries the fur by stove heat, the pelt being kept moist. When the fur is dry he places the skin on a beam, and while it is warm removes the main coat of hair with a dull shoe-knife, grasping the hair between his thumb and his knife, the thumb being protected by a rubber cob. The hair must be pulled out, not broken. This process is continued until every coarse or outer hair, long or short, is worked out from the pelt. The skins are then dried again and shaved on the pelt side to a fine even surface. They are next stretched and softened either in a fulling mill or by a workman, who throws them into an open hoghead and dances upon them barefooted until they are broken into leather.

They are now ready for dyeing, which is done by applying the liquid dye, made according to the different formulas used by the various firms and put on with a brush, carefully covering the points of the standing fur. After lying folded with the points touching each other for some little time, the skins are hung up and dried. The dry dye is then removed, another coat applied, dried and removed, and so on until the required shade is obtained. From eight to twelve coats are required to make a good color. This tedious process over, the skins are ready to be made into cloaks, sacks, dolmans and other garments chiefly for ladies' wear. From three to five skins are used, according to the size of the garment required. It is an interesting and rather significant fact that, although more than 80 per cent. of the entire sealskin product of the world is gathered on American soil, the American people are about the only people on the globe who pay a tax for the privilege of using them. This anomaly is brought about by the fact, as has been shown, that nearly all skins are dyed in London. More than 75 per cent. of the dyed skins find their way back to the United States, and must pay a duty of about \$6 per skin before they can pass the custom house. This increases the cost of a skin to about \$30. As it requires five skins to make a dolman, the cost of the raw material would be about \$150; hence the high prices of these garments.

The demand for seal garments is steadily increasing, while the supply must, for many years at least, remain fixed at about 170,000 skins per annum. It is therefore apparent that there will be no immediate decrease in price. On the contrary, the sales in London last October showed an advance over those of former years of more than 40 per cent. Of course, fashion's commands have much to do with the demand for sealskins, but it is plain that they now have an intrinsic value just as gold and silver have, and that they always will have it, no matter what be the styles. Even if they were not considered stylish, sealskin garments would be a costly purchase to the wearer, and will always be so.

Subscriptions \$1 per year. Now is the time to subscribe.

OLD NEW YORK.

A VALUABLE COMPENDIUM OF LOCAL HISTORY.

A new magazine bearing the apparently contradictory title of "*Old New York*" has just made its appearance under the editorial guidance of Mr. Wesley W. Fasko, the erudite secretary of the Typothetæ Society of this city. As the name suggests the new periodical is to be devoted to the history and antiquities of the American metropolis. The initial number, before us, gives promise of rare excellence both in mechanical execution and in the quality of the reading matter. The work, the editor informs us, is intended to cover the entire range of events from the period of Hendrik Hudson down to recent times. All available material in the possession of the State and City Governments, the files of newspapers which are extant, the pamphlets and manuscripts in our public libraries, the letters of those who have passed away, references in books of travel, and in fact every thing that can be obtained will be examined and digested. Many well known New York collectors and antiquaries have promised their assistance, and it is believed that the repository thus made will speedily be regarded as a most valuable one. One prominent feature of *Old New York* will be its indexes. These will refer to the collections already made or books already published, enabling writers on New York topics to have brought before them all that has been said or written elsewhere. Each number will contain at least sixty-four pages of reading matter, thus making two large volumes yearly. Many of the articles will be illustrated; each volume will have a copious index, and each series of volumes will also contain a general index, similar to those in Notes and Queries. The price will be \$5 a year. We shall take occasion to refer to *Old New York* again at an early date.

SURPLUS DOCTORS.—In 1886 Dr. J. H. Rauch said there were from 1,500 to 2,000 physicians in the State of Illinois more than necessary to supply the legitimate demands for professional services, and who were not earning a comfortable livelihood from legitimate professional exertion. Between the years 1880 and 1886, 1,060 physicians left the State after having registered for practice.

HYGIENE AND HURRY.—There are many simple rules of health violated because it is considered inconvenient to obey them, but it is the violation of these same simple rules that burdens life with that greater inconvenience—ill-health. The busy man will find that it takes far less time to comply with hygienic laws than it does to suffer the sickness resulting from their violation.—*Sanitary News.*

QUARANTINE STATIONS.—Owing to a reduction in the appropriations, three of the national quarantine stations on the Atlantic coast, one in the Gulf, and two on the Pacific coast, will be closed on the 1st of October. The Governmental appropriation amounts to \$50,000, and as this amount is insufficient to maintain all the stations now in operation throughout the year, two only will be kept open—namely, the one at San Francisco and one on the Gulf coast.

A SUBSTITUTE FOR OLIVES.—Instead of olives a kind of burnt almond has been introduced of late between the courses at dinner. These are very simply prepared. Get some fresh butter to boiling point (if put in before the butter is brown and fizzling, the almonds will not turn brown so readily); drop in your almonds—blanched, of course; fry until of a golden brown, and sprinkle a little salt over them while hot. *Voilà tout!* The so-called Coolie-nuts, after being nicely baked, make a capital and novel substitute.

TO MAKE ICE AT HOME.—Take a cylindrical vessel and pour $3\frac{1}{2}$ ounces of commercial sulphuric acid and $1\frac{3}{4}$ ounces of water into it, and then add one ounce of powdered sulphate of soda. In the centre of this mixture place a smaller vessel containing the water to be frozen; then cover the vessel and, if possible, revolve the whole with a gentle motion. In a few minutes the water in the small vessel will be converted into ice. The same mixture can be used a second or a third time for making a block of ice. The operation should, if possible, be performed in a cool place.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

September.

MEATS.—Beef, mutton, lamb, veal, ham, kidneys, liver, venison.

GAME AND POULTRY.—Pigeon, chicken, duck, woodcock.

FISH.—Bass, blackfish, bluefish, clams, cod, crabs, eels, flounder, halibut, herring, lobster, mackerel, muskels, porgie, prawn, rockfish, salmon, trout, sea bass, sturgeon, turtle, white fish, whiting.

VEGETABLES.—Beets, beans, cabbage, carrots, cauliflower, corn, cucumbers, egg-plant, garlic, lettuce, onions, parsley, parsnips, potatoes, radishes, rhubarb, savoy, shallots, spinach, squash, tomatoes, turnips.

FRUITS.—Apples, bananas, blackberries, gooseberries, huckleberries, grapes, melons, oranges, peaches, pears, pineapples, plums, raspberries, currants.

PRACTICAL RECIPES.

BEEF KIDNEY.—Cut the kidney in slices, and put a layer in the bottom of the dish; take some finely shred parsley, thyme, sweet herbs, mixed eschalots and mushrooms, with paper and salt to taste, and sprinkle over the layer of kidney; proceed thus alternately until the dish is full; cover the top with slices of bacon; bake the pie, and when done pour in some boiling stock or good gravy.

CHICKEN FRITTERS.—Make some good batter with a cup of flour sifted; melt a tablespoonful of butter in a scant cup of warm water, which pour by degrees to the flour, making a batter thick enough to mask the back of a spoon dipped in it; salt to taste; add, the last thing the white of an egg well beaten; make the chicken mixture into balls the size of small walnuts, dip into the batter, and drop from the spoon into very hot fat, the same as croquettes.

FLOUR GRIDDLE CAKES.—Mix with one quart flour, three teaspoonfuls Horsford's baking powder, and one teaspoonful salt; then add one tablespoonful melted butter, two well-beaten eggs, and milk enough to make a batter of proper consistency; cook immediately.

FRUIT FRITTERS.—Soak a teacupful of fine bread crumbs in a cup of hot milk till they are very soft, then stir in a tablespoonful of flour wet with two tablespoonfuls of cold milk; boil till it thickens, stirring to prevent lumps; to this add the well-beaten yolks of three eggs when it is sufficiently cool, then half a teacupful of jelly or jam, or small berries, and lastly the well-beaten whites; fry at once in hot fat.

HAZELNUT KISSES.—Beat one pound of pulverized sugar with the whites of eight eggs over a slow fire until they are light; then add four ounces blanched filberts cut fine; lay them out on paper and bake in a slow oven.

AGNES' LEMON PIE.—Yolks of two eggs and one whole egg, one cupful of sugar, one heaping tablespoonful flour, one-half cup water, juice and pulp of one lemon, piece of butter and pinch of salt; beat the eggs thoroughly, and to them add the sugar and flour mixed together; beat well and put in the salt, melted butter, water and lemon; this makes one pie; bake with lower crust only, and spread over the top a meringue made of the whites of two eggs and three tablespoonfuls of powdered sugar.

GRAHAM BREAD.—Half fill a bread bowl with half Graham and half white flour; put to it a tablespoonful of salt, half a cup of sugar and half a cup of molasses, and half a yeast cake dissolved in a little warm water; use enough water to make a thick batter; set to rise over-night; in the morning dip it out into greased bread pans, and set to rise again when light; bake in a good steady oven that will not burn. Very good recipe.

RUDIMENTARY ORGANS.

SOME SINGULAR SUPERFLUITIES IN THE PHYSICAL FRAME
OF MAN.

One of the strongest confirmations of the Darwinian theory of descent is found in the existence of rudimentary organs in animals, which, while subserving no useful purpose, still exist as an inheritance from some lower form of life to which they were both useful and necessary. One of the most familiar examples in the human body is that of the nails. These appendages are really of no particular use, and render no service in the struggle for existence. Artificial uses have been found for them, it is true; we could hardly open our pen-knives without their aid, but this is a case where their previous existence has suggested a subsequent use. The nails suggested the common type of knife-blade, but they were certainly not developed through many generations of knife-opening beings, with the survival of those best fitted to open their knives with promptness in case of trouble. It is only when we look back among the lower animals, and see how important a part of their means of offense and defense the nails become, that we realize that our digital appendages are simply the useless degenerate forms of those which, in some very remote progenitor, were of the greatest importance to his comfort and safety. The hair may be considered as another worthless inheritance of ours, and the occasional cases where it grows quite thickly upon the body as a partial reversion to some former type. It is a curious fact that it still grows luxuriantly upon the head, where it is of very little use, and its presence there is hard to be explained, except by considering it as an ornamental appendage, like the brilliant plumage of birds, thus bringing into play the principle of sexual selection. The fact that women rarely become bald adds weight to this supposition. One of the most curious instances of a rudimentary organ is to be found in the *cæcum*, a portion of the intestines, which is in shape like a small pouch, attached to the alimentary canal. It subserves no use whatever in the human organism, and is, in fact, a source of danger, for, although the opening is closed by a wonderfully constructed valve, yet fatal accidents have occurred from foreign matters passing into it, and inducing inflammation and abscesses. If we examine the intestines of a herbivorous animal, such as an ox, we find the same *cæcum* present, but greatly enlarged, and usually filled with partly digested food. In these animals it is undoubtedly an important part of the digestive apparatus, but only survives in man as a useless and dangerous appendage. Certain valves in the veins of man are very poorly adapted to support the blood pressure due to an upright position, and were probably first developed in some animal which walked upon all four limbs, and it has recently been discovered that the portal veins of newly born infants contain rudimentary valves, which soon disappear, but which are always present in some of the lower animals during their entire life. Rudimentary organs are found in other animals as well as man. The clavicle, or collar-bone, of the cat is a small bone, apparently of little consequence, but in man it is a most important means of maintaining an outward position of the shoulder-joint, so as to allow the widest range of motion to the limb. The "jew-claws" which hang down from the feet of deer, and the splint bones in a horse's leg, are well-marked survivals of a previously useful member. The occasional occurrence of uncommon organs in the human body may rather be considered as cases of reversion to former types, than as direct survivals. The power possessed by certain persons of moving the ears and scalp, is an instance of this, as well as the hairy men and women, and many other dime museum "freaks." There are certain organs of which the use is still unknown, such as the supra-renal capsules or the prostrate gland, which may or may not be survivals. It is more probable that they serve some unknown purpose in the human economy, especially as

when attacked by disease they often produce severe constitutional disturbance. The presence of rudimentary organs is, however, a settled fact, and is a strong argument against the distinct and separate origin of the different forms of life. It is impossible to think that the superfluous and dangerous *cæcum* would have been introduced into the human anatomy if man had come into existence independently of those forms in which it is an important organ, and it is a belittling conception of a Creator which regards him as forming his special creations in weak imitation of each other, and endowing them with useless organs and members, without regard to the varying conditions of their future environment.—*Pop. Science News.*

BOILS—THEIR CAUSE AND CURE.

One of our humorists, in commenting on the popular old saw that "boils are healthy," says, in effect, yes, boils may be healthy, but not the poor victims who suffer from them. There our humorist hit the truth. Some one else has asserted that the best place for a boil was on some other fellow. All can endorse this; for almost every one has had enough experience to know how extremely painful and annoying these eruptions are. But what are boils? and how may they be best cured or prevented? A boil may be defined as a limited area of inflammation situated in the loose tissue which binds the skin to the deeper structures. Generally it starts in or around a sweat gland and approaches the surface as it grows. Many theories have been advanced to account for the origin of boils, but it has now come to be pretty well established that they are caused by the growth in the tissues of certain minute organisms. These are found in every abscess; they can be cultivated, their life history can be studied, and when they are placed in the tissues again under favorable circumstances another boil, precisely like the first, is produced. How these bodies find their way into the system it is sometimes not easy to say, but probably it is through some slight break in the skin which has escaped notice. Some persons seem to present a more suitable soil for the cultivation of the germs than others and certain conditions of the system are very favorable to their development. A lowered vitality, sea bathing, changes of diet, especially during athletic training, and convalescence from certain fevers, are not uncommonly followed by boils. Children with scrofula and rickets are apt to suffer. Excessive sweating, lack of cleanliness, the long use of poultices, the application of irritants to the skin, and especially the chafing of clothing, seem to favor their formation. Any part of the body may be affected, but they are most frequently seen on the back of the neck, in the arm-pit and on the lower part of the trunk. Where the skin is firmly tied down, as in the passage of the ear, the pain and tenderness become intense; in the looser structures it may be but moderate. If left to itself a boil will break in four or five days, and discharge pus, and, generally, some dead tissue known as "core." It is usual to apply poultices till the abscess nears the surface and then make an opening; but often, if a free incision is made at the beginning, the process will be arrested. Poultices are of benefit only to relieve pain; they should not be continued after the incision is made, since they serve but to prolong the discharge. More than that, Dr. Pye Smith, of London, in the course of a recent discussion declared his belief that the crops of boils which sometimes are seen in the case of school children are due to the transfer of germs, by means of poultices, from an open sore to the glands of the healthy skin. The rational treatment, then, is an early opening and washing-out of the boil, using fluids that are destructive of the germs. At the same time the general health must be seen to, in order that it may offer a sufficient barrier to further inroads. The best method of improving the general health, and thus preventing the recurrence of boils, is by the use of Ayer's Extract of Sassa-parilla, which contains just the medicinal properties required by persons subject to these afflictions. This ex-

BUFFALO LITHIA WATER

In the Uric Acid Diathesis, Bright's Disease, Chronic Inflammation of the Bladder, etc.

JAMES L. CABELL, M. D., A. M., LL. D., Professor of Physiology and Surgery in the Medical Department in the University of Virginia, and President of the National Board of Health.

"The Water of Buffalo Spring No. 2 contains in notable quantities two of the ALKALIES which are accredited as extremely valuable in the treatment of GOUT, LITHIASIS, and Liver Affections. I refer to the CARBONATES of POTASH and LITHIA.

"I have recently read with interest a paper in 'The New York Medical Journal' on the Buffalo Lithia Water in Diseases of the NERVOUS SYSTEM, in which the writer, Dr. Boyland, citing his own observations and those of other eminent physicians, ascribes to this water a special virtue as a direct tonic for the NERVOUS SYSTEM in cases of CEREBRAL exhaustion. I have only had occasion to test its effects in this direction in cases in which the NERVOUS SYMPTOMS may have been due to LITHAEMIC conditions. In these cases the relief following the use of the remedy was very decided."

Dr. WM. A. HAMMOND, of New York, Surgeon-General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the Buffalo Lithia Water in cases of affections of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION OF THE LITHIA SALTS, and is, moreover, better borne by the Stomach. I also often prescribe it in those cases of CEREBRAL HYPER-EMIA resulting from over-mental work—in which the condition called NERVOUS DYSPEPSIA EXISTS—and generally with marked benefit."

Dr. ROBERT BATTEY, of Georgia, SUGGESTOR OF BATTEY'S OPERATION.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of CHRONIC INFLAMMATION of the BLADDER, whether induced by STONE, by enlarged PROSTATE in the aged or by NEGLECTED GONORRHEA, AND HAVE SECURED EXCELLENT RESULTS, which encourages me to prescribe it for the future."

HUNTER McGUIRE, M. D., LL. D., late Professor of Surgery, Medical College of Virginia, Richmond.

"BUFFALO LITHIA WATER, Spring No. 2, as an ALKALINE DIURETIC, is invaluable. In URIC ACID GRAVEL, and, indeed, in diseases generally dependent upon a URIC

ACID DIATHESIS, it is a remedy of extraordinary potency. I have prescribed it in cases of RHEUMATIC GOUT, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. WM. B. TOWLES, Professor of Anatomy and Materia Medica in the Medical Department of the University of Virginia.

"BUFFALO LITHIA WATER, No. 2, belongs to the ALKALINE or, perhaps, to the ALKALINE-SALINE Class, for it has proved far more efficacious in many diseased conditions than any of the simple ALKALINE waters.

"I feel no hesitancy whatever in saying that in GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE in the BLADDER, and in all Diseases of URIC ACID DIATHESIS, I know of no remedy at all comparable to it.

"Its effects are marked in causing a disappearance of ALBUMEN from the urine. In a single case of BRIGHT'S DISEASE OF THE KIDNEYS I witnessed decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of the disease."

Dr. THOMAS H. BUCKLER, of Paris (formerly of Baltimore), SUGGESTOR OF LITHIA as a Solvent for Uric Acid.

"Nothing I could say would add to the WELL-KNOWN REPUTATION OF THE BUFFALO LITHIA WATER. I HAVE FREQUENTLY USED IT WITH GOOD RESULTS IN URIC ACID DIATHESIS, RHEUMATISM, AND GOUT, and with this object I have ordered it to Europe, from Coleman & Rogers, of Baltimore. Lithia is in no form so valuable as where it exists in the Carbonate (the form in which it is found in the BUFFALO LITHIA WATER), Nature's mode of solution and division in water which has passed through Lepidolite and Spondumine Mineral formation."

Dr. GRAEME M. HAMMOND, of New York, Professor of Diseases of the Mind and Nervous System in the New York Post-Graduate Medical School and Hospital.

"In all cases of BRIGHT'S DISEASE of the KIDNEYS I have found BUFFALO LITHIA WATER of the greatest service in increasing the quantity of urine and in eliminating the ALBUMEN. In certain cases of Melancholia, accompanied by excessive eliminations of URATES and URIC ACID, it is often the only remedy necessary. In GOUT and RHEUMATISM it is highly beneficial, and in many cases of Impotence its restorative qualities have been of undoubted assistance. I have long regarded BUFFALO LITHIA WATER as the most valuable mineral water in use."

Water in cases of one dozen half-gallon bottles, \$5.00 per case at the Springs.

THOMAS F. GOODE, Proprietor, Buffalo Lithia Springs, Virginia.

cellent and well-known alterative acts on the digestive, assimilative, and excretory organs with such beneficial effect as to result in a thorough cleansing and toning-up of the system, when the boils and all other cutaneous eruptions entirely disappear.

AMMONIA AND BATHING.—The *Annals of Hygiene* has discovered there is nothing that so quickly restores tone to exhausted nerves and strength to a weary body as a bath containing an ounce of aqua ammonia to each pail of water. It makes the flesh firm and smooth as marble, and renders the body pure and free from all odor.

VALUABLE DEVICE.—A self-counter sinking screw is a novelty. It is simply fitted with cutting teeth on the under side or bevel of the head, which cut into the wood as the screw is driven home, thus enabling the head to counter sink itself. The channels and the teeth are both wider as they near the top of the head, thereby allowing the sawdust to escape.

ANTISEPTIC WHITING.—An antiseptic whiting has recently been introduced, and is recommended by the makers for hospitals, ships, stables, kennels, etc., in order to keep them free from insects. The compound, which appears to contain some camphor, is also useful for cleaning silver plate and articles of domestic use. The aroma is said to be not unpleasant, while the compound is non-poisonous and will not injure colors.

PETROLEUM DETERGENT.—Miss Gordon Cumming has drawn attention to the cleansing effect of petroleum on soiled clothes. The best way to employ it is to fill an average boiler, say of fourteen gallons, with water, adding half a pound of soft soap, and when all is boiling thoroughly pour in one and a half tablespoonfuls of petroleum. Then put in the clothes and boil them for half an hour before lifting them out and rinsing them in several waters. A little more soap, water and paraffine should be added to make up for loss as successive lots of the clothes are boiled.

A BOOK FOR EVERY LOVER OF FICTION! Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,
By MISS M. E. BRADDON.

THE GIRL AT THE GATE,
By WILKIE COLLINS.

A BRIDE'S TRAGEDY,
By MISS MULOCK.

THE RECTOR'S DAUGHTER,
By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,
By MARY CECIL HAY.

GABRIEL'S MARRIAGE,
By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,
By ETTA W. PIERCE.

THE RIGHTFUL HEIR,
By M. T. CALDOR.

THE DOUBLE HOUSE,
By MISS MULOCK.

TWICE SAVED,
By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, profusely and handsomely illustrated, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the AMERICAN ANALYST.

DRY SALT.—The hygroscopic quality of table salt and its tendency to pack together in cruets and containers, may be entirely overcome by thoroughly drying the salt and intimately mingling with it a small percentage of dry corn starch or arrowroot. From 8 to 10 per cent. is amply sufficient for the most humid atmosphere (as on the sea coast), while a much less percentage of the starch is sufficient for ordinary use.

VARIATIONS IN MILK.—From the results of about 50,000 analyses made in the laboratory of the Danish Dairy Supply Company, it is found that the dry matter less fat is an almost constant value (8.7 to 8.8). The fluctuations in total solids depend almost entirely on variations of the fat. The evening milk contains more fat and more total solids than the morning milk. In October and November the milk is richer in fat and total solids than in other parts of the year.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPEDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

ADDRESS ANALYST PUBLISHING CO.,

—19 PARK PLACE, NEW YORK.—

Mothers Know the danger in using a poorly washed Nursing bottle—it often causes death. A bottle washed with Pyle's Pearline and water will be perfectly clean—cannot be otherwise. Not necessary to use shot, etc., etc. Ordinary servants may be trusted to wash the baby's bottle if you see that they use Pearline. It has no equal for washing children's linen. OUR MISSION.**WHAT THE AMERICAN ANALYST IS DOING.****FIGHTING ADULTERATION.**

The steadily growing favor which the **AMERICAN ANALYST** is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the **AMERICAN ANALYST** has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the **AMERICAN ANALYST** is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which these bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are wide-spreading.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the **AMERICAN ANALYST** also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the **AMERICAN ANALYST** does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose spurious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar, we believe the day is approaching when the **AMERICAN ANALYST** will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING CO.,

19 Park Place, N. Y.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

A BOOK THAT EVERY LADY NEEDS.

THE LADIES' GUIDE TO FANCY WORK.

How to make the Home Beautiful at small cost is a subject now uppermost in the mind of every lady of good taste. This book is a complete practical instructor in every description of Ladies' Fancy Work, and the only first-class work of the kind ever published at a low price. It contains nearly 300 illustrations, and the instructions given are so plain and simple that by their aid even a child may make the many beautiful things which the book describes. It gives plain and practical instructions in Drawing, Oil Painting, and making Wax Flowers; likewise all kinds of Fancy Needle Work, Artistic Embroidery, Lace Work, Knitting, Tatting, Crochet and Net Work. It contains designs for Monograms, Initials, Cross Stitch Patterns, Knit Edgings, Embroidered Borders and Corners, Macramé Work, Applique Embroidery, Berlin Work, Java Canvas Work, Tricot and Burlaps, Antique Lace, Beaded Lace, Darned Net Work, Filles, Lambrequins, Ottomanas, Counterpanes, Rugs, Carriage Robes, Brackets, Wall Pockets, Waste Paper Baskets, Work Boxes, Work Baskets, Work Bags, Pen Wipers, Hanging Baskets, Catch-alls, Pin Cushions, Footstools, Handkerchief Boxes, Glove Boxes, Card Baskets, Sofa Pillows, Table Covers, Table Scarfs, Screens, Scrap Bags, Hand Bags, Table Mats, Toilet Mats, Lamp Mats, Lamp Shades, Pillow Shams, Pillow Sham Holders, Curtains, Toilet Stands, Picture Frames, Slipper Cases, Letter Cases, Toilet Sets, Clothes Brush Holders, Cigar Boxes, Hassocks, Sachets, Fancy Purses, Slippers, Dressing Gowns, Music Portfolios, Knife Cases, Fans, Flower Baskets, Plant Stands, Flower Pot Covers, Shawls, Dress Trimmings, Window Shades, Feather Work, Spatter Work, Leaf Photographs, and many other things. It is a book that should be in every American household. With it as a guide you may make hundreds of beautiful things for the adornment of your home and for presents to your friends at the most trifling expense, and no employment for ladies is more fascinating and useful. The book will repay its small cost many times over in a very short time. Every lady will be delighted with it. It is a large book of 64 large 3-column pages, with handsome cover, is finely printed, and, as above stated, contains nearly 300 illustrations. It will be sent by mail, post-paid, upon receipt of price, only Twenty-five Cents.

INVALUABLE TO EVERY HOUSEWIFE!

THE MODERN COOK-BOOK AND MEDICAL GUIDE.

This is practically two books in one—a perfect cook-book and a perfect medical book—and there is so much in it, and so much care and pains have been taken in its compilation, that we feel perfectly safe in asserting that the Cooking department is fully the equal, in quantity and quality of contents, of any low-priced cook-book published, and the same as to the medical department herein as compared with any low-priced medical work on the market. It is a complete encyclopedia of domestic information, and we fully believe that no lady, after having it in the house a short time, would willingly do without it for ten times its cost. The cooking recipes number 627, and include Breakfast Dishes, Soups, Meats and Poultry, Fish, Vegetables, Salads and Relishes, Bread and Rolls, Jellies and Preserves, Puddings and Pies, Fancy Dishes, Cakes, Confectionery, Ice Cream and Summer Drinks. The compilation of this department was superintended by a practical housekeeper, every recipe will be found reliable, and it has been pronounced one of the best, most complete, and practical cook-books published. The Medical Department will be found fully the equal of any doctor book published at one dollar or less. It tells you how to cure, by simple means, available in every home, Malaria, Pneumonia, Poisons (antidotes for), Nervousness, Measles, Rheumatism, Toothache, Wounds, Sprains and Bruises, Weak and Inflamed Eyes, Dust in the Eye, Sore Throat, Scall Head, Whooping Cough, Neuralgia, Earache, Worms, Warts, Burns and Scalds, Headache, Offensive Breath, Bleeding (to stop), Cancer, Consumption, Felons, Dyspepsia, Dysentery, Diphtheria, Diarrhoea, Croup, Corns, Liquor Appetite, Coughs and Colds, Cold in the Head, Catarrh, Scarlet Fever, Nose Bleed, Baldness, Smallpox, Sleeplessness, Ringworm, Chills, Costiveness, Cholera Morbus, Bright's Disease, Convulsions, Mumps, Superfluous Hair (to remove), Hysterics, Colic, Sciatica, Biliousness, Nettle Rash, Typhoid Fever, Ingrowing Toe Nails, Stammering, Hemorrhage, Asthma, Hydrophobia, Scrofous, Bronchitis, Lockjaw, Erysipelas, Hoarseness, Chills and Fever, Dropsy, Bunions, Pits, Dandruff, Scurf, Quinsey, Heartburn, Syphilis, Liver Complaint, Cramps, Corpulence, Sunstroke, Knock-knees, Indigestion, Jaundice, Gout, Prickly Heat, Ulcers, Salt Rheum, Fainting, Boils, Tobacco Habit, Gray Hair (to prevent), Cholera Infantum, Deafness, Stiff Neck, Piles, Choking, Freckles, Pimples, Sunburn, Chapped Hands, and many other ailments. It will save you many dollars annually in doctors' bills and patent medicines. Who can doubt that twenty-five cents invested in such a useful and valuable book as this would be the best and most profitable investment that could possibly be made of so small a sum? THE MODERN COOK BOOK AND MEDICAL GUIDE is a large book of 128 pages, neatly bound in colored covers. It will be sent by mail post-paid to any address upon receipt of only Twenty-five Cents.

AVOID LITIGATION! BE YOUR OWN LAWYER!

EVERYBODY'S LAW BOOK.

Litigation is a very expensive luxury; avoid it, for it doesn't pay. Thousands of lawsuits are brought because people do not understand the simple principles of law and their own and others' rights, and there are plenty of lawyers always ready to take advantage of this lack of knowledge. The object of this volume is to impart, in a simple, concise manner, the fullest information regarding legal matters. It is to be used as a work of reference, and in all ordinary emergencies will save employing a lawyer. It is a complete compendium of business and domestic Law, by a prominent member of the New York bar, containing concise explanations of the general laws and the laws of the several States, regarding Administrators and Executors, Affidavits, Agency, Agreements, Apprentices, Arbitration and Award, Assault and Battery, Assignments, Attachments, Banks, Bills of Exchange, Checks and Promissory Notes, Bills of Sale, Chattel Mortgages, Citizens and Aliens, Common Carriers, Contracts, Corporations, Deeds and Mortgages of Real Estate, Descent and Distribution, Lower, Easement, Exemptions, Farmers' Law, Fences, Fixtures, Garnishment, Gifts, Guaranty, Guardians and Ward, Heirs and next of Kin, Homestead Exemptions, Husband and Wife, Infants, Interest and Usury, Landlord and Tenant, Libel and Slander, Liens, Limitation of Actions, Marriage and Divorce, Rights of Married Women, Master and Servant, Parent and Child, Partnership, Payment and Tender, Personal Property, Power of Attorney, Principal and Agent, Privileged Communications, Railroads, Railroad Real Estate, Receipts and Releases, Replevin, Right of Way, Seduction, Trustee Process, Warranty, Water Rights, Wills and Codicils. Together with complete forms of Acknowledgments, Agreements, Articles of Co-partnership, Assignments, Award of Arbitrators, Bills of Sale, Bonds, Chattel Mortgages, Contracts, Deeds, Executions and Administrators' Accounts, Interest, Table, Liens, Mortgages of Real Estate, Powers of Attorney, Releases, Satisfaction Pieces, Wills and Codicils, etc., etc., specially adapted for the daily use of those who are not lawyers, with directions for their preparation. Every farmer, mechanic, manufacturer, business man, professional man, merchant and householder will find the information contained in this book of great value, and will have occasion to refer to it nearly every day. It is the cheapest book of the kind ever published, and is quite as complete and valuable as other works for which four times the amount, or more, is asked. EVERYBODY'S LAW BOOK is a large volume of 128 pages, 12mo, with handsome cover. It will be sent by mail, post-paid, upon receipt of only Twenty-five Cents. Send for it! It is worth ten times the amount asked for it to any man, young or old, in America.

For School Exhibitions and Public and Private Entertainments.

The Complete Book of Recitations and Dialogues.

This book contains, so far as we know, the best and most complete collection of recitations ever published in a single volume. All the popular recitation books of the day have been consulted and the cream selected, and the result is a mammoth collection of recitations which cannot fail to answer every requirement. There are hundreds of them, and they embrace every kind and character of recitations, adapted to every need, humorous, dramatic and pathetic—from short juvenile pieces for the little boys and girls on Friday afternoons to pretentious dramatic works for the professional elocutionist. We have space to enumerate the titles of only a very few of them, as follows: "Ostler Joe," "Asleep at the Switch," "The Last Hymn," "The Deadman's Journey," "The Engineer's Story," "Cripple Ben," "Two Loves and a Life," "The Mother-in-Law," "The Old Parson's Story," "Taking Toll," "The Engineer," "The Tramp," "Tim's Daisies," "John Darryll's Dream," "Too Late," "The Book-keeper's Dream," "Saving Mother," "Curfew must not Ring To-Night," "The Palmetto and the Pine," "The Polish Boy," "Drafted," "The Blacksmith's Story," "The Burning Prairie," "Guilty or Not Guilty," "The Foreclosure of the Mortgage," "The Clown's Baby," "Bill Mason's Rule," "How we tried to Whip the Teacher," "Driving Home the Cows," "Somebody's Mother," "When the Rule Goes Out," "The Old Farmer's Elegy," "Wilder Spriggins' Daughter," "The Light-keeper's Daughter," "How the Parson Broke the Sabbath," "Which Shall it Be?" "Somebody's Darling," etc., etc. In addition to the Mammoth collection of Recitations contained in this book, it also contains a number of fine Dialogues, mostly humorous, among which are: "Marrying a Poetess," "What's in a Name?" "The Train to Mauro," "The Graduates," "The Female Astrologer," "Proposing by Proxy," "Story-Telling," "The Morning Call," etc. Those who have sent for books of this character and been disappointed in them, owing to the meagreness and inferiority of their contents, will be happily surprised in this book, for not only is it the largest collection of Recitations and Dialogues ever sold at a low price, but great care has been taken in the selection of its contents, the aim being to include only the best. It is a splendid book, guaranteed to give satisfaction. THE COMPLETE BOOK OF RECITATIONS AND DIALOGUES is a large book of 64 large 3-column pages, with handsome colored cover. It will be sent by mail post-paid to any address upon receipt of only Twenty-five Cents.

HOW THE READERS

OF THE

AMERICAN ANALYST

MAY OBTAIN ANY ONE OR MORE OF

THE ABOVE BOOKS

FREE.

To any one who will send us One New Subscriber to the AMERICAN ANALYST for one year, at \$1, we will send, Free, any one of the above books, to compensate him for his trouble; to any one who will send us two new subscribers, we will send any two of the books; and for three new subscribers, we will send the three books. This will be good pay for little work, for it is a simple and easy matter to get one or more new subscribers to the AMERICAN ANALYST. Show the paper to your friends and neighbors, and you will have little difficulty in inducing one or more of them to subscribe for one year. And when you have received your book or books you will feel doubly repaid for what trouble you have taken. If the parents do not wish to try it, let the little boys and girls do so after school hours. We feel sure that every one of our present subscribers and readers can readily secure for us one or more new subscribers, and we offer this special inducement in order to stimulate effort in this direction. The books will be found well worth the slight effort that will be required to secure them. Try it, and see how easy it will be.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no re-constructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only THREE possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract, and Keppeler's Malt Extract. WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alteratives.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Ferrated.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peppones.	MALTO-VIBURNUM.
MALTINE with Pepsin and Pancreatine.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analysis by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

COLDEN'S
LIQUID
BEEF TONIC.

ORIGINAL LABEL:

"Colden's Liebig's Liquid Extract of Beef and Tonic Invigorator."

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M.D., F.R.S., and an endorsement by SIR ERASMUS WILSON, F.R.S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No 2."

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

"THE KITCHEN."

The subscribers to *The Kitchen*, a magazine recently published in Chicago, will be gratified, doubtless, at receiving the AMERICAN ANALYST for the unexpired term of their subscription to the former publication. The *Kitchen* was ably conducted, but the field it essayed to cover is so thoroughly embodied in that of the AMERICAN ANALYST, as to render a separate publication in that interest superfluous. We hope to commend ourselves to the large constituency thus added to our list in such a manner as to render the relationship both acceptable and permanent.

THE SENATE DRESSED BEEF COMMITTEE.

Senator Vest, who is chairman of the Senate Committee on the Dressed Beef industry, is well known to bear no good will to that industry. He seems to think that his political power depends upon playing the demagogue and posing before his constituents in Missouri as a bitter opponent of dressed beef. It was to be expected that he would not miss any opportunity to bring out be-

fore that committee every statement that could possibly damage that important business. So long as he confined himself to witnesses who were interested on the same side with himself and who gave their impressions and opinions very freely he got just the kind of vague, wild statement he wanted, but when he touched on facts, as he did in the examination of Mr. S. B. Armour, at Kansas City, he got more than he bargained for. It was a perfect boomerang. Sworn facts and figures showing just the reverse state of things to that which he was desirous of bringing out did not sit well on his mind. Like a pettifogging country lawyer he endeavored to stop the witness and switch off on another track, but the harder he tried the worse he was off, until he found himself in the most ridiculous attitude of having brought out the strongest evidence against himself. The subjoined extracts from this testimony are interesting to those who want to know the truth, unappetizing as it may be to Mr. Vest.

"Mr. Reagan was recalled by Senator Farwell, who wanted to know why the prices of cattle had fallen so much during the last ten years. It was for two reasons, the witness thought, first, over-supply, and, second, the control of the market by a few men.

"Which has the greater effect?" asked Mr. Farwell.

"The over-supply," answered the witness.

"The control of the market by buyers don't amount to much, then?"

"No, very little."

S. B. Armour, head of the Armour Packing Company, of this city, testified that he had no agreement with the railroads by which he got lower rates on shipments than any other firm. The witness denied that he was a member of any combination whose purpose it was to control either the prices of cattle or dressed meats. The Territory was not divided up between the packers. All the packers were in all the markets. Competition was very brisk, so brisk, in fact, that even he and his brother often cut each other's business throats. Senator Vest asked if he had knowledge of any combination in Chicago.

Mr. Armour had no connection with the business of the Chicago Armours.

In replying to questions regarding to prices paid by the witness for cattle, and the prices received for the various parts of the animal after it had been slaughtered and dressed it was found that the profit only figured up 60 cents per head, at a liberal estimate.

"Humph! Must be some mistake there," meditated Senator Vest.

"Do you think so?" asked Mr. Armour. "Now what do you think would be a fair profit on a steer of average weight and quality?"

None of the Senators would venture an opinion. Mr. Armour had a balance sheet with him, showing the profit, but he did not wish to expose his business. He would not give the total profit, but would let the reporters figure it out. The balance sheet showed, he said, that he had killed 144,863 head of cattle during the year 1887. They had netted him just 33.6 cents per head profit.

"The former testimony," said Mr. Vest, "shows that the price of meat to the consumers had not decreased during the time that cattle had depreciated in value. How did that come about and who gained the profit?"

"The prices of meat to the consumer had decreased on all but choice cuts," said the witness. "The prices of those have been maintained because the demand for that kind of meat had increased; more people ate better meats."

BOGUS CLOVES.

The latest fraud in the line of wooden nutmegs and shoe-peg oats is in artificial cloves moulded from paste. Dr. Hanausek, in the *Apotheker Zeitung*, says that the resemblance of the spurious article to the real one is sufficiently close to allow of their being overlooked in the mass; their color approaches closely to that of the genuine, but when examined more closely ridges from the mould are perceptible, and there is an adherent dust that is yellow, consequently much lighter than the clove. In the mouth the spurious "cloves" soften to a gritty paste, coloring the saliva brown, and tasting slightly of cloves, with a remarkable "bark" flavor. When pulverized and the powder examined microscopically, a very minute proportion of clove tissue was found. The conclusion arrived at was that the spurious "cloves" are made from a paste consisting mainly of wheaten flour and ground oak bark, with a small proportion of genuine powdered clove, pressed into metal moulds and roasted.

EXECUTION BY ELECTRICITY.

Considerable excitement has been created by the attempt of the New York Legislature to change the method of executing criminals. The experiment of substituting life imprisonment for the death penalty has proved a failure. It has been found that wherever this has been done murder has increased. The slow processes of our criminal courts, the innumerable delays of the law, the appeals for executive clemency, and the mawkish sentimentality displayed towards murderers have all tended to bring the death penalty into contempt, and to materially remove the fears of the death penalty for murder, which would otherwise be so wholesome a restraint upon crime of this kind. The old method of hanging undoubtedly is objectionable because of the bungling manner in which that punishment is generally inflicted. The law should not be revengeful; the object of the death penalty is to punish as well as to prevent other crimes by the infliction of the law's certain decrees. The fact that the condemned man was not so tender in the infliction of death on his victim is no excuse for torturing the criminal. Execution by electricity has been well considered by scientists and the medical profession. It is claimed by many to be superior to hanging, and its use would certainly obviate the frequent spectacle of the condemned being slowly choked to death or the tortured victim of a broken rope. But the details of electrical execution have unfortunately been made recently to attract public attention by the squabbles of conflicting interests among the manufacturers of the apparatus. It seems that the apparatus selected by the expert of the commission appointed by the Legislature to devise the required instruments is the one employing the alternating current, the same as that used by the Sawyer-Mann Electric Light Company. Competitors of this company have used the fact that New York

State has chosen their dynamos as the instrument of death as an argument against the use of this company's method of lighting, and thus have frightened many into discarding this system in favor of some other, perhaps just as dangerous, but not officially so pronounced. This result has been followed by an injurious effect on the market value of the stock of the Sawyer-Mann Company. This is really the main cause of the stubborn and bitter fight over electrical execution. Newspaper articles of the bitterest kind, crimination and recrimination, charges of fraud, theft and burglary even have been made, and the public must not be surprised if more than one man's reputation is ruined and even if financial failure should follow. The real facts are somewhat difficult to arrive at, but we are having prepared by a competent writer an exhaustive article, which will show the acknowledged or proven facts in the case, and then the readers of the *AMERICAN ANALYST* can judge of the true merits of the controversy.

WHO MAKES THE PROFIT?

In the senatorial investigation of the Dressed Beef business in Kansas City, September 11, Mr. F. H. Brice a retail butcher, was called on to testify. Mr. Vest, to be frank with the witness, told Mr. Brice that Mr. Armour had testified the day before, that the butchers and retail men were the ones who made the great profit out of the meat business. He explained that the price of cattle had depreciated 40 per cent, in the last ten years, but that the price to the consumer of dressed beef was maintained. The cattlemen were losing money, and Mr. Armour had testified that the packer was making, only 33.6 cents profit per head. Who, then, was making this great profit? Mr. Brice was quite certain that it was not the butchers.

"Hold on" interrupted Mr. Vest, "how much do you pay the packer for your dressed meat?"

"About \$18.55 per carcass."

From the answers to succeeding questions it was found that, in selling the meat to the consumer, the butcher received \$25.40 per carcass.

"Pretty good profit, isn't it?" asked Senator Farwell.

"A profit of \$6.85 per head is fair," was the answer, "but our expenses are large. We don't make anything."

Senator Vest wanted to know if the packers had driven the butchers out of the slaughtering business, they had taken means to force the butchers to buy the dressed product?

"Yes," answered the witness, "by selling at a price so much cheaper than we can slaughter."

"That will do," said Mr. Vest.

Other butchers testified, Their evidence corroborated that of given by Mr. Brice.

DINNER MANNERS.

A FEW HINTS NOT REQUIRED BY THE READERS OF THE
"AMERICAN ANALYST."

"Woman first tempted man to eat, but he took to drink himself." The first of these propositions may be true, but it needs a qualifying clause. If she taught him to eat, she failed to teach him to do it properly. And again, if he took to drink of his own accord, he failed to appreciate the art of it, more especially when his drinking is done at the table. The best rules governing table etiquette are the simplest ones, but they should not attain that simplicity which comes to us from the time when forks were unknown and fingers were used instead. Those authorities that speak as a matter of taste, and not according to the edict of form, tell us, and emphasize their words by actions, that he who would eat well and eat appreciatively must so conduct himself that his manner neither gives offence to others at the table nor marks a reflection on his own lack of breeding. Bad manners at the table are especially characteristic of the summer resorts. It is not so much a matter of rush to get the best things that are on the table, or to assert one's desire to obtain what he has paid or expects to pay for, but the little and sometimes gross breaches of etiquette in the management of table utensils, and the edibles themselves. Vinegar and pepper don't look well, and certainly taste worse, to an appreciative palate on iced blue points or little necks. The sibilant sound from sipping soup may be sweet music to a voracious and ill-mannered summer boarder, but it is positive discord and agony to those of more sensitive ears and stomach. And when from an up-turned plate potage is drawn toward the holder of the spoon, with a sound suggestive of road scraping, the culmination of the spoon act is complete, although there may have been an intervening dig in the ribs to the off-hand guest, as a result of taking soup from the end of the spoon. Almost every one understands that fish is to be eaten with a fork only, but very few realize that fish tastes better when it is taken with the points of the fork held downward. It is rather distressing, in fact, to see a fork used as a shovel, and one might as well return to first principles, using the knife for the fork, and do what some one has graphically described as the sword-swallowing feat. But perhaps the greatest test of one's conversance with the better table etiquette is when he has to dispose of the roasts and entrees, while the manner in which vegetables are eaten is a test of only secondary importance. Meats are cut, not hacked or sawed. Vegetables, as a rule, are eaten from the fork, not from the spoon. Entrees, excepting when of too fleshy character, seldom require the use of a knife, much less of a spoon. It is considered quite the proper thing, in the eating of small game, to use the fingers instead of the knife or fork in disposing of the wings and other small parts, but it is a matter of fact that very few, even of our better looking women, appear to advantage while gnawing at bones; and besides, they are very apt to get grease on their faces, while very few, even of the best adapted complexions, can stand this test. Desserts, of course, require less careful handling, although too often is the spoon brought into requisition, while even the fingers sometimes play an inappropriate part. Demi-tasse only requires the use of a spoon in aiding the dissolving of the sugar, but many a hotel or other guest has been seen taking his coffee with the spoon, apparently attempting to make researches in his starboard ear. And when it comes to the finger bowl, the napkin is too often used as a towel, while the bowl itself sometimes serves the purposes, if not the form, of a diminutive wash bowl, and some extremists in the art of vulgarity have been known to use it as a cuspidore. As a finale, the toothpick comes

into play, and is used too often as a dentist's tool, without even the intervening excuse of an upheld napkin. These observations are not intended entirely as criticisms, but are made as cold-blooded statements of fact, not at all tempered by the disgust that their recollection incites. The use of wine at the table is a fine art. The proper variety or vintage to be taken with each succeeding course largely depends upon one's individual tastes, but there are certain established principles that should not be neglected. And the first principle is, no matter what may be the variety of the wine, take it by absorption, as it were, sip, but don't gulp it. Too much at a time of the best vintage in the world will drown out the choicest viands. As to the courses, Chablis goes well with oysters. Wine with any suspicion of sugar in the taste should be avoided as a snare and an abomination, alike injurious to taste and stomach. A good burgundy goes well with the fish, while the preceding course, la potage, or, in ordinary United States, soup, should have just a touch of claret. A soupcon of absinthe frappe stimulates the appetite at this point in the game, and serves, as well, to encourage one's conversational powers. But don't take too much of it, or the tongue will run away with the wit, and Parnassus become merely the sea level of the imagination. Here comes the critical period. What wine shall go with the meats? Sherry, says the average diner, while port has its advocates, and Tokay has a few to speak in its behalf. Claret is often used, when it is not taken with the soup; but claret, like the little girl with a curl on her forehead, is very good when it's good at all, but when it's bad it's horrid. If claret can spoil anything on the menu, that thing will be found under the head of rotis. Sherry is perhaps the best of all, but it should be dry and fruity, not musty, or flavored from the cork. Champagne, dry of course, but if possible, comes next, with either entrees or game, unless one is eating terrapin and then it should be sherry, or if that wine has been dashed over it in the chafing dish, take the terrapin straight. Desserts should be their own best excuse for being, and, when such, require no wine, as a good wine needs no bush. But champagne can be well run over into this course without going far astray, although just here another touch of absinthe comes in handily. Liqueurs follow cafe noir, with Benedictine a'leau ranking as favorite, Chartreuse second, and annisette trailing. Then the cigars, and with them that delightful sensation that comes only after a well ordered, well served and properly eaten dinner, where there has been no gaucherie or porcinity, and where digestion has waited on appetite and health on both. How many a good dinner has been spoiled in the eating of it. How much better dinners we could have—even without the wine—if there were a more general observance of the simplest forms and rules of taste, not gastronomic, but personal.

INSOMNIA.

SOME HINTS HOW TO INDUCE PEACEFUL SLEEP.

If we may judge by the appeals for help that come to us, this trouble is rapidly increasing in this country. "I cannot sleep," says one; "the doctors give me opiates, but these are becoming ineffective; I shall die ere long if I cannot obtain relief." The causes are widely varied, we suppose, but the effect is in every case the same. A merchant of good character and irreproachable habits writes to us: "What will cure sleeplessness? I use no stimulants, am a very moderate eater, and never eat anything after six o'clock in the evening. I have consulted the doctors, but they all give me opiates which I do not wish to use." Our table is covered with letters of this character, although some of them are more intense in their tone and show a marked excitement of the whole nervous system. The difficulty does not always come, as most of the writers seem to believe, from bodily ailment or infirmity. In fact, the trouble at the outset is far more frequently in the mind. Mental restlessness keeps the eyes from closing, and

denies to the body that repose it would otherwise enjoy. It may not have its origin in any serious trouble or great anxiety, but undue mental excitement grows by indulgence until it becomes a fixed habit difficult to overcome. The idea that sleep is not coming at once to the pillow will keep a man of a fine nervous temperament toying on his bed for hours, when if he only thought he was to find rest as he lay down he would drop into dreamland without any delay. This mental activity is the first and most difficult thing to cure. When the nerves no longer brace themselves against the coming drowsiness the recovery is not far to seek. Whatever tends to quicken thought, to excite the emotions, to stir up the quivering brain to fresh activity, should therefore carefully be avoided. Novel reading at night, games of skill requiring study, or games like whist taxing the attention and memory, ought not to be indulged in during the evening by those who find it difficult to sleep. Above all, the conscience should be at rest. We are not preaching a sermon, but prescribing an antidote, when we say that no thoughtful man who has in his heart a controversy with his Maker can lie down to calm repose. To have quiet in the brain, there must be peace in the soul. We know a man of great intellectual power who has often declared to us that he cannot rest until he has been on his knees, and in his own language "made it all right" between himself and the One who "giveth His beloved sleep." But the body is often an ally to the mind in its restlessness, and sometimes is the provoking cause of the whole disturbance. Some years ago we wrote for this column an essay on "Eating and Sleeping" which went the rounds of the whole world. Two at least of our readers had large editions of it printed in pamphlet form, at their own expense, and one who had been greatly profited by it sent out 10,000 copies for gratuitous distribution. In that article we showed, as we think conclusively, that going to bed with a well-filled stomach is the essential prerequisite of refreshing slumber. The cautions so often reiterated in old medical journals against "late suppers" were directed chiefly to the bibulous habits of those early times. When at every late feast the guests not unselfishly drank themselves under the table, or needed strong assistance to reach their couch, the canon against such indulgence was not untimely. Nature and common sense teach us that a full stomach is essential to quiet repose. Every man who has found it difficult to keep awake after a hearty dinner has answered the problem for himself. There are few animals that can be trained to rest until after they are fed. Man, as he comes into the world, presents a condition it would be well for him to follow in all his after life. The sweetest minstrel ever sent out of Paradise cannot sing a new-born child to sleep on an empty stomach. We have known reckless nurses to give the little one a dose of paregoric or soothing syrup in place of its cup of milk, when it was too much trouble to get the latter, but this is the one alternative. The little stomach of the sleeping child, as it becomes gradually empty, folds on itself in plaits; two of these make it restless; three will open its eyes, but by careful soothing these may be closed again; four plaits, and the charm is broken; there is no more sleep in that household until that child has been fed! It seems to us so strange that with this example before their eyes full-grown men are so slow to learn the lesson. The farmer does it for his pigs, who would squeal all night if they were not fed at the last moment, and the groom knows that his horse will paw in his stall until he has had his meal. But when he wishes to sleep himself he never seems to think of it. To sleep, the fullness of the blood must leave the head; to digest the eaten food the blood must come to the stomach. Thus, sleep and digestion are natural allies; one helps the other. Man, by long practice, will train himself to sleep on an empty stomach, but it is more the sleep of exhaustion than the sleep of refreshment. He wakes up after such a troubled sleep feeling utterly miserable until he has had a cup of coffee or some other stimulant, and he has so injured the tone of his stomach that he has little appetite for break-

fast. Whereas one who allows himself to sleep after a comfortable meal awakes strengthened, and his appetite has been quickened by that preceding indulgence. The difficulty in recovery comes from the fact that we are such creatures of our habits, it is impossible to break away from them without persistent effort. In this case the man who has eaten nothing, like our correspondent, after six o'clock, and retires at ten or eleven, takes to his bed an empty stomach upon which the action of the gastric juices make him uncomfortable all the night. If he proposes to try our experiment, he will sit down and eat a tolerably hearty meal. He is unaccustomed to this at that hour, and has a sense of discomfort with it. He may try it once or twice, or even longer, and then he gives it up, satisfied that for him it is a failure. The true course is to begin with just one or two mouthfuls the last thing before going to bed. And this should be light food easily digested. No cake nor pastry should be tolerated. One mouthful of cold roast beef, cold lamb, cold chicken and a little crust of bread will do to begin with; or, what is better yet, a spoonful or two of Borden's condensed milk (not the sweetened that comes in cans) in three times as much warm water. Into this cut half a pared peach and two or three little squares of bread, the whole to be one-fourth or one-sixth of what would be a light lunch. Increase this very gradually, until at the end of a month or six weeks the patient may indulge in a bowl of milk, two peaches, with half a hard roll or a crust of home-made bread. When peaches are gone take baked apples with the milk till strawberries come, and eat the latter till peaches return again. This is the secret of our own health and vitality. We often work until after midnight, but eating the comfortable meal is the last thing we do every night of the year. This is not an untried experiment, or one depending on the testimony of a single witness. We have a record of several hundred persons who have tried the remedy we suggest, and it has failed in no single instance where the initial steps were taken with caution and judgment. It is nature's own suggestion, and sleep after eating is as natural as grass after rain in the desert fields of California.

BEET SUGAR.

THE PRESENT STATUS OF THE AUSTRIAN SUGAR INDUSTRY.

Our readers are aware the beet sugar industry has attained great perfection in Austria, hence we trust that the following facts, gleaned in part from the "Commercial Archives," in Germany, etc., will prove of interest. Austro-Hungarian beet factories are of several kinds, the difference in the working being due to their geographical location; in some cases the production is only for domestic consumption, in others for exportation to England, Holland, etc. A great number of the factories under consideration are stock companies, where the owners of the stock do not supply the beets. Some factories are worked by a system of small stockholders, where no one owns more than two shares, valued at thirty dollars each, and the capital is hundreds of thousands of dollars. In such cases there is great difficulty in bringing about harmony between the numerous stockholders; the interests of the farmer and manufacturer result in discord. On the other hand, in Germany, the stockholder and farmer being one and the same individual soon appreciates that it is to his interest to cultivate rich beets. For complicated reasons, too long to discuss in this writing, the co-operative system has not met with the success in Austria it has in Germany. Nevertheless those factories working on important estates have been very profitable to all interested. The existing system of taxation is said to be one of the very best in Europe, and the prospects for a constantly increasing production never looked more favorable than at present. The proof of this assertion is the fact that many new factories are building in Hungary. The refining business, which has not had much encourage-

ment hitherto, has now a promising future; this will evidently result in an important export to the Orient. Respecting the system of taxation doing so much good, we would say that it is upon sugar, only when it is consumed, with direct bounty for exportation.

It is evident that the manufacturer can, under these circumstances, dispose of a greater capital, and ameliorate the farming condition of the estate. The cost of manufacturing sugar in Austria-Hungary is very low, labor may be had in abundance, and the wages are small. A curious fact is that notwithstanding the success of the sugar industry in the country, the value of lands is less than in France or Germany. In Bohemia an acre of ground suitable for beet cultivation is worth \$250, and only \$140 in Hungary. Women and children work in the fields for 8 to 14 cents per day, while the hands at the factory receive 24 to 32 cents. On a model Bohemian farm the cost of working land cultivated in beets was \$38.40 per acre; this includes working of the soil, chemical fertilizer (saltpetre), beet seed, thinning out, interest of capital, etc. The leaves and their value are not considered—the beets thus cost \$3.20 per ton (including the interest on value of land). The cost of manufacturing sugar at these factories was \$2.40 per ton of roots worked, and in some special cases \$1.80 when 100 lbs. sugar were extracted from 900 lbs. beets. The cost per pound would be about two cents. Sugar for the home consumption is made in 56 factories, of which 11 are refineries; of the 45 remaining, about one-half refine the sugar made in the factory and the other half refine sugar purchased from outside factories. Of late years the exportation of refined sugar from Austria has become very important. Hamburg, as a shipping centre, appears to offer many advantages. Trieste is also one of the important shipping ports. It must be said respecting the latter that the French have of late years offered considerable competition from Marseilles.—*The Sugar Beet.*

GIANT DIAMOND.—The Giant diamond, lately discovered in Cape Colony, and now at the Paris Exposition, weighs 180 carats and is valued at \$4,000,000. It is kept in a glass case by itself and guardians stand around it all day. At night it is placed in a big safe, which is similarly guarded all night. It is said to be of the first water and as pure as the famous Regent in the French crown diamonds.

HEIGHT OF SEA WAVES.—Carefully repeated experiments made by an experienced English navigator at Santander, on the north coast of Spain, showed the crest of the sea waves in a prolonged and heavy gale of wind to be 42 feet high, and allowing the same for the depth between the waves would make a height 84 feet from crest to base. The length from crest to crest was found to be 386 feet. Other estimates of the waves in the South Atlantic during great storms give a height of 50 feet for the crests and 400 feet for length. In the North Sea the height of crest seldom exceeds 10 feet and the length 150 feet.

MANIFOLD PAPER.—Brackelsberg's multiplying paper consists of sheets of paper, each one supplied with a coloring layer, whose principal element is a violet aniline methyl. An oiled leaf serves as a hard, smooth under layer. Place a sheet of the copy paper on this, then a sheet of writing paper, and write with a hard lead pencil. The back of the writing paper will give a negative of the writing in high color. Wet the copy sheet thoroughly, and from it twenty or more copies can be made, which will not roll nor show a gelatinous coating. Embroidery and compass sawing patterns are finely rendered in this way.

A PHOTOGRAPHIC PHONOGRAPH.—M. Leone Esquive, a Mexican, it is stated has perfected a marvellous invention in electricity and photography. By speaking in a photophone transmitter, which consists of a highly polished diaphragm, reflecting a ray of light, this ray of light is set into vibrations, and a photograph is made of it on a travelling band of sensitized paper. Now comes the wonderful part. If the image of this photographic tracing is projected by means of an electric arc or oxyhydrogen light upon a selenium receiver, the original speech is then heard. It is evident that there is no limit to the development of this peculiar combination of methods. This is very important—if true.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

September.

MEATS.—Beef, mutton, lamb, veal, ham, kidneys, liver, venison.

GAME AND POULTRY.—Pigeon, chicken, duck, woodcock.

FISH.—Bass, blackfish, bluefish, clams, cod, crabs, eels, flounder, halibut, herring, lobster, mackerel, muskels, porgie, prawn, rockfish, salmon, trout, sea bass, sturgeon, turtle, white fish, whiting.

VEGETABLES.—Beets, beans, cabbage, carrots, cauliflower, corn, cucumbers, egg-plant, garlic, lettuce, onions, parsley, parsnips, potatoes, radishes, rhubarb, savoy, shallots, spinach, squash, tomatoes, turnips.

FRUITS.—Apples, bananas, blackberries, gooseberries, huckleberries, grapes, melons, oranges, peaches, pears, pineapples, plums, raspberries, currants.

PRACTICAL RECIPES.

CURRIED EGGS.—Press one pint of cooked peas through a puree sieve; add sufficient cream to make the consistency of a sauce; add one teaspoonful of curry powder, a half teaspoonful of salt, and stir the whole over the fire until thoroughly heated. This is best done in a double boiler. Have ready six hard-boiled eggs, cut them in smooth slices, lay them on a heated dish, and pour the sauce over them. Serve with squares of bread, toasted or fried.

BROILED OYSTERS WITH CRUMBS.—Take one pint of oysters and broil carefully. Have ready one half pint of crumbs of bread (fine) which have been prepared in the following way: Put a teaspoonful of butter into a saucepan which has been rubbed with onion; pour in crumbs and fry brown. Squeeze over the crumbs the juice of two lemons and heat again. Now add a teaspoonful of very finely chopped Chili sauce. Mix these with the broiled oysters, and serve at once.

SOUTHERN JOHNNY CAKE.—To one quart corn meal add one teaspoonful of salt and pour over it one pint of boiling water in which one teaspoonful of lard has been melted. Stir well, spread on a board of hard wood, shape with the hand and bake before an open fire, until it is brown; turn over to brown the other side; eat hot.

PARSNIP CAKES.—Boil some parsnips till quite tender then mash them with some butter. Beat up one egg and add thereto a few bread crumbs. Mingle these together with the mashed parsnips, adding pepper and salt to taste. Form the mixture into cakes and fry in boiling lard. The number of eggs must be regulated to suit the quantity of parsnips.

CUSTARD CAKE.—One cupful of sugar with one tablespoonful of butter rubbed in; two tablespoonfuls of sweet milk, one cupful of flour, before sifting, two teaspoonfuls of Horsford's baking powder put in flour, and two eggs, beaten separately, adding whites last thing before baking. Bake in layer tins.

Custard Part.—One cupful of milk just to a boil, one half cupful of sugar, one tablespoonful of butter, one level tablespoonful of corn starch, and yolks of two eggs, (one will do.) Beat and stir sugar, eggs, and starch into boiling milk. Flavor with lemon. When cool spread between layers.

TO PRESERVE PARSLEY.—Take fresh gathered sprigs, pick and wash them clear. Set on a stewpan half full of water, put a little salt in it, boil and skim it clean, and then put in the parsley. Let it boil a few minutes, then take it out, lay it on a sieve before the fire, that it may be dried as quickly as possible. Put it away in a tin box, keep it in a dry place and when wanted for use,

lay it in a basin and cover it with warm water a few minutes before using.

SWEETBREADS.—Clean, wash and parboil two sweetbreads. Throw them into cold water for a few minutes. Separate them into small pieces by removing all the fibrous matter. Make a sauce as follows. To a tablespoonful of hot melted butter add a good tablespoonful and a half of flour, cook for a few minutes, stirring it constantly. When quite smooth add sufficient cream or milk to make it thin enough—the yolks of two eggs may be added. Put in the sweetbreads, season with salt and pepper and serve at once when they are taken from the fire.

PINE PILLOWS.

A SIMPLE RELIEF FOR LUNG TROUBLES.

It has long been known that pine needle pillows would alleviate persons afflicted with lung troubles, and a Florida editor relates an incident in support of the fact, as follows: During a visit to the home of a most estimable lady living on Indian River, this editor was told of a discovery that had been made which may prove a boon to sufferers from lung or bronchial troubles. This lady having heard that there was peculiar virtue in a pillow made from pine straw, and having none of that material at hand, made one from fine, soft, pine shavings, and had the pleasure of noting immediate benefit. Soon all the members of the household had pine shavings pillows, and it was noticed that all coughs, asthmatic or bronchial troubles abated at once after sleeping a few nights on these pillows. An invalid suffering with lung trouble derived much benefit from sleeping upon a mattress made from pine shavings. The material is cheap and makes a very pleasant and comfortable mattress, the odor of the pine permeating the entire room and absorbing or dispelling all unpleasant odors.

WESTERN BEEF CATTLE.

A MONUMENT OF FAILURE ERECTED TO THE MEMORY OF
SPARKS.

The following article from the *N. Y. Tribune* sets forth, in plain language the cause of the existing low prices of beef cattle:

"Where are the 'Cattle-Kings' and the 'Cattle-Barons' we used to hear so much about? Bankrupt, or on the 'ragged edge' of bankruptcy. There are fortunate exceptions, of course, but these exceptions have been very fortunate indeed if they 'got out' in good time, extraordinarily fortunate if they had 'stayed in' till now, so much so that in all the great grazing region of the Territories and the new States they may almost be counted on the fingers. The causes are not far to seek.

"About fourteen years ago, a few adventurous spirits were struck by the facts that young cattle were cheap in Texas, beef dear in Chicago, and the richest natural grasses in the world to be had for the asking, or without so much as asking, in every hill and valley of the vast Rocky Mountain region. They embarked all their energy, their capital, when they had it, and when they had not then all the money they could borrow, in buying two and three-year old steers in Texas for \$16 to \$18 a head. In the spring they drove them north by the broad and well-watered trail that once fed the vast herds of buffalo in their migrations. For two winters and summers the young cattle were allowed to roam the unfenced ranges of Colorado, of Wyoming of Dakota, or Montana. The expense, confined to the spring and fall round-up, was a mere song. At the end of the second summer, or earlier in favored places, the cattle, then in their fifth or sixth year, and 'rolling fat' were driven perhaps a hundred or even two hundred miles to the railway, shipped to Chicago, and sold for from \$55 to \$65 a head. Great fortunes were rapidly made. The profits were reinvested, more money

was borrowed, often at enormous interest, and new men in great numbers, with new capital, made haste to embark in so lucrative a business. In the course of a few years the ranges were overstocked, the driving trail was eaten out, the price of young cattle rose in Texas, and the price of beef fell in Chicago. Then the cattlemen took to breeding on the ranges. A very few hard winters sufficed to show that there was no money in this; in short, nothing but disaster. The young calves and the breeding cows perished by thousands in every bad storm, and when the snows melted after every severe winter their bones were found whitening the plains. Then the prudent speculator sold out, fortunate if he could do so before others made the discovery which he had, in the language of the ranch, paid his money to learn. But the more enterprising and industrious of the ranchmen thought they saw the way to mend this. They were in the business not to sell but to stay. They would fence the unclaimed desert land, fertilize it with the waste waters of the mountain streams, protect and feed their cows and calves in the sheltered valleys near the home ranch, and let the hardy steers go on the range as before. Just then came Sparks, with his sham policy, backed by a sham public opinion. These industrious and enterprising cattlegrowers, who were merely repeating in those arid mountain wastes the history of American progress from the Merrimac to the Missouri, were branded as 'thieves,' as 'cattle-thieves' and 'land thieves,' their fences were cut, their land entries were denounced as fraudulent, a small army of detectives was set upon them, and, upon the secret reports of these men, mostly without knowledge and without character, the whole land system was arrested, in disregard of the law, by the officer appointed to enforce the law. The injury was immediate and enormous. The ruin of the cattle-growers was complete. And who was the gainer? No one. Not the Government, even granting that the Government can ever profit by injuring the people, for the Government has lost the sale of millions of acres of desert in the remote mountain region at the very price it was glad to take for the rich garden soil of Illinois and Iowa, in the very heart of the land. Not the citizen, the mythical 'actual settler' of the Sparks vision, for it may be doubted if to this day he has actually settled upon a single acre of the land thus 'redeemed for the people.' Strangely enough, while all this outcry was being made over the 'preservation' of the dry and worthless desert, not a word was said nor a step taken toward preserving the one thing of value in the whole region—the water. Anybody might take that—and did. Under the Territorial laws, men, often mere speculators, have been allowed to 'pick the eyes out of the country' unmolested. But now that the subject of irrigation is at last attracting proper attention, there will soon be an end of this. Finally, during the last fifteen years the processes of breeding and feeding beef cattle in all the great and populous alluvial regions tributary to Chicago have so improved that, with favored exceptions, the Western ranges can no longer compete with the farmers of Illinois, Iowa, Wisconsin and Minnesota; for example, in producing beef for the table. Thus the poor discredited 'cattle-king,' buffeted by fortune at every turn, is at last forced to sell his 'Western rangers' to the cannery. These are three or four in number. Practically that means one. The price they allow him nets the poor 'cattle-king' about \$20 a head for an ordinary steer. The disadvantage of owning a thing that only one man wants to buy all men know."

TOUGHNESS OF PINE.—Evidences of the durability of yellow pine for flooring occasionally come to notice, says the *Northwestern Lumberman*. One is an instance in which a saw manufacturing concern five years ago put a long leaf pine floor in its factory. It is as sound now as when put down. The manager of the concern declares that if white pine had been used it would not have lasted more than a year, on account of the wear of constantly rolling saws over it, the teeth cutting into the soft wood.

USEFUL, IF TRUE.—Some one has made the discovery, or rather makes the assertion, that a fly always walks upward. Put a fly on a window, and up he goes toward the top; he can't be made to walk downward. So an inventor has made a screen divided in half. The upper part laps over the lower, with an inch space between. Well, as soon as a fly lights on the screen, he proceeds to travel upward, and thus walks straight out-doors. By this means a room can be quickly cleared of flies.

BUSINESS NOTES.

REMOVAL

John H. Woodbury, the noted Dermatologist of 210 W. 42d Street, New York City, has removed to the brownstone front building 125 W. 42d Street, which he has leased for a term of years.

COD-LIVER OIL.

The great therapeutic value of cod-liver oil in phthisis (consumption), scrofulosis, rheumatism and similar disorders, is recognized by all physicians. The unpleasantness of the improperly made oils that abound has deterred many from realizing its benefits, and stimulated the production of a host of emulsions as substitutes claiming palatability. This claim is not well founded for "emulsions are thick, slow running, sticky preparations which are swallowed with difficulty, and leave an unpleasant taste behind them." Besides, the indiscriminate continued use of the salts of lime and soda in emulsions, is injudicious if not positively pernicious. The benefits to be expected from cod-liver oil, can be readily realized by the selection of Peter Moller's Norwegian. There is nothing unpleasant about this clean, pure oil, therefore no necessity to disguise its taste. It has taken nineteen gold medals at the great exhibitions of the

world, establishing its superiority over all others. It has claims which entitle it to preference, and insure the effects that can be expected only from a pure and perfect product. It is not offensive either in taste or smell, but sweet and agreeable. Its administration is always followed by satisfactory results. It is more easily assimilated, and more nutritious than other oils. It is noted for its perfect digestibility, and perfect limpidity. It costs the consumer no more than the poorer qualities abounding in the stores. All well-stocked drug stores have it.

HUMAN HEALTH.

Human health can only be maintained when the rules of life are strictly obeyed. Man's system is like a town, to be healthy it must be well drained. No one would wish to live in a town where the sewers are always clogged. Our system is most beautifully fitted by nature to drain itself of all waste and effete matter. This drainage is frequently interfered with by careless habits and when it becomes clogged illness is the result. Beecham's pills, which have been in popular use in Europe for many years are specially adapted in a safe, gentle manner to keep human drainage in perfect order.

Delicious Drink

Horsford's Acid Phosphate

Makes a healthful and invigorating drink with water and sugar only. It harmonizes with such stimulants as may be necessary to take. A desirable substitute for lemons or lime juice. Alays the thirst, aids digestion, and relieves lassitude.

"Dr. T. C. Smith, Charlotte, N. C., says:

"An invaluable nerve tonic, a delightful beverage, and one of the best restorers when the energies flag and the spirits droop."

Dr. J. S. Niles, Pownal, Vt., says:

"Excellent as a tonic, and refreshing as a substitute for lemonade."

CAUTION.—Be sure the word "Horsford's" is PRINTED on the label. All others are spurious. Never sold in bulk.

WHOOPING COUGH CURED

Or Prevented by Page's Vaporizer and Cresolene.

We have abundant testimony that Cresolene vaporized in a closed room is an almost infallible remedy for Whooping Cough, for which distressing malady no other assured remedy is known to us. A cure usually effected in five or six days, at a trifling expense and but very little trouble. It is also exceedingly efficient in Asthma, Croup, Catarrh, Diphtheria, Influenza and Scarlet Fever. It is a safeguard against the spread of contagion.

Vaporizer complete, including a bottle of Cresolene, \$1.50. Ask your druggist for it.

VALUABLE TO ADVERTISERS.

You have determined to make money by vigorously pushing your business. As the *AMERICAN ANALYST* has determined to do the same thing, we have a community of interests. Our way of making money is to increase our circulation, and we can only do so by publicity; that is, by bringing our journal to the notice of a great number of people, who have the intelligence to appreciate a good journal when they read it and the money to buy what they want. You must necessarily want to reach the same class. Even if you do not sell directly to the consumer, it is necessary for you to tell the consumer of the quality of the goods you have to offer to induce him to ask the dealers with whom he trades for them. We propose this Fall and Winter to send a sample copy of this journal to the address of every person in the United States whose name we can find in any of the *Elite* directories or blue-books of the various cities and villages. We will thus reach several millions of new readers in addition to our already large subscription-list, covering every State in the Union. Previous experience with this method of getting new subscribers war-

rants us in undertaking the expense, believing that it will pay us. This large addition to our circulation will put any advertisement in our columns before a multitude of readers. Our advertising prices remain the same, and are so arranged as to give the lowest rates to larger and longer-continued advertisements, and will be sent on application. All respectable advertising agencies will take orders for us. If we find this system profitable, advertisers surely will. Those who have advertised with us always renew as their season comes around, and you will do the same when you have tried it. We have found that in the great competition now existing we must keep our journal prominently before the public, and, in our mutual interest, we ask you to join us. Our system is more effective than a circular, and you will find it just as effective for your business and the cost very much less. Try us. For any further information write, and it will be forthcoming.

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar.** It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

F. ALLEN & Co., 365 Canal Street, New York, sole agents for the United States. Prepared only by THOS. BEECHAM, St. Helens, Lancashire, England.

In ordering mention THE AMERICAN ANALYST.

Four Books in One! No Household is Complete Without It!

THE COMPLETE BOOK OF HOME AMUSEMENTS.

What most lives need is *more sunshine*. Let us banish care, have a good time, enjoy ourselves while we may. How much happier—how much better off—are those homes wherein the father and mother, and even the gray-haired grandparents, join with the children after tea in a merry game or other amusement, than those wherein reticence and reserve and chilly demeanor prevail. "But," you say, "what shall we do? We read until we are tired; and we know of no amusement that we care for. How shall we employ the long winter evenings?" We have published a book to answer this question, and a wonderful book it is. It contains 64 large 3-column quarto pages, neatly bound in handsome covers, and is filled to the brim with every conceivable thing for the enlightenment of home. It is in reality *four books in one*, for it covers the ground usually occupied by four distinct volumes, and contains four times as much matter as any book published at the same price. It is a complete text-book for Public and Private Entertainments, Private Theatricals, Parlor Exhibitions, Social Gatherings, School Exhibitions and Evenings at Home. It is a book for old and young, grave and gay—a veritable storehouse of good things for all. It contains a number of ACTING CHARADES, with full directions how to perform them. It gives some very excellent PARLOR DRAMAS, easily acted yet very amusing. It tells all about SHADOW PANTOMIMES, and this alone we think you will say is worth the price of the book. It contains nearly fifty beautiful TABLEAU VIVANTS, and gives full and explicit directions for performing them. In it are so many amusing PARLOR GAMES that we have not attempted to count them, but we think we have almost everything, new and old, that was ever thought of in the game line. Then we come to a lot of wonderful ILLUSTRATED PUZZLES—tantalizing, perplexing, apparently intricate, but so easy when you turn to the proper place and learn the answers. Here also is a savory dish of RIDDLES, ENIGMAS, CHARADES, ETC.—a nice large lot of them. How young and old heads will puzzle and study over them, and how proud you will feel when you have solved one correctly. As to CONUNDRUMS, there are nearly a bushel of them, some so funny you will want to hold your sides with laughter, and what fun it will be for one of the company to read the questions and see who can guess the answers! A considerable portion of the book is allotted to PARLOR MAGIC, and here you will find hundreds of wonderful and amusing tricks, easily performed, yet exceedingly mystifying to your audience. Then there are a lot of amusing and instructive CHEMICAL EXPERIMENTS, showing how the combination and manipulation of the simplest agents will produce the most surprising results. Following these are a number of excellent DIALOGUES, comic and serious, suitable either for school exhibitions or parlor entertainments. Last, but not least, the book contains nearly fifty of the finest RECITATIONS, dramatic, pathetic, sentimental, and comic, ever written. It is handsomely illustrated, and is indeed a splendid book. THE COMPLETE BOOK OF HOME AMUSEMENTS will be sent by mail, post paid, to any address, upon receipt of only Twenty-five Cents.

HOW THE READERS

OF THE

AMERICAN ANALYST

MAY OBTAIN ANY ONE OR MORE OF
THE ABOVE BOOKS

FREE.

To any one who will send us **One New Subscriber** to the AMERICAN ANALYST for one year, at \$1, we will send, **Free**, any one of the above books, to compensate him for his trouble; to any one who will send us two new subscribers, we will send any two of the books; and for three new subscribers, we will send the three books. This will be good pay for little work, for it is a simple and easy matter to get one or more new subscribers to the AMERICAN ANALYST. Show the paper to your friends and neighbors, and you will have little difficulty in inducing one or more of them to subscribe for one year. And when you have received your book or books you will feel doubly repaid for what trouble you have taken. If the parents do not wish to try it, let the little boys and girls do so after school hours. We feel sure that every one of our present subscribers and readers can readily secure for us one or more new subscribers, and we offer this special inducement in order to stimulate effort in this direction. The books will be found well worth the slight effort that will be required to secure them. Try it, and see how easy it will be.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill
Vineyard Company and have found them excellent. The Sauterne is
superb—much better than most of the imported that costs five times
as much. The same is true of the Claret and the Riesling. The time
is soon coming when Americans will know enough to appreciate the
wines of their own country. Most people judge of wines, not by what
is in, but by what is on the bottle. They taste the label, and then they
are not positive that they like it until they know the cost. If you
could only manage to have the Edge Hill Wines imported, they would
taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly inter-
esting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,

By MISS M. E. BRADDON.

THE GIRL AT THE GATE,

By WILKIE COLLINS.

A BRIDE'S TRAGEDY,

By MISS MULOCK.

THE RECTOR'S DAUGHTER,

By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,

By MARY CECIL HAY.

GABRIEL'S MARRIAGE,

By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,

By ETTA W. PIERCE.

THE RIGHTFUL HEIR,

By M. T. CALDOR.

THE DOUBLE HOUSE,

By MISS MULOCK.

TWICE SAVED,

By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most
famous names in literature, both American and European. Each of the ten novels is extremely interesting,
though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and
exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book,
profusely and handsomely illustrated, and making a most delightful and very interesting volume. We will send the
book by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new
subscriber to the AMERICAN ANALYST.

ANALYST PUBLISHING CO.,

19 PARK PLACE, NEW YORK.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera
Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands,
and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it.

Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results
when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine
in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive
value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is
prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree
with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

P. O. Box 1574. **THE NEW YORK PHARMACAL ASSOCIATION,** NEW YORK.

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are wide-spreading.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose curious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar, we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING CO.,

WE ARE CONFIDENT that we have Reached the HIGHEST DEGREE OF PERFECTION in Solving the INFANT FOOD PROBLEM,

LACTO-PREPARATA.

A Prepared Human Milk perfectly Sterilized and especially designed for Children from birth to six or eight months of age.

Made wholly from cow's milk with the exception that the fat of the milk is partially replaced by cocoa butter. Cocoa butter is identical with milk fat in food value and digestibility, being deficient only in the principle which causes rancidity. The milk in LACTO-PREPARATA is treated with Extract of Pancreas at a temperature of 105 degrees, a sufficient length of time to render twenty-five per cent. of the casein soluble, and partially prepare the fat for assimilation. In this process the remaining portion of the casein not peptonized, is acted upon by the pancreatic ferment in such a manner as to destroy its tough, tenacious character, so that it will coagulate in light and flocculent curds, like the casein in human milk.

Composition:	ALBUMINOIDS,.....	19 Parts.
	MILK SUGAR,.....	64 "
	FAT,.....	10 "
	MINERAL MATTER,.....	3 "
	CHLORIDE of SODIUM added,.....	1/2 "
	PHOSPHATES of LIME added,.....	1/2 "
	MOISTURE,.....	3 "

SEND FOR SAMPLE and compare it with every other food used in artificial feeding of Infants.

LACTO-PREPARATA is not designed to replace our SOLUBLE FOOD but is better adapted for Infants up to eight months of age.

CARNRICK'S SOLUBLE FOOD

Is the Nearest Approach to Human Milk that has thus far been produced, with the exception of Lacto-Preparata.

During the past season a large number of Physicians and eminent Chemists visited our Laboratory at Goshen, N. Y., and witnessed every detail connected with the production of Carnrick's Soluble Food. This invitation to witness our process is continuously open to Physicians and Chemists. All expenses from New York to Goshen and return will be paid by us. The care used in gathering the milk, its sterilization, and the cleanliness exercised in every step, cannot be excelled. Soluble Food has been improved by increasing the quantity of milk sugar and partially replacing the milk fat with cocoa butter.

PHOSPHO-CAFFEIN COMP. A SEDATIVE, NERVE AND BRAIN FOOD.

(GRANULAR EFFERVESCENT.)

This preparation has been thoroughly tested, and found to produce the happiest effects in Headaches, Neuralgia, Sleeplessness and General Nervous Irritability. We are confident that the above combination will be found superior to any of the various preparations that are used in nervous affections. It is not only a nerve sedative but a Brain and Nerve Food. The depressing effects of the sedative ingredients are fully overcome by its reconstructive constituents.

As a harmless and positive remedy in Headaches and Insomnia we are certain it has no equal. It is far more palatable than any of the preparations used for similar purposes.

PUT UP IN FOUR, EIGHT AND THIRTY-TWO OUNCE BOTTLES.

REED & CARNRICK, New York.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the **AMERICAN ANALYST** a good advertising medium. Why should not you?

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by **E. McILHENNY,**
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making Bi-Carb. Soda from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2."

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation, physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS, FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

UNDOING VICIOUS LEGISLATION.

A Chicago despatch of September 13, relates the following outcome of a suit at law that had been previously alluded to in the AMERICAN ANALYST: "An interesting decision was rendered by Judge Blodgett this morning. Gustavus F. Swift of the packing firm of Swift & Co., asked for damages in the sum of \$7,500 against John B. Sutphin, the Mayor of Duluth, Minn., alleging failure of contract on the part of the Mayor. Some time ago the plaintiff and defendant entered into partnership whereby the defendant was to receive dressed meats from the plaintiff and sell on commission and a salary of \$40 per week. Much meat was shipped to the Mayor, but the latter, being informed of the law in Minnesota, which expressly stipulates that all meats sold in the State must be inspected at least twenty-four hours before slaughter, refused to handle the shipments, alleging his fear of the law. The claim was set up because of the loss accruing to the plaintiff. Judge Blodgett held that the law was unconstitutional, as the meats had already been inspected here in Chicago before slaughter. Were such a law to be upheld Minnesota would be practically shut off from all shipments of dressed meats. He awarded damages to the plaintiff in the sum prayed for."

DEATH BY ELECTRICITY.

In all the talk about execution by electricity there has been entirely too much attempt at high science, and too little common sense. Self-styled experts and those wrongly called by others, have been called upon to answer questions which the questioners themselves did not understand, and which had very little, if any, bearing, either practically or theoretically, upon the main subject—which is, "Can criminals be put to death by electricity more surely and rapidly than by hanging?" The questions and their answers, and the manner of those who put and give them, remind one of the Scotchman's definition of metaphysics: "When two men are talkin' thegither, an' him that's listenin' dinna ken what the other means, an' him that's talkin' dinna ken what he means himsel', that's metaphysics." There was a time when interested parties filled the daily papers with quasi-scientific articles upon the deadly effects of the electric current. There was hardly a day when there was not a report, more or less harrowing in its details, of the death of or injury to some man or brute, by stepping upon something iron in the neighborhood of electric wires. Since the gas companies or their stockholders in so many instances became interested in electric lighting stock, these paragraphs have partially disappeared. The same thing took place when gas was introduced for lighting, just as when the steam engine was first used or expected to be used for hauling cars upon tramways. The plain English of it is, that if you take a current that has very high tension (corresponding to pressure per square inch in a water pipe) but little volume (corresponding to amount of flow per minute in a water pipe) death need not necessarily ensue, no matter how high the tension in volts. If the current has an immense volume and but little tension or intensity, it need not necessarily be fatal. If the resistance of the "subject" be very high by reason of imperfect contact between the poles or electrodes, or whatever they may be called, a current may have both high tension as measured in volts, and great quantity as measured in amperes, and the ohms of resistance of the subject may save him from death or even from any great injury or pain. But the resistance of the "subject" may be rendered very slight by having proper contacts. The fact that where no special attempt was made to give good contact, many persons have been subjected to the action of part of a current of very high tension or of very great quantity, or even of both, does not prove anything one way or the other about the death question. It is a fact that rifle balls will kill if properly shot and aimed, and the human target does not wear a coat of mail or other resistance. It is a fact that a heavy weight will crush a man to death if properly applied. And it is a fact that a cannon ball, which has both velocity and weight, will kill. In the hands of the unskilled a cannon may not be able to do much damage to anything or any one, except, perhaps, those who are mismanaging it. But that proves nothing one way or the other about the value of

cannon in warfare. The alternating current is claimed by medical experts to be more effective as a curative and tonic than the continuous current of the same voltage and amperage. Whether or not it will prove more efficient than the continuous current in putting criminals to death remains to be seen. There are several machines in the market which generate currents having intensity and volume enough of current to kill a man in five seconds by the watch if the current was properly applied; and the makers of these machines know how to apply that current, too. They probably have both business and humanitarian reasons for declining to take a contract to put to death human beings, however worthless their lives may be, and however injurious their presence on this earth may be. Any one of these makers of dynamos would take a contract under guarantee to kill steers at any abattoir in the country more humanely, surely and rapidly than at present.

CHRISTIAN SCIENCE.

This term according to the dictionary, means knowledge pertaining to Christ and his religion, therefore, when it is applied to a system of healing the sick it is misapplied, and we believe that those who so apply it do it with the purpose of misleading. A recent writer, a clergyman of high standing, answers the question—What is Christian Science? thus: "No matter: All mind: All God: All good: No evil. These tenets clearly deny a personal God and nearly every doctrine which Christians hold including such vital doctrines, as redemption, regeneration, sin, resurrection, heaven and hell, and a personal devil, and affirm absolute inherent perfection of man." This shows conclusively that the title under which those who pretend to believe in this fraud, and who have unluckily succeeded in finding many dupes, masquerade, is a delusion and snare. The people who teach these false doctrines may be morally good, kindly and intelligent in some cases, but they are as a rule, vain sentimentalists either ignorant of, or disbelievers in, the Bible, the mainstay of the Christianity they claim to believe. The question naturally arises how we can explain "the many marvelous cures accomplished by Christian science." They claim to cure all sorts of incurable diseases, as pulmonary consumption, cancer, Bright's disease, leprosy, etc., as a matter of fact, they do not cure these diseases. We deny most of their claims. The majority of the ailing do not themselves know what diseases they have, and even skilled physicians are not always positive in their diagnosis. Many of those whose cases are widely trumpeted as cures die afterwards of the disease of which they believe they have been cured, while a great many who are not ill at all believe themselves to be so, and they, of course can readily be convinced by these so-called Christian scientists that they are cured. In many diseases the influence of mind and will over the body, when rightly directed, is of great value in medical treatment as has been seen in cases treated by mesmer-

For use at the Soda Fountain and in all Pharmaceutical preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

DRYDEN & PALMER,
19 Hudson St., New York.

ists. There could be no objection to the treatment employed by those who call themselves Christian scientists, provided they would call in regular physicians to effect the curing.

A HEALTH EXHIBITION.

The American Public Health Association will hold its next annual meeting at Brooklyn, N. Y., October 22, 23, 24 and 25, 1889. This association comprises over eight hundred members, all devoted, officially or otherwise, to the advancement of sanitary science and the promotion of practical public hygiene. In the furtherance of this purpose it has met annually during the last sixteen years in different cities of the United States and Canada, and has in every instance had the effect of greatly stimulating public effort in the promotion of health and measures for its maintenance. With the hope of still further magnifying this interest and effort, it is the purpose of the Association, through its local committee, at the forthcoming meeting, to provide an exhibition of everything available adapted to the promotion of health. The exhibits will be displayed under the following classification: The Dwelling; Schools and Education; Factories and Workshops; Clothing and Dress; Food; Sanitary Engineering; Public Health Administration in Cities and Towns; The Laboratory; Red Cross Section. Addresses will be delivered by Mayor Chapin, on behalf of the city, and by Alexander Hutchins, M. D., on behalf of the medical profession. The following topics have been selected for consideration at the meeting: 1. The Causes and Prevention of Infant Mortality; 2. Railway Sanitation; 3. Steamship Sanitation; 4. Methods of Scientific Cooking; 5. Yellow Fever; 6. The Prevention and Restriction of Tuberculosis in Man; 7. Methods of Prevention of Diphtheria, with Results of Such Methods; 8. How Far Should Health Authorities be Permitted to Apply Known Preventive Measures for the Control of Diphtheria; 9. Compulsory Vaccination; 10. Sanitation of Asylums, Prisons, Jails, and Other Eleemosynary Institutions. There will also be a comprehensive exhibition of sanitary goods and appliances in another large hall close by.

THE JOHNSTOWN CALAMITY.

We learn with interest that the public will at an early date be placed in possession of an authoritative narrative of the Johnstown disaster, which the Harrisburg, Pa., *Telegram* is preparing to publish in book form. The volume will meet the popular demand for a full, well-written, trustworthy description of the great calamity. Besides its literary and artistic merits, the fact that the net proceeds from the sales will be applied for the ben-

efit of printers, orphan children and aged men and women who suffered by the flood commends the work to the favorable consideration of the public. It goes without saying that a book of this style, profusely illustrated, written by an experienced editor from personal knowledge, and published to help a charitable object, will meet with an extensive sale over the entire country.

SCIENCE IN THE BOUDOIR.

THE CHEMISTRY OF THE TOILET TABLE.

We owe, in many cases, directly to chemical science the various preparations and devices by which the neatness and attractiveness of the person are secured, and such a simple operation as washing the hands is dependent upon complex chemical reactions, which even at present are not well understood. Soap is a combination of various fatty acids with an alkali such as soda or potash, and is a true chemical salt. When dissolved in water and applied to the skin, it has the property of uniting with the greasy matters secreted by it and removing them along with other foreign matter. The action is similar to that of the alkali itself, but is greatly weakened and modified by the fatty acid with which the alkali is combined in the soap. A double decomposition seems to take place between the soap and the matters on the skin, forming new and soluble compounds. There is no chemical principle involved in the brushing of the hair; but we may mention the curious formation of electric sparks, when dry hair is brushed or combed in cool, dry weather. If this is done in a dark room, quite good sized sparks may be seen playing around one's head; and this phenomenon may be the origin of the legends of ancient heroes, and the divine fires which blazed about them in their infancy without burning them. Similar sparks may sometimes be seen in winter, when woolen, or more especially, silk underclothing is removed. In all these cases, the electricity is simply produced by friction, and is not formed in the body by any of the vital processes. "Electric" hair brushes or combs may be mentioned only to warn our readers against their use, as they are entirely worthless. They not only produce no electricity whatever, but if they did it would not have the slightest effect upon the hair. The same is true in regard to the so-called electric tooth-brushes, hair-curlers, corsets and all the rest of the list. The use of fatty matters as a dressing for the hair dates from a remote antiquity, but it is a custom better honored in the breach than in the observance. Their use is uncleanly in the highest degree, and they serve no good purpose whatever. Bear's grease has long had a great reputation as a dressing for the hair, but it does not differ from any other coarse animal fat, and possesses no particular beneficial properties. If a dressing of this sort must be used, a solution of castor oil in cologne water is perhaps the best, or vaseline is a most excellent unguent which never turns rancid; but the occasions are very few where it is a necessity. Hair dyes are of two classes: those containing lead and those containing silver. Neither are fit to use, and serious illnesses have been caused by them. The effect of lead is dependent upon the presence of sulphur in the hair, which unites with the colorless salt in the dye, forming a brown or black sulphide of lead. With silver dyes, the well-known blackening effect of light is added. Dyes containing silver are not much used nowadays, as the bright purple tint they give to the hair, while it may be highly ornamental, is certainly not very natural. The bleaching solutions, for changing dark hair to an alleged blonde color, consist of a solution of peroxide of hydrogen. The substance only gives a dead, unnatural, grayish hue to the hair, and is always to be avoided. Hair restorers, for increasing the growth of the hair, are rarely of any benefit, and usually owe their properties to cantharides or some similar irritant or stimulating substance. When the hair-producing glands are inactive and sluggish in their action, they

may sometimes be stimulated to increased activity but in all such cases the advice of a physician should be taken. When the glands are destroyed, from disease or any other cause, it is impossible to cause the hair to grow again. Flesh powder should consist of finely powdered starch or rice flour, with a trace of perfume, or in some cases, pulverized talc may be used instead. Such preparations are not objectionable, but only the best qualities should be used, as the cheaper preparations are often very coarse and impure. Some years ago samples of powder were offered for sale in England which contained a considerable amount of arsenious acid. The various cosmetics and washes for the skin usually contain zinc, bismuth, lead, or mercury. They are really nothing but paints, and are not only injurious from the poisonous metallic substances they contain, but they fill up the pores of the skin, and thus increase the troubles they are supposed to remedy. A bad complexion is usually dependent upon constitutional causes, and cannot be improved by outward applications. Cologne water, as well as most other liquid perfumes, is a solution of various odoriferous gums and oils in very pure alcohol. If a few drops are poured into a glass of water the alcohol is so much diluted that the dissolved substances are precipitated out, forming a light cloud in the water. The perfume industry is a very extensive one, and the quality of the products varies all the way from very good to very bad—principally the latter, we should judge from our personal experience. Tooth powder is, or should be composed of finely powdered chalk and soap. Chalk has a scientific interest, in that it is made up of the skeletons of myriads of microscopical animals which lived in past geological ages, and it is a curious thought that millions of years ago certain little animals lived and died, that their remains might, in a future age, serve to cleanse the teeth of a being whose future existence was not at that time, even hinted at in the structure of any living organism. As to the more objectionable toilet preparations,—such as solutions for brightening the eyes, preparations of arsenic for the complexion, blue paint to imitate the veins under the skin, enamels for covering up defects, etc.,—they are of no interest or value, either scientific or practical, but are both dangerous and useless, and to be avoided under all circumstances; while the natural cosmetics—pure soap and water, plain, simple food, and correct hygienic habits—will always produce the beauty of good health, which is best and most attractive form.

THE CIGARETTE ABOMINATION.

FURTHER TESTIMONY TO THE DANGER OF THE HABIT TO BOYS.

The practice of tobacco smoking has now become so general that at present few of the advocates of abstinence from the weed are heard. Temperance in this habit is assuredly necessary, for while in adults the moderate use of the narcotic seems to supply a want, apparently universal, of the human race, its abuse is attended by certain more or less constant evils. This want is evinced by the use of narcotics from the earliest times, all nations, savage, semi-savage and civilized having employed them in various forms, for that solace which the smoker of to-day finds in his pipe or cigar. Considering the large number of persons using tobacco, and their general health, it can hardly be said that its moderate use is harmful. Good observers have come to the conclusion that in the majority of cases tobacco, "used in moderation and when the stomach is not empty, has a beneficial effect." This, of course, applies to its use by adults. It has, in those accustomed to its use, a soothing effect upon the nervous system; but, on the other hand, it often acts as a nervous stimulant to mental work, as in reading, business, etc., the student being clearer with his pipe in his mouth and the broker mentally more active while puffing his Havana. Its action as a brain stimulant is believed to be due to the

irritation of the sensory nerves of the mouth and nose, which reflexly stimulates the vaso-motor centre, and dilates the vessels of the brain, thus providing for the most complete internal respiration of the brain cells by a free supply of arterial blood to them; an effect similar to that first produced by sipping alcohol. The difficulty is, that this like other remedies of its class, it is very liable to be abused, excess following the moderate use of the drug, when a whole train of characteristic evils follow; such as furred tongue, irritation of the throat and hoarseness, dyspepsia, irritability of the heart with a characteristic rhythm and palpitation (tobacco heart) trembling, cold, clammy extremities, loss of appetite, tobacco amaurosis, sudden fainting spells, etc. But it is upon young persons that its most baneful effects are seen. While we have above stated that its moderate use by adults is often beneficial, it cannot be too strongly urged that it is a most potent and insidious poison to the young. It is a question whether the present pernicious habit of cigarette smoking by boys is not equally of importance with the use of alcoholic liquors upon the rising generation. In this country we believe it is more harmful, inasmuch as cigarette smokers among boys outnumber spirit drinkers, largely, perhaps by twenty to one. These boys show the characteristic pallor, sickness and nervousness which result from the swallowing of nicotine. Anyone who has seen boys of from ten to sixteen or eighteen years of age, not only smoking, but inhaling the smoke of cigarettes, cannot but have seen the effects of the poison depicted not only upon their faces, but in their listless walk, delicate frame and mental lassitude. The special evils of this form of smoking are well marked. The poorest qualities of tobacco are commonly used in their manufacture, rich in nicotine rather than in the aromatic principles of the best specimens of the plant. More or less stringent laws have been enacted to restrict the sale of tobacco to children, but we all may observe how non-effective they are. In New York a recent act by the legislature makes it a misdemeanor to sell cigarettes or any form of tobacco to persons under sixteen years of age. Pennsylvania has a similar prohibitory law. Here it is unlawful to sell to boys under fourteen years of age, without a written order from the parents. Girls of any age may purchase. It will be easily understood how boys of any age may, by clubbing their cents, obtain the desired cigarette through the agency of a boy of fourteen years of age, the purchase being divided amongst them. Just how the evil is to be met is a grave question, moral suasion being of little avail among the lower classes, who are the greatest sufferers from this form of dissipation. A prohibitory law as to the manufacture of cigarettes might meet the case, for while the use of tobacco in any form is detrimental to the health of children, the use of cigarettes is undoubtedly at the present time the form of smoking which is most prejudicial to the health of the rising generation. —Canada Lancet.

EDISON'S INVENTIONS.

CLASSIFIED ENUMERATION OF THE PATENTS SECURED BY THOMAS A. EDISON.

TELEGRAPHY.—Printing and automatic, 52; chemical and perforating, 34; perforating machines, 6; chemical stock printer, 1; multiplex, 17; relays, 8; switches, 2; phonoplex, 3; induction relay tel., 2; acoustic, 2; amr. and ind. signal app., 4.

ELECTRIC LIGHTS.—Incandescent lamps and manfr., 104; arc lamps, 4.

DISTRIBUTION.—Systems of regulation and indicating devices, metres, sockets, switches, 68.

GENERATION.—Dynamoes, motors, 3; transmission of power, 54; regulation, 50.

RAILWAYS.—Electric motor and tracks, 8.

CONDUCTORS, UNDERGROUND AND OVERHEAD, 3.

TELEPHONES.—Transmitters and receivers, 32.

BATTERIES, GALVANIC AND SECONDARY, 3.

PHONOGRAPH, 21.

ORE MILLING, 4.

MISCELLANEOUS.—Electric pen and stencil app., 66; typewriter, 3; shafting, 1; malleable iron, 1; vocal engine, 1; preserving fruit, 1. Total, 493.

Besides these he has over 300 applications for patents pending on all subjects.

The various interests bearing his name own many hundred other patents covering details and modifications of Mr. Edison's inventions.

BUSINESS UPS AND DOWNS.

HIGH SPEED ATTAINED BY SOME OF THE NEW YORK ELEVATORS.

"The fastest elevator in the city," said a builder of them to a reporter recently, "is the old water-balance elevator in the Western Union Building. It isn't one of the regular passenger elevators, but is used mostly by the operators. To a man who tries it for the first time its speed seems simply tremendous. It goes down almost as fast as it could drop, and goes up again just as quickly. Practically the speed is almost unlimited. In figures it is anywhere from 1,000 to 2,000 feet a minute, and 1,000 feet is three times as fast as any other elevator runs. It is constructed in the very simplest manner. At the top is a pulley, over which a rope runs. At one end of the rope is a car. The other end, attached to a great bucket, runs down a long tube, reaching to the bottom. The bucket is filled with water. It becomes much heavier than the car, and drops to the bottom; consequently, the car shoots to the top. The water is let out, the car falls and the bucket rises. The elevator was built in 1875, a year before hydraulic elevators came into use. Why is it, you ask, that more haven't been built, and why has the slower hydraulic elevator crowded it out? For two reasons. In the first place, a skilled expert is required to run the water balance elevator. Then 1,000 feet a moment is entirely too fast for any one not fully accustomed to it. To get to the top of an eleven-story building in a minute is quick enough even for those in the greatest hurry, and an elevator running at 300 feet a minute, the average for the big buildings, can easily do that, with its stops on the way. The tall office buildings of the city seldom have a 'rise' of over 150 feet. The elevators of the city never run at their very highest speed. There is positive discomfort to the passenger when the elevator goes much faster than 300 feet a minute. The Washington Building makes the claim to, and it probably has, the swiftest service in the city. The rise is 175 feet. Without stops, it can be done in 18 seconds. That is over 500 feet a minute. These four elevators carry 10,000 people a day. The elevator plant of the Produce Exchange is the finest in the world. It runs nine elevators, each built to hold thirty persons, and is the most powerful to be found anywhere. Each elevator averages in its round trip a minute and a half, and can make 400 trips a day. They have a total capacity of 108,000 people daily. As a matter of fact, about 22,000 to 24,000 are carried. But the need of such a service appears just before the opening of 'Change, when four trips will place upon the floor over a thousand men. The service at the Cotton Exchange, though less extensive, is of the same power as the Produce. The speed is over three hundred feet a minute. The elevators in the Standard Oil Building attain another high rate of speed. There is little stopping, and it is said that each of the four elevators there make seventeen miles of trips a day. On actual trial they were run 725 feet in a minute. But there were no passengers then, and no such rate is attempted now. The elevators of the Potter Building carry 12,000 to 15,000 a day. There are four of them, and the speed is nearly three hundred and fifty feet a minute. The round trip for the eleven stories takes just two minutes.

The Union Bank Building's elevators run at the rate of 300 feet, and carry from four to five thousand people. Those of the *Times* Building, at a little over three hundred feet. None of the uptown apartment houses or hotels have especially speedy elevators. Elevators there are constructed especially for comfort. The Navarro Flats are remarkable for having the greatest number of elevators of any building—sixteen in all—that is, if the Navarro can be considered one building, instead of several."

THE VOGELPHONE.—William Vogel, the inventor of the vogelphone, claims that his instrument will enable him to talk between Paris and Chicago.

RATS!—It is said that rats are so fond of sunflower seeds that they will, if plenty, flock into the wire cage kind of a trap in such quantity as to nearly fill it. But they should be fed awhile on the seed before introducing the trap.

SPRING TRACES.—The ordinary leather and chain traces for drawing carts have been superseded on the Eastern Railway of France by chains with spiral springs, which permit the horse gradually to bring its force to bear on the vehicle in starting it. They are found more serviceable than the rigid trace.

MOSQUITO CURE.—To keep off mosquitoes: Take a small quantity of a 2 per cent. carbolic acid solution and sprinkle sheets, coverlets, pillows and bolsters on both sides, the edges of bed curtains and the wall next the bed. The face and neck may also be slightly wet with the solution. Not a single gnat or mosquito, it is said, will come near.

TOUGH PAPER.—Paper tough as wood is said now to be made by mixing chloride of zinc with the pulp in the course of manufacture. It has been found that the greater the degree of concentration of the zinc solution the greater will be the toughness of the paper. It can be used for making boxes, combs, for roofing, and even, it is added, for making boats.

MAGNETIC EXTRACTION.—Mr. G. W. Perkins, of East Somerville, Mass., recently stepped upon a needle, which broke off in his flesh and could not be removed by the surgeon's knife. Finally he was taken to the Somerville electric light station, and holding his foot in close proximity to one of the dynamos the needle was drawn from its hiding place through the lacerated flesh.

PERHAPS SO.—From an experimental investigation carried out by the Dresden Municipal authorities it would appear that pathogenic micro-organisms do not thrive on books. The dust from a number of unused volumes was found to be only matter of a harmless character. The tubercle bacillus was especially sought and most conspicuously, not found. The conclusion arrived at was that the danger of circulating libraries spreading infection is very slight, but a recommendation is given to dust books well before reading them, and never to wet the finger in the mouth for the purpose of turning over the leaves.

SUBSTITUTE FOR OARS.—An ingenious contrivance is about to be brought out by Capt. Woolward, of the royal mail steamer "Don," by which it is proposed to do away with oars as a means of propelling ships' life-boats. It consists of a hand-power screw propeller, which enables the boat to be driven by any one in it though unacquainted with rowing. This, Capt. Woolward points out, will obviate the chance of passengers who may get away from a stranded ship finding themselves in a boat without oars or having them without any skilled in their use. The machinery takes up little room, and seems to be both efficient and simple.

ELECTRIC MINING.—Electricity has been brought into use as a motor for coal mining. A machine of the kind has been in practical operation every day at the mines of the Shawnee and Iron Point Coal Company, Shawnee, O., since the 1st of May. It only requires 3½ minutes to make a cut 5½ feet deep and 3 feet face. The cuts are made and the cutter bar withdrawn within 4 minutes, and the machine moved ready for another cut in less than 10 minutes. It does not require any effort on the part of the attendant while the machine is at work. At this rate six cuts per hour, or 60 cuts per day of 10 hours, can be easily made, and the machine will undercut 200 tons of coal.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

September.

MEATS.—Beef, mutton, lamb, veal, ham, kidneys, liver, venison.

GAME AND POULTRY.—Pigeon, chicken, duck, woodcock.

FISH.—Bass, blackfish, bluefish, clams, cod, crabs, eels, flounder, halibut, herring, lobster, mackerel, muskels, porgie, prawn, rockfish, salmon, trout, sea bass, sturgeon, turtle, white fish, whiting.

VEGETABLES.—Beets, beans, cabbage, carrots, cauliflower, corn, cucumbers, egg-plant, garlic, lettuce, onions, parsley, parsnips, potatoes, radishes, rhubarb, savory, shallots, spinach, squash, tomatoes, turnips.

FRUITS.—Apples, bananas, blackberries, gooseberries, huckleberries, grapes, melons, oranges, peaches, pears, pineapples, plums, raspberries, currants.

PRACTICAL RECIPES.

TOMATO SAUCE.—Take fresh ripe tomatoes, put them over the fire in a stewpan, pour on two or three tablespoonfuls of water and let them cook for a few minutes. Take from the fire and strain through the colander. Add to the liquor thus obtained a slice of raw ham, two shallots, a few spoonfuls of good soup stock, and let it cook for an hour; then strain. Make a little good brown sauce in another stewpan, add to it the tomato, boil together, season with cayenne, salt and sugar.

GREEN CORN FRITTERS.—Sift together a pint of flour, a heaping teaspoonful of Horsford's baking powder, half a teaspoonful of salt and a dash of white pepper. Cut through the centre of each row of kernels, and press out the inner part of them with the back of a knife; add three half pints of the corn pulp to the flour and four eggs well beaten; mix, and if the corn is not juicy enough to make the batter, add a little milk; drop spoonfuls of it in smoking hot fat, brown them nicely, and serve plain or with the sauce recommended for tomato fritters.

CHOCOLATE MACAROONS.—Melt three ounces of Baker's chocolate, slowly work it to a thick paste with one pound of pulverized sugar and three whites of eggs. Roll the mixture down to the thickness of about one-quarter of an inch; cut it in small round pieces with a paste cutter, either plain or scalloped; butter a pan slightly and dust it with flour and sugar, half of each; place the pieces of paste or mixture in and bake in a good steady oven.

"BRUNSWICK STEW."—Two slices of middling, chopped fine; put in water and start to boil; add two squirrels, two onions; boil well and strain; add two squashes sliced fine, four pods okra, one handful butter beans, two Irish potatoes, one half-pint tomatoes, three ears of tender corn; salt and pepper to taste; thicken with grated cracker or bread-crumbs, while boiling; last of all, add one tablespoonful of butter.

PICKLING GREEN PEPPERS.—Cut off the top of the pepper and take out the seeds; chop fine one cabbage, one cauliflower, and one dozen onions (small); put in whole 100 gherkins, two ounces of mustard-seeds, sufficient salt to season; fill the peppers full; place the top on and tie with a cord; stand upright in a stone jar, not packed too closely; cover with cold vinegar and put in a cool place. It will be ready to use in a week. This will pickle fifty large peppers.

ROLLED PANCAKES.—Beat six eggs separately; stir the yolks into one quart of warm milk with a tablespoonful of melted butter and a teaspoonful of salt; add sufficient flour to make a thin batter; then sprinkle in one teaspoonful of yeast powder, and stir

in the whites of the eggs; put a fryingpan on the fire, when it is hot, grease with a spoonful of lard; pour in a cupful of batter, fry a light brown and turn carefully so as not to break the cake; when brown on both sides lift out and spread with strawberry jam, or any kind of jam or marmalade you have; roll up nicely, and lay them on a plate; sprinkle with pulverized sugar; send to the table hot, and serve with or without cream.

POTATO PUFF.—Add two tablespoonfuls melted butter to one pint mashed potatoes and beat to a cream with a large fork; add the yolks of two eggs, beat well, one cup of cream, beat again, then add the well whipped whites, stir lightly, pour into a well buttered dish and bake until it is a rich brown.

BLOOD POISONING.

The increasing occurrence of cases of what is known as blood poisoning should excite far more interest in the general public than thus far has been displayed. Blood poisoning is not a new malady, but has been known and recognized by the medical profession for at least a thousand years. It is not local, but is found in every land upon the globe. Generally it is caused by the malignant action of decaying organic matter, or of some specific virus when introduced into the system through the skin. A familiar illustration is afforded in the fatal cases where flies that have fed on offal have bitten human beings, and introduced minute portions of decomposing animal tissue into the veins. The Jupiter fly of India, the Tsetse of Central Africa, and the carrion fly of Europe and the United States, have in this manner produced thousands of deaths. In every instance the progress of the disease was the same. From the point where the insect broke the cuticle and introduced the poison, inflammation started and spread until the entire organization was permeated with the ever-increasing malignant matter. Of a similar type are those dreaded diseases, charbon, malignant pustule and malignant carbuncle. Here the poison seems to be self-engendered. It comes into being at a certain point, and from this as a centre it spreads just exactly as its counterpart does in the case of Jupiter fly and other bites. A careful study of these disorders reveals the fact that they are all of the same character. In every instance the blood has been impure, either being surcharged with humors, depraved by former diseases or excessive use of powerful drugs and chemicals, or else contaminated by malaria or miasmatic germs. When the blood is pure and healthy, these disorders seldom happen. The bite of the insect causes a painful local inflammation which lasts a couple of days and then disappears, leaving behind a small cicatrix. So great is the contrast between pure and impure blood in this regard that the first question put by a physician who is called in to treat a complaint of this class is respecting the previous general health of his patient, and more especially as to those ills which result from impurity of the system. With the increasing complexity of civilization there is a strong and dangerous tendency toward blood disorders. The construction of modern houses, the ever-growing evil of sewer gas, and the countless emanations from a bad soil and decaying organic matter, and the narrowing limitations of trade, industrial and social life, tend toward restricting physical activity and developing impurities in the human system. There is no doubt in the minds of scientific students but that most of the diseases of today result from impure blood, and that two-thirds of the cases of blood poisoning arise from the same cause. The danger of blood poisoning is terribly on the increase. It may come from the bites of animals, birds, reptiles, fish, insects and even men; from being wounded, scratched or abraded by knives, forks, pins, needles, skewers, the edges of cracked glass, china, metal or earthenware; from blows, bruises, falls or collisions; from scratches, broken teeth, hang-nails, chafing or eruptions. In the past five years there have been authenticated fatal cases in which the prime injury arose from the bite of a bluefish, from the crushing of a caterpillar, from the attack of a mosquito, from the extraction of a tooth, from the treatment of a corn,

from the slipping of a razor in a barber's hand, from the blow of a potato-masher, and from the scalding of a kettle of boiling soup. So great is this increase that the text-books of to-day devote fifty pages to this field of disease when those of fifty years ago seldom gave as many lines. While the danger of blood poisoning is great and the disease in nearly every instance is of a frightful character, yet there need be little apprehension in the mind of the individual. All that is requisite is to expel from the system the humors which make blood poisoning a possibility. This is simple enough. Exercise and fresh air, regular bathing and regular habits, good diet and wholesome drinks, a proper amount of reading and thinking, and a sensible mode of clothing the body will keep the physical organism in admirable order and condition. When a person is in the enjoyment of perfect health, these are all that are needful to insure its continuance indefinitely. But, unfortunately, there is not one person in a hundred thousand who enjoys perfect health. For this vast army one other thing is necessary, and that is the regular use of a first-class blood-purifier. Many compounds of this nature are excellent, but one, and only one, complies with every condition and is useful in every case. This is the famous Ayer's Sarsaparilla, a simple but scientific combination of sarsaparilla, yellow dock, stillicia, podophyllin, and the double iodides. It stimulates and strengthens all the vital functions and purifies not only the blood but also every tissue in the body. Its use means health, comfort, strength and beauty. It also means immunity from that long series of disorders of which blood-poisoning is so prominent a type. To all who are in danger of such disorders, Ayer's Sarsaparilla is a priceless boon.

SULPHONAL.

A correspondent of the *Pall Mall Gazette* speaks of the proper use of narcotics as follows: Like so many other things, it is the abuse, not the judicious use, of narcotics which is to be deprecated. The great danger is in the constantly-increasing doses in which the injudicious indulge. I am convinced from long experience that it is better to get sleep from a mild narcotic than not to get sleep at all. But nevertheless it should be indulged in as seldom as possible, and never in increasing doses; and it should never be resorted to until every effort to obtain natural sleep has failed. The utmost caution in the use of narcotics is requisite. The desire for them is as insidious in some minds as the craving for alcohol is in others, and unless there is sufficient strength of mind to resist the inclination to increase the dose it is better to avoid it altogether. This was written before I met with the letters and articles recently published in the *Pall Mall Gazette* on the new remedy for sleeplessness, sulphonal. The dose recommended was from three to five tabloids (of five grains each), crushed up and mixed with a small quantity of water or milk. I have only used the former. I thought under these circumstances that four tabloids would be considered a moderate dose; and, acting on the suggestion in one of the letters on the subject, I took it about three-quarters of an hour before going to bed. A very few minutes after laying my head on the pillow I was asleep, and I slept as I had not slept since I was a child. Even in the morning when I awoke I felt sleepy, and turned round on my pillow and went off again. At about 7.30 I awoke, feeling perfectly well and more refreshed by my night's rest than I had felt for years. The next night I reduced the dose to three tabloids and had another good sleep for about five hours, and afterwards for another hour or two. I continued taking the smaller dose night after night, and watched carefully to see whether my general health was in any way affected. I am bound to admit that I felt better in every respect. I had more energy for my work, my digestion was better, and my whole nervous system seemed improved. Still I could hardly believe that the continuous use of the drug would not entail some evil consequences. I therefore paid a visit to the manufacturers, and laid the case before them. I received an assurance from them that the drug had been tested in every way, and that it left absolutely no after-effects. It does not effect the brain, heart or digestive organs. Its action is to soothe the nerve centres, and thereby induce sleep. I have now continued taking the drug for a month with the exception of a few nights, when I slept about the same time as I had previously slept. I am bound to admit that my nights have been more enjoyable than any I have had for years, and my general health is undoubtedly better. The sleep induced is precisely the same as natural sleep—at first sound, then followed by pleasant dreams, and the desire to sleep again when you wake. On the other hand, the effect of chloral and other hypnotics and narcotics is to send you into a sort of dull, dreamless stupor for a certain number of hours, from which you suddenly awake without any further desire to sleep.

WHOOPIING COUGH CURED.

Whooping cough is a very distressing disease, and unless checked by some effectual remedy will hang on for three months or longer. It not unfrequently proves fatal. Physicians' prescriptions are usually unavailing, but the inhalation (breathing) of vaporized cresolene will quite uniformly stop it in from six to ten days. The only effective way to use this remedy is by means of Page's vaporizer, which can readily be procured of druggists, with the requisite quantity of cresolene. Treated in this way the danger and suffering usually extended to months is shortened to a few days, at a trifling expense and but very little trouble. The fumes of cresolene are also of great value in the treatment of croup, diphtheria, and scarlet fever, preventing the spread of these contagious and much to be dreaded diseases. It is also a great relief in asthma.

CATARRH.

A NEW HOME TREATMENT.

Sufferers are not generally aware that these diseases are contagious, or that they are due to the presence of living parasites in the lining membrane of the nose and eustachian tubes. Microscopic research, however, has proved this to be a fact, and the result of this discovery is that a simple remedy has been formulated whereby catarrh, catarrhal deafness and hay fever are permanently cured in from one to three simple applications made at home by the patient once in two weeks.

N. B.—This treatment is not a snuff or an ointment; both have been discarded by reputable physicians as injurious. A pamphlet explaining this new treatment is sent on receipt of 10 cents, by A. H. Dixon & Son, 337 and 339 West King Street, Toronto, Canada.—*Toronto Globe*.

Sufferers from catarrhal troubles should carefully read the above.

WRITING RIGHT.

Raphael Rightwell procured a paying position on account of his perfect penmanship. R. Rightwell wrote well because he used one of Easterbrook's No. 128 Extra fine elastic pens.

HORSFORD'S ACID PHOSPHATE.

Imparts new energy to the brain, giving the feeling and sense of increased intellectual power.

NIEDER-SELTERS-WATER.

The genuine Nieder-Selters-Water is so much superior to the many so-called natural mineral waters and to all the artificial waters, that it is surprising that every one

does not give it the preference. The price, too, is in its favor. It is cheaper. As an addition to wine or spirits, it brings out the flavor better, and is far healthier than the trashy and often vile imitation mineral waters. Try it.

REASONS WHY

Should be preferred to all others:

Because—It is genuine-pure, just as it existed in the hepatic cells of the living fish, not depleted of its natural virtues by any process of refining, nor weakened by being made into an emulsion with an equal quantity of water, glycerine, etc., which latter device makes water bring the price of Oil.

Because—In taste and smell it is not offensive, but instead, sweet and agreeable.

Because—Its administration is always followed by satisfactory results.

Because—It is more easily assimilated than other Oils.

Because—It is more nutritious than other Oils.

Because—Of its perfect digestibility, perfect limpidity.

Because—This perfect Oil costs consumers no more than the poorer qualities abounding in the stores.

Because—It is readily obtainable; all well-stocked Drug Stores have it.

Because—It is unquestionably the purest and best COD-LIVER OIL IN THE WORLD.

W. H. SCHIEFFELIN & CO.,
NEW YORK.

Sole Agents for U. S. and Canada.

NATURAL GAS FOR BALLONS.—Prof. Carl Myers, who lately made a balloon ascension from Sandy Creek, N. Y., had the balloon inflated with natural gas from the gas well there. Nearly 1,000 people witnessed the ascension. Prof. Myers had been invited to Sandy Creek by the directors of the gas well for the purpose of testing the supply of the well. The experiment proved eminently satisfactory. The capacity of the balloon was 11,500 ft., and it took just thirty minutes to fill it, which would show an average flow of over 500,000 ft. per day. According to the present showing the well is a very valuable one, and the prospects are very flattering for a much larger flow as the drilling continues.

INCOMBUSTIBLE TEXTILES.—There are many substances which have the property of rendering the fabrics to which they are applied incombustible, but they usually spoil them, either by changing the color or stiffening them to such a degree that they cannot be used. An easy and safe way of protecting curtains and mosquito nets against fire is said to be by steeping them in a solution of phosphate of ammonia, obtained by mixing half a litre of water (one pint) with 100 grammes (about three ounces) of phosphate. In this way the color and texture remain unaltered.

AMERICAN PILE DWELLINGS.—Mr. H. B. Cresson, of Philadelphia, has been studying certain stakes or piles, which were first pointed out to him nearly twenty years ago, by a fisherman, in the mud at the mouth of Naaman's Creek, a small tributary of the Delaware river. These piles are the first indication of anything in North America resembling the remains of lake dwellings in Europe. Mr. Cresson's investigations led to the discovery of three distinct localities near each other. Around these stations were found a very important and instructive collection of stone implements, a few points and fragments of bone and human tooth. At one station a number of fragments of rude pottery were found, and at this were obtained several pile-ends, which are now in the Peabody Museum.

SACCHARINE.—This substance, which, as known, is three hundred times sweeter than sugar, is beginning to

be felt by the beet sugar manufacturers as a very dangerous enemy. It is stated that in Germany, already, so much saccharine has been made as to render 5,000 tons of beet sugar superfluous. It is principally employed in the preparation of fluids and the production of sweet liquors. It is not a food stuff. Indeed, it has been condemned by eminent medical authorities as directly prejudicial to health. The sugar manufacturers are of the opinion that saccharine should only be sold by chemists. France, Italy and Portugal are already contemplating imposing a tax on it.

HOSPITAL REMEDIES

THE Favorite Prescriptions of the Brightest Medical Minds in the world, as used by them in the Hospitals of London, Paris, Berlin and Vienna.

RELIABLE AGENTS WANTED.

A Tablespoonful of Pearline

in a pail of water, will convince a woman against her will that it washes everything; best and quickest—injures nothing; coarse or fine—just the reverse—by doing away with the rubbing it saves the very thing which ruins the most clothing—especially fine things. It takes the drudgery out of woman's hardest work. Wash day and cleaning time are no longer "bugbears" in the homes where Pearline is used—these homes number millions.

Beware

Peddlers and some unscrupulous grocers are offering imitations which they claim to be Pearline, or "the same as Pearline." IT'S FALSE—they are not, and besides are dangerous. 149 JAMES PYLE, New York.

VALUABLE TO ADVERTISERS.

You have determined to make money by vigorously pushing your business. As the AMERICAN ANALYST has determined to do the same thing, we have a community of interests. Our way of making money is to increase our circulation, and we can only do so by publicity; that is, by bringing our journal to the notice of a great number of people, who have the intelligence to appreciate a good journal when they read it and the money to buy what they want. You must necessarily want to reach the same class. Even if you do not sell directly to the consumer, it is necessary for you to tell the consumer of the quality of the goods you have to offer to induce him to ask the dealers with whom he trades for them. We propose this Fall and Winter to send a sample copy of this journal to the address of every person in the United States whose name we can find in any of the *Elite* directories or blue-books of the various cities and villages. We will thus reach several millions of new readers in addition to our already large subscription-list, covering every State in the Union. Previous experience with this method of getting new subscribers war-

rants us in undertaking the expense, believing that it will pay us. This large addition to our circulation will put any advertisement in our columns before a multitude of readers. Our advertising prices remain the same, and are so arranged as to give the lowest rates to larger and longer-continued advertisements, and will be sent on application. All respectable advertising agencies will take orders for us. If we find this system profitable, advertisers surely will. Those who have advertised with us always renew as their season comes around, and you will do the same when you have tried it. We have found that in the great competition now existing we must keep our journal prominently before the public, and, in our mutual interest, we ask you to join us. Our system is more effective than a circular, and you will find it just as effective for your business and the cost very much less. Try us. For any further information write, and it will be forthcoming.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

MRS. F. M. G. PENDER,

47 West Twenty-second Street.

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,

By MISS M. E. BRADDON.

THE GIRL AT THE GATE,

By WILKIE COLLINS.

A BRIDE'S TRAGEDY,

By MISS MULOCK.

THE RECTOR'S DAUGHTER,

By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,

By MARY CECIL HAY.

GABRIEL'S MARRIAGE,

By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,

By ETTA W. PIERCE.

THE RIGHTFUL HEIR,

By M. T. CALDOR.

THE DOUBLE HOUSE,

By MISS MULOCK.

TWICE SAVED,

By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, *profusely and handsomely illustrated*, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the AMERICAN ANALYST.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

THE WORLD'S MEDICINE.

From the earliest days of medicinal science no antidote has achieved such a reputation as

BEECHAM'S PILLS.

Their fame has reached the uttermost parts of the earth; their curative power is universally acknowledged to a degree unprecedented in the annals of physical research; and it is echoed from shore to shore that for Bilious and Nervous Disorders, Indigestion with its dreaded allies, and for assisting Nature in her wondrous functions, they are

WORTH A GUINEA A BOX.

BEECHAM'S PILLS—the wonderful English Medicine—are a safe and speedy cure for **Weak Stomach, Impaired Digestion, Sick Headache, Constipation, Disordered Liver, etc.** Sold by all druggists in the United States at 25 cents a box, or will be mailed on receipt of price by B. F. ALLEN & Co., 365 Canal Street, New York, sole agents for the United States. Prepared only by THOS. BEECHAM, St. Helens, Lancashire, England.

In ordering mention THE AMERICAN ANALYST.

Four Books in One! No Household is Complete Without It!

THE COMPLETE BOOK OF HOME AMUSEMENTS.

What most lives need is *more sunshine*. Let us banish care, have a good time, enjoy ourselves while we may. How much happier—how much better off—are those homes wherein the father and mother, and even the gray-haired grandparents, join with the children after tea in a merry game or other amusement, than those wherein reticence and reserve and chilly demeanor prevail. "But," you say, "what shall we do? We read until we are tired; and we know of no amusement that we care for. How shall we employ the long winter evenings?" We have published a book to answer this question, and a wonderful book it is. It contains 64 large 8-column quarto pages, neatly bound in handsome covers, and is filled to the brim with every conceivable thing for the enjoyment of home. It is in reality *four books in one*, for it covers the ground usually occupied by four distinct volumes, and contains four times as much matter as any book published at the same price. It is a complete text-book for Public and Private Entertainments, Private Theatricals, Parlor Exhibitions, Social Gatherings, School Exhibitions and Evenings at Home. It is a book for old and young, grave and gay—a veritable storehouse of good things for all. It contains a number of ACTING CHARADES, with full directions how to perform them. It gives some very excellent PARLOR DRAMAS, easily acted yet very amusing. It tells all about SHADOW PANTOMIMES, and this alone we think you will say is worth the price of the book. It contains nearly fifty beautiful TABLEAU VIVANTS, and gives full and explicit directions for performing them. In it are so many amusing PARLOR GAMES that we have not attempted to count them, but we think we have almost everything, new and old, that was ever thought of in the game line. Then we come to a lot of wonderful ILLUSTRATED PUZZLES—tantalizing, perplexing, apparently intricate, but so *easy* when you turn to the proper place and learn the answers. Here also is a savory dish of RIDDLES, ENIGMAS, CHARADES, ETC.—a nice large lot of them. How young and old heads will puzzle and study over them, and how proud you will feel when you have solved one correctly. As to CONUNDRUMS, there are *nearly a bushel* of them, some so funny you will want to hold your sides with laughter, and what fun it will be for one of the company to read the questions and see who can guess the answers! A considerable portion of the book is allotted to PARLOR MAGIC, and here you will find hundreds of wonderful and amusing tricks, easily performed, yet exceedingly mystifying to your audience. Then there are a lot of amusing and instructive CHEMICAL EXPERIMENTS, showing how the combination and manipulation of the simplest agents will produce the most surprising results. Following these are a number of excellent DIALOGUES, comic and serious, suitable either for school exhibitions or parlor entertainments. Last, but not least, the book contains nearly fifty of the finest RECITATIONS, dramatic, pathetic, sentimental, and comic, ever written. It is handsomely illustrated, and is indeed a splendid book. THE COMPLETE BOOK OF HOME AMUSEMENTS will be sent by mail, post paid, to any address, upon receipt of only *Twenty-five Cents*.

HOW THE READERS OF THE AMERICAN ANALYST

MAY OBTAIN ANY ONE OR MORE OF
THE ABOVE BOOKS

FREE.

To any one who will send us **One New Subscriber** to the AMERICAN ANALYST for one year, at \$1, we will send, **Free**, any one of the above books, to compensate him for his trouble; to any one who will send us two new subscribers, we will send any two of the books; and for three new subscribers, we will send the three books. This will be good pay for little work, for it is a simple and easy matter to get one or more new subscribers to the AMERICAN ANALYST. Show the paper to your friends and neighbors, and you will have little difficulty in inducing one or more of them to subscribe for one year. And when you have received your book or books you will feel doubly repaid for what trouble you have taken. If the parents do not wish to try it, let the little boys and girls do so after school hours. We feel sure that every one of our present subscribers and readers can readily secure for us one or more new subscribers, and we offer this special inducement in order to stimulate effort in this direction. The books will be found well worth the slight effort that will be required to secure them. Try it, and see how easy it will be.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no constructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dinmock, only three possessed the power of acting on starch. These brands were **MALTINE**, Corbyn, Stacey & Co.'s Extract, and Keppel's Malt Extract.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

PROF. R. H. CRITCHFIELD, Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Quinine.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Fermented.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peptones.	MALTO-VIBURNIN.
MALTINE with Pepsin and Pancreatic.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analysis by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, 4 inches, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without iron, is designated on the label as "No. 2."

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

ORGANIZED HYPNOTISM.

A movement is on foot in London to organize a society for promoting the development of the science of mesmerism, and the application of hypnotism to practical needs. Two eminent French physicians, distinguished for their investigations in the realm of animal magnetism, Drs. Grillo and Charcot, are among the leading spirits in the new movement, one important object of which is to protect society from the risks consequent upon the practice of hypnotism by rogues and pretenders. It is sought to confine it to the medical profession and persons duly and legally qualified to practice it. For this purpose it is proposed to found a school of hypnotism in London, at which the science will be properly taught by the best exponents, scientifically demonstrated by lecture and experiment, and its beneficial uses correctly defined and expounded. From this school it is hoped that a wider knowledge and appreciation of the science will spread. At present the medical profession does not look with much kindness upon hypnotism, nor does the general public, for it has

been accustomed only to see it practiced by mountebanks and charlatans. But if it were made the subject of genuine scientific research, as has been done by Dr. Charcot in Paris, and if its practice was restricted by law to the duly qualified, then both the public and the medical profession would begin to accord to it the respect this very remarkable and, in its effects, marvelous science deserves. Dr. Charcot and Dr. Grillo are the greatest of present day exponents of this science. Their practice is totally different, however. Dr. Charcot uses it frequently as an anæsthetic. Dr. Grillo, on the other hand, employs the science almost exclusively for what he rightly terms "moral cures." This is by means of suggestion. He goes, for instance, to the reformatories for boys and girls, and having hypnotized a patient, whose disease we will say is theft, suggests that he shall no more steal nor be dishonest. The results of suggestion are variable in their effect. Sometimes they will last for two or three years. In a few cases the suggestion needs never to be repeated; but in the majority of cases the effect is good in this way, that the patient learns during its continuation to appreciate the advantages of the suggestion to such a degree, that after the effect of the hypnotism itself has worn off, the appreciation remains and the "moral cure" is complete. Dr. Charcot has applied it in cases of hysteria. Many people fancy they are sufferers from certain diseases, as lameness, rheumatism, paralysis. He hypnotizes them and "suggests" to them that they are cured. When he restores them to their consciousness, the suggestion remains and the cure is complete. Hypnotism is in reality produced by the tiring of one of the senses, and it may be induced by acting upon the credulity. Thus, for instance, in the well known cases of the pilgrims to Notre Dame de Lourdes, the people are first of all fully convinced that they are going to be cured. In other words, they are hypnotized. The cure is then "suggested" to them, and the result is a so-called miracle, which is no miracle at all.

BURSTING THE INSPECTION BUBBLE.

On Monday, September 23d, in the United States Circuit Court in St. Paul, Minn., Judge Nelson delivered an able and exhaustive opinion, holding the Minnesota Meat Inspection Law unconstitutional and void. He held that it was in plain violation of the commercial clause of the Constitution, which provided that Congress shall have control of commerce between the States and with the Indian tribes. He also held that it was in violation of the clause of the Constitution which provides that the citizens of each State shall be entitled to all the privileges and immunities of the citizens of the several States. The decision opens the State of Minnesota throughout to the sale of dressed beef from Chicago and Kansas City, and practically settles the validity of the law compelling inspection on the hoof, because there is no court except the Supreme Court of the United States that has authority to reverse

or overrule this decision, and it becomes the law of the land until it is reversed. As an appeal could not be heard in the Supreme Court in from three to five years, and it is not at all probable that the decision of two so able jurists as Judges Blodgett and Nelson would ever be reversed, it practically kills the Minnesota Cattle Inspection Law.

GRASPING TIME'S FLEETING FORELOCK.

The 500th natal year of the United States of America is to be celebrated in Chicago. An exposition of the world's industries is to be organized as a fitting celebration of that important epoch. The Hottentot and the Esquimaux, the Mongolian, and the Caucasian, the Arab and the Indian, the bushman and the cowboy, the Jap and the African, the lion of commerce and the lamb of industry will unite in their praise of Christopher Columbus by a friendly rivalry in exhibiting their products of art, science and literature.

The above from the Chicago *Health and Home* for September affords a brilliant illustration of that city's indomitable enterprise. When the exposition of 1892 was first mooted there were some vague rumors that Chicago would willingly accept the contract if she should be selected as the site for celebrating the Columbus anniversary. But popular sentiment was naturally averse to locating an exposition of such significance elsewhere than in the national metropolis, and Chicago was compelled to give way to New York. It appears now from the editorial quoted above that, far from being disheartened at failing to secure the show of 1892, Chicago has determined to get up on her own account a glorious demonstration for the Fourth of July, 2276, which our esteemed contemporary rightly conjectures will be an "important epoch." One scarcely knows which is the more commendable—the good natured manner in which the Queen City drops the Columbus memorial as being too large for her grasp, or the caution she displays in selecting a date 387 years ahead for getting up a performance on her own account. She evidently expects to require about that interval for educating the Hottentots, Esquimaux and Arabs in their respective parts in the pageant, and we trust we shall be pardoned for expressing the editorial regret that we cannot personally be present on the auspicious occasion. We should like to see those Bushmen, and hear them warble their praises of Columbus.

SUNFLOWERS AND MALARIA.

In a recent issue of the Russian medical journal, the *Meditsina*, a contributor emphatically draws attention to the common sunflower as an excellent and cheap substitute for quinine in the treatment of malarial fevers of all possible forms. The remedy has been from time immemorial used for the purpose in the Russian, as well as Persian and Turkish popular medicine, and that mostly after the following plan: A flask is filled loosely with finely cut dry or recent flowers and stem, and then with vodka aqua vitæ. The hermetically corked vessel is left to stand under sun rays, or at

some warm place, for two or three days. The tincture is then ready for use and should be given as a small wineglassful three times a day. In recent cases, complete and permanent cure ensues in from one to three days; in most obstinate and inveterate, not later than a week. The remedy proved successful even in such cases where quinine and other anti-malarial means failed.

LIGHT FANTASTIC ATOMS.

A congress of chemists was held recently in Germany in which several notable scientific diversions were exhibited. One in particular attracted special attention. Dr. Hoffmann, of Cologne, gave a short lecture enumerating the difficulties experienced by students in remembering the constitution of organic compounds, and proposed an original method of fixing the formulæ in their memory. A ballet then commenced, in which the coryphees, dressed in various colors, represented the different atoms. Under the direction of the professor, the atoms grouped themselves in different attitudes, representing the chemical compounds and their reactions. Specially noteworthy were the composition of benzole and aniline and its derivatives. On the formation of fuschine, or any of the coloring matters, brilliant lights illuminated the groups. The representation terminated in the explosion of one of the substances. This "excellent ballet" was the crowning event of the evening.

ENFORCING ADULTERATION LAWS.

We learn from our Western exchanges that the advocates of pure food in Minnesota and Wisconsin are about to begin a series of prosecutions for violations of the laws relating to the adulteration of food. The dairy and food commissions in both States claim to have discovered recently many despicable and dangerous adulterations which deserve the severest criticism. Dr. Drew, of Minneapolis, has made a report as department chemist showing the result of analyses of suspected food and food constituents. Twenty-three samples of cream of tartar and ten of olive oil were reported on. Six of the olive oil samples were largely or entirely made up of cottonseed oil, which is sufficient to bring the article under the ban. Out of the 23 samples of cream of tartar, only two were anywhere near pure, while the other 21 were rank frauds, none of them containing any cream of tartar whatever. All contained tartaric acid; 20 had starch or flour, 10 contained acid calcium phosphate, 4 alum, and all terra alba or sulphate of lime. During the month of August 123 samples of dairy and food products and liquor were received at the

Minneapolis laboratory, including milk, cheese, baking powder, vinegar, lard, wine, whiskey, cream tartar, olive oil. Sixty-seven were adulterated, 47 were pure, and the analysis of 11 is not yet completed. The laws against food adulteration are directly in the interest of the consumer, and it rests with him to see that these abuses are exposed and punished.

SODA.

SOME INVESTIGATIONS RESPECTING THIS IMPORTANT PRODUCT.

This term is applied scientifically only to the oxides of the metal sodium, but practically it covers several other sodium compounds, more particularly the hydrate and carbonates. Three oxides are known but neither of them is of any considerable importance in manufacturing or industrial operations. The carbonate of sodium Na_2CO_3 is an important salt existing in nature but not to a very great extent. The sesqui carbonate is found in several localities especially in Egypt and South America under the name of *trona*. Other varieties are found in India, Hungary, Mexico, etc. Formerly soda was largely obtained from the ashes of marine plants by calcination, the product being known as barilla or kelp. About the close of the last century Scheele and others worked out a process for the decomposition of common salt. The use of sulphuric acid for the decomposition of salt and fusing the resultant sulphate of soda with coal into sulphide and decomposing this by iron or lead into caustic soda and sulphide of lead was first proposed by Higgings in 1781. LeBlanc's process, originally stimulated by a reward of the French government to find a substitute for barilla, consisted in the decomposition of salt by sulphuric acid, the conversion of the sulphate of soda thus formed into carbonate of soda and sulphate of lime by means of chalk and coal and then by washing, of the soluble carbonate. This process, as we have roughly described it with remarkably little modification, is the one now generally employed. The sulphate of soda is generally known as salt-cake. The action of sulphuric acid upon salt is very simple; thus

The soda carbonate is also known as soda-ash. This is further refined by dissolving in hot water, settling, boiling down and re-furnacing. The crystalline compound of carbonate of soda with ten atoms of water is known as soda-crystals which are extensively used for household and cleansing purposes, also in bleaching, tanning and dyeing.

Bicarbonate of sodium NaHCO_2 is prepared by passing a stream of carbon dioxide through a cold solution of the neutral carbonate or by exposing the crystals to the gas. It is also prepared by another process where four parts of soda crystals are mixed with one part of sesqui carbonate of ammonia, which when heated gives off ammonia, the bicarbonate of sodium remaining. This solvay process is founded upon the well known laboratory reaction, that when carbon dioxide is passed into a solution of common salt and ammonia, bicarbonate of soda and chloride of ammonia are formed:

American manufacturers have greatly improved their method of manufacture, cheapening and bettering their product. Some manufacturers still adhere to the old method of charging the soda with carbonic dioxide in large bulk while others use only thin layers. The latter naturally have a more even product, because every part of the thin layer of soda becomes evenly charged with the carbonic acid gas while in the old process only the outside portions of the soda are sufficiently charged, the inner portions or core not having been as accessible to the gas. It follows that bicarbonate of soda prepared by the latter method does not run as evenly in the amount of bicarbonate it contains. The value of bicarbonate of soda depends upon the large and even proportion of bicarbonate, the low amount of carbonate and

the minimum of moisture found therein. As in many other goods the consumer will find his interest best subserved in buying bicarbonate of soda in packages bearing the trade mark and name of the manufacturer. It is generally sold in packages from one half pound to a hundred or more pounds.

PACIFIC INQUIETUDE.

THE CHILDLIKE CHINAMAN THREATENING THE CALIFORNIA CANNING BUSINESS.

The Pacific coast fruit packers are far from the enjoyment of the quiet contentment that eastern packers associate in their minds with the glorious climate of California. They have their troubles just like their eastern brethren, and in addition to ordinary disappointments they sometimes find it difficult to make the railroads give them reasonable rates on their products coming East. But now the greatest of all evils seems to threaten their business. The Chinese have developed a taste for canning fruits, and they are going into the business at a rate that is sufficient to alarm some of the packers. During the few years that the quiet Chinaman has been engaged as a laborer in the canneries he has kept both eyes open and learned all he could. What his keen observation has discovered cannot be told, but suffice to say it has its bearing on that part of the business that will reduce the expenses of labor to less than half of what is now paid for it. The American canners have been very slow to act in the matter of ascertaining the feeling among the trade in regard to the growth of the Chinese canning business. An informal meeting of the Canned Goods Association of California was held recently, at which the situation was discussed, and it was understood that an open meeting would be held soon to take action. The *Herald of Trade* has the following to say on the subject: "When it was first announced that the Chinese had established two fruit canneries in California, one at San Jose and the other in this city, there was an inclination to keep the matter quiet; but it was soon noised abroad, and now the daily newspapers are discussing the situation. Several prominent manufacturers have been interviewed, and the canners have been scored for first engaging the Chinese and letting them into the mysteries of fruit packing. To some extent they justly have been subjected to the public criticism of their course in the past. It is a fact that they have been employed about the fruit canneries for years, although they have never been allowed to handle fruit, at least in the city canneries. They never should have been allowed an entrance to the canneries under any consideration. History of all California industries in which Chinese have been engaged repeats itself. In cigar making they have driven out the American manufacturer. In boot and shoe making the trade has had the same experience. In clothing manufacturing the Chinese have built up a business at the expense of the Americans engaged in the trade. To look for anything else but a steady increase in the number of Chinese canneries, if they are allowed to continue in the way in which they have commenced operations is simply a momentary evasion of a disagreeable situation. If the industry is to be turned over to the Chinese, there is no occasion for any alarm, but if it is to be preserved and protected against the threatened inroad, action must be taken immediately, and decisive action, too."

ANTI-SHAKE.—A Brazilian inventor, to whom a patent has just been issued, proposes to remedy the annoyance suffered from the shaking of dishes upon the tables on shipboard by means of an electric contrivance. His idea is to use an electro-magnetic device. To the under side of the dishes will be attached small pieces of iron, and on the table will be laid long strips of soft iron to which wires leading to a battery will be connected. The use of this electro-magnetic appliance will not mar the appearance of the tables, and certainly it should prove effective.

MONOTONY AND NERVES.

MENTAL AND NERVOUS OVERSTRAIN FROM PIANO PRACTICE.

The weariness of long-continued study is proverbial. Its explanation is not far to seek. One portion of our entire being is almost entirely occupied, and the monotony of the process constitutes in large measure the cause of exhaustion. Relief must accordingly be sought in rest, in the exercise of other functions, or in variation of the form of mental exertion. Such timely and refreshing change enters into all well-ordered plans of education. There is, however, in every study a stage at which persistent concentration is indispensable to anything like high development. Reiteration, though tedious, is necessary to full instruction. Perhaps no better illustration of this fact could be found than that which is constantly evident in the cultivation of music. One could hardly conceive of anything more truly monotonous than a continuance of that tax of patience, piano practice. No doubt inclination and inborn faculty may do much to create an interest, but the most enthusiastic learner will sometimes, notwithstanding, rebel against the exactions of musical cram. It has even been stated by a German observer that much of the nervous delicacy so common among girls is traceable to excessive diligence at the piano. There is more than a grain of truth in this observation. The limit of moderation, indeed, may not be capable of exact definition, for a longer or shorter period would naturally suit the need and capacity of different persons. One or two hours of practice, it is probable, would rarely prove excessive. When, however, six or eight hours are daily absorbed in repeating a humdrum series of manipulations, the wonder is that nature long endures the drudgery. Yet this is the common lot of many who aspire to skillful execution. The coveted perfection doubtless is often approximately reached, but the associated circumstance of nervous overstrain will suggest a doubt whether such qualified excellence is altogether desirable. At all events, it is but reason to allow that proficiency so dearly purchased is not, for young people of deficient nervous tone, a social necessity, especially if they be also void of any special artistic aptitude. Nay, even for those whose health and energy permit them to enjoy, if they choose, the privilege of musical hard labor, a frequent interlude of rest and recreation is no less needful than discreet.

CORRESPONDENCE.

SOME FASHIONABLE FANCIES OF LONDON SOCIETY.

LONDON, Sept. 20.

Editors AMERICAN ANALYST: Since I last wrote I have been enjoying a very lively time at Cowes alternately with little visits to House Boats in the realms of Father Thames. A description of the Cowes festivities and a luncheon on a House Boat I hope will be acceptable to the readers of the AMERICAN ANALYST. A luncheon at the house of one of the private residents at Cowes was a most decorative affair. Fishing-nets were festooned round the tops of the rooms, and in them was a sort of *omnium gatherum* of imitation marine productions, such as lobsters, mackerel, oyster shells, intermingled with Japanese grasshoppers, frogs and other Japanese creatures I wot not the name of. Japanese fans and birds were dotted about between the nets, oars crossed over the windows and doors, fringes of shells looped back the window curtains. In the centre of the table in the dining-room was a trophy of flags of all nations, of course in miniature size; they were placed in a large old-silver bowl. At the top and bottom of the table were miniature cannon made entirely of flowers; whilst down the table were specimen glasses each holding a different colored or differently marked picotee or

carnation. Small flags standing on cannon-balls were the guest-cards, and the menus were written on shells. At several houses the floral decorations were very charming. One table of water-lilies and grasses was especially captivating. A great block of ice stood in the centre, and miniature glass bowls were placed round, containing very small gold fish. At another dinner there were metal archways placed along the table, covered with blooms of pink and crimson roses interspersed with mignonette. At one table the flowers were most original, but I do not know that I quite liked it, as it was a little heavy: it was a combination of mauve orchids, gold roses, and black foliage; it is prophesied these mixtures will be very prevalent in 1890. At one of the last of the season dinner-parties there were mauve orchids, yellow foliage and very dark red roses. The boat-house to which I was bidden to luncheon was a trophy of floral decoration. The boat was hung with baskets of flowers of every description; window-boxes of them were placed on the top, and on which top we had our lunch under a brilliant tent awning. It was a long table, and in the centre was a sedan chair entirely composed of corn flowers and poppies, in the centre of the chair a maidenhair fern; at intervals in the centre of the table, were tiny pleasure-boats entirely made of corn flowers, with here and there a poppy; there were sprays of the same flowers scattered all over the table, and down the sides were little silver shrimp nets containing flowers. The menus were miniature ships, the bill of fare written on the sails, and each guest-card was in the shape of an oar. The balcony or railing round the top of the boat was festooned with garlands of flowers. The china was all hand-painted, and descriptive of river scenes, such as boats of all kind, fishing, bathing, swimming, etc. Among the guest-cards most in vogue this season were hats and horse-hoofs. Candle shades have become rather costly this season, for at many houses I saw that the shades were in perforated silver to match the candlesticks; they were lined with red or yellow, according to the tone and tints of the decorations. Macbeth menus were greatly used also. They were made in cardboard in the shape of the witches' caldrons, smoke and all. Butterfly menus and guest-cards all in one were some of the pretty table conceits. The name was written on the wings and the wings unfolded disclosed the menu.

W.

MICROBES IN A TRUNK.

INFECTED MEMENTOES AFFLICT TWO FAMILIES AFTER THIRTY YEARS.

Thirty-five years ago an opulent family lived in one of our most beautiful suburbs, says the *Journal of Surgery*. Two lovely children graced the happy household. But scarlet fever closed their eyes in death. The grief stricken mother gathered up little slippers and toys, with two golden tresses, and reverently laid them away in a trunk as sad but priceless mementoes of her lost darlings. War came with its tragic vicissitudes, and death time and again threw its shadow over the hearthstone. Finally the place passed into strangers' hands. Last year two families took it as a summer residence. The children, six in number, with childish curiosity, began to explore the secret recesses of the grand old house. In a closet was found the forgotten trunk. A touch dissolved the time-corroded clasp and one by one the sacred relics were removed, until a faded newspaper was found which told the pathetic story. Half spelling out the meaning they took it to their mother, who chided their curiosity and tenderly replaced the treasures. Five days after this occurrence two of the children were seized with scarlet fever and forty-eight hours later the other four were attacked. Two cases were grave, the others mild. All recovered. Was the disease contracted from the trunk? I think so, because there was no other ascertainable source of infection.

Moral—Silks, woolen and hair, being good fomites,

should not be put away in air-tight trunks as mementoes of friends dying with infectious diseases, because they may become at some remote period the starting point of a wide spreading and disastrous epidemic, a calamity which was averted in this instance only by complete isolation.

FAITH FOLLIES.

CURRENT EXPOSURES OF CRIMINAL CHRISTIAN SCIENCE.

A GIRL FORCED TO DIE WITHOUT MEDICAL AID.

A despatch from Watertown, N. Y., dated September 22, says: Anna McKee, one of the prettiest young ladies of Cape Vincent, was employed as dressmaker in Redpath's establishment in New York. A few weeks ago she came up from New York to visit friends. While in Cape Vincent she stopped at the residence of Emma Ingalls, a spinster, who thinks she has been cured of innumerable ills through the medium of one Mrs. A. J. McConnell, who is chief among a small band of Christian Scientists. A few days ago Miss McKee was taken ill with gastritis. Mrs. McConnell and Miss Ingalls took full charge of her case. They did not send for a physician, but told the girl that God would be angry with her if she distrusted Him to that extent. They advised her that if she kept right on trusting and praying she would get well. Miss McKee did not believe in Christian Science, but she was powerless. When at last she lay in the most terrible agony, the only comfort or help she got was an exhortation to be faithful and pray. Three days before Miss McKee's death Miss Libbie Iselin and Mrs. E. Stala heard how ill she was, and went to the house. They were denied admittance by Miss Ingalls, but pushed the spinster aside and reached the sick girl's bedside. They sent for Dr. Masson, but when the physician arrived he was unable to do anything to save the girl's life. Miss McKee died next day. The physician believes that if he had been called in time he could have saved her life. The people of the town are very indignant over the affair.

SMOKE SANITATION.—The belief that smoke from soft coal may have beneficial sanitary effects is gaining ground. It is claimed that that the sulphur in the coal when burned becomes sulphurous acid gas, a well-known disinfectant. Further, that creosote and its allied products are thrown off with the fumes of bituminous coal, and that an atmosphere charged with carbolic acid must be freer from germs of disease than an apparently purer air.

DELICATE WORK.—A process of engraving on glass and crystal by electricity has been communicated to the French Academy of Science by M. Plante. The plate to be engraved is covered with a concentrated solution of nitrate of potash, and put in connection with one of the poles of the battery, and the design is traced out with a fine platinum point connected to the other pole. The results are said to be of marvellous delicacy.

THE WATCH ANATOMIZED.—The average watch is composed of 175 different pieces, comprising upwards of 2,400 separate and distinct operations in its manufacture. The balance has 18 000 beats or vibrations per hour, 12,060,080 in thirty days, 157,680,000 in one year. It travels 1 43-100 inches with each vibration, which is equal to 9½ miles in twenty-four hours, 292½ miles in thirty days, or 3,558½ miles in one year.

NOISELESS CLOCK.—A curiously considerate invention has been produced by a Frenchman, in the shape of a noiseless clock, for use more especially in sick rooms. In place of the usual pendulum, the hands are set in motion by the unrolling of a chain, the end of which is fastened to a buoy floating in a tank of liquid. This fluid escapes at a uniform rate, and can be utilized to feed a lamp wick, thus giving the apparatus the double character of clock and lamp. When the lamp is lighted the necessary diminution of liquid takes place by combustion, and at other times by carefully-regulated dropping.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

October.

MEAT.—Beef, mutton, pork, venison.

POULTRY AND GAME.—Chicken, duck, geese, grouse, hare, partridge, pheasant, pigeons, celery, rabbits, turkeys, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, whiting, salmon, trout, perch, smelts, oysters.

VEGETABLES.—Artichokes, broccoli, potatoes, turnips, cauliflower, cabbage, carrots.

FRUIT.—Apples, pears, quinces, grapes, nuts.

PRACTICAL RECIPES.

TO FRICASSEE COLD ROAST BEEF.—Cut the beef into slices (which should be very thin), and put it with some strong broth into a stewpan; add parsley chopped small, an onion scored, and a piece of butter; simmer fifteen minutes, then add a glass of port wine and the yolk of a couple of eggs; mix well, stew quickly, heat the dish, rub it with a shalot, pour fricassee into it and serve.

BROILED SALMON.—Cut the fish in inch slices from the best part, season well with pepper and salt; wrap each slice in white paper which has been buttered with fresh butter; fasten each end by twisting or tying; broil over a very clear fire eight minutes. A coke fire, if kept clear and bright, is best. Serve with butter, anchovy or tomato sauce.

FRENCH VEAL PIE.—Mince some cold roast veal with a little fat ham; season it highly with pepper, salt, mace and lemon peel; add a large tablespoonful of mushroom ketchup, about two dozen oysters, and a teacupful of good gravy. Line the dish with puff paste, put in the ingredients; cover the pie and let it remain in the oven long enough to bake the paste.

GIBLET PIE.—Stew the giblets in a little water with an onion, two or three cloves, a bunch of sweet herbs, some salt and whole pepper. The remains of cold duck or goose seasoned with pepper, salt, an onion finely minced, a piece of butter rolled in flour should be laid on a plate. When the giblets are sufficiently stewed, take out the onions, herbs and whole pepper, then put them with the other ingredients into the dish. Add a teaspoonful of Worcestershire sauce or Yorkshire relish to a wineglassful of mushroom ketchup to the gravy from the giblets and pour it into the dish. Cover with puff paste and bake for an hour.

COLD VEAL OR CHICKEN PIE.—Lay a crust into a shallow tart dish, and fill it with the following mixture: shred cold veal or fowl, and half the quantity of ham, mostly lean, put to it a little cream, season with white and cayenne pepper, salt, a little nutmeg, and a small piece of shallot chopped as fine as possible; cover with crust, and turn it out of the dish when baked, or bake the crust with a piece of bread to keep it hollow, and warm the mince with a little cream, and pour in.

OATMEAL GEMS.—One pint of oatmeal, one pint of sweet milk; soak over night; then add two eggs, a tablespoonful of sugar, a little salt, a teaspoonful of Horsford's baking powder and half a pint of flour; bake in a quick oven.

SOFT GINGERBREAD.—Three pints of flour, one cupful lard well mixed through it, one teaspoonful salt, one teaspoonful ginger; beat two eggs, add one pint molasses, one cupful brown sugar, one and a half teaspoonfuls soda, dissolved in water, stirred in half a pint sour milk or buttermilk thoroughly; add all to flour; mix well, pour into sponge-cake pans, and bake in a good oven.

ROYAL PREVARICATIONS.

THE TRUTH, THE WHOLE TRUTH, AND NOTHING BUT THE TRUTH.

In the annual report for 1884 of the Department of Inland Revenue of the Dominion of Canada, the chemist, W. Saunders, reports on the results of his analyses of baking powders, and among these reports are included those on the Price Baking Powder, and on the Royal Baking Powder. In this report on page 21, as published by that department reads as follows:

Baking Powder, Price's—Contains matter insoluble in water, 24.16 per cent., consisting of starch, with crystals of tartrate of lime; 10 grammes yield, 36½ cubic inches carbonic acid gas; ash 37.94 per cent., containing 3.74 of matters insoluble in water, the remainder mixed alkaline carbonate. A mixture chiefly consisting of bicarbonate of soda and cream of tartar, adulterated with about 20 per cent. of starch.

Baking Powder, Royal.—Contains 24.80 of matter insoluble in cold water, chiefly starch; 10 grammes yield 33½ cubic inches carbonic acid gas; ash 38.84 per cent., containing alkaline carbonates. A mixture consisting mainly of bicarbonate of soda and cream of tartar, adulterated with about 20 per cent. of starch.

A ROYAL MISREPRESENTATION:

"Here is the truth. The Chief Government Chemist, appointed for the examination of food by the Canadian Government says: Dr. Price's Baking Powder contains matter insoluble in water, 24.16 per cent. consisting of starch and tartrate of lime—a mixture adulterated 20 per cent."

As the Royal Baking Powder Company has deemed it judicious to publish a garbled copy of the report on the Price Baking Powder and carefully omitted the report on its own powder, we have deemed it just to reprint a full copy of these reports as actually printed, and the foregoing garbled report published by the Royal, the official reports headed "Here is the Truth" below. A comparison will enable a fair-minded public to decide on which side the truth is.

A further explanation may be added that the true value of a baking powder consists in its leavening power. In this respect, according to the genuine report, Price's powder gave 4.44 per cent. more carbonic acid gas. The matter insoluble in water, mostly starch, in the Royal, exceeded that in the Price by .64 per cent. The ash in the Royal exceeded that in the Price by .90 per cent. Thus it will be seen that according to this very report, upon the value of which the Royal sets so much store, the Price baking powder is superior to it in all that makes a baking powder valuable, and is only exceeded by the Royal in those matters which are inseparable from a baking powder, but which, if present in excess, are a detriment to it. The chemist gave the Royal unintentionally an unfair advantage over the Price by not stating that the Royal derives considerable of its leavening power from the presence of carbonate of ammonia, a not very appetizing substance, which the Price has never used. It is but just to add that notwithstanding this advantage, which cheapens the powder, the Royal baking powder did not show as much leavening power as the Price, which is not defiled by ammonia, and relies only on cream of tartar. The reference to what the chemist chooses to call "adulterated with about 20 per cent. of starch," applies to both powders, and is easily explained. It is not an adulteration for the purpose of cheapening either product, but is an absolutely unavoidable addition to every good baking powder for the purpose of preserving it.

The following resolution passed by the New York Board of Health will also help to throw light on the methods of the Royal Baking Powder Company:

"Misrepresentation of the New York State Board of Health, by the Royal Baking Powder Co.

"At a meeting of the State Board of Health, held February 11, 1885, it was

"Resolved, That the advertisement of the Royal Baking Powder Company quoting the State Board of Health of New York, as recommending through one of its analysts, its purity, etc., is a misrepresentation. In no case does the State Board of Health or its representatives cause such examination to be made with a view of recommending particular products.

"ALFRED L. CARROLL, M. D.,

"Secretary,"

BUSINESS NOTES.

WATER COLORS.

BEAUTIFUL PORTFOLIO OF PAINTINGS.

The manufacturers of the well-known Scott's Emulsion of Cod Liver Oil are issuing the most beautiful portfolio of Eight Artistic Studies (Birds and Flowers) that has ever come under our notice. This work is worth at least \$2.00, but Messrs. Scott & Bowne, with their usual enterprise, have made arrangements whereby they can supply a copy by mail to any one who will write to them, enclosing 25 cents in stamps or P. O. order. This is a chance seldom offered, and all lovers of art should avail themselves of it. Mention this paper, and address Scott & Bowne, 132 & 134 South Fifth Avenue, New York.

HORSFORD'S ACID PHOSPHATE.

A BRAIN AND NERVE FOOD,

for lecturers, teachers, students, clergymen, lawyers, and brain-workers generally.

LESS SANGUINARY.

The laws of Draco, said to be written in blood, would have been less sanguinary if written with Esterbrook's Steel Pens.

NIEDER-SELTERS-WATER.

The taste of the water is refreshing, mild, a little saltish, effervescent and extremely agreeable; it has no smell if that sensation which is excited in the nose by the carbonic acid rising from the water may not be considered as such. By shaking a half filled bottle a good deal of gas is disengaged; any other odor than that of the carbonic acid is not to be observed. This water has not changed its constituents in any essential for many years. It is sold here just as it comes from the spring and for this reason is to be preferred to the many imported more or less artificial waters.

GELATINE.

The only American manufactory exclusively devoted to making gelatine is that of James Chalmers' Son. This gives it the greatest advantage over all factories where glue is also made, because of the possibility to keep the gelatine pure. Mr. Chalmers was formerly the foreman for Cox in England, hence he knows how to make good gelatine and those who are constantly using it in preference to any other say that it is by far the best.

SLATE ON IRON.—Iron roofs covered with slate are not to be recommended, as the contraction and expansion of the iron trusses are apt to work the slate loose in time and cause trouble.

GOOD ADVICE.—Sir William Gull says that when fagged out by professional work he recruits his strength by eating raisins, and not by drinking wine or brandy. Another good saying from the same source: A pint of warm water, taken on an empty stomach in the morning, is the safest and surest of all remedies for habitual constipation. It stimulates peristaltic action, thereby giving a normal action without pain. If the tongue is coated, squeeze a lemon into the water and drink without sweetening.

ICE IN THE SICK ROOM.—A saucerful of shaved ice, says the New York Medical Times, may be preserved for twenty-four hours with the thermometer in the room at 90 deg. Fahr., if the following precautions are observed: Put the saucer containing the ice in a soup plate and cover it with another. Place the soup plates thus arranged on a good, heavy pillow, and cover it with another pillow, pressing the pillow so that the plates are completely embedded in them. An old jack-plane set deep is a most excellent thing with which to shave ice. It should be turned bottom upward, and the ice shoved backward and forward over the cutter.

COMPULSORY FRAUD.—Georgia Cracker (in Atlanta)—“You say it ain't wuth nothin'?” Storekeeper—“Not five cents. It's confederate money. Where did you get it?” Georgia Cracker—“Hank Uplans passed it on me, 'way back in '62. I've had it in a stockin' up-garret ever since, a savin' of it up.” Storekeeper—“Can't you pass it back on him?” Georgia Cracker—“Not easy. Yer see, Hank kinder held back on givin' of it up, an' I hed t' gun him. He never come to.”

A FINANCIER.—“Dorothy, I think you are dreadfully extravagant to buy all those groceries.” “But, my dear Rufus, I had them charged.”

THE HEALTHFUL EUCALYPTUS.—The cutting down recently of a number of eucalyptus trees in the vicinity of the White House at Washington recalls the fact that the eucalyptus has a distinct sanitary virtue. It has the power of absorbing moisture, thus affording a protection against malarial diseases. Fifteen years ago the Trappist monks, who possessed an abbey in the city of Rome, planted trees of this species, and now have several hundred acres covered with them. The malarial fevers, which were formerly so common there, have now almost disappeared, and the same effects have been noted in those parts of California where the tree has been introduced. There are plenty of other sections of the country where its culture might be profitably attempted.

PHYSICIAN, HEAL THYSELF.—A pharmacist who puts up extensively a preparation for dyspepsia went to the editor of a prominent medical journal the other day, and said: “I want you to recommend me by letter to Dr. B.; the fact is I've got some stomach trouble, and my dyspepsia specific won't take care of it; you were telling me some time ago that Dr. B. was strong on stomach troubles; give me a letter to him.” “Yes,” said the editor, sententiously, “Dr. B. obtained a great reputation in his speciality.” “Well, write me out a letter to him,” said the pharmacist. “I would do so,” said the editor, “but he is out of town.” When will he return? “The fact is,” said the editor, “he died at sea.” “Ah!” exclaimed the druggist, “and what did he die of?” “He died of stomach trouble.”

A STEEL CHURCH.—A German firm has constructed a building for a church of Bessemer steel. It is going to the island of Manilla, where it is necessary to fortify against earthquakes.

MEDICINAL VIRTUE OF PINE FORESTS.—One of the German physicians who has charge of a sanitarium in Germany believes that there is something in the popular notion that the balsamic odors of pine forests are salubrious, and treats his consumptive patients with steam inhalations of pine needles or leaves with good results, as he claims.

JAPANESE GOLD THREAD.—Japanese gold thread, which is used in finer embroidery on account of its elegant lustre, consists of a core of silk or of wool and a spiral envelope of thin gilded paper. The strip of paper is only two-fiftieths to three-fiftieths of an inch wide, and therefore must be wound with great care. The thread thus wound is saturated with shellac and then gilded. Compared to European gold thread these threads possess the advantage of greater flexibility and finer lustre. In this they equal the beautiful gold thread of the Middle Ages, the manufacture of which for a long time was a lost art, and was recently discovered by microscopic investigation.

CURE FOR INSOMNIA.—A writer in the St. Louis *Globe-Democrat* says: “The abuse of the eye is the crime of the age. I am prepared to demonstrate that at least nine-tenths of the prevailing sleeplessness of which we hear so much is due to nervousness directly traceable to the optic nerve. We are wearing our eyes out over books and desks and types, and the effect shows itself, not only in the appearance of the organ itself, but in its retrospective effect on nerve and brain. I have discovered a remedy for sleeplessness, and for the reason I have never known it to fail. I am fortified in my opinion that the whole trouble arises from the overstrain of the eyes. Take a soft cloth—say a piece of napped towel—and fold in it two small pieces of ice at a distance apart to exactly cover the eyes when the cloth is laid across them. Then lie down, adjust the cloth with the ice over the closed eyes, and you will be asleep in a very short while.

Delicious Drink

Horsford's Acid Phosphate

Makes a healthful and invigorating drink with water and sugar only. It harmonizes with such stimulants as may be necessary to take. A desirable substitute for lemons or lime juice. Alays the thirst, aids digestion, and relieves lassitude.

“Dr. T. C. Smith, Charlotte, N. C., says:

“An invaluable nerve tonic, a delightful beverage, and one of the best restorers when the energies flag and the spirits droop.”

Dr. J. S. Niles, Pownal, Vt., says:

“Excellent as a tonic, and refreshing as a substitute for lemonade.”

WHOOPING COUGH CURED

Or Prevented by Page's Vaporizer and Cresolene.

We have abundant testimony that Cresolene vaporized in a closed room is an almost infallible remedy for **Whooping Cough**, for which distressing malady no other assured remedy is known to us. A cure usually effected in five or six days, at a trifling expense and but very little trouble. It is also exceedingly efficient in Asthma, Croup, Catarrh, Diphtheria, Influenza and Scarlet Fever. It is a safeguard against the spread of contagion.

Vaporizer complete, including a bottle of Cresolene, \$1.50. Ask your druggist for it.

Send at once for a **Trial Order** to the **Old Reliable** and enjoy a cup of Good Tea. For particulars address The Great American Tea Co., 31 and 33 Vesey St., New York, N.Y. P. O. Box 287.

GAS HEAT.—It is said that 40,000 cubic feet of natural gas are equal in heat-creating power to one ton of anthracite coal.

BRIGHT BRASS.—To keep highly polished brass free from tarnishing cover it with a thin coat of varnish made of shellac dissolved in alcohol. So long as the varnish remains the brass will continue to remain bright. The article should be warm when the varnish is applied.

HYDRAULIC BRICK.—A new hydraulic brick is now manufactured in eight different shades of red and brown, which, on cheap houses, is designed to supply the place of brownstone or sandstone for trimmings. The shades of color run from a rather dark brown to a reddish hue, and at a superficial glance might well be taken for the stones the places of which they supply.

CULTIVATING SPONGES.—An Austrian savant has obtained a harvest of 4,000 sponges which are the result of an experiment of literally sowing small parts of living sponges in a soil favorable to their production. The Austrian Government is much pleased with the experiment, which is to be repeated on a large scale in Dalmatia. The cost of the 4,000, which have been growing for the last three years, is a little over \$55, everything included.

GAS AS A FUEL.—Natural gas as a fuel has been in use about fifteen years. There are now employed in its transmission for fuel purposes 27,350 miles of pipe mains. There are in Pittsburgh 500 miles, which carry a supply to 4,268 private houses, 40 iron-working establishments, 27 glass-working places, 83 foundries and machine shops, and 450 enterprises of different kinds not enumerated. This represents an annual consumption of 7,000,000 tons of coal.

SPONGE DETECTOR.—The Florida fishermen detect the presence of sponges by means of a water-glass, which is a simple contrivance, being a circular piece of glass inserted to the bottom of a bucket. The bucket is thrust into the water, and looking through the glass the sponge hunter can clearly distinguish any object on

the bottom of the sea, even if the water be rough. The sponges are gathered with a pole from eighteen to forty feet long, with a three-pronged iron claw at the end.

SALT CALF.—A farmer named Hilton hired a very inexperienced boy to help about the place. One morning he told the lad to go and salt the calf over in the pasture. The boy took about a quart of salt, rubbed it all over the calf, working it into the hair. A gang of colts in the pasture scented the salt and got after the calf. They licked the hair all off the calf's back, and tried to lick the hide off too. The farmer tried to catch the calf to wash it, but the creature, thinking he wanted to lick, too, kept out of his way. The boy, calf and farmer are all unhappy. The colts are the only ones that got any fun out of it.—*Savannah Republican.*

DEAFNESS**

A NEW TREATMENT.
Sufferers are not generally aware that these diseases are contagious, or that they are due to the presence of living parasites in the lining membrane of the nose and eustachian tubes. Microscopic research, however, has proved this to be a fact, and the result of this discovery is that a simple remedy has been discovered which permanently cures the most aggravated cases of these distressing diseases by a few simple applications made (two weeks apart) by the patient at home. A pamphlet explaining this new treatment is sent free by A. H. Dixon & Son, 337 and 339 West King Street, Toronto, Canada.

SCOTT'S EMULSION

OF PURE COD LIVER OIL WITH

HYPOPHOSPHITES OF LIME AND SODA.

THE STANDARD EMULSION OF COD LIVER OIL THROUGHOUT THE WORLD.

A BEAUTIFUL CREAMY MIXTURE—ALMOST AS PALATABLE AS MILK.

Having much greater remedial power than the crude Cod Liver Oil, without any of its nauseating effects. Its PALATABLENESS, EASE OF DIGESTION, and long tolerance by most sensitive stomachs as well as its reliable therapeutic effect, has given it special favor with the medical Profession, and receives their unqualified endorsement and support.

Possessing as it does the tonic and stimulating properties of the Hypophosphites in combination with the strengthening and fattening qualities of the Cod Liver Oil—gives it a remedial value in WASTING DISEASES, ANÆMIA or IMPOVERISHED BLOOD, EMACIATION and CONSUMPTION—unequalled by any single or combined remedy in existence. The rapidity with which delicate children fatten and grow strong on this palatable Emulsion, is very remarkable.

Samples will be sent free except express charges to any wishing to try this preparation. For sale by all druggists.

SCOTT & BOWNE, New York.

VALUABLE TO ADVERTISERS.

You have determined to make money by vigorously pushing your business. As the AMERICAN ANALYST has determined to do the same thing, we have a community of interests. Our way of making money is to increase our circulation, and we can only do so by publicity; that is, by bringing our journal to the notice of a great number of people, who have the intelligence to appreciate a good journal when they read it and the money to buy what they want. You must necessarily want to reach the same class. Even if you do not sell directly to the consumer, it is necessary for you to tell the consumer of the quality of the goods you have to offer to induce him to ask the dealers with whom he trades for them. We propose this Fall and Winter to send a sample copy of this journal to the address of every person in the United States whose name we can find in any of the *Elite* directories or blue-books of the various cities and villages. We will thus reach several millions of new readers in addition to our already large subscription-list, covering every State in the Union. Previous experience with this method of getting new subscribers war-

rants us in undertaking the expense, believing that it will pay us. This large addition to our circulation will put any advertisement in our columns before a multitude of readers. Our advertising prices remain the same, and are so arranged as to give the lowest rates to larger and longer-continued advertisements, and will be sent on application. All respectable advertising agencies will take orders for us. If we find this system profitable, advertisers surely will. Those who have advertised with us always renew as their season comes around, and you will do the same when you have tried it. We have found that in the great competition now existing we must keep our journal prominently before the public, and, in our mutual interest, we ask you to join us. Our system is more effective than a circular, and you will find it just as effective for your business and the cost very much less. Try us. For any further information write, and it will be forthcoming.

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,
By MISS M. E. BRADDON.

THE GIRL AT THE GATE,
By WILKIE COLLINS.

A BRIDE'S TRAGEDY,
By MISS MULOCK.

THE RECTOR'S DAUGHTER,
By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,
By MARY CECIL HAY.

GABRIEL'S MARRIAGE,
By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,
By ETTA W. PIERCE.

THE RIGHTFUL HEIR,
By M. T. CALDER.

THE DOUBLE HOUSE,
By MISS MULOCK.

TWICE SAVED,
By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, profusely and handsomely illustrated, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the AMERICAN ANALYST.

ANALYST PUBLISHING CO.,

19 PARK PLACE, NEW YORK.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

P. O. Box 1574. **THE NEW YORK PHARMACAL ASSOCIATION, NEW YORK.**

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose purious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar, we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING CO.,

AMERICAN * ANALYST

WANTED ON LIBERAL TERMS.

WE ARE CONFIDENT that we have Reached the HIGHEST DEGREE OF PERFECTION in Solving the INFANT FOOD PROBLEM.

LACTO-PREPARATA.

A Prepared Human Milk perfectly Sterilized and especially designed for Children from birth to six or eight months of age.

Made wholly from cow's milk with the exception that the fat of the milk is partially replaced by cocoa butter. Cocoa butter is identical with milk fat in food value and digestibility, being deficient only in the principle which causes rancidity. The milk in LACTO-PREPARATA is treated with Extract of Pancreas at a temperature of 105 degrees, a sufficient length of time to render twenty-five per cent. of the casein soluble, and partially prepare the fat for assimilation. In this process the remaining portion of the casein not peptonized, is acted upon by the pancreatic ferment in such a manner as to destroy its tough, tenacious character, so that it will coagulate in light and flocculent curds, like the casein in human milk.

Composition :	ALBUMINOIDS.....	19 Parts.
	MILK SUGAR.....	64 "
	FAT.....	10 "
	MINERAL MATTER.....	3 "
	CHLORIDE OF SODIUM added.....	1/2 "
	PHOSPHATES OF LIME added.....	1/2 "
	MOISTURE.....	3 "

SEND FOR SAMPLE and
compare it with every other
food used in artificial feeding of
Infants.

LACTO-PREPARATA is not designed to replace our SOLUBLE FOOD but is better adapted for Infants up to eight months of age.

CARNRICK'S SOLUBLE FOOD

Is the Nearest Approach to Human Milk that has thus far been produced, with the exception of Lacto-Preparata.

During the past season a large number of Physicians and eminent Chemists visited our Laboratory at Goshen, N. Y., and witnessed every detail connected with the production of Carnrick's Soluble Food. This invitation to witness our process is continuously open to Physicians and Chemists. All expenses from New York to Goshen and return will be paid by us. The care used in gathering the milk, its sterilization, and the cleanliness exercised in every step, cannot be excelled. Soluble Food has been improved by increasing the quantity of milk sugar and partially replacing the milk fat with cocoa butter.

PHOSPHO-CAFFEIN COMP. A SEDATIVE, NERVE AND BRAIN FOOD.

This preparation has been thoroughly tested, and found to produce the happiest effects in Headaches, Neuralgia, Sleeplessness and General Nervous Irritability. We are confident that the above combination will be found superior to any of the various preparations that are used in nervous affections. It is not only a nerve sedative but a Brain and Nerve Food. The depressing effects of the sedative ingredients are fully overcome by its reconstructive constituents.

As a harmless and positive remedy in Headaches and Insomnia we are certain it has no equal. It is far more palatable than any of the preparations used for similar purposes.

PUT UP IN FOUR, EIGHT AND THIRTY-TWO OUNCE BOTTLES.

A BUSINESS BENEFIT.**ADVANTAGES TO ADVERTISERS OFFERED BY THE AMERICAN ANALYST.**

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

• The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the AMERICAN ANALYST a good advertising medium. Why should not you?

AVOID LITIGATION! BE YOUR OWN LAWYER!**EVERYBODY'S LAW BOOK.**

Litigation is a very expensive luxury; avoid it, for it doesn't pay. Thousands of lawsuits are brought because people do not understand the simple principles of law and their own and others' rights, and there are plenty of lawyers always ready to take advantage of this lack of knowledge. The object of this volume is to impart, in a simple, concise manner, the fullest information regarding legal matters. It is to be used as a work of reference, and in all ordinary emergencies will save employing a lawyer. It is a complete compendium of business and domestic law, by a prominent member of the New York bar, containing concise explanations of the general laws and the laws of the several States, regarding Administrators and Executors, Affidavits, Agency, Agreements, Apprentices, Arbitration and Award, Assault and Battery, Assignments, Attachments, Banks, Bills of Exchange, Checks and Promissory Notes, Bills of Sale, Chattel Mortgages, Citizens and Aliens, Common Carriers, Contracts, Corporations, Deeds and Mortgages of Real Estate, Descent and Distribution, Lower, Easement, Exemptions, Farmers' Law, Fences, Fixtures, Garnishment, Gifts, Guaranty, Guardian and Ward, Heirs and next of Kin, Homestead Exemptions, Husband and Wife, Infants, Interest and Usury, Landlord and Tenant, Libel and Slander, Liens, Limitation of Actions, Marriage and Divorce, Rights of Married Women, Master and Servant, Parent and Child, Partnership, Payment and Tender, Personal Property, Power of Attorney, Principal and Agent, Privileged Communications, Railroads, Railroad Real Estate, Receipts and Releases, Replevin, Right of Way, Seduction, Trustee Process, Warranty, Water Rights, Wills and Codicils. Together with complete forms of Acknowledgments, Agreements, Articles of Co-partnership, Assignments, Award of Arbitrators, Bills of Sale, Bonds, Chattel Mortgages, Contracts, Deeds, Executors' and Administrators' Accounts, Interest Table, Liens, Mortgages of Real Estate, Powers of Attorney, Releases, Satisfaction Pieces, Wills and Codicils, etc., etc., specially adapted for the daily use of those who are not lawyers, with directions for their preparation. Every farmer, mechanic, manufacturer, business man, professional man, merchant and householder will find the information contained in this book of great value, and will have occasion to refer to it nearly every day. It is the cheapest book of the kind ever published, and is quite as complete and valuable as other works for which four times the amount, or more, is asked. EVERYBODY'S LAW BOOK is a large volume of 123 pages, 12mo, with handsome cover. It will be sent by mail, post-paid, upon receipt of only **Twenty-five Cents**. Send for it! It is worth ten times the amount asked for it to any man, young or old, in America.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making Bi-CARB. Soda from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

COLDEN'S LIQUID BEEF TONIC.

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of
Beef and Tonic Invigorator."

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fuel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M.D., F.R.S., and an endorsement by SIR ERASMUS WILSON, F.R.S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

CELLULOSE SILK.

Man is gradually developing an ability to dispense with the familiar old-time processes of manufacture in supplying his wants, which is fraught with startling suggestiveness in relation to the future advancement of the race. The latest illustration of this fact that has come to our attention is afforded by a French savant, named de Carbonnet, who it is claimed has discovered how to make silk without worms. He began his experiments some time ago with the guiding idea that the peculiar appearance of silk was the result of the spinning of a liquid. After many months of repeated and unsuccessful trials he produced several yards of silk in this wise: He poured a collodion solution into a copper receiver which emptied into a system of small glass tubes. These tubes terminated in capillaries which carried off the solution in fine threadlike streams. In the second system of glass tubes, filled with water, the fine streams became fine threads, which, before leaving the water were caught mechanically and wound around tiny rollers. After being heated and cooled in an acid of special gravity and temperature, the threads were made less combustible than cotton by being saturated in a simple chemical preparation. The quality of the

silk goods manufactured from these threads is fine. The threads are cylindrical, and are from one to forty micromillimetres in diameter. They sustain a weight of 25-35 kilograms per square millimetre. Ordinary silk bears a weight of 30-45th kilograms per square millimetre. De Carbonnet's silk is much more brilliant than ordinary silk, and absorbs and holds coloring matter more satisfactorily. As yet only a few pieces have been produced by the new process. Several of them are shown in the Paris exposition. De Carbonnet is confident, however, that further experiments will enable him to manufacture silk cheaply and in large quantities. In fact, he thinks that a few years hence the silkworms may as well go and die, as machinery will then be doing their work much better than they can do it themselves.

EXPOSED AND CONDEMNED.

The grave public wrong which the beef inspection conspirators attempt to inflict upon Eastern consumers, through the instrumentality of mistaken legislation, has been happily frustrated by the prompt submission of the subject to judicial investigation by the parties whose immediate interests were thus sought to be attacked. The Minnesota decision, reported in our last issue, was, we believe, the fourth declaration of the courts in that State that the inspection law is unconstitutional. And in several other States, wherever, in fact, the courts have been resorted to on the subject, similar judgment has been rendered. The *Dispatch*, of St. Paul, commenting with just severity on the final overthrow of the conspiracy in Minnesota, says: "It needed but little legal acumen at any time to distinguish the animating principle of this legislation which is so readily condemned by all the judicial officers to whom it has been submitted. An exercise of the police power of the State it has been called by its friends. Its verbal framework was fashioned somewhat skilfully in order to impose that false belief on those who examined it; but appeals to local sentiment were thought to be so fruitful of good to its authors that they thoughtlessly expressed in public and without seeming equivocation, time after time, their true object, viz.: the securing to themselves of a monopoly of the sale of slaughtered meat within this State by excluding the like products of other States. What did it matter to them whether meat were inspected on the hoof or on the butcher's block, so long as there was practically no meat to inspect but that which they purposed selling? Twenty-four hours was the interval established by them between the inspection of the beast and the offer of its carcass for sale. Was it thought that dangerous disease might develop itself in that brief interval? Or was it that the adoption of a longer period might render their pet scheme unavailable? Whatever might have been their avowed purpose, the courts refused to accept them in their self-assumed characters, as guardians of the public health, have stripped them of every shred of the

false pretenses with which they sought to cover themselves and have revealed them to public view as a knot of would-be local monopolists who cared nothing for the restraints which are imposed by either law or morals upon responsible citizenship."

DANGERS OF TIGHT CLOTHING.

Now that rational ideas as to dress have acquired a definite place in public esteem, it may be imagined that the practice of tight lacing and customs of a like nature, if known at all, are not what they used to be. A case of sudden death lately reported proves that it is still too early to indulge in such illusory ideas. The deceased, a servant girl of excitable temperament, died suddenly in an epileptoid fit, and the evidence given before the coroner respecting her death attributes the fatal issue to asphyxia, due in a great measure, to the fact that both neck and waist were unnaturally constricted by her clothing, the former by a tight collar, the latter by a belt worn under the stays. We have here certainly those very conditions which would lead us to expect the worst possible consequences from a convulsive seizure. There is no organ of the body whose free movement is at such times more important than the heart. Yet here we find, on the one hand, its movement hampered by a tight girdle so placed that it could with difficulty be undone at a critical moment; on the other, a contrivance admirably adapted to allow the passage of blood to the brain, while impeding its return. This is no isolated case as regards its essential character, though, happily, somewhat singular in its termination. Minor degrees of asphyxiation, we fear, are still submitted to by a good many of the self-torturing children of vanity. The tight corset and the high heel still work mischief on the bodies of their devoted wearers. Taste and reason, indeed, combine to deprecate their injurious and vulgar bondage, and by no means unsuccessfully. Still the evil maintains itself. Cases like that above-mentioned ought to, if they do not, open the eyes of some self-worshippers of the other sex, who heedlessly strive by such means to excel in a sickly grace. We would strongly impress on all of this class the fact that beauty is impossible without health, and would advise them, in the name of taste as well as comfort to avoid those methods of contortion, one and all, by which elegance is only caricatured, and health may be painfully and permanently injured.

BRAINS AND SUCCESS.

One of the universal and dominant problems of life is how to achieve success. Some sensible suggestions on that point relating especially to mechanics are offered by the *Northwestern Mechanic* which we reproduce in condensed form: The man who is to succeed as a mechanic, the writer concludes, must be a queer mixture of go-aheadness and conservatism. He must stick to the old ways, and yet be alive to all that is new and

For use at the Soda Fountain and in all Pharmaceutical preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

DRYDEN & PALMER,
19 Hudson St., New York.

savors of advance. To hold to old methods and practice is to be left behind in the race, while to adopt everything new that presents itself would quickly relegate to failure the unfortunate who attempted it. To sift out what is good, and to reject the worthless, is the problem the successful mechanic has to solve. It is but a continual example of the truth of Darwin's theory of the "survival of the fittest." The mechanic preserves the best methods, and is in turn kept alive by the very methods he has preserved and put to work. The successful mechanic was enabled to succeed because he possessed the faculties of perceiving what was useful and what was worthless. Once this point determined, the rest is easy. The good is to be kept, the worthless discarded, but in knowing what to keep lies the secret of success. Must the necessary qualities be born in a mechanic or can he be educated to it? Both. To be a successful mechanic a man must possess certain characteristics, but many kinds of men will make good and successful mechanics. To begin with, the would-be success must be a thinker. He must be able to reason clearly from cause to effect, and instead of sitting down and waiting for something to turn up, he must think out ways and means of forcing the desired results from the material at hand. He must be able to make the best of things, and all the "born-in" characteristics necessary is that aptness for mechanics without which no man can put his heart and soul into it as a life work. Some men are better mechanics than others. They obtain better results from the same material than some of their co-laborers. The reason of this is that the men in question are better adapted to the work they have to do. In other words they are the "fittest," and will survive accordingly. They succeed better than we do because they have better things to work with, brains included. We might do better should we think more and study out better methods and opportunities.

TRAINING THE MIND.

WHAT CONSTITUTES THE BASIS OF A SCIENTIFIC EDUCATION?

Without discussing the question of public *versus* private education, or the wisdom of the immense expenditure of public money in this direction, which is universal in this country, it will be admitted by everyone that the results of our systems of elementary education are not commensurate with the money and labor expended upon them. The first essential in a scientific education is that the child should learn to read, write and perform the simplest arithmetical calculations. This knowledge is equally necessary for all, and it is eminently proper that the first years of school life should be, as is usually

the case, almost entirely devoted to those branches. But once they are attained, the unfortunate pupil is crammed with an intellectual hash of dead and living languages, grammar, geography, mathematics, literature, physiology and hygiene, mental philosophy, ancient and modern history, book-keeping, evidences of Christianity, natural and physical science, and a hundred other studies, of which no one mind could digest the hundredth part, until graduation day or brain fever brings the long-desired relief. Such a pupil, if he survives after being graded "perfect" in physics, will, very likely, take stock in the Keeley motor, or some similar scheme; or, after completing his course in mental philosophy and physiology with honors, become an ardent believer in the mind cure. Such an education will, undoubtedly, give a thin veneering of culture to those possessing it, but to our mind, what is much more to be desired is an education which will best develop the intellectual faculties to the full extent of their varying powers in different individuals, and fit them to be of the best use to their possessors in the infinitely differing conditions of their after life. The conditions of adult life are different in almost every individual, and it is the height of absurdity to hold that any one, or even a dozen fixed courses of study, will be of direct practical benefit to the pupils who take them. The object of preliminary education—that is up to the time when the college course is usually commenced—should be to give a good solid foundation, upon which the individual himself must erect the superstructure as the circumstances of his after life may determine. A scientific education then, should be one in which the observing faculties are trained to the utmost accuracy, so that a true and accurate comprehension of facts may be obtained, and next the reasoning faculties so developed that the logical value of the observed facts may be properly estimated. Very few persons are able to properly observe and comprehend any unusual occurrence. Let a teacher question the members of his class separately in regard to any circumstance which may have happened out of the common course, and the chances are that he will have as many different accounts as there are scholars who saw it. Let him ask their opinion upon any political or social question of the day, and in nine cases out of ten, the answer will simply be the opinion of some older person, or of their favorite newspaper,—somewhat changed in language, it is true, but without the slightest trace of any independent thought. Now it is just these deficiencies, which are common to every untrained mind, that it should be the object of education to remove, and the question arises as to what course or system of study is best for this purpose. It is impossible to lay down any rigid course, or certain definite studies suitable for everyone; the individual tendencies of each student must be taken into consideration, and it is as much the manner in which the instruction is given as in the subject itself which determines success or failure. One pupil may excel in mathematics—an excellent discipline for the reasoning faculties alone,—while another may be unable to comprehend a simple algebraic formula, and yet have a wonderful knowledge of the habits of animals and plants, or spend all his spare time experimenting with chemical substances and such scientific apparatus as he may be able to procure. Even the dead languages may be made useful although we must confess to thinking that, in a practical or scientific method of education, a very little Greek or Latin will go a great way. Admitting then, that the individual peculiarities of a child's mind must be considered first of all, we would recommend the study of the laws, phenomena, and forces of nature as of the very highest value as a means of mental discipline, to say nothing of their eminently practical value. They all rest on a basis of absolute fact, and when once they are properly comprehended and their logical value estimated, the student has acquired something definite, and not,—as in the purely literary studies—something that rests merely upon the opinion of some one else, and liable to be changed at any time. The pupil should be introduced at an early age to the great kingdom of

Nature about him, and taught to observe the animals and plants, the rocks and minerals, and the heavenly bodies, and to note their habits, characteristics and movements. Later on he may be taught the laws governing them, but always with the idea that he is to do the work himself, and not to blindly accept what the teacher may tell him. The essence of science is skepticism. He should undertake original work from the very beginning, even if it is of the most simple kind, for every fact observed, every effect reasoned back to its cause, is of indefinitely more value to him than pages of text-books committed to memory, only to be forgotten after that useless relic of mediæval barbarism, the "examination." Physical geography, geology, mineralogy, and botany can always be illustrated in one's own locality, and the connection between the most ordinary actions of life and the great fundamental principles of nature should always be impressed upon the mind. Physiology and anatomy should be given a place in such a course, and taught for their scientific value, and not for the purpose of indoctrinating the ideas of any particular class of reformers. Elementary mathematics are a most admirable mental discipline, if the student is capable of comprehending them and the French and German languages are of the highest practical value; but the main object should always be to teach the student to observe and reason correctly, and when this is accomplished, he is ready to take up and study intelligently and profitably such other advanced courses—whether literary, artistic, philosophical, mathematical, linguistic, or technical—as his natural predilections may indicate, or the circumstances of his after life require. Everyone, must after all, educate himself, and the true function of the teacher is to direct and guide the efforts, and not to cram the mind with a certain amount of knowledge in a given time, with the sole end in view of having his pupil attain a certain "percentage," or pass a formal examination.—*Pop. Science News.*

HAT ETIQUETTE.

WHY SHOULD NOT LADIES BE AS COURTEOUS AS MEN?

A friend of ours was recently at work in the Astor Library, and, feeling a draught of cold air on the top of his bald head, put on his hat. One of the library attendants thereupon requested him, courteously, to remove it, though upon the explanation being given, the request was as courteously waived. Why the wearing of the hat in the library is not permitted to men as well as to women it is difficult to explain, except upon the ground that the library is a sacred place, like a church, and disrespect must not be shown to it. But even on this ground the taking off of the hat has a purely conventional and arbitrary significance. In a Hebrew synagogue it is esteemed a discourtesy, and it is not much more than a century since the wearing of one's headgear was as customary in the drawing room as it is now out of doors. Old prints and pictures of interior scenes represent the men as well as women with hats on, and in several of our fashionable clubs the men wear their hats as freely as they do in the street. In a church, or in a theatre, the reason for taking off the hat is obvious, though why it applies to men only and not to women is not so clear. In the better class of theatres and opera houses in Europe women are not permitted to wear their hats any more than men are, and in the old days only veils and not hats were allowed to be worn by the women who attended the services of St. Peter's Church at Rome. This, also, was a purely arbitrary conventionality. Complaint has been made long and bitterly of the inconvenience caused to the spectators in American theatres by the tall hats of the women. It would be easy to remedy the evil by providing a place where the offending articles of dress could be left during the performance, and sooner or later no doubt it will be done. Already the wearing of full evening dress by men at theatres and concerts as

well as at the opera has become very prevalent, and it would not be much of an advance if women, likewise, would show their pretty heads at such entertainments unencumbered by the disfiguring and wrath-provoking hat.—*N. Y. Sun.*

FAITH FOLLIES.

CURRENT EXPOSURES OF CRIMINAL CHRISTIAN SCIENCE,

Fatal Result of Consistent Faith Reliance.

Miss Karen Olsen, age twenty-eight, died last week at her home in Vermont-ave., Brooklyn from typhoid fever, and Dr. Richard Burns, of Hinsdale street, gave a death certificate. It is alleged that she refused to take the medicine prescribed for her and depended upon faith cure. She was a Scandinavian, and her case was similar to that of Miss Martha Olsen, who died recently in the same way in South Brooklyn, but the two women were not related. Dr. Burns was called in to save a coroner's inquest. He had previously attended a young man sick with the same fever at the same house. The patient in this case also refused to take the medicine, but recovered. Dr. T. P. Norris was first called to attend the woman but was first told by her brother that she would not take medicine, but his attendance was desired so that if she died there would be no need of an inquest. He refused to go at first, but when told that he might persuade her to take a remedy, consented. She did not take the medicine and he did not go to see her again.

Why do not the Authorities Act?

The *N. Y. Mail & Express* of Oct. 1., sums up the question of responsibility of the faith lunatics in the following terse sentence: "The 'Faith Curists' have just killed another woman in this vicinity by their idiotic nonsense. It is time that the officers of the law took cognizance of this sort of murder."

THE PROBLEM OF WOMAN'S WORK.

A SERIOUS QUESTION THAT STILL LACKS ADEQUATE SOLUTION.

Although the avenues of employment have multiplied, it is still difficult for a woman brought up in what is called good society and left suddenly destitute and self-dependent to earn her own support. Our older readers will recall the time when a few of the more robust of this class were shut up to the alternative of taking in washing or opening a boarding house, while the frailer ones became brides of the needle and spent long hours in the weary round of "stitch, stitch, stitch," at wages that hardly kept the wolf from the door. The organized laundries, and, more than all, the cheap ready made collars and neckties, cut down the opportunities of the washerwoman, and still later the Chinese experts left but little to do in this chosen line. The boarding house keeper has found some interference with her occupation from the cheap flats, easily furnished, where a young married couple may maintain a "respectable" appearance without a servant and at moderate expense. But housekeeping, even with such conditions, has no charms for a large class of newly married people, and the boarding houses maintain their rank in the community. The renting of furnished rooms without board, or with a simple breakfast to the occupants, has been a growing business, and has given more congenial employment than the ordinary boarding house to many women who must earn their living. The old class of sewing girls has almost wholly disappeared. The machines gave them a lift at first, but now these are most profitably run by machinery, and the operators are brought together into establishments furnished with steam or other power to do the harder part of the work. The very cheapest of ready made clothing is still given out in large quantities to be made up at home by those engaged in this service. The public have little idea at

what small rates such garments are produced. But it is not now the single woman in a lonely garret who operate upon these; whole families take the fabrics cut out by the gross and return them finished for the dealer to sell. The father, mother and children are often employed in this way, and the household together contrive to make both ends meet. We know a few "lorn, lone women" who work by themselves on these cheap garments, but do their best, and take no idle hours. The utmost they can earn, spent with great care and economy, will only just keep them from actual starvation. The opening of shops and factories has given a large amount of employment to the weaker sex, but these places are mostly filled by young girls, many of whom board at home. Few of these brought up in idleness, or with no call to work, and then suddenly bereft of their support, drift into this service. We cannot say why, but even where steady work, and wages that will supply comfortable food and clothing are offered in a manufacturing establishment, the woman who has looked upon herself as a "lady" does not take to it. It may be the uncongenial companionship, but it is probably the being one of many in an undistinguished crowd from which she shrinks. In some shops the rude, coarse laugh and the vulgar manners, even where nothing can be brought against the moral character of those employed, are sufficient to make the association intolerable. The typewriter opened a rare field for the enterprising young woman bent upon self support. A large number who have become proficient have steady employment at good wages. When a quick-witted girl adds the gift of taking shorthand notes from the lips of her employer, and then writing them out after he has finished the declaration, she may be certain of a place that will enable her to live comfortably and lay by a portion of her earnings. The great difficulty in this and in many other avenues of employment is that those who are engaged do not look upon the service as a life work. Few of the sex are content with the prospect of perpetual maidenhood. They work in waiting for a call to be married. This is one reason why so few young women are wholly devoted to their chosen task, and explains, in part, why the same wages are not paid to them as are given to the other sex. To a man, a change in his domestic relations brings no necessary interference with his occupation, while few young women expect to hold to their employment beyond the years to be reckoned in the near future. The painting of china gave many gifted women an opportunity of pleasant employment at remunerating wages. We think if they would persevere in it, and not give up the task when it becomes a drudgery, they might continue to find it profitable. We know of a number that worked steadily at the ornamentation of plates, tea sets, pitchers and vases while the novelty lasted and they were paid fancy prices for their skill. But when it became necessary to bend to the task day after day, giving six or eight hours of hard labor for only a dollar or two of pay, they gave up in disgust. Plates at fifty cents or a dollar apiece, and plaques at three or five dollars were very well, but to do steady work on dishes to be counted by the dozen and only to earn eight to ten dollars for a whole week of hard work was discouraging. And yet it is by such persistent toil that most laborers in this world earn their daily bread. A few who are not only real artists, but downright industrious women, willing to eat their well earned bread in the sweat of their face, have made a good living, year after year, decorating card cases, Christmas and Easter tokens and other articles to be sold in the shops. Those who expect to do a little fancy work when they feel like it, and to sit idly by bemoaning their sad fate during most of the flying hours, will not earn a livelihood at anything, no matter how promising the opening may seem. We cannot speak as we would of the training school for nurses, which have not only given employment to so many in the care of the ill and the wounded, but have removed so largely the discomforts of the hospital and the sick chamber, for these are deserving of a chapter by themselves. It

is a blessed service for those who give and those who accept it. Nor have we space in this article to speak of the work of education, in general so largely committed in this country to hands that perform the task so well. We say nothing of domestic service, for it is useless to recommend the kitchen to American girls. Some women with brains have started little establishments of their own where they execute orders for preserves, pickles and sweetmeats at paying prices, but few have sufficient business tact to manage such an undertaking. To go out to service in the household of another is the best paying work for the woman of average strength and ability in the United States, but no amount of persuasion will induce the class we have described to undertake it. A comfortable home where food and raiment are secure, where with rare exceptions they are protected from insult and shielded from temptation, and may earn enough to have a snug account in the savings bank, would be open to every one competent to do ordinary housework if she would accept it in the proper spirit. If for the clumsy fingers that waste the china, and the unskillful hands that spoil the marketing in so many pantries and kitchens, there could be substituted the deft manipulation of well taught native-born housekeepers, who would pride themselves upon their ability to make the dwelling of their employer a place of comfort and repose, a new era would dawn on this land so highly favored in all else that makes a happy home. But the American citizen is a Ruler, and the daughters of a king will not become servants and give to another the title of master or mistress. They hold it to be more noble to starve in a garret, or to be fed by the hand of charity, than to grow fat in the kitchen. If we are to have servants at all, we must import them from other lands.

MOUNTAIN OYSTERS.—What is considered one of the most unaccounted for sights in Utah is a mountain about thirty-five miles north-east of Salt Lake City, occupying an area of about thirty acres, and completely and thickly covered with oyster shells. The mountain is between 300 and 400 feet high, and situated over 4,000 feet higher than Salt Lake City, which is 4,300 feet above the level of the sea.

HEART ELECTRICITY.—Dr. Augustus Waller, of Philadelphia, has recently made a number of experiments showing that it is possible to detect, by existing electrical instruments, the electric currents generated at each beat of the heart. Two people holding each other by the hand, and connected with a capillary electrometer, give evidence of electrical shocks through each other. The hands of a single subject, dipped into two basins of water in connection with the electrometer, give a deflection of the instrument at every beat of the pulse.

REMEDY FOR SNAKE BITES.—L. G. Lincecum, M. D., writing from Texas, says: "Permanganate of potash is a successful remedy. I have treated more than one hundred cases in Texas, and have used whiskey, soda bicarb., spt. ammonia, turpentine, chloroform and other remedies, but have found that potas. permanganas in one or two gr. doses hypodermically, and chloroform, locally and by inhalation, are undoubtedly the most certain and successful remedies in bites of venomous reptiles I ever used. I have never seen a case treated with these two remedies result fatally."

WINDOW DECORATION.—The decoration of store windows is getting to be more and more of an art in New York, and all the large firms in the retail dry-goods business have some one employed at a good salary to make their show windows attractive. The work is done mainly in the night time, but also in the daytime, before and after the hours of opening for business. The largest salary paid by any individual house to a window decorator is \$4,500 a year, and there is but one man in New York receiving that amount. He is said to be unapproachable in his particular line, and might command even higher pay but for a disposition to look upon the wine when it is red. Twenty-five hundred a year is regarded as a fair salary for a good window decorator, and there was a man who made several thousand dollars annually by travelling from city to city and arranging show windows by the job. Dry-goods dealers have great confidence in the effect upon customers of a finely decorated window.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

October.

MEAT.—Beef, mutton, pork, venison.

POULTRY AND GAME.—Chicken, duck, geese, grouse, hare, partridge, pheasant, pigeons, rabbits, turkeys, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, whiting, salmon, trout, perch, smelts, oysters.

VEGETABLES.—Artichokes, broccoli, celery, potatoes, turnips, cauliflower, cabbage, carrots.

FRUIT.—Apples, pears, quinces, grapes, nuts.

PRACTICAL RECIPES.

VEGETABLE SOUP-STOCK.—Clean and cut up three or four pounds of carrots, celery, turnips, onions, lettuce, parsnips, and herbs; put them altogether in a stewpan, with some fresh butter and a little water, and stew until the water is evaporated and the butter begins to hiss then fill up with fresh water, add nutmeg, pepper, salt, and a few green peas; simmer for three hours; strain and keep in a stone crock in a cool place until wanted.

CHOPPED CLAMS.—Scald fifty small clams, drain and chop them very fine. Butter a number of small dishes or, if obtainable, some fine clam shells, and in them put a thin layer of fine bread crumbs, then a layer of chopped clams, a few small pieces of butter, a sprinkle of chopped parsley and a dust of black pepper; then a layer of bread crumbs and another of clams, and so alternate until you have the desired quantity, the last layer being bread crumbs, upon which lay two or three small pieces of butter; pour in a little rich cream, arrange your scallops in a baking pan and cook in a moderate oven until the tops are of a delicate yellow color; send them to table as hot as possible.

LOBSTER CUTLETS WITH TOMATO SAUCE.—Chop up the meat of two or three boiled lobsters, add to it the yolks of two eggs, half a teaspoonful of salt, a salt-spoonful of white pepper, two ounces of butter, and a tablespoonful of grated bread crumbs. Mix and shape the mixture in the form of cutlets; dip them in beaten egg, roll them in crumbs and fry in very hot fat. Send to table with tomato sauce.

TOMATO OMELETTE.—One pound tomatoes, one pound bread crumbs, one large Spanish onion three eggs, two ounces butter, cayenne and salt to taste. Melt the butter in a saucepan, add the onion chopped small, with a little cayenne and salt (no water); let it cook for twenty minutes before adding the tomatoes, stirring occasionally, but not keeping the saucepan lid off longer than necessary. Scald and skin the tomatoes, cut them into small pieces, add to the onion, and let simmer together for about half an hour; pour the whole over the bread crumbs in a large basin, mix together, then add the eggs, well beaten, and turn into a shallow tin or tins, previously well buttered. Bake in a quick oven for about ten minutes.

WAFERS.—Take five cupfuls of flour, one cupful of sugar, and two-thirds cupful of butter; rub butter and sugar to a cream, mix with the flour, add two well beaten eggs, half a cupful of sweet milk, one teaspoonful soda, stir all together, roll very thin, and bake.

HOT MUSTARD SAUCE FOR FISH OR MEAT.—Mix together one teaspoonful of flour, one of sugar, four of mustard, the yolks of two eggs and two teaspoonfuls of vinegar. Melt two ounces of butter, add to it the above ingredients, and stir unceasingly until the same boils. Add water or vinegar, if too thick; it must pour creamy. Sliced gherkins may be added.

RICE CAKE.—Beat a half pound of butter and one pound of sugar together, add to them rose-water to taste, then nine well-beaten eggs, and lastly one pound ground rice. Bake in shallow tins.

DOUGHNUTS.—One egg, one cupful milk, one cupful sugar three pints flour, three teaspoonfuls of Hossford's baking powder, one egg, one teaspoonful of butter, a little nutmeg. Fry in boiling lard.

GREEN AND RED.

AN INGENIOUS TEST FOR VISUAL MALINGERING.

In a large factory a workman in wielding his hammer carelessly allowed it to slip from his hand. It flew half across the room, striking a workman in the left eye. The man brought suit in the courts, and although an eminent oculist, after an examination, declared that no apparent injury could be detected, claimed that his eyesight was destroyed, and refused all offers of compromise. As the law requires owners of factories to pay all claims for damages resulting from injury during work, the owner, though confident that the man was shamming, had about made up his mind that he would be compelled to pay the claim. On the day of the trial a further test was made. The oculist for the defence had a pair of glasses made, the right eye being of red and the left eye of ordinary glass. He brought also a black card with a sentence written on it in green ink. The plaintiff was ordered to put on the glasses and read the sentence, which he readily did, thus proving himself a perjurer, as the sound right eye, being fitted with a red glass, could not distinguish the writing,—the combination of green and red producing black, which, on a black ground, was of course not visible,—and the left eye, which he claimed was blind, was the one with which the reading had been done.

DARWIN DOUBTED.

PROF. VIRCHOW SAYS THAT THE PROOF OF HIS THEORY
IS STILL LACKING.

Some sensation has been caused at the recent Anthropological Congress in Vienna by the speech of the great Berlin biologist, Prof. Virchow. About a year ago Virchow, on a similar occasion, made a severe attack on the Darwinian position, and this year he is similarly outspoken. We make the following extracts from his long address to the Congress: "Twenty years ago, when we met at Innsbruck, it was precisely the moment when the Darwinian theory had made its first victorious mark throughout the world. My friend Vogt at once rushed into the ranks of the champions of this doctrine. We have since in vain sought for the intermediate stages, which were supposed to connect man with the apes; the proto-man, the *pro-anthropos*, is not yet discovered. For anthropological science the *pro-anthropos* is not even a subject of discussion. The anthropologist may, perhaps, see him in a dream, but as soon as he awakes he cannot say that he has made any approach toward him. At that time in Innsbruck the prospect was, apparently, that the course of descent from ape to man would be reconstructed all at once; but now we cannot even prove the descent of the separate races from one another. At this moment we are able to say that among the peoples of antiquity no single one was any nearer to the apes than we are. At this moment I can affirm that there is not upon earth any absolutely unknown race of men. The least known of all are the peoples of the central mountainous districts of the Malay Peninsula, but otherwise we know the people of Terra del Fuego quite as well as the Eskimo, Bashkirs, Polynesians and Lapps. Nay, we know more of many of these races than we do of certain European tribes; I need only mention the Albanians. Every living race is still human; no single one has yet been found that we can designate as Siminian or quasi-Simian. Even when

in certain ones phenomena appear which are characteristic of the ape—e. g., the peculiar ape-like projections of the skull in certain races—still we cannot on that account alone say that these men are ape-like. As regards the lake dwellings, I have been able to submit to comparative examination nearly every single skull that has been found. The result has been that we have certainly met with opposite characteristics among various races; but of all these there is not one that lies outside of the boundaries of our present population. It can thus be positively demonstrated that in the course of 5,000 years no change of type worthy of mention has taken place. If you ask me whether the first man were white or black, I can only say I don't know." Prof. Virchow summed up the question as to what anthropological science during the last forty years has gained, and whether, as many contend, it has gone forward or backward. "Twenty years ago the leaders of our science asserted that they knew many things which, as a matter of fact, they did not know. Nowadays we know what we know. I can only reckon up our account in so far as to say that we have made no debts; that is, we have made no loan from hypotheses; we are in no danger of seeing that which we know overturned in the course of the next moment. We have levelled the ground, so that the coming generation may make abundant use of the material at their disposition. As an attainable objective of the next twenty years, we must look to the anthropology of the European nationalities."

STOP THAT COUGH!

At this season of the year, when the summer is said to die in the arms of winter, humanity is apt to celebrate the fact by coughs, colds or some one of the endless variety of respiratory and muscular disorders which are so prevalent in the autumn. There is little or no excuse for this state of affairs, inasmuch as there is no reason physiologically why a man should not enjoy the same health in the fall as at all other times of the year. All that is needful to this end is a knowledge of how to meet the change in temperature and how to keep the body under the circumstances. Common sense will teach these, just as well as the most learned scientist or the most expert physician. In the first place, the clothing should conform to the weather. The low shoes, moccasins and fanciful footwear of the summer should give place to something heavier and more substantial. A well made shoe, fitting well, but not too closely, and of moderate weight is the best and only form of footwear which can be recommended. The underwear should be changed from gauze, light-weight merino, jean, linen or cotton, to woolen. The best are those which are closely woven, soft and uncolored. Colored underwear should be viewed with suspicion. Nearly all colors wash out and leave a dingy and dirty-looking fabric behind. A few stain both the body and the outside clothing, while some are dyed with poisonous bodies, such as fuchsine, arsenic compounds, and chromates. The best of all are the unbleached wools. The natural color is a pale gray, yellow or brown, which never changes its hue and is always neat and attractive. There will, of course, be outcries against this advice by those who favor cotton, linen or silk for their hosiery. They are wrong, nevertheless, from every standpoint. All three of the materials named, whether in their natural form, or whether as Lisle thread, Balbriggan or linen and cotton mixed, chill the feet, condense perspiration, clog the pores and interfere with the circulation. Heavy knitted yarn or worsted stockings are a trifle but not much better. The only sensible kind are smooth merino, camel's hair, or goat's hair of medium or light weight, according to the taste of the wearer. In this case, as with underwear, the natural color is far preferable to those given by the dyer and manufacturer. In diet a man should use heavier and more heat-giving foods than he does in summer. Nature sets a good example in cutting short the supply of acid and sub-acid fruits and vegetables the moment that the leaves begin

to turn. For the tomato, green pea, sweet corn and butter-bean, she substitutes the potato, carrot, field corn and white bean. These latter are not so aperient, and are far more calorific. So with meats. Spring lamb, veal and suckling-pig now give place to mutton, beef and pork. In the daily bill of fare, the wise housekeeper follows this suggestion and introduces such dishes as wheat cakes, sausage, corn meal bread, buck-wheat and the like. Coffee, chocolate, cocoa and broma should replace the iced tea, lemonade, raspberry, vinegar and mineral waters so much in vogue in July and August. Of course, there is no absolute rule in these matters. Personal tastes and preferences rise superior to anything that can be laid down as a principle of eating or drinking. While the suggestions made apply to nine out of ten the land over, they do not apply to the tenth. Whoever has a craving or aversion for a certain lot of foods or drinks should follow the dictates of their own bodies, unless, as is frequently the case, they are the victims of disease or morbid action. In the latter case, their duty is to consult a physician. In all other cases let them follow the wishes of their palates, at the same time bearing in mind the principles heretofore enunciated. Last and most important, keep the blood and system free from impurities. To those who enjoy perfect health, this advice is needless. But the number of these is so small as to be insignificant. The vast majority, from the necessities of modern life, are compelled to pursue courses which result in filling the blood with humors. These persons should keep a careful eye upon their bodies, and at the first indication of physical ailment, whether it assume the form of pimples, rash, eruptions, coughs, colds, rheumatism, diarrhoea, dysentery, dyspepsia, malaria, headache, insomnia or nervousness, should use a blood purifier to remove or destroy the cause of their trouble. Of the many preparations useful in this regard, the one which has received the unanimous approval of the scientific and medical world is the famous Sarsaparilla compounded by Dr. Ayer, of Lowell. This dispels every humor from the body and restores health and strength in every regard. It is not so much a cure for disease as a preventive of disease. In the fall its use prevents absolutely the coughs, colds and other ills which are then so common, so dangerous, and often so fatal.

UP IN THE SKY.—First Cloud—I believe I am wasting away.

Second Cloud—You do look dissipated.

CHARACTERISTIC.—First Chicago Citizen—Laker referred to you as a hog last night.

Second Chicago Citizen—That's just like Laker—always talking shop.

PLEASANT COMPANION.—Smith (to vis-a-vis)—Nice day. (No answer.)

Smith (persistently)—Nice day, I say.

Traveller (gruffly)—That doesn't make it one because you say so.

THE SUNFLOWER.—Kansas proves that the home of the sunflower is the meeting place for all that is best in American agriculture. The Sunflower State is the representative State, and the sunflower, bold, bright, pushing, and high-headed, ought to be the national flower.

HE KNEW.—Teacher (to class in arithmetic): "John goes marketing. He buys two and a quarter pounds of sugar at eleven cents a pound, two dozen eggs at sixteen cents a dozen, and a gallon and a half of milk at twenty cents a gallon. What does it all make?" Smallest boy (hugging himself ecstatically): "Custard."

THE WIZARD'S PREDICTIONS.—Thomas A. Edison asserts that in a few years the world will be one gigantic ear. Nobody will then dare to gossip, for fear of being overheard by a concealed phonograph. Surely such a condition would mark a long step towards the millennium. If the harm done in the world by indiscreet tongues could be estimated, it would be found that the misery of the human race is to a great extent due to the misrepresentations of people who would rather talk malicious nonsense than remain silent.

LIQUID STONE.—August Boorfried, a Minnesota stone mason, says he has discovered a process by which granite, marble, cobblestones—if you please—may be liqui-

fied and run into molds. Mr. Boorfried has come to New York to interest wealthy capitalists in his strange invention. He says mankind ought to be able after a while to live in translucent houses, so that the whole neighborhood will know, by the soft glow that will permeate the walls, every time a lamp or a gas jet is lighted. He proposes to provide this translucent building material.

POWERFUL STEAM.—The new fire boat which New York will have next spring will be one of the nautical wonders of the port. She is to throw four solid four-inch streams of water, and the range of these streams will be from 350 to 450 feet—solid water not spray. It is asserted that the firemen can bore through the brick and stone walls along shore with ease with these streams just as miners in the mountains bore into and wash down the faces of solid cliffs with streams carried down the mountain sides. To fully comprehend the power of a four-inch stream it should be remembered that it is from eight to twelve times as large in cross section as the streams from the ordinary fire engines, while the nozzle velocity of the water is several times greater. The efficiency of such a stream is probably twenty-five times as great as the stream from an ordinary engine. The new boat will flood out a fire as with a deluge anywhere within 2,000 feet of the water front.

BUFFALO LITHIA WATER

In the Uric Acid Diathesis, Bright's Disease, Chronic Inflammation of the Bladder, etc.

JAMES L. CABELL, M. D., A. M., LL. D., Professor of Physiology and Surgery in the Medical Department in the University of Virginia, and President of the National Board of Health.

"The Water of Buffalo Spring No. 2 contains in notable quantities two of the ALKALIES which are accredited as extremely valuable in the treatment of GOUT, LITHIASIS, and Liver Affections. I refer to the CARBONATES of POTASH and LITHIA.

"I have recently read with interest a paper in 'The New York Medical Journal' on the Buffalo Lithia Water in Diseases of the NERVOUS SYSTEM, in which the writer, Dr. Boyland, citing his own observations and those of other eminent physicians, ascribes to this water a special virtue as a direct tonic for the NERVOUS SYSTEM in cases of CEREBRAL exhaustion. I have only had occasion to test its effects in this direction in cases in which the NERVOUS SYMPTOMS may have been due to LITHIEMIC conditions. In these cases the result of following the use of the remedy was very decided."

Dr. WM. A. HAMMOND, of New York, Surgeon-General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the Buffalo Lithia Water in cases of affections of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION OF THE LITHIA SALTS, and is, moreover, better borne by the Stomach. I also often prescribe it in those cases of CEREBRAL HYPER-ÆMIA resulting from over-mental work—in which the condition called NERVOUS DYSPEPSIA EXISTS—and generally with marked benefit."

Dr. ROBERT BATTEY, of Georgia, SUGGESTER OF BATTEY'S OPERATION.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of CHRONIC INFLAMMATION of the BLADDER, whether induced by STONE, by enlarged PROSTATE in the aged or by NEGLECTED GONORRHEA, AND HAVE SECURED EXCELLENT RESULTS, which encourages me to prescribe it for the future."

HUNTER MCGUIRE, M. D., LL. D., late Professor of Surgery, Medical College of Virginia, Richmond.

"BUFFALO LITHIA WATER, Spring No. 2, as an ALKALINE DIURETIC, is invaluable. In URIC ACID GRAVEL, and, indeed, in diseases generally dependent upon a URIC

ACID DIATHESIS, it is a remedy of extraordinary potency. I have prescribed it in cases of RHEUMATIC GOUT, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. WM. B. TOWLES, Professor of Anatomy and Materia Medica in the Medical Department of the University of Virginia.

"BUFFALO LITHIA WATER, No. 2, belongs to the ALKALINE or, perhaps, to the ALKALINE-SALINE Class, for it has proved far more efficacious in many diseased conditions than any of the simple ALKALINE waters.

"I feel no hesitancy whatever in saying that in GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE in the BLADDER, and in all Diseases of URIC ACID DIATHESIS, I know of no remedy at all comparable to it.

"Its effects are marked in causing a disappearance of ALBUMEN from the urine. In a single case of BRIGHT'S DISEASE OF THE KIDNEYS I witnessed decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of the disease."

Dr. THOMAS H. BUCKLER, of Paris (formerly of Baltimore), SUGGESTER OF LITHIA as a Solvent for Uric Acid.

"Nothing I could say would add to the WELL-KNOWN REPUTATION OF THE BUFFALO LITHIA WATER. I HAVE FREQUENTLY USED IT WITH GOOD RESULTS IN URIC ACID DIATHESIS, RHEUMATISM, AND GOUT, and with this object I have ordered it to Europe, from Coleman & Rogers, of Baltimore. Lithia is in no form so valuable as where it exists in the Carbonate (the form in which it is found in the BUFFALO LITHIA WATER), Nature's mode of solution and division in water which has passed through Lepidolite and Spondumine Mineral formation."

Dr. GRAEME M. HAMMOND, of New York, Professor of Diseases of the Mind and Nervous System in the New York Post-Graduate Medical School and Hospital.

"In all cases of BRIGHT'S DISEASE of the KIDNEYS I have found BUFFALO LITHIA WATER of the greatest service in increasing the quantity of urine and in eliminating the ALBUMEN. In certain cases of Melancholia, accompanied by excessive eliminations of URATES and URIC ACID, it is often the only remedy necessary. In GOUT and RHEUMATISM it is highly beneficial, and in many cases of Impotence its restorative qualities have been of undoubted assistance. I have long regarded BUFFALO LITHIA WATER as the most valuable mineral water in use."

Water in cases of one dozen half-gallon bottles, \$5.00 per case at the Springs.

THOMAS F. GOODE, Proprietor, Buffalo Lithia Springs, Virginia.

BUSINESS NOTES.

TABLE DELICACIES.

To establish and maintain a reputation for table delicacies such as Gordon & Dillworth have succeeded in doing, demands first class goods, conscientiously and carefully preserved and packed by experienced hands. It also implies the unalterable purpose, no matter at what loss, to have only the best goods go out under the brand. This has always been the practice of this house, consequently they have obtained such popularity for their goods that they are constantly complaining that their orders exceed their facilities for manufacturing. Though they have repeatedly enlarged their premises they are not able to supply every demand and they cannot well increase the supply even with their increased facilities, because they adhere to the rule that everything must be done under the personal supervision of a member of the firm.

A SURE CURE.

An editorial in the *Wayne Co. Courier*, published at Detroit, Mich., September 16th, 1886, states as follows: "There is probably no disease to which mankind is heir which has brought out so many shams and frauds as Catarrh has. Of all human ills this one seems to have been ordained specially to exercise the ingenuity of quacks in the production of nostrums as manifold as they are worthless. It is therefore actually refreshing to come across a remedy for this disease which affords positive assurance of relief if not actual cure to the sufferer. We refer to the treatment of A. H. Dixon & Son, Toronto, Canada. We have the name of a gentleman in our possession, which will be given to enquirers, who has been a sufferer from Catarrh for the past twenty years. He tried many doctors and innumerable so-called safe-cures, but all left him in a worse plight than before. One treatment of A. H. Dixon & Son's remedy made a new man of him and effected he believes a perfect cure. The Messrs. Dixon have a theory of their own about Catarrh, different from all others and upon this they work to eliminate the cause of the disease, with almost certain success. It is seldom that we are able to give so full and free an endorsement to anything as we are able to accord to this really wonderful remedy."

FOR HEADACHE.

USE HORSFORD'S ACID PHOSPHATE.

DR. I. R. SANFORD, Sheffield, Mass., says: "Most excellent in derangements of the nervous system, such as headache and sleeplessness."

Will buy sufficient

Pearline to do a large wash—
Clean a house,

or enough of both to prove to any woman its wonderful dirt-removing and labor-saving qualities. Costs almost nothing, but makes the dirt jump. Does it hurt the hands or clothing?—NO, it is harmless. Many millions of packages used every year—no complaints, but many women write: cannot get along without PEARLINE.

Caution Peddlers and unscrupulous grocers are offering imitations which they claim to be Pearline, or "the same as Pearline." IT'S FALSE. PEARLINE is never peddled. 146 JAMES PYLE, New York,

REASONS WHY

Should be preferred to all others:

Because—It is genuine-pure, just as it existed in the hepatic cells of the living fish, not depleted of its natural virtues by any process of refining, nor weakened by being made into an emulsion with an equal quantity of water, glycerine, etc., which latter device makes water bring the price of Oil.

Because—In taste and smell it is not offensive, but instead, sweet and agreeable.

Because—Its administration is always followed by satisfactory results.

Because—It is more easily assimilated than other Oils.

Because—It is more nutritious than other Oils.

Because—Of its perfect digestibility, perfect limpidity.

Because—This perfect Oil costs consumers no more than the poorer qualities abounding in the stores.

Because—It is readily obtainable; all well-stocked Drug Stores have it.

Because—It is unquestionably the purest and best COD-LIVER OIL IN THE WORLD.

W. H. SCHIEFFELIN & CO.,
NEW YORK.

Sole Agents for U. S. and Canada.

A GOOD THING.—A self-counter sinking screw is a novelty. It is simply fitted with cutting teeth on the under side or bevel of the head, which cut into the wood as the screw is driven home, thus enabling the head to countersink itself. The channels and the teeth are both wider as they near the top of the head, thereby allowing the sawdust to escape.

ANTISEPTIC WHITING.—An antiseptic whiting has recently been introduced, and is recommended by the makers for hospitals, ships, stables, kennels, etc., in order to keep them free from insects. The compound, which appears to contain some camphor, is also useful for cleaning silver plate and articles of domestic use. The aroma is said to be not unpleasant, while the compound is non-poisonous and will not injure colors.

HYDRAULIC MOTOR.—There is now running at the Paris Exposition a hydraulic train that consists of four carriages and has room for about 100 passengers. The train runs as smoothly as a boat on water. There are no wheels, no steam, no electricity, apparently nothing to make it go. Yet it will go at the rate of 125 miles an hour, while as far as motion may be felt, there is none. The passenger cannot tell by any vibration of the car that he is moving at all.

VALUABLE TO ADVERTISERS.

You have determined to make money by vigorously pushing your business. As the **AMERICAN ANALYST** has determined to do the same thing, we have a community of interests. Our way of making money is to increase our circulation, and we can only do so by publicity; that is, by bringing our journal to the notice of a great number of people, who have the intelligence to appreciate a good journal when they read it and the money to buy what they want. You must necessarily want to reach the same class. Even if you do not sell directly to the consumer, it is necessary for you to tell the consumer of the quality of the goods you have to offer to induce him to ask the dealers with whom he trades for them. We propose this Fall and Winter to send a sample copy of this journal to the address of every person in the United States whose name we can find in any of the *Elite* directories or blue-books of the various cities and villages. We will thus reach several millions of new readers in addition to our already large subscription-list, covering every State in the Union. Previous experience with this method of getting new subscribers war-

rants us in undertaking the expense, believing that it will pay us. This large addition to our circulation will put any advertisement in our columns before a multitude of readers. Our advertising prices remain the same, and are so arranged as to give the lowest rates to larger and longer-continued advertisements, and will be sent on application. All respectable advertising agencies will take orders for us. If we find this system profitable, advertisers surely will. Those who have advertised with us always renew as their season comes around, and you will do the same when you have tried it. We have found that in the great competition now existing we must keep our journal prominently before the public, and, in our mutual interest, we ask you to join us. Our system is more effective than a circular, and you will find it just as effective for your business and the cost very much less. Try us. For any further information write, and it will be forthcoming.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

MRS. F. M. G. PENDER,

47 West Twenty-second Street.

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,
By MISS M. E. BRADDON.

THE GIRL AT THE GATE,
By WILKIE COLLINS.

A BRIDE'S TRAGEDY,
By MISS MULOCK.

THE RECTOR'S DAUGHTER,
By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,
By MARY CECIL HAY.

GABRIEL'S MARRIAGE,
By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,
By ETTA W. PIERCE.

THE RIGHTFUL HEIR,
By M. T. CALDOR.

THE DOUBLE HOUSE,
By MISS MULOCK.

TWICE SAVED,
By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, profusely and handsomely illustrated, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the AMERICAN ANALYST.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, **ONLY THREE** possessed the power of acting on starch. These brands were **MALTINE**, Corby's, Stacey & Co.'s Extract, and Keppeler's Malt Extract. **WILLIAM ROBERTS, M.D., F.R.S.**

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alteratives.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Ferrated.
MALTINE with Hypophosphites.	MALTO-VEBERIN.
MALTINE with Peptones.	MALTO-VIBURNIN.
MALTINE with Pepsin and Pancreatine.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

ALL ABOUT HORSES, CATTLE, SHEEP AND HOGS.

The American Live Stock Manual.

No subject is of greater importance to the farmer than that of Live Stock, and few there are who have not much to learn regarding it. Many a man has lost a valuable animal for no other reason than that he did not know how to take care of it when well or to treat it when sick. **THE AMERICAN LIVE STOCK MANUAL** is a book the cost of which is but trifling, but it is simply worth its weight in gold to every man in America who owns a horse, a cow, a sheep or a hog, for it is a complete text-book, containing the fullest information regarding the care and management, feeding and rearing, of live stock, likewise directions for the cure of all diseases peculiar to these animals and of all unruly and vicious habits, for the construction of necessary buildings and conveniences, etc., etc. The following are only a small portion of the topics treated in this book: How to Judge a Horse; Feeding Horses; Raising a Colt; To Bit a Colt; To Break Horses from Pulling at the Halter; Warts on Horses; Stumbling Horses; Care for Foalry Horses; Kicking Horses; Training Vicious Horses; Galls and Sores on Horses; Reining Horses; Colic; Bots; Founder; Heaves; Epizootic; Shying; Scratches; Ringbone; Spavin; Cribbing; Windgalls; Brittle Feet; Worms; Over-Reaching; Sprains and Bruises; Hide-Bound Horses; Avoiding Indigestion; How to Save Oats in Feeding; Watering Horses; Care of Horse's Legs; How to Tell a Horse's Age; Neck Yokes; Good Grooming; Shoeing; To Make the Mane and Tail Grow; Box Stalls; Stables and Stabling; Breeding Horses upon Farms; Horse Education; Ringing a Bull; Relieving Choked Cattle; Bone Disease in Milch Cows; Marks of a Good Cow; Cattle Racks and Feed Boxes; Feeding Cattle; How Good Cows are Ruined; To Prevent Hooking Fences; Black Tongue; Lice; To Prevent Kicking; Contagious Cattle Diseases; Fattening Stock; Milking; Cooking Feed for Live Stock; The Solling System; Raising Calves; To Break a Heifer or Vicious Cow to Milk; Wintering Live Stock; How to Take Off a Hide; Assistance at Birth; Hollow Horn; Obstructed Teats; Black Leg; Oaked Udder; Jumping Cattle; Garget; Care and Management of Hogs; Piggeries; Troughs; Pig Sties; Over-Feeding; To Cure the Mement of Swine; Hog Cholera; Paralysis; Soury Pigs; Preparing Food for Swine; Butcherings; Fattening Hogs; Driving Hogs; To Prevent Hogs Becoming Diseased; Raising Sheep; Washing Sheep; Sheep Rot; Hurdling Sheep; To Tell the Age of Sheep; Sheep Ticks; Early Lambs; How to Make Sheep Pay; Spring Feeding of Ewes; Treatment of Lambs; Increasing the Growth of Wool. **THE AMERICAN LIVE STOCK MANUAL** is a large book of 128 pages, 12mo., with handsome cover, and is profusely illustrated. It will be sent to any address by mail post-paid upon receipt of only **Twenty-Five Cents**. Send for it! The price is but a trifle compared to its real value to every farmer.

Four Books in One! No Household is Complete Without It!

THE COMPLETE BOOK OF HOME AMUSEMENTS.

What most lives need is *more sunshine*. Let us banish care, have a good time, enjoy ourselves, while we may. How many of us have much better off—are those homes wherein the father and mother, and even the gray-haired grandparents, join with the children after tea in a merry game or other amusement, than those wherein reticence and reserve and chilly demeanor prevail. "But," you say, "what shall we do? We read until we are tired; and we know of no amusement that we care for. How shall we employ the long winter evenings?" We have published a book to answer this question, and a wonderful book it is. It contains 64 large 3-column quarto pages, neatly bound in handsome covers, and is filled to the brim with every conceivable thing for the enlivenment of home. It is in reality *four books in one*, for it covers the ground usually occupied by four distinct volumes, and contains four times as much matter as any book published at the same price. It is a complete text-book for Public and Private Entertainments, Private Theatricals, Parlor Exhibitions, Social Gatherings, School Exhibitions and Evenings at Home. It is a book for old and young, grave and gay—a veritable storehouse of good things for all. It contains a number of **ACTING CHARACTERS**, with full directions how to perform them. It gives some very excellent **PARLOR DRAMAS**, easily acted yet very amusing. It tells all about **SHADOW PANTOMIMES**, and this alone we think you will say is worth the price of the book. It contains nearly fifty beautiful **TABLEAUX VIVANTS**, and gives full and explicit directions for performing them. In it are so many amusing **PARLOR GAMES** that we have not attempted to count them, but we think we have almost everything, new and old, that was ever thought of in the game line. Then we come to a lot of wonderful **ILLUSTRATED PUZZLES**—tantalizing, perplexing, apparently intricate, but so easy when you turn to the proper place and learn the answers. Here also is a savory dish of **RIDDLES, ENIGMAS, CHARADES, ETC.**—a nice large lot of them. How young and old heads will puzzle and study over them, and how proud you will feel when you have solved one correctly. As to **CONUNDRUMS**, there are nearly a bushel of them, some so funny you will want to hold your sides with laughter, and what fun it will be for one of the company to read the questions and see who can guess the answers! A considerable portion of the book is allotted to **PARLOR MAGIC**, and here you will find hundreds of wonderful and amusing tricks, easily performed, yet exceedingly mystifying to your audience. Then there are a lot of amusing and instructive **CHEMICAL EXPERIMENTS**, showing how the combination and manipulation of the simplest agents will produce the most surprising results. Following these are a number of excellent **DIALOGUES**, comic and serious, suitable either for school exhibitions or parlor entertainments. Last, but not least, the book contains nearly fifty of the finest **RECITATIONS**, dramatic, pathetic, sentimental, and comic, ever written. It is handsomely illustrated, and is indeed a splendid book. **THE COMPLETE BOOK OF HOME AMUSEMENTS** will be sent by mail, post paid, to any address, upon receipt of only **Twenty-five Cents**.

HOW THE READERS

OF THE

AMERICAN ANALYST

MAY OBTAIN ANY ONE OR MORE OF

THE ABOVE BOOKS

FREE.

To any one who will send us **One New Subscriber** to the **AMERICAN ANALYST** for one year, at \$1.00, we will send, **Free**, any one of the above books to compensate him for his trouble; to any one who will send us two new subscribers, we will send any two of the books; and for three new subscribers, we will send the three books. This will be good pay for little work for it is a simple and easy matter to get one or more new subscribers to the **AMERICAN ANALYST**. Show the paper to your friends and neighbors, and you will have little difficulty in inducing one or more of them to subscribe for one year. And when you have received your book or books you will feel doubly repaid for what trouble you have taken. If the parents do not wish to try it, let the little boys and girls do so after school hours. You feel sure that every one of our present subscribers and readers can readily secure for us one or more new subscribers, and we offer this special inducement in order to stimulate effort in this direction. The books will be found well worth the slight effort that will be required to secure them. Try it, and see how easy it will be.

ADDRESS,

The Analyst Publishing Co.

19 PARK PLACE,

NEW YORK.

To Subscribers, Readers and
Advertisers.

SUBSCRIBERS' attention is called to the great variety of interesting and instructive subjects treated in this number. We respectfully ask the co-operation of our subscribers in extending our Subscription list, which will enable us still further to increase the value of the AMERICAN ANALYST to them.

The CASUAL READER is specially requested to examine our liberal premium offer.

ADVERTISERS who do not know of this Journal already, are respectfully referred to article headed "A Business Benefit."

ALL are kindly requested to peruse this number thoroughly.

The AMERICAN ANALYST can be had at any news stand in the United States. Any news-dealer will take orders for it, the American News Company being our wholesale agents. All postmasters will receive subscriptions.

COLDEN'S LIQUID BEEF TONIC.

ORIGINAL LABEL:

"Colden's Liebig's Liquid Extract of Beef and Tonic Invigorator."

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

WHAT WILL THE HARVEST BE ?

In view of the astonishing achievements of this generation's inventive talent the imagination is utterly at a loss in attempting to conjecture the progress likely to be made by humanity within the next fifty years. Recalling the familiar instances of the extraction of pigments, perfumes and saccharine out of coal tar, the magical utilization of electricity, and the wonderful advancement in a thousand directions of constructive as well as speculative science, there seems literally to be no limit to man's capabilities in bending the forces of nature to his control. Nature itself appears to be subverted through its own instrumentality. The manufacture of silk out of cellulose, without the intervention of the silkworm, mentioned in this column last week, is a striking but by no means an exceptionally remarkable illustration of this fact. We see and hear of such things every day, and they scarcely elicit more than a passing comment, while the mere suggestion of any one of them half a century ago would have provoked universal ridicule. There is another textile material called vegetable flannel which is being

manufactured in considerable quantities in Germany out of the leaves or needles of the pine tree. The fibre is spun, knitted and woven into undergarments and clothing of various kinds. The foreign delegates now visiting this country in attendance upon the Pan-American Congress are reported to have been especially interested a few days ago in witnessing in an eastern factory the spectacle of the sawing, splitting, chopping, crushing, and grinding into pulp of whole trees and the transmutation of the product into the finest and whitest quality of paper. How completely the old fable of an antecedent golden age has been shattered by the wondrous strides that have marked the progress of man during the present century. There never before was such an age as the one we live in, and yet the race is only on the threshold of its development. What ultimate destiny man is to achieve for himself lies beyond the grasp of the most venturesome speculation.

OUR SOUTH AMERICAN RELATIONS.

The "Congress of the three Americas" which met recently in Washington to organize and then dispersed temporarily in order to allow the delegates from Central and South America to visit and investigate our great industrial centres is likely to prove of great and lasting importance to our commercial interests. One point that it will probably settle is the question of reciprocity between the United States and the countries of South America, whose products are now shipped almost exclusively to Germany and England. Senator Morgan, of Alabama, in a recent interview on the subject of the congress, expressed the liveliest satisfaction with its probable outcome. "There is" he said "the question of direct railroad communication between North and South America. It would not be so difficult to construct such a road along the base of the Andes as it was to construct any of the Pacific railroads, and I predict that within a few years we shall see such a road built, connecting the countries in a way that will not only be of almost incalculable benefit commercially, but will also join these countries in an offensive and defensive alliance against the world and enable them to defy it. Then there is the establishment of a court of claims to clear up the thousand and one claims of all sorts for damages that are pending, brought by the citizens of this government against the various South American States, and by citizens of those States against our Government. What we now want is perfect amity. I think the probable result of the congress will be the appointment of a claims commission having, say, one member from each of the nineteen States, and that claims should first be brought before the government of any State, and then, if thought worthy, be presented to the commission, the decision of such a tribunal to be final. That would effectually dispose of the many claims which have done more than anything else to breed ill-feeling between these countries and our own." "Then" he continued "the Nicaragua Canal will be com-

pleted in five years. The work that is being done is astonishing, but it is being accomplished so quietly that nobody knows about it. When this great work is completed it will be another tie to bind us to South America, and will revolutionize trade and commerce with those countries as well as abroad. The clearing house of the world will then be removed from London to New York. Our country, controlling that canal, one war ship will then be able to do the work of ten under the present system. With the vast natural fresh water harbor and provision stations there, our ships could reach almost any point in six or eight days that those of other countries that would have to go around would take fifty days to reach."

FAITH AND SUICIDE.

We continue in this issue, and propose to go on doing so as the facts reach us, the record of men and women barbarously done to death by the malpractice, or the no-practice, rather, of the so-called Christian scientists. It is difficult to account for the existence, to say nothing of the prevalence in this generally enlightened age, of such besotted and suicidal folly, antagonizing as it does all the impulses of reason, the teachings of science and the plainest dictates of revealed religion. The following absurd, though tragical, case of blind devotion to the supposed efficacy of unassisted faith is reported by the Chicago Herald :

"An old German and his wife had been influenced to believe in the unreasonable teachings of some crank, who had method enough in his madness to make money out of the credulous. This old German had retired from business with a moderate competency and lived alone with his wife on Market Street. For more than two years he suffered from consumption and paid half his fortune to faith cure people, who seemed to hold him in complete control. One of his neighbors, who had known him for years, sent a physician to his bedside. The doctor was an unwelcome visitor, but he told the old man that he could live but a few days longer, and advised him to make such disposition of his property as he thought best. The faith cure imposters were early on hand to dispute the physician's judgment. They held a kind of pow-wow and consulted the oracle. The next day the old man sent for his son, who is a young business man in the city. He asked the boy to help him into a carriage. He was so weak as to be almost helpless. He confided in his son to a limited extent, and told him that he was going to renew his life. Away up the river he remembered that the current flowed swiftly against one of the banks. If he could reach that point and drop a handful of pebbles into the stream he would be made whole again by faith. The son knew that his father could live but a short time and humored his desire. The carriage was driven to the river bank above the city and the old man was carried to the edge of the water. He must make the test alone or the charm would fail. The son laid his father's prostrate form on the bank, and gathering a lot of pebbles placed them in the bony hand. Then he left him alone and hid himself in some thick underbrush that grew a short distance away. In a few minutes he stepped out of his hiding place and was horrified to find his father gone. He ran to the river bank, and there below him in the water was the dead body of the old

man. While dropping the pebbles into the stream and muttering the incantation, he had rolled from the bank and was drowned. The boy drew his father's dead body from the stream and placed it in the carriage. The test had failed.

ADULTERATIONS IN MINNESOTA.

The Minnesota State Board of Health has published a report of the State chemists, Drs. Drew and Eberman, relative to the prevalence of adulterations of food materials in that commonwealth. The legislature last winter passed a law directing an investigation of lard, cheese, milk, cream, butter, vinegar, wines and liquors, baking powders, cream tartar and food products that might contain cotton seed oil or terra alba. Dr. Drew reports that he has examined and analyzed 249 articles. Out of eleven samples of milk, ten were found deficient in fat, and one was of legal character. Of fifteen samples of cheese, fourteen were full cream, and one adulterated with 80 per cent. of foreign fats in shape of lard. Twenty-five samples of baking powder were analyzed. Two were found to be phosphate baking powders, four cream tartar baking powders, and nineteen alum powders. Of twenty-three samples of cream tartar purchased from retail grocers, two were of satisfactory purity, while the remainder did not contain cream of tartar at all, being made up of mixtures of tartaric acid, acid calcium phosphate, and in some instances alum. Of fifty-five samples sold as cider vinegar, eleven were pure, thirteen were spurious cider vinegars made from the exhausted pomace from which the cider had been pressed, and thirty-one were colored low wine vinegars, containing in some instances a small proportion of apple solids or cider vinegar. Three samples sold as malt vinegar were colored low wine vinegars. Nineteen samples were below the legal limit of acidity. Sixty-eight samples of lard were examined, and thirty-seven proved to be adulterated with cotton seed oil. Ten samples of olive oil were examined, and six found to consist largely or entirely of cotton seed oil, the other four being pure. The report of Chemist Eberman shows similar results. It indicates that impure goods have everywhere been put upon the market as pure unadulterated goods.

WARM BATHS.—Sir Edin Chadwick, at the recent Health Congress and Exhibit at Hastings, England, expressed the opinion of the wonderful sanitary effect of bathing in tepid water. The German army, he said, had the lowest death rate of any in Europe, which he attributes to the fact that frequent bathing in warm water is compulsory.

SALT.

ITS NUMEROUS QUALITIES PRACTICALLY APPLIED.

Salt is a natural digestive when taken in conjunction with many articles of food, as for example with nuts. Upon the latter, salt almost acts as a natural solvent, when once they have been taken into the inner system. Salt is in a sense, nature's own blood purifier; those who talk about scurvy may hold contrary opinions, but then I am not speaking of the abuse of the mineral in question; I am dealing with its use in a moderate and consistent manner. Heartburn may be relieved almost instantly, if half a teaspoonful of table salt be dissolved in a wine glass full of cold water, and then drunk. When the eyes are tired or weak, if they are bathed in slightly saline water, they will soon become soothed. A gargle of salt and water, used before retiring at night will strengthen the throat and keep off bronchial attacks. If the flesh is stung by an insect, salt is useful again. It should be slightly wetted and applied somewhat like a thick plaster would be, by being tightly bound over the spot which is troublesome, and the insect's venom will vanish as if by magic. Those who suffer from that which is a very troublesome complaint and for which there is very little sympathy—I allude to eructations and flatulency, should try what hot salt will do for them, and for the former complaint fill a conveniently sized linen bag with salt, then make this almost red hot in the oven, and immediately clap it upon the chest. The relief will be instantaneous, and almost wonderful in its effects. For the latter complaint, a somewhat similar tactic should be adopted, but the hot salt should be laid inside a very long linen swathe, and then bound tightly round the body so as to cover the pit of the stomach and the kidneys at the same time. The effect of this will be almost as marvellous as in the previously mentioned instance. Try a bandage of hot salt outside the face, for neuralgia; fill the mouth with hot salt in cases of toothache; put a little hot salt in a piece of muslin, and then put it in the ear for a second or two when earache is troublesome. When a person is upset or has taken something which disagrees with the system, and a harmless emetic is desired, some salt dissolved in warm water will be found an excellent thing for the purpose. In any such cases relief will be experienced very quickly. When the feet are tired and the system consequently feels jaded, try a foot-bath of warm salt-water before retiring at night; the sleep will be a refreshing one, and the next morning the tiredness will have vanished. Of course the slumber will help this considerably, but then the warm salt water bath will assist the sleep to do its work. Coming now to domestic uses of salt (apart altogether from culinary demands), full notice should be taken of the following hints which I give. Straw hats, straw mats, willow furniture, etc., etc., may be cleaned almost like new if salt and water be used for washing them. To clean a carpet thoroughly throw damp salt upon it and then sweep it briskly, and it will be found that all the coloring will have been vastly brightened; or if the carpet has been well swept, go over it afterwards with a clean cloth and clear salt water, and the result will be almost as good. It will certainly make the water harder than if no salt had been added, but then when washing light cambrics, linens, or other gauzy material of ladies' attire a handful of salt, dissolved in the washing water will set the color wonderfully. This practice should be pursued before washing the goods with soap, and by that means the colors will not be so prone "to run." Delicately colored goods of any kind should never be washed without a salt water bath first, but care should be exercised in reference to materials which are likely to shrink when immersed in water. There is a general impression abroad that articles which are dyed black cannot be washed without ruining the color. This is a mistake because so long as the material is washable at all, black dye can practically be rendered a fast color by the help of the salt water bath before the general washing is

commenced upon. After such a treatment faded black caused by washing will never occur. To remove grease from any material, take some spirits of wine, liberally dissolve salts with it, rub the greasy spot, and it will then require a good deal of examination to find where the grease was previously present. People with thin hair should wash their heads in salty water before retiring to rest, and the next morning wash the head again in clear water without soap. I know a case in which excellent results ensued from this treatment. By the use of dry salt any stain may be removed from white table linen, etc., and similarly slight fruit stains may be eliminated, if the dry salt be applied promptly. If the chimney catches fire run to the salt box, and empty it out upon the flames; they will be reduced as if by magic and further steps can be taken to subdue the outbreak. If soot falls upon the carpet or rug, do not attempt to sweep it until it has been covered thickly with dry salt; it can then be swept up properly, and not a stain or smear will be left. If anything happens to catch fire either whilst cooking, or otherwise, throw salt upon it at once to prevent any disagreeable smell. If it is desired to have a bright, clear fire instead of a smoky one, sprinkle some salt over the coals and in a few minutes the desired object will be attained. In summer salt is very useful to the gardener, because a strong solution of it will kill insects or worms on plants, provided that it be poured over the earth in such a way as not to touch the leaves of the plant itself, otherwise the plant will be killed as well as the insects. On account of the last mentioned reason, it will be seen, that salt is very useful to kill weeds, but great care must be taken to see that it does not become scattered more widely than for its immediate purpose. Now a couple of culinary wrinkles to finish with. When beating up the whites of eggs, add a tiny pinch of salt because this will "cut them up," and make them frothy much quicker, as well as make the froth more "heady," than it otherwise would be. Presuming that one wishes to cool a hot dish in a hurry, it will be found that if the dish be placed in a vessel full of cold salty water it will cool far more rapidly than if it stood in water free from salt. I think these hints of mine are almost sufficient for the present occasion, for if I give more of them just now I am afraid I shall bore my patient readers.—P. H. DAVIS in *London Housekeeper*.

CITY HYGIENE.

ADVANTAGES OF THE ELECTRIC LIGHT, ASPHALT PAVEMENT AND CABLE CAR.

In enumerating "some of the hygienic advantages of modern city buildings, with special reference to the respiratory organs," in a paper read before the State Sanitary Convention, Dr. W. T. English says among other things that a casual view of our streets, alleys and courts reveals an advance in street paving—Belgian block substituted for cobble stones on the streets and concrete or asphalt on alleys and courts. He quotes Rudolph Hering, who says that one horse can draw as much weight on an asphalt pavement as would require two horses on Belgian block and seven and four-fifths horses on cobble stone. Dr. English, says the *Pittsburg Dispatch*, urges the Belgian block and asphalt on account of hygienic considerations. Streets so paved are more easily cleansed. The air contamination is reduced, dust decreased, and the streets are largely cleansed by rainfall. Dr. English also finds that cable and electric railways in Pittsburg and Allegheny, when completed, will remove 4,000 horses from the streets, and the absence of offal incident to such a herd of animals, exhalations of effluvia, dust, gas, and odors innumerable constitute only a small portion of the benefits. On the reduction of oxygen waste by the use of electric lights instead of gas, the doctor finds that the 10,000 street lamps of Pittsburg and Allegheny represent an oxygen waste that would supply a city of 35,000

or 40,000 inhabitants, and the grand total of oxygen waste saved indoors and outdoors, on streets, in business houses and printing offices, factories, etc., by electric lighting in these two cities, he finds enough to supply a city of 115,000 inhabitants. He quotes from Dr. Haller and Kried, of Germany, to prove that inhalation of superheated air is destructive of bacilli, and finds that the use of natural gas in baking the air of public assembly rooms, after the departure of the audience, is valuable for the destruction of micro-organisms and rendering of the air aseptic, after which the temperature may be permitted to decline to its wonted place. He indorses the proposition that in all cities there should be provided homes, or hospitals, for consumptives. When deemed advisable the rooms could be heated beyond the temperature of 105 deg. Fahr., at which bacilli perish, and when thought necessary, the patient could be advised to inhale for some time the air at the same altitude which would render the lungs aseptic. In 1883 the relative death rate in Pittsburg from consumption was nearly 12 per cent. In five years preceding 1889 it never reached more than the average of 9.96 per cent. On the whole Dr. English believes that with cleanliness, electric lighting, etc., the cities are improving in both physical and mental health, and that Farr's law of density, which assumes that "the nearer men live to each other the shorter their lives may be reversed by statistics of future cities. It is in large cities that the greatest progress has been made in hygienic requirements and in small cities the proportionate death rate is the largest.

CHARTREUSE.

A SINGULAR INDUSTRY MAINTAINED BY CARTHUSIAN MONKS IN FRANCE.

When the republican government in France suppressed many of the religious orders, an exception was made in favor of the Carthusians of the Grand Chartreuse; and much occasion for satirical remark did this exception provoke, because the reason for the exception was so manifest—that the French were unwilling to drive a flourishing manufacture out of France into Switzerland, whither, or to Tyrol, the Carthusians would have migrated at once, carrying with them their secret, had the republican government resolved to extinguish them. But this was not the sole reason of the exception made in their favor. The Carthusians of the Grande Chartreuse pay to the State annually a duty of 600,000 francs for alcohol, and if the Carthusians were abolished, the State would accordingly be 600,000 francs poorer annually, and Austria and Switzerland so much the richer. But that was not all. Another consideration was that the expulsion of the Carthusians and the transference of their business elsewhere would most assuredly have aroused disturbances in the department of Isere. The manufacture of the famous liqueur Chartreuse is a benefit to the entire department, as the inhabitants are well aware and relieves them from onerous rates. For the Carthusians who manufacture it are the members of a strict order, one of the very strictest, and they do not want money for themselves; they live the most solitary and abstemious of lives, indulge in no splendor, not even of ecclesiastical building; and all the profits made by the sale of the liqueur, the secret of whose manufacture they alone possess, goes for the general good. It is said that the profits obtained from the sale of the liqueur amount to the annual sum of £100,000—a princely income; but the Carthusians make a princely use of it. Almost all of the income is spent in the relief of the poor and in works of general utility. Recently not a little uneasiness reigned in the department, for it was rumored that the house of Rothschild had offered to buy the manufacture, and the recipe of the general of the order for the sum of 80,000,000 francs. We can understand that this offer was a tempting one, if it had been made; for the manufacture of the liqueur had

greatly extended, and was extending annually to the disturbance of the object for which the order was constituted, the order being nothing other than a collection of Hermits. The proposition, however, was refused. The monks met with some opposition from the Vatican some years ago, in consequence of a refusal to pay a million francs a year into the Papal Treasury. The Vatican encouraged the Benedictines to rival the Carthusians with a liqueur of their own composition; so also have the monks of The Fontana, with the "Eucalyptica," derived from the Eucalyptus plantations in the Campagna, near Rome, but none of these can, in the estimation of connoisseurs, equal the delicate flavor of the Chartreuse. This liqueur leaves the monastery of the Grande Chartreuse, in Dauphine, in peculiarly formed, low, broad bottles, with the label and seal bearing the arms of the convent and the letters "D. O. M." (Deo Optime Maximo), as the pledges of genuineness. It must not be supposed that the monks are engaged in distillation of spirits and the mixing of herbs and bottling of liqueur. They live apart from the manufacture in their abbey in the High Alps of Dauphine, and the manufacture takes place in extensive factories in the same mountain basin, but disconnected with the abbey. This abbey of the Grande Chartreuse is the headquarters of the order, which has other houses in France, Italy Switzerland and Austria—in all fifteen. The manufacture is carried on by paid operatives, and the village population is employed in the collection of the requisite herbs. Some of these are becoming scarce, owing to the extent to which they have been gathered. The herbs are mixed with eau-de-vie, which is purchased by the abbey, not manufactured by it, and they are then distilled along with the spirit. Only one of the monks, the steward, supervises the operations, and only one of these operations is conducted in secret, and that is the mixture of the herbs; in which consists the secret. The rest of the brothers of the order have nothing whatever to do with the manufacture, they follow their silent, quiet life independent of it. The manufacture of Chartreuse is of comparatively modern origin. Till 1835, in the Grande Chartreuse alone, an elixir was made of certain herbs steeped and distilled in brandy for medicinal purposes; and it was solely as a remedy that the original Chartreuse was employed and distributed by the brothers. That their decoction would become a liqueur for the palate of luxury never occurred to them. In time, however, both the manufacture was improved and the fame of its excellence extended, so that the rude old workshops in which the brothers distilled the herbs no longer sufficed, and new buildings were erected, and operatives came into that Alpine basin to lend their aid to the perplexed and overworked brothers. Now, the manufacture has called into existence quite a small town. Formerly three kinds of Chartreuse were made—the white, the yellow, and the green—but the white has been abandoned of late years. The green is both the strongest and the most expensive. There is more alcohol in the green than in the yellow. It is hinted that the reverend fathers themselves regard a blend of the two as the perfection of the liqueur, in the proportion of one-third green to two-thirds yellow. Near Florence in the Cartosa, is the Val d'Emmo, where the Carthusians also manufacture a Chartreuse liqueur, green, deliciously flavored with angelica. The monks are suppressed, and only a few old ones linger on, and are not permitted to take novices. Hence their Chartreuse will probably perish with them. In Florence itself the Dominicans of Sta Maria Novella had also their manufactory of elixirs and scents. They have been dispersed, and the government has sold their manufactory, their very pots—and portraits of the inventors of the several elixirs—to speculators, who are installed in their rooms, and who trade on the old credit of the manufactures of the banished friars. Will the Chartreuse of the future have the qualities in such perfection as that of the present? Will the guarantee of a joint stock company be as reliable as that of the order of St. Bruno? The amount of the Alpine plants

is limited. More than a certain quantity of the liqueur cannot be sent forth in the year, and this is what gives to the Chartreuse its high cost. We can hardly expect that a company will be as scrupulous in adhering to the recipe. Let us hope that the good brothers will not sell their secret and their factory, but still send forth the bottles labeled D. O. M.

FAITH FOLLIES.

CURRENT EXPOSURES OF CRIMINAL CHRISTIAN SCIENCE.

A Broken Leg and Lifelong Lameness.

A correspondent, writing from Milwaukee, says: The Wisconsin legislature at its last session struggled with a law that should govern the practice of medicine in the State. There is probably no State in the Union where the laws relating to the practice of medicine are so loose and disjointed as in Wisconsin, and for this reason the itinerant healers from every country of the world flock to the main centres of population within the State. Through the efforts of Dr. Rauch the State of Illinois was made a dangerous place for quacks, and with stringent laws in other surrounding States, Wisconsin receives the exodus of unprofessional practitioners. As the metropolis of Wisconsin, Milwaukee, is overrun with men and women who claim to heal the sick by means unknown to regular physicians. Here the Christian scientists and faith healers flourish. The herb doctor, with a decoction of something harmless in itself, can impose on the helpless invalid with impunity. The great injustice of it all seems to be that only the poorer classes are victimized. With the Christian scientists but very few of their blunders are ever known. Two weeks ago a middle-aged woman broke her leg. It happened that her neighbor was a Christian scientist, and a few prayers and incantations were said while the poor woman suffered for days with a broken limb. A surgeon was at last summoned, who saved the woman's life with difficulty, but she will be a cripple for the rest of her life.

THE LOCAL INSPECTION FIZZLE.

THE COURTS STAMPING OUT LEGISLATION SECURED FOR SELFISH ENDS.

The meat inspection law has again been declared unconstitutional, this time by Judge Nelson, of the United States Circuit Court. The opinion by Judge Nelson is able and exhaustive, and holds it to be a plain violation of the commercial clause of the constitution which provides that Congress shall have control of commerce between the States and with the Indian tribes. He also held that it was in violation of the clause of the constitution which provides that the citizens of each State should be entitled to all the privileges and immunities of the several States. This decision opens the State of Minnesota throughout to the sale of dressed beef from Chicago and Kansas City, and practically settles the invalidity of the law compelling inspection on the hoof. An appeal has been taken to the Supreme Court, and the decision of that body will be looked for with interest, but with little doubt that Judge Nelson and the other judges of the State who have declared the law unconstitutional will be sustained. The failure of the law is what the *Bulletin* prophesied immediately after it was signed by the Governor. Its object was too apparent to receive honest support, and indeed it seems unnecessary that the Minnesota packing interests should require the enactment of such a statute in order to compete with the established packers. There is a good deal of inconsistency about the health cry the country over. It is founded on selfish motives in very many instances. The whiskey sold in a State in one day will do more to injure health than all the diseased meat that

is sold in the entire West in a month. Then away with this health bugaboo. But somebody says look at that death that occurs from eating poisoned meat. But does anybody say look at that drunken engineer in Chicago who ran blindly into a train, causing the death of five innocent passengers? Away with the health bugaboo on meat until the health cry takes more substantial form. The packing interests of Minneapolis and the northwest will soon prove strong enough to exist without blind legislation of this sort. The country westward is an empire of ranges, and from them will be drawn a supply that will build up here an enormous business interest that is now in its merest infancy. What is needed is more freedom in trade and less restriction. If a man cannot buy or sell over a certain line, business is bound to be affected, for it will be crippled. If there were real necessity for the inspection law on the ground of health, that would be another matter; but a law made ostensibly for health, but really for a selfish end, will not find support even among them whom it was intended to benefit—*Chicago Com. Bulletin, Sept. 28.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

October.

MEAT.—Beef, mutton, pork, venison.

POULTRY AND GAME.—Chicken, duck, geese, grouse, hare, partridge, pheasant, pigeons, rabbits, turkeys, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, whiting, salmon, trout, perch, smelts, oysters.

VEGETABLES.—Artichokes, broccoli, celery, potatoes, turnips, cauliflower, cabbage, carrots.

FRUIT.—Apples, pears, quinces, grapes, nuts.

PRACTICAL RECIPES.

OKRA SOUP.—Cut a pound of round steak into bits and put with a sliced onion into a hot frying-pan in which some butter has been melted, and fry until very brown; put the meat into the soup kettle, with three or four quarts of cold water, and boil slowly for an hour; add one pint of sliced okra, and simmer for three hours or longer; season with salt and pepper; strain and serve.

PANNED OYSTERS.—Wash and wipe the oyster shells, without opening them; place them in a pan, the round side down; set the pan in a very hot oven for three minutes. Take from the oven and remove the top shell with a sharp knife; take out some of the oysters and put three in each deep shell that is to go to the table; sprinkle with salt, pepper, bits of butter and cracker crumbs, and bake for a minute or two until they are brown.

COMBINATION BREAD.—One pint each of sifted yellow meal and rye flour; pour in a pint of boiling milk and let it stand until cold. Sift together a pint of wheat flour, a tablespoonful of Horsford's baking powder, a full teaspoonful of salt, a teaspoonful of sugar. Mix these with the meal mixture; add an ounce of creamed butter, and cold water or milk enough to make a stiff batter or dough; shape quickly into loaves; put these in hot, buttered tins and bake an hour; the first half hour, keep the loaves covered.

CHEESE CAKES.—Press a pint of perfectly dry curds through a colander; beat six eggs well, and to them add a cupful of powdered sugar; beat well, and add to

the curds a little salt and a cupful of milk; flavor with vanilla or lemon, and bake in tart shells. When done, spread over them an icing.

OYSTER SALAD.—Use equal portions of small oysters and finely cut celery, and serve with French or Mayonnaise dressing.

PUMPKIN PIE.—To make four ordinary sized pies, take two teacupfuls of cold cooked pumpkin, two eggs, one and a half cupfuls of sugar, nearly two cupfuls of milk; salt, nutmeg, ginger and cinnamon to taste. Bake with under crust only.

BREAKFAST CAKES.—Set at night a batter made of one cupful of milk, one cupful of warm water, three eggs, one teaspoonful of sugar, four tablespoonfuls of yeast; flour enough to make it stiff. The egg yolks and sugar must be beaten well together; then stir in the water, milk and yeast; lastly the flour. Stir together thoroughly and set in a warm place to rise. In the morning stir in the whites of the eggs, beaten to a froth, and a pinch of salt. Bake on a hot griddle.

TERPSICHOE FETTERED.

DANCING ARBITRARILY RESTRICTED IN GERMANY.

Wonders will never cease. Of all European realms, Germany, says a dispatch in the London *Telegraph*, is the one in which the recreative exercise of dancing is most generally and assiduously practised throughout every class of society. Well nigh every Teuton son and daughter, from prince to plumber, from duchess to dairy-maid, knows how to dance, and delights in displaying that accomplishment at every convenient opportunity, not with the perfunctory carelessness and languor that characterizes ball-room performances in this country, but in a highly spirited, correct and painstaking manner. Germans not only like dancing, but dance as if they liked it. With the majority of Kaiser Wilhelm's subjects dancing is a passion, rather than a pastime. As such, it would appear, and for reasons which have not yet been authoritatively set forth, the German Government has resolved to curb it in the young. Henceforth the following regulations are to be strictly observed by those communes in which, during Whitsuntide, on the Emperor's birthday and on other national holidays, public dances are organized for the special diversion of children. Dancing is not to begin until after noon, and is in no case to be continued after eight o'clock P. M. No one but school children is to be allowed to join in, the "mazy." Boys and girls who happen to be undergoing preparation for the ceremony of confirmation are absolutely forbidden to take part in terpsichorean joys. Those to whom the moral and religious training of persons of tender years is entrusted are strenuously enjoined to use every means in their power for the total prevention of dancing among their pupils, and to substitute children's games for that pernicious recreation, such "jeux innocents," moreover, to be played only under the personal superintendence of the teachers. For the future waltzes and polkas, quadrilles and cotillions are to be tabooed to the youngsters of the fatherland. This announcement has all but drained the resources of our capacity for amazement. It will take a good deal to astonish us for some time to come.

WONDERFUL WATCHES.

SOME CURIOUS TIMEPIECES OF OLD AND MODERN TIMES.

For years Dr. Allan, the Scottish physician, was suspected of being a wizard, an opinion which was considered all but confirmed when in 1630, he provided himself with a silver watch of the regulation size and style. Chancing to stop with a neighbor over night, and it being somewhat cold he laid the watch near his body and covered it with the bed-quilts, so that the chilly weather would not effect the works. Next morning he

arose rather abruptly and left the house without removing his treasure from its cosy nest in the bed. In fixing up the room the servant discovered "the infernal chattering thing," and immediately concluded it must be the old doctor's "familiar spirit," conclusions which she hardly arrived at before she had fled wildly from the room. Other servants were called and the whole array charged the "chattering thing" in the bed. Clubs and tongs were freely used but the case was strong and the thing still chattered defiantly. One of the girls, more courageous than the others, finally agreed that she would take the tongs and carry the thing to the moat and drown it, a proceeding fraught with danger, but at last decided upon. The others followed at a respectable distance with hoes, clubs, and shovels, with which they proposed to pounce on the thing should it attempt to attack the heroic girl. When the old doctor returned for his watch he was informed of what had been done, one of the servants leading the way to where the thing had been drowned. It was found hanging on a bush on the bank of the moat. The failure to beat or drown the thing to death fully convinced the servants that it was in reality the old wizard's spirit, and they could not be persuaded to touch it. The story is related to show what rarities watches must have been even at that late period of the seventeenth century. In 1769 one of the admirers of George III. caused to be made for that monarch a watch which was a marvel in its way. It had a calendar hand which pointed to the days of the month and of the year. Instead of making a revolution every month, like calendar watches of to-day, it took the whole 365 days to get once around. The dial-plate was only two inches in diameter, therefore the figures must have been very minute, otherwise the 365 numerals could not have been arranged around the border. The annual dial-calendar was but one of a number of extras with which this watch was provided. A movable diamond performed diurnal revolutions as regularly as did the great orb after which it was modeled, it struck the hours, the half-hours, and the quarters, while an inside dial-plate revolved in a manner clearly exhibiting the variations of the seasons. The English House of Commons, following a suggestion of Sir Isaac Newton, appointed a committee June 11, 1714, with power to offer a reward of £20,000 to anyone who would invent an accurate time-keeper for use at sea in determining longitude. After many years of labor and study the invention was announced as perfected. However, the inventor, one John Harrison, did not receive the reward for his labor until Sept. 14, 1764. Keyless watches have been known for the past hundred years, but not until the past twenty-five have they come into general use. It would take columns to enumerate all the dainty and wonderful little time-pieces that have been made during the past 200 years. They have been made no larger than peas, and set in rings for physicians to facilitate the counting of the pulse. They have been fixed in bracelets, brooches, eye-glasses, tops of umbrella-handles and even on the ends of lead pencils, where they occupy the same position as the rubber on the average Faber. In 1883 a watchmaker of Dresden exhibited a watch made entirely of paper. The paper was chemically prepared and the maker claimed that it would be as serviceable as if made of the material ordinarily used. The same year at a fair held at Worcestershire, England, Crowther Bros. & Co., exhibited one made entirely of iron. An ingenious prisoner at Kariaus, Bohemia, recently constructed a watch eight centimeters in diameter, with no other tools or material except two needles, a spool of thread, a newspaper and some rye straw. The wheels, posts and cogs are all made of the rye straw, which it is well known is quite coarse and tough. It runs six hours without winding and keeps good time. It is now in the possession of the Prefect of Kariaus, who considers it the greatest marvel of the nineteenth century. The most ingenious, perfect and complex watch ever manufactured was sent out from the works of Patek, Philippe & Co., of Geneva, Switzerland, in July 1877, and is now in possession of Baron

Nicholas. It is what is known as the full-sized "hunter." On one side there is a dial of the regulation kind, exhibiting the hour, minute, and second hands; also an independant chronograph hand which marks the fifth of seconds. The same dial has repeating mechanism which strikes the hours, quarters and minutes. The opposite dial has hands pointing to the months, weeks and days. Another large central hand on this dial, if set at the beginning of each year, correctly points to all moon phases and also acts as a perpetual calendar. It is so constructed as to admit of its keeping two different times, say standard on one side and sun time on the other.

WASTED STUDY.

CULTIVATING THE LOWER AT THE EXPENSE OF THE HIGHER MENTAL FACULTIES.

Probably ninety-nine per cent. of all professional men regret the time spent during youth in the study of the ancient languages, believing the time could have been more profitably spent. Physicians having sons to educate, should remember their own feelings, and not insist upon "the boys" treading in the same paths. Felix L. Oswald, M. D., in the September number of the *Popular Science Monthly*, makes a plea for this. He says: Not one of a hundred non-philological students (graduates devoting themselves to the special study and the teaching of ancient languages) would ever dream of continuing his antiquarian pursuits or be able to look upon a Greek or Latin text book without a shudder of disgust. It has been conclusively proved that all the etymological benefits derived from linguistic graveyards could be reaped in a single year by the study of root-words (most of them familiarized by their English and French derivatives). It has been demonstrated to the satisfaction of every impartial thinker that grammar drill is *not* the superlative intellectual exercise vaunted in the arguments of its advocates, but, on the contrary, almost the worst of all possible systems of mental training—a dead-lift of memory, exercising the lower at the expense of the higher mental faculties. Nor is there a shadow of doubt that in natural history, astronomy, geography, geology, physiology and mathematics, the achievements of Greece and Rome have been distanced as far as their own writers eclipsed the wisacres of Scythia and Abyssinia. Yet the New World continues to emulate the Old in wooing the spectres of the past, and thousands of American parents encumber the memory of their children with a mass of antiquarian rubbish that leaves no room for the culture of progressive science, too often not even for the adequate study of their own mother-tongue.

SPECTACLE LENSES.

HOW THEY ARE CUT OUT OF A SHEET OF GLASS.

The work of cutting is all performed with a tiny fragment of diamond, known in the trade as a spark. It is not every spark, however, that will cut a lens. The sparks are mounted in the following manner: A piece of brass wire is selected, say $\frac{1}{8}$ of an inch in diameter, a hole is drilled in the end large enough to admit the spark, and it is set in the hole with the point up. The outer edge or shell of the wire is beaten inward and holds the spark firmly in place. The wire is then placed in the lathe and cut off just back of the spark, turning the end hemispherical, using the point of the spark that sticks through the brass as a centre. A piece of steel wire is next selected, of the same diameter as the brass wire, and the end is turned in, forming a cup. The mounted spark is then soft-soldered into this cup and it is ready for the machine, which works automatically from a pattern, and can be set to cut larger or smaller than the pattern. Before the mounted spark is placed in the machine, however, it is tested by holding the handle upright. If it does not cut in an

upright position, the point is unsoldered by means of the blowpipe and the handle resoldered, leaving the cutting point at the required angle, while the handle itself is upright. When the spark is found to cut well in an upright position, it is then placed in the machine for trial. The glass is placed upon a pad under the spark, the glass varying in form according to the kind of lens being cut. If the lens is flat, the pad is also, and if the lens is convex the pad is concave, and must be a perfect fit; for the better the fit, the more accurate will be the work. The pattern and glass travel around while the diamond remains stationary. The life of a spark is short, some being only one day, while once in a while they can be worked for a year. The workmen average fifty dozen pair of lenses per day. A good diamond will cut on an average of 1,500 dozen pairs. The average lens measures four inches around, and a dozen pairs would be eight feet. In cutting 1,500 dozen pairs, the spark would travel over a surface equal to a piece of glass 12,000 feet long. There are exceptional sparks that cut for months. I now have one which has been in operation for fifteen months and has cut 7,200 dozen pairs, traveling about 57,600 feet. We use two kinds of sparks, the Brazilian and the African, and they cost from \$3 to \$5 each.—*American Jeweler*.

FALL CHESTNUT.—First Squirrel: What are you doing for a living now?

Second Squirrel: Oh, chestnuts.

KNEW HER BUSINESS.—Lady (in intelligence office): "Have you ever minded children before?"

Nurse: "No, mum; but I've made manny a choild mind me."

HAD EXPERIENCE.—Lawyer: "Do you understand the nature of an oath, madam?"

Witness: "Well, I should say I did. My husband took off the screens yesterday, and is putting up the stovepipes to-day."

SHEET IRON HOUSES.—A system of building houses entirely of sheet iron has been communicated to the Society of Architecture, in Paris. The walls, partitions, roofs and wainscoting are composed of double metallic sheets, separated by an air mattress, which is surrounded by different non-conductors of heat.

A NEW FORM OF FUEL.—An Indiana man grinds corn stalks and coarse prairie grass, moistens them with water, reduces them to a coarse pulp and then subjects the mass to a heavy pressure, compressing them into blocks 12x4 and 4 inches thick. These, when thoroughly dry, furnish more heat than ordinary bituminous coal.

COTTON SEED.—One of the most surprising features of the modern business world is the extensive use of cotton seed, formerly considered worthless. According to the *New York Tribune*, over 800,000 tons of these seeds are now pressed for their oil, from 36 to 40 pounds being obtained from each ton. The consumption of cotton seed oil is increasing both in this country and in Europe, and new uses for the oil are constantly being discovered.

BRICK ESTIMATES.—Readers in many branches of trade will be glad to know this method of estimating brickwork, which is obtained from an authority on the subject: Ordinary bricks are about eight inches in length, and, with the mortar joint, about half that in width, so that each brick on the flat will give a horizontal surface of about 32 square inches, or $4\frac{1}{2}$ bricks will cover a square foot. As ordinarily laid, there are nine courses to every 24 inches, or $4\frac{1}{2}$ to the foot. Four and a half courses with $4\frac{1}{2}$ bricks to the course, will give $20\frac{1}{4}$ bricks to the cubic foot. Waste, cutting, and closer joints will easily require an allowance of twenty-one bricks per cubic foot, which will be found a very convenient figure for estimating the number of bricks required for a wall of given height and thickness, as it thus becomes unnecessary to find the cubic contents of the wall, but merely to multiply its face area, or the product of its length and height in feet, by seven-fourths of its thickness in inches, which, as the thickness is always some multiple of the four inches, is a very simple process.—*The Artisan*.

Fine Table Wines

From our Celebrated Orleans Vineyard.

Amud Hamworthy & Co.
Producers of the
ECLIPSE
CHAMPAGNE,
530 Washington St.
SAN FRANCISCO.

Delicious Drink

Horsford's Acid Phosphate

Makes a healthful and invigorating drink with water and sugar only. It harmonizes with such stimulants as may be necessary to take. A desirable substitute for lemons or lime juice. Alays the thirst, aids digestion, and relieves lassitude.

"Dr. T. C. Smith, Charlotte, N. C., says:

"An invaluable nerve tonic, a delightful beverage, and one of the best restorers when the energies flag and the spirits droop."

Dr. J. S. Niles, Pownal, Vt., says:

"Excellent as a tonic, and refreshing as a substitute for lemonade."

DESCRIPTIVE PAMPHLET FREE.

RUMFORD CHEMICAL WORKS,

PROVIDENCE, R. I.

Beware of Substitutes and Imitations.

CAUTION.—Be sure the word "Horsford's" is PRINTED on the label. All others are spurious. Never sold in bulk.

HOW TO MISS IT.—Fortune knocks once at every man's door, but she doesn't go hunting through beer saloons for him if he happens to be out.—*Puck.*

SMALL AVERAGE.—The largest animal known is the torquial, which is about 100 feet in length. The smallest is the twilight monad, whose dimensions are 1/1000 of an inch. It is evident that the middle term is one-third of an inch, about the length of the common house fly, which may, therefore, be considered as an animal of medium size in the creation.

LIGHT AND LIFE.—An English scientist has been making experiments to determine the important part which light plays in the development of animal life. A dozen tadpoles were confined in a box from which every ray of light was excluded. The result was that only two of them developed into frogs, and those were short lived. The others increased considerably in size, but never left the tadpole form.

TYPHOID FEVER.—Dr. Edson, of the New York Board of Health, sums up his conclusions in regard to typhoid fever, as follows: First, that typhoid fever never infects the atmosphere; second, that it never arises *de novo*, and third, that the causes of the disease, in order of their frequency, are as follows: First, infected water; second, infected milk; third, infected ice; fourth, digital infections; fifth, infected meat.

COLLEGE DEGREES.

The American Academy of Medicine is endeavoring to make as complete a list as possible of the Alumni of Literary Colleges, in the United States and Canada, who have received the degree of M. D. All recipients of both degrees, literary and medical, are requested to forward their names at once, to Dr. R. J. Dunlison, Secretary, 814 N. 16th street, Philadelphia, Pa.

NEW MAGAZINE.

The *National Magazine* is the name of a new literary venture of Chicago, which begins with the October number. It is published under the auspices of the new "National University," which opens October 1, of which it is the organ. The first number will contain articles on literary, educational and scientific subjects, and a prospectus of the University, which is said to be modelled after the London University and has extensive non-resident courses, teaching many subjects by mail. Published at 182 Clark street.

BUSINESS NOTES.

THE MOST NOTED DERMATOLOGIST OF THE WORLD.

The accompanying cut will be recognized as John H. Woodbury, the noted dermatologist, who has gained a reputation unsurpassed by any others; universally acknowledged by thousands of patients who have successfully been treated by him for the skin or scalp during his practice of twenty years or over. The most common subject to arouse skeptics is dermatology—caused by frauds who, having

J. H. Woodbury, a small capital and still smaller experience, place before the public a specific or cure-all, and after benefit is derived from their sales they disappear, never to be heard of again. John H. Woodbury has outlasted them all. He has convinced skeptics that dermatology is a study, which by a score or years of constant practice has, and will prove the most wonderful results in the treatment of the hair and scalp, eczema, moles, warts, superfluous hair, birth marks, moth, freckles, tan, wrinkles, red nose, red veins, oily skin, acne, pimples, blackheads, barber's itch, scars, pitings, powder marks, bleaching, facial development, etc. Every honorable physician must know that it is utterly impossible for any one medicine to cure all forms of disease, whether external or internal, and that in order to treat the various ills of the body successfully, or at all, he must first diagnose the trouble he is called upon to treat, and then prescribe that medicine which seems best suited for its cure. John H. Woodbury's treatment of all the different affections of the skin and scalp is, first, to make a correct diagnosis in every case, and then prepare such

medicines as the case requires, which by experience of twenty years has taught him to believe the most effective for their cure. From this it will be plainly seen that his treatment is the only one calculated to effect perfect cures without temporizing with his patients, or extorting money from them. A perfect diagnosis can be made by people distant from his office by sending 10 cents for his 128 page book (6th edition), revised and illustrated, containing a treatise on "Disfigurements and Imperfections of the Skin, and their Treatment." This valuable informant enables one to become enlightened on the study of dermatology to such an extent as to be able to diagnose their own imperfections by accurately describing the same by mail, and always receiving John H. Woodbury's own personal attention, they can be treated successfully and permanently cured. His increasing practise has compelled him to remove, and he now occupies the elegant four-story and basement brown-stone front building, with laboratory in the rear, at 125 West 42d Street, New York City. Hours: 9 A. M. to 9 P. M.; also Sundays. Consultation free. John H. Woodbury's facial soap is and has been nonpareil for the skin and scalp. It is the only soap of its kind ever placed on the market, and constantly used will permanently keep the skin in a clear and healthy condition. Sold by all druggists, or by mail, price 50 cents.

FOR TIRED BRAIN

USE HORSFORD'S ACID PHOSPHATE.

Dr. O. C. Stout, Syracuse, N. Y., says: "I gave it to one patient who was unable to transact the most ordinary business, because his brain was 'tired and confused' upon the least mental exertion. Immediate benefit, and ultimate recovery followed."

PRINTERS' AND OTHER INK.

In considering the wonders accomplished with printers' ink, due credit should be given to the Esterbrook Steel Pen with which the printers' copy was written.

CATARRH
HAY FEVER
CATARRHAL
DEAFNESS

A NEW TREATMENT.
Sufferers are not generally aware that these diseases are contagious, or that they are due to the presence of living parasites in the lining membrane of the nose and eustachian tubes. Microscopic research, however, has proved this to be a fact, and the result of this discovery is that a simple remedy has been discovered which permanently cures the most aggravated cases of these distressing diseases by a few simple applications made (two weeks apart) by the patient at home. A pamphlet explaining this new treatment is sent free by A. H. Dixon & Son, 337 and 339 West King Street, Toronto, Canada.

WHOOPING COUGH CURED

Or Prevented by Page's Vaporizer and Cresolene.

We have abundant testimony that Cresolene vaporized in a closed room is an almost infallible remedy for **Whooping Cough**, for which distressing malady no other assured remedy is known to us. A cure usually effected in five or six days, at a trifling expense and but very little trouble. It is also exceedingly efficient in Asthma, Croup, Catarrh, Diphtheria, Influenza and Scarlet Fever. It is a safeguard against the spread of contagion.

Vaporizer complete, including a bottle of Cresolene, \$1.50. Ask your druggist for it.

For particulars address The Great American Tea Co., 31 and 33 Vesey St., New York, N.Y. P. O. Box 287.

VALUABLE TO ADVERTISERS.

You have determined to make money by vigorously pushing your business. As the AMERICAN ANALYST has determined to do the same thing, we have a community of interests. Our way of making money is to increase our circulation, and we can only do so by publicity; that is, by bringing our journal to the notice of a great number of people, who have the intelligence to appreciate a good journal when they read it and the money to buy what they want. You must necessarily want to reach the same class. Even if you do not sell directly to the consumer, it is necessary for you to tell the consumer of the quality of the goods you have to offer to induce him to ask the dealers with whom he trades for them. We propose this Fall and Winter to send a sample copy of this journal to the address of every person in the United States whose name we can find in any of the *Elite* directories or blue-books of the various cities and villages. We will thus reach several millions of new readers in addition to our already large subscription-list, covering every State in the Union. Previous experience with this method of getting new subscribers war-

rants us in undertaking the expense, believing that it will pay us. This large addition to our circulation will put any advertisement in our columns before a multitude of readers. Our advertising prices remain the same, and are so arranged as to give the lowest rates to larger and longer-continued advertisements, and will be sent on application. All respectable advertising agencies will take orders for us. If we find this system profitable, advertisers surely will. Those who have advertised with us always renew as their season comes around, and you will do the same when you have tried it. We have found that in the great competition now existing we must keep our journal prominently before the public, and, in our mutual interest, we ask you to join us. Our system is more effective than a circular, and you will find it just as effective for your business and the cost very much less. Try us. For any further information write, and it will be forthcoming.

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPEDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a New Subscription with **One Dollar.** It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.
STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,

By MISS M. E. BRADDON.

THE GIRL AT THE GATE,

By WILKIE COLLINS.

A BRIDE'S TRAGEDY,

By MISS MULOCK.

THE RECTOR'S DAUGHTER,

By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,

By MARY CECIL HAY.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, profusely and handsomely illustrated, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the AMERICAN ANALYST.

ANALYST PUBLISHING CO.,

19 PARK PLACE, NEW YORK.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Vandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

P. O. Box 1574. **THE NEW YORK PHARMACAL ASSOCIATION, NEW YORK.**

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cook-book, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose pururious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING CO.,
19 Park Place, N. Y.

AMERICAN * ANALYST

WANTED ON LIBERAL TERMS.

WE ARE CONFIDENT that we have Reached the HIGHEST DEGREE OF PERFECTION in Solving the INFANT FOOD PROBLEM.

LACTO-PREPARATA.

A Prepared Human Milk perfectly Sterilized and especially designed for Children from birth to six or eight months of age.

Made wholly from cow's milk with the exception that the fat of the milk is partially replaced by cocoa butter. Cocoa butter is identical with milk fat in food value and digestibility, being deficient only in the principle which causes rancidity. The milk in LACTO-PREPARATA is treated with Extract of Pancreas at a temperature of 105 degrees, a sufficient length of time to render twenty-five per cent. of the casein soluble, and partially prepare the fat for assimilation. In this process the remaining portion of the casein not peptonized, is acted upon by the pancreatic ferment in such a manner as to destroy its tough, tenacious character, so that it will coagulate in light and flocculent curds, like the casein in human milk.

Composition:	ALBUMINOIDS.....	19 Parts.	SEND FOR SAMPLE and compare it with every other food used in artificial feeding of Infants.
	MILK SUGAR.....	64 "	
	FAT.....	10 "	
	MINERAL MATTER.....	3 "	
	CHLORIDE OF SODIUM added.....	1/2 "	
	PHOSPHATES OF LIME added.....	1/2 "	
	MOISTURE.....	3 "	

LACTO-PREPARATA is not designed to replace our SOLUBLE FOOD but is better adapted for Infants up to eight months of age.

CARNRICK'S SOLUBLE FOOD.

Is the Nearest Approach to Human Milk that has thus far been produced, with the exception of Lacto-Preparata.

During the past season a large number of Physicians and eminent Chemists visited our Laboratory at Goshen, N. Y., and witnessed every detail connected with the production of Carnrick's Soluble Food. This invitation to witness our process is continuously open to Physicians and Chemists. All expenses from New York to Goshen and return will be paid by us. The care used in gathering the milk, its sterilization, and the cleanliness exercised in every step, cannot be excelled. Soluble Food has been improved by increasing the quantity of milk sugar and partially replacing the milk fat with cocoa butter.

PHOSPHO-CAFFEIN COMP. (GRANULAR EFFERVESCENT.) A SEDATIVE, NERVE AND BRAIN FOOD.

This preparation has been thoroughly tested, and found to produce the happiest effects in Headaches, Neuralgia, Sleeplessness and General Nervous Irritability. We are confident that the above combination will be found superior to any of the various preparations that are used in nervous affections. It is not only a nerve sedative but a Brain and Nerve Food. The depressing effects of the sedative ingredients are fully overcome by its reconstructive constituents.

As a harmless and positive remedy in Headaches and Insomnia we are certain it has no equal. It is far more palatable than any of the preparations used for similar purposes.

PUT UP IN FOUR, EIGHT AND THIRTY-TWO OUNCE BOTTLES.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond doubt that they have found the **AMERICAN ANALYST** a good advertising medium. Why should not you?

INVALUABLE TO EVERY HOUSEWIFE!

THE MODERN COOK-BOOK AND MEDICAL GUIDE.

This is practically two books in one—a perfect cook-book and a perfect medical book—and there is so much in it, and so much care and pains have been taken in its compilation, that we feel perfectly safe in asserting that the Cooking department is fully the equal, in quantity and quality of contents, of any low-priced cook-book published, and the same as to the medical department herein as compared with any low-priced medical work on the market. It is a complete encyclopedia of domestic information, and we fully believe that no lady, after having it in the house a short time, would willingly do without it for ten times its cost. The cooking recipes number 627, and include Breakfast Dishes, Soups, Meats and Poultry, Fish, Vegetables, Salads and Relishes, Bread and Rolls, Jellies and Preserves, Puddings and Pies, Fancy Dishes, Cakes, Confectionery, Ice Cream and Summer Drinks. The compilation of this department was superintended by a practical housekeeper, every recipe will be found reliable, and it has been pronounced one of the best, most complete, and practical cook-books published. The Medical Department will be found fully the equal of any doctor book published at one dollar or less. It tells you how to cure, by simple means, available in every home, Malaria, Pneumonia, Poisons (antidotes for), Nervousness, Measles, Rheumatism, Toothache, Wounds, Sprains and Bruises, Weak and Inflamed Eyes, Dust in the Eye, Sore Throat, Sore Head, Whooping Cough, Neuralgia, Earache, Worms, Warts, Burns and Scalds, Headache, Offensive Breath, Bleeding (to stop), Cancer, Consumption, Felons, Dyspepsia, Dysentery, Diphtheria, Diarrhea, Croup, Corns, Liqueur Appetite, Coughs and Colds, Cold in the Head, Catarrh, Scarlet Fever, Nose Bleed, Baldness, Smallpox, Sleeplessness, Ringworm, Chilblains, Costiveness, Cholera Morbus, Bright's Disease, Convulsions, Mumps, Superfluous Hair (to remove), Hysterics, Colic, Scatica, Biliousness, Nettle Rash, Typhoid Fever, Ingrowing Toe Nails, Abscess, Stammering, Hemorrhage, Asthma, Hydrophobia, Scrofula, Bronchitis, Lockjaw, Erysipelas, Hoarseness, Chills and Fever, Dropsy, Bunions, Fits, Dandruff, Scurf, Quinsey, Heartburn, Styes, Liver Complaint, Cramps, Corpulence, Sunstroke, Knock-knees, Indigestion, Jaundice, Gout, Prickly Heat, Ulcers, Salt Rheum, Fainting, Boils, Tobacco Habit, Gray Hair (to prevent), Cholera Infantum, Deafness, Stiff Neck, Piles, Choking, Freckles, Pimples, Sunburn, Chapped Hands, and many other ailments. It will save you many dollars annually in doctors' bills and patent medicines. Who can doubt that twenty-five cents invested in such a useful and valuable book as this would be the best and most profitable investment that could possibly be made of so small a sum? THE MODERN COOK BOOK AND MEDICAL GUIDE is a large book of 128 pages, neatly bound in colored covers. It will be sent by mail post-paid to any address upon receipt of only **Twenty-five Cents.**

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making Bi-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

DEAN'S PATENT

ARDENTER MUSTARD.

BEST IN THE WORLD.

Ardenter Mustard Pellets

— FOR —

Dyspepsia and Indigestion.

UNIVERSALLY recommended and prescribed by physicians. The medicinal property are English mustard seed coated with pepsin and sugar. You will find it will relieve you after using two or three doses. It is very beneficial for Heartburn, Sour Stomach and Headache. They are a beautiful confection for children. Each bottle contains full directions.

W. G. DEAN & SON,

361 and 363 Washington Street, 84, 86 and 88

North Moore Street, New York.

To Subscribers, Readers and
Advertisers.

SUBSCRIBERS' attention is called to the great variety of interesting and instructive subjects treated in this number. We respectfully ask the co-operation of our subscribers in extending our Subscription list, which will enable us still further to increase the value of the AMERICAN ANALYST to them.

The CASUAL READER is specially requested to examine our liberal premium offer.

ADVERTISERS who do not know of this Journal already, are respectfully referred to article headed "A Business Benefit."

ALL are kindly requested to peruse this number thoroughly.

The AMERICAN ANALYST can be had at any news stand in the United States. Any news-dealer will take orders for it, the American News Company being our wholesale agents. All post-masters will receive subscriptions.

DR. PRICE'S CREAM BAKING POWDER

MOST PERFECT MADE.

Its superior excellence proven in millions of homes for more than a quarter of a century. It is used by the United States Government. Endorsed by the heads of the Great Universities as the Strongest, Purest and Most Healthful. Dr. Price's Cream Baking Powder does not contain Ammonia, Lime or Alum. Sold only in Cans.

PRICE BAKING POWDER CO.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2."

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation, physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

DANGERS OF HYPNOTISM.

Hypnotism flourishes in France, and while, as recently stated in this column, some of the prominent physicians of that nation seldom use it for therapeutical purposes, others consider it an invaluable curative instrument. Many of the leading German doctors, however, raise warning voices against its use—or perhaps we should say, against its abuse. The learned Prof. Ziemssen of Munich, announces it as his conclusion that while hypnotic treatment may be of some use in slight functional disturbance, it may be harmful to many patients. The difficulty is that suggestion and fixation remove a symptom for the time being only, but have no influence on the disease itself. Many persons especially men, fail entirely to respond to hypnotism, and in fact only the so called nervous constitution is influenced by it. There is hardly a case on record where it gave a decided benefit in several neurotic diseases, as epilepsy, chorea, paralysis, agitans. It cannot be denied that some severe symptoms of hysteria, as convulsions, paralysis or contractures have been temporarily removed by hypnotism, but it is only a change from one anomalous

state of the brain into another one. It is in fact analogous to the treatment of morphinism by changing it into cocainism. Not only in hysterical patients, but also in healthy persons, it can be shown that the Nancy school is off the track when they consider hypnosis a state related to natural sleep. It is far more a pathological state, developing itself by frequent repetition into a state which may be called psychotic. It is a well-known fact that frequent repetition may increase hypnotization to such a degree that the patient becomes autohypnotic by fixing his vision on a shining point, or he may become even hypnotized by the mere approach of the physician. Thus a patient may fall into a lasting state of debility of the centres presiding over conscious cognition and will-power. We do not know yet all the injuries heaped upon the brain by repeated hypnotization. If such treatment needs all the knowledge of the conscientious physician, how much the abuse must be feared when people apply it promiscuously?

UNKNOWN SENSES.

The president of the British Association, Professor Flower, endorses Sir John Lubbock's idea that the field of inquiry is limitless, and that there may be "fifty other senses as different from ours as sound is from sight; and even within the boundaries of our own senses there may be endless sounds which we cannot hear, and colors as different as red from green of which we have no conception. These and a thousand other questions remain for solution. The familiar world which surrounds us may be a totally different place to other animals. To them it may be full of music which we cannot hear, of color which we cannot see, of sensations which we cannot conceive."

A HYGIENIC CONVENTION.

In our issue of September 26, we published a detailed account of the preparations being made for the annual meeting of the American Public Health Association to be held in Brooklyn on the 22d inst., continuing four days. The *Chicago Sanitary News*, of October 12, says in reference to the important gathering:

The association consists of about eight hundred members, and probably exerts the greatest influence on public health of any association of a similar character. It is national in its composition and labors, and allied with many associations of the same general character. Its object is the promotion of the public health and the advancement of general sanitation. Among its members are to be found our most advanced sanitarians, and its annuals, "Public Health," are among the best additions to the literature of preventive medicine we have. We have published the list of subjects to be discussed at the coming meeting, a reference to which will show the general character and scope of the work performed at these meetings and the great value of it to the cause of sanitation. The subjects selected are of the highest importance, and the high character and ability of the membership will insure a treatment of these subjects that will render a service to sanitary sciences that

could be obtained no where else. They will be not only of practical value, but coming from the high source they do, they will give to that science the dignity and elevation that come from authorities in any matter. The object they seek to promote must necessarily partake of the nature of the membership of this association. No association could be formed having for its object a greater or more important aim than this one has. Its value to the public renders it worthy of national support and aid in the dissemination of the knowledge it obtains regarding public hygiene. The endorsement of every one who values health and happiness will be given it, for it means much to the individual. It means the prevention of those diseases which seek a stealthy entrance to the homes and leave vacant chairs about the fireside. In order to render a greater service to the cause of sanitation to advance it in every particular, the association this year has taken a step in advance and will have on exhibition everything available adapted to the promotion of public hygiene.

FRENCH SPIRITUALISTS.

Among the interesting gatherings that have assembled in Paris during the past season, attracted thither by the great Exhibition, was an International Congress of Spiritualists. The New York representative was Mr. H. Lacroix, editor of *La Spirite*, a Paris publication, who at one of the sessions raised quite a tumult by his opposition to a resolution declaring Allan Kardec to be the founder of modern Spiritualism. He said that he opposed it in the name of 40,000 American Spiritualists. His protest, however, had no effect. Several medical men took an active part in the recent congress. These members must have satisfied themselves that there was something outside of the common order of phenomena in Spiritualistic manifestations before risking their professional reputation by showing an active interest in the movement. Two classes of investigators were, however, represented. On the one hand, there were the genuine Spiritualists, who believe that the communications which are received through "mediums" really come from spiritual beings. On the other hand, there were those who recognize the phenomena of Spiritualism, but who connect them with physical laws, the operations of which are as yet imperfectly understood. These people speak of psychic force, while they either deny the existence of spirit in nature or contend that no conclusive evidence of such existence has yet been offered. It is possible, therefore, to believe in the phenomena ordinarily attributed to Spiritualism while maintaining that when a man dies all that composes his individuality dies with him. By far the greater number of the delegates repudiated this materialistic doctrine.

OUR MEXICAN TRADE.

The Mexican *Economist*, the best authority on Mexican finance and statistics, gives some facts and figures regarding the condition of trade between Mexico and the United States which are regarded as rather startling, and which differ materially from those given out at Washington. It says that in the fiscal year 1887-88

ROCK CANDY and ROCK CANDY SYRUPS.

For use at the Soda Fountain and in all Pharmaceutical preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

DRYDEN & PALMER,
19 Hudson St., New York.

the value of the exports from the United States to Mexico was in American coin \$19,264,675, and that the value of exports from Mexico to the United States during the same period was \$23,294,000. These figures are regarded as the most accurate that have ever been obtained, and show that exports from the United States to Mexico are several millions larger than heretofore stated by either Mexican or United States authority.

THE GOVERNMENT GEOLOGIST.

Maj. J. W. Powell, Director of the U. S. Geological Survey, who accompanied the Senate Committee on Irrigation on their recent tour through the Northwest, probably knows more about the western half of the continent than any other man living. He has been an explorer and pathfinder in the mountains and on the great plains and through the deep canyons of great rivers almost ever since the close of the civil war. When the war broke out, he was a college professor in Illinois. He went into the artillery service, lost an arm at Shiloh, rose to the position of Chief of Artillery in one of the great armies, and then, when peace was restored, unbuckled his sword and went back to his professor's desk. Thence he was soon summoned by the government to undertake important surveys in the new territories. He is now the head of the extensive organization which is prosecuting a geological survey of the entire country. Incidental to this work, and authorized by a special act of Congress, is the survey of the streams and drainage basins in the arid regions, and the reservation of reservoir sites, with a view to the construction of future irrigation works. Major Powell is a man of about fifty-five, of a somewhat gnarled and rugged appearance, showing the traces of the many hardships and rude adventures he has gone through; but of a genial temper and an active and buoyant spirit. He is an exceeding interesting talker, whether in conversation or on his feet before public assemblies, and brims over with scientific information which he has the art of making entertaining to the most unscientific listener.

SACCHARINE IN EUROPE.—Saccharine, which is three hundred times sweeter than sugar, is beginning to be felt by the beet sugar manufacturers as a very dangerous enemy. It is stated that in Germany, already, so much saccharine has been made as to render 5,000 tons of beet sugar superfluous. It is principally employed in the preparation of fruits and the production of sweet liquors. It is not a food stuff. Indeed, it has been condemned by eminent medical authorities as directly prejudicial to health. The sugar manufacturers are of the opinion that saccharine should only be sold by chemists. France, Italy and Portugal are already contemplating imposing a tax upon it.

THE THREE FLIES.

FATAL RESULTS OF FILIAL DISOBEDIENCE AND OF EATING FOOD PREPARED FOR MAN.

(From the French of *Maxime du Camp*.)

Mrs. Fly had three children. She was not a widow, but her husband, who was passionately fond of traveling, had one day flown away in search of adventures, and since that time she had never heard from him. The poor forsaken wife bore her fate with dignity, and devoted herself to the education of her son Muscarello and her daughters Muscabella and Muscadine. When the children had reached their majority and learned from her all she could teach them, Mrs. Fly called them to her side one day, and looking at them lovingly, said with great emotion:

"The time has come for you to finish your education. You must leave me and go out into the world, and learn from Nature what she has to offer to those who seek to profit from her instructions. Travel is needful for the young. It develops their intelligence by giving them an opportunity of drawing comparisons. It will soften your hearts, inasmuch as it will initiate you into the miseries the fly race is subjected to. Go then, my dear children, to gather information upon every subject, and experience in the ways of the world, without which you can never become useful or good citizens or good parents. Before I take leave of you and give you my blessing, listen to the counsel of your doting mother, who has not hesitated to make every sacrifice, in order that you might become perfect beings, and who wishes to prepare you for the dangers you will encounter upon your travels.

The whole world is open to the flies. It belongs to them, it was created for them. Every where flies find luscious food which Dame Nature prepares for them. Fruits, cereals and animals belong to them. Do not hesitate to satisfy your hunger for the food your Creator has prepared for you. But as you value your life, beware of touching anything prepared by the hand of man. He is a wild animal, without honor, pity or virtue. He is—so he boasts—the king of all creatures, and he seeks to prove it in that he destroys them. What passes through man's hands comes forth adulterated—he is a liar in his words, works and actions. He despises our race. As soon as his children, who are reared with difficulty, are taught the habits of cleanliness, and reach the age when it is expected of them to learn an ancient language called Latin, a book is given them in which this adage is found: '*Puer abige muscas.*' Oh! my dear children, avoid man, do not touch his concoctions. Promise your mother solemnly, that upon this point you will conform to her wishes."

The three flies who could scarcely restrain their sobs, said, with trembling voices, "We promise it."

"I expected this promise from you. Farewell, then my dear children. Muscarello, my son, I confide your sisters to your care. You were born a few seconds before them; you are the eldest and you must be their protector. I have often admired the strength of your wings, and the nimbleness of your legs and your keensighted comprehension. Use these noble gifts to watch over, to defend my daughters, and to prevent them from making mistakes, which young and inexperienced flies are so often tempted to make. Receive them from my hands as a precious treasure for which I shall require an account of you. If your travels lead to Miapolis, and you should meet your father there, tell him that his faithful wife longingly awaits his return to his fireside. And now let us be strong. To-night we will sleep near each other, but to-morrow morning, as soon as the haze is dispersed, and we have taken our first breakfast, you must set out on your journey. Do not forget in your travels your sorrowing mother, who will never cease to think of you."

The next morning the mother blessed her children, pressed them to her heart, and lovingly looked after them as they flew away. At the very moment they

fluttered out of sight, an Auvergnat passed and played upon his organ the tune of "Gratia Dei."

"How large and beautiful this world is," exclaimed Muscarello, and his sisters were enchanted and uttered constant screams of delight, at the same time feasting their eyes upon the beauties of Nature surrounding them. They said to each other, "How many delightful reminiscences, how many grand impressions we shall treasure up for our old age. We shall have many marvellous adventures to relate to our grandchildren, if we are ever fortunate enough to have any."

Completely worn out with fatigue, yet intoxicated with enthusiasm, they took up their first night's quarters upon a sycamore tree, a leaf of which protected them from the dampness. Muscadine, the younger sister, who had a beautiful voice, sang a cradle song that their mother had often hummed to lull them to sleep. The song recalled to the three flies their childhood's days, and after they had dropped asleep they dreamt they were in their maternal home, playing together like good, frolicsome little flies, as they were in those olden days.

The following morning, before they set forth on their journey they took an invigorating bath in the dew drops hanging on the top of a stalk of oats. They dried themselves in the sun, dressed their wings carefully and flew off again into space. They were suddenly overtaken by a shower as they passed a castle, in which they quickly took refuge, making their way to the dining-room. The table was spread with beautiful silverware and elegant crystal glasses, which, it appears, is the custom in gentlemen's houses. A servant stood by the table, poured out a glass of wine drank it, and said, "How fortunate my master is, to be able to drink as much of this wine as he desires. It is nectar." He poured out another glass, but hid it quickly behind the sideboard, as the owner of the castle at that moment entered the dining-room.

Muscadine, who was a curious little fly, ogled the glass and exclaimed, "What a rich color that wine has! It must have a delicious flavor. I have a strong desire to taste it."

Muscarello scolded her sharply, saying, "Have you forgotten the advice of our mother, who warned us not to touch anything made by man's hand?"

Muscadine turned up her little nose, raised her wings in a very insolent manner and replied, "Wine is one of Nature's products; it is made from grape juice. Have you forgotten the old Drone who often came to dine with us on Sundays? She was excessively gay, and reeled about the room in a comical manner, embracing me and singing droll songs. When I asked her, 'Well, Mother Drone, what is the cause of your merriment?' she answered, 'I drank two drops of wine, and that has made my heart light.' Yes, brother Muscarello, wine is nothing but the juice of the grape. Man cannot adulterate it, and therefore, in spite of your ill-humor, I shall taste it." Saying this, Muscadine swung herself lightly upon the rim of the glass, dipped her lips into the red liquid, took a long draught, and flew back to her sister, who chided her for being disobedient. Muscarello was very indignant, and ready to strike her; but he remained transfixed when he saw how pale his sister had turned. Her eyes betrayed great suffering, a shiver shook her body and made her wings tremble. With a dying voice she whispered "Mother!" and fell back, her legs stiffened, a last sigh escaped her lips. Muscadine was dead! The wine was adulterated.

Inconsolable at their loss, Muscarello and Muscabella bore the body of the foolish little Muscadine into the park. They dug a grave at the foot of a weeping willow and laid the body of their sister therein, covering it with a leaf to prevent it from being devoured by ravenous wild beasts, such as sparrows and lizards, that are always in search of prey. They then left the last resting place of their dearly beloved sister, who had been so suddenly torn from them. The night was long and dreary, for the sleep of the two little flies was disturbed by bad dreams. Worn out with sobbing, they began to talk

of their little sister Muscadine, recalling to each other her grace and her fascinating, coquettish ways. They portrayed to themselves the poignant grief of their mother, and felt as if there were never two such miserable little flies as they. This sleepless night had greatly fatigued the brother and sister; still, as soon as the sun had risen they continued their journey. Scarcely exchanging a word, they flew listlessly along without casting a glance at the lovely scenery around them, for their hearts were full of grief and their wings heavy. They took their first rest at a farm which stood on the outskirts of a small village. In the yard were a number of men, who, under the supervision of the owner of the farm, were occupied in filling large cans, which were to be sent to the city for distribution. The snow white-foam bubbling over the edge of the cans looked very appetizing and appeared to be perfectly pure. Muscabella, who was very thirsty, could not resist the temptation of tasting it. She said to Muscarello, "I will take a drink, for it is not adulterated like wine. The most depraved of men would not adulterate milk, and the good honest cow is not capable of committing such a crime." So without waiting for Muscarello's answer, she flew away, sipped of the milk, and returned to her brother. She had scarcely reached his side before she exclaimed, "Oh, how cold I am! My heart is like a lump of ice, and my eyes grow dim! Tell mother——" The poor little fly could not finish her sentence. She was dead. The milk was adulterated.

Muscarello was completely crushed by this new sorrow, and asked himself why it was that such fearful calamities should befall him. In his grief he addressed himself to some beetles, who were taking a stroll upon an old stone wall, in the crevices of which they had lived all their lives. He begged them to assist him in preparing a fitting burial for his sister. Notwithstanding the beetles have a forbidding appearance, they have hearts full of sympathy for the distress of others, as they also have known sorrow and are acquainted with grief. Tenderly they carried Muscabella to her grave, and laid her to rest beneath the shadow of an oak tree. The sad ceremony over, Muscarello, with tears in his eyes, thanked the beetles for their assistance, and then returned to the farm, hardly knowing what he did, for his great sorrow had paralyzed his thoughts. He groaned "What can I answer my mother when she asks, 'Where are your sisters, Muscarello?' I would rather vanish from this accursed earth than return home without my sisters. I am tired of life—I long to die."

He was disturbed in his gloomy reveries by the entrance of the farmer, who was in a violent frame of mind. He held a ham in his hand, the best part of which had been gnawed off by rats. Throwing it upon the table, he said to his wife, who was with him, "I will not put up with this any longer. The rats devour everything eatable in the cellar. Go directly to the apothecary for some rat poison, and be sure to have him give you the best he has for sale. Do you understand? Ask for the first quality, for I want to exterminate this fiendish brood once for all."

The farmer's wife started off to do his bidding, while the farmer continued to curse the rats. Muscarello, who had seen and heard all from where he was sitting, thought to himself, "Oh, how tired I am of living!"

Soon after the farmer's wife returned, and put upon the table a package which greatly resembled a cake of soap. "The parcel I brought," she said to her husband, "is a new preparation, and excels anything ever offered to the public. The apothecary confided to me that this rat poison is composed of arsenic, strychnine, prussic acid and other deadly ingredients. He added that it worked so powerfully, and at the same time so rapidly, that even if an elephant tasted of it he would fall dead as if he were struck by lightning."

Muscarello thought: "Now is my chance. I can at last put an end to my miserable existence. Poison that is powerful enough to exterminate rats and kill elephants must be sufficiently potent to get the mastery of a poor little creature like me."

The remembrance of his dear mother did not make him waver in his resolution. He thought also of a little blue fly, who was both young and lovely, and with whom he had passed many a delightful moment behind a Persian curtain. By her side he might have found the joys of a happy home, surrounded by children, whom he would have carefully educated, and who would have been the comfort of his declining years. But he quickly dismissed this dream of bliss, and flew down upon the table, where lay the tempting poison. His despair gave him redoubled strength. He tasted greedily of the cake, and fairly intoxicated himself with the poison. He fluttered back to his old seat near a crack in the chest, into which he preferred that his dead body might drop and thus be hidden from sight, in order to escape the fangs of the voracious spiders that were lying in wait for prey on the ceiling. Now that he had nothing left to hope for in this world, Muscarello awaited with resignation his hour of release. He awaited it with impatience and longing, but death would not come, for—the poison was adulterated.

SPECTRUM ANALYSIS.

WHAT SCIENCE LEARNS WITH THE AID OF THE SPECTROSCOPE.

The solar spectrum, as shown in the rainbow or dew-drop, has always been a familiar object to mankind; but it is only within the last quarter of a century that the marvelous facts written in the rays of light from the sun and stars have been revealed to us. Two German scientists, Bunsen and Kirchhoff, first carefully investigated the phenomena of the spectra of the light proceeding from various luminous bodies; and their labors, with those of others following in their footsteps, have opened up a field of investigation which is apparently limitless. One of the most useful applications of the spectroscopy is to the analysis of different substances. The chemist would be unable to detect with his reagents the presence of small quantities of certain elements; but let him bring the substance into the flame of a lamp, and glance through his spectroscopy, and in a moment their presence or absence is indisputably proved. A ten-thousandth part of a grain of sodium can be easily detected by this means; and simply clapping the hands near the flame will give off enough of this omnipresent element to cause its characteristic yellow line to appear at once in the spectroscopy. We have by this means proved the presence of the rare element lithium in the blood of a person who had been drinking a mineral water containing a trace of its salts. Not only does spectrum analysis show us the presence of familiar elements, but sometimes lines are observed indicating the presence of those previously unknown. Cæsium, rubidium, indium, gallium, thallium and several others were thus discovered, although present in such small quantities that no ordinary reagent could have discovered them. But still more wonderful are the facts made known to us when we turn the spectroscopy toward the celestial bodies. Every ray of light reaching us from the sun bears a message which, with the aid of the spectroscopy, we can read as easily as we can read the words on those minute photographs which are only visible through a microscope. The characters of many ancient inscriptions are still undeciphered; but the story told by the little dark lines crossing the solar spectrum is perfectly familiar to us, although only a few chapters of it have as yet been interpreted. We know that iron, sodium, platinum and many other elements are present in the sun in the state of vapor; and it has been well said that if the word "iron" appeared on the disk of the sun, the proof of its presence would be much less perfect than is that furnished by the lines which it causes to appear in the solar spectrum. The spectrum of fixed stars, comets, nebulae, variable stars, etc., all give us an immense amount of information concerning them. We may judge of the temperature of

the stars, and calculate the speed at which they are moving toward or from the earth. It tells us that comets are, in part at least, gaseous bodies, and distinguishes between those nebulae which are simply distant clusters of separate stars, and those which are masses of glowing glass not yet cooled down to the liquid or solid state. The spectroscopy shows the presence of more or less moisture in the upper air, with the accompanying probability of rain or fair weather. It shows the presence of the constituents of blood in solution, besides many other organic substances; and, finally, the spectrum, of the light from certain rare metals glowing in a vacuum under the influence of an electric current proves their compound nature, although to the coarser chemical and physical tests they appear as simple elements.

CHILDREN'S EYES.

THE DANGER OF UNDULY STRAINING THEM AT SCHOOL.

A mother sends to the *Tribune* the following kindly, wise words: Allow me to say a few words in regard to the children's eyes. Years ago, when the children studied their lessons from their books, we did not hear very much about their eyes giving out. Let us consult our blackboards and see what they can tell us about this world-wide subject. Dear parents and guardians all over this broad land, how many hours of the day are your little children sitting in school staring at a black board upon which are placed by the teacher most of the lessons for the day, many times the lines being so fine and pale they could not be easily read more than half or two-thirds the way across the room, but the children are required to see them all the way across and from the remotest corners. Many of the children when first looking at the board do not see much of anything, but looking very sharp for a few seconds the lines reveal themselves. This, my friend, means strained eyes, and strained eyes mean weakened or diseased optic nerves, possibly no eyes at all—it all depending upon the severity of the strain. Even when the work is quite distinct, for children who have naturally weak eyes the distance many times is so great that the air waves coming between the poor, tired eyes and the board cause the lines to waver and flicker, and especially this is the case when the light is poor and the ventilation bad. Anything put on the board for children to see, whether old or young, should have large proportions and broad, clear lines throughout, so no extra efforts will have to be made to discover it. There is a great difference in eyes; one child will readily see what another could not without the fatal strain. I know whereof I speak, for my own eyes were nearly destroyed through this same practice, and I know others who suffered a like fate.

DISINFECTION OF BOOKS.—The Boston Board of Health have ordered the Public Library card in each family to be stamped, so as to indicate the presence of such a disease there. The library will thereafter decline to allow other books to be taken out on this card until there is no longer danger of contagion. When books are returned from such a locality, they will be disinfected.

CALIFORNIA WINE.—The trade in California wines in the East is steadily growing. There are many people of wealth and taste in this city who buy California wines for home use. Many of these people have been in California and visited its vineyards, and learned the merits of their wines from personal inspection. But the bulk of the California wines is used by the middle-classes, who desire a good wine at reasonable prices, for good California wine compares favorably with foreign wines. Most of it is shipped by way of Cape Horn. The four or five months' trip around the Cape improves the wine, provided it is well fermented. Dry white and red California wine retails in this city at from 85 cents to \$1.50 and higher per gallon, and sweet wines at from \$1.25 and \$3 and higher. Prices are lower now than they have been for years.

WHAT TO DRINK.

SUGGESTIONS AS TO THE BEST AND MOST WHOLESOME BEVERAGES.

If a man must drink, the best thing he can take with his meals is a little claret or light Rhine wine, and if he wants something a little stronger, pure Scotch whiskey is the best thing he can have. The habit of taking a drink early in the morning—we mean by drink a cocktail or stimulant of that kind commonly called as an eye-opener—is one of the worst things that can possibly be done. The effect of alcohol is to inflame the stomach, and it will do this even when diluted with food or anything else, and will do so a great deal more when taken on an empty stomach early in the morning. Men should not maintain their strength throughout the day by taking stimulants. To keep up by the means of alcohol is very bad, and by and by the system will break down entirely under it. The best drink that a man can possibly take is milk. Milk, though, is hardly a drink. One can live longer on it than on any one thing. Milk is more nearly a perfect food than anything; it contains more elements that go to build up the system than any other article. Early in the morning the best drink to take is water. That is, if one must drink; but if he can get along without drinking so much the better. Some drink hot water, some cold and some hot and cold milk. All of these are good in their way. Tea and coffee drunk in moderation will not hurt any body, although they are both stimulants.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

October.

MEAT.—Beef, mutton, pork, venison.

POULTRY AND GAME.—Chicken, duck, geese, grouse, hare, partridge, pheasant, pigeons, rabbits, turkeys, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, whiting, salmon, trout, perch, smelts, oysters.

VEGETABLES.—Artichokes, broccoli, celery, potatoes, turnips, cauliflower, cabbage, carrots.

FRUIT.—Apples, pears, quinces, grapes, nuts.

PRACTICAL RECIPES.

SAUSAGE MEAT.—Ten pounds fresh meat, minced fine; four tablespoonfuls salt, two tablespoonfuls pepper, five tablespoonfuls sage—If liked, add one tablespoonful of ginger, mix well together; pack tightly in a stone jar and over the top pour melted lard. This will keep well if every time meat is taken out the lard is scraped off and re-melted and poured over again so as to exclude the air.

SWEET PICKLED BEETS.—Boil the beets in a bright kettle until they are tender. Make a syrup of equal parts sugar and vinegar, with a bunch of ground cloves—half a teaspoonful to two quarts syrup, tied in a cloth. When the beets are cold peel and cut lengthwise into slices, pour the hot syrup over them.

RICE BREAD.—One pint of cold boiled rice pounded until smooth, add to it three half pints of wheat flour, a full teaspoonful of salt, three heaping teaspoonfuls of Horsford's Baking Powder, a heaping teaspoonful of powdered sugar, and a tablespoonful of butter; add gradually a pint of water in which the rice was boiled; mix quickly and bake in loaves.

LUNCHEON BREAD.—To one pint buttermilk or sour milk put one small teaspoonful soda and a pinch of salt.

Add enough flour to make it like biscuit dough, cut it into three pieces handling as little as possible; roll each piece out about an inch thick, and bake twenty or thirty minutes in a hot oven. Eat hot. Break instead of cutting.

CREAM TURNIPS.—Pare three or four turnips, slice them and cut into inch square dice, pour over them as little water as will take to boil them nearly tender, adding a little sugar—one tablespoonful to a quart of turnips—and salt. Strain off all the water, add two or three spoonfuls of cream and a beaten egg. Serve.

FRIED SCALLOPS.—Lard the scallops crosswise, with very thin strips of fat bacon, dip them in egg and fine cracker crumbs and fry in boiling lard. Serve at once.

CORNSTARCH CAKES.—Half a pound powdered sugar, half a pound butter, beat to a cream, stir in gradually, beating well, the yolks of six eggs. Whip the whites to a stiff froth, adding to it a small pinch of salt; add to the mixture stirring thoroughly, but lightly; add three ounces flour, and five of cornstarch sifted together; flavor with vanilla. Beat well, pour into small pans, dust with powdered sugar, bake to a delicate brown.

ATOMS.

SOME INCOMPREHENSIBLE CONJECTURES RESPECTING THE ULTIMATE SOURCES OF MATTER.

All substances are made up of tiny particles which cannot be further reduced in size without change of properties and breaking up into their component atoms. These particles or groups of atoms are molecules, and all matter is trembling with their billions of vibrations per second. In solids the molecules are arranged in a certain fixed order, and their vibration is in a limited space; in liquids they move about in all directions, yet none can voluntarily separate themselves from the others; while in gases they are in a state of vibration so violent that they fly about with marvellous rapidity in all directions. Every cubic inch of air contains no less than twenty-one trillions of molecules, and every point on our skin is bombarded by thousands of millions of them every second. Each is so small that 300 would not extend across the width of the smallest line the most powerful microscope shows us. Magnify them one trillion diameters, and each atom is the size of our globe, each molecule is a planetary system, and each air bubble from the fringe around the water in a goblet is a wonderful galaxy. Magnified 10,000 trillion diameters the air bubble would have the dimensions of our entire stellar system, but would contain 50,000 billions of stars instead of the twenty millions our best telescopes can show us. If the atoms had inhabitants, with our sensations quickened and shortened 1,000 billions times to correspond to their diminutiveness, each atom would be a world, each molecule a solar system, and the revolutions of the atoms would give days and years. The atom-dweller would see no more of the air bubble than we see of our stellar universe; for, though the air bubble's molecules average eighty million collisions every second, thousands and tens of thousands of generations of the living beings might exist before a perceptible alteration of their starry firmament could be recorded. Is not our world an atom, our solar system a molecule in a stellar bubble of an unknown and mightier creation?—*Science*.

ALDEN'S MANIFOLD CYCLOPEDIA.

Volume XV. of Alden's Manifold Cyclopaedia includes the titles from Fluctuate to Galvanism. Following the same general lines as its predecessors it is, in some respects, a marked advance upon them in solid worth. We notice with pleasure the large number of practical topics which are treated, and the thoroughness and accuracy with which they have been handled. There is also the same thorough treatment of scientific matters and of the more abstruse subjects which naturally belong to such

work. Other publishers have demonstrated the possibility of making costly and elaborate cyclopedias which are invaluable for professional men, but far above the range of ordinary life. Alden has shown, in the Manifold how to make for a low price a cyclopaedia which shall serve the needs of the great majority of scholars and also be especially prepared to meet the everyday wants of the masses of reading people. The merchant, mechanic, farmer, gardener, and laborer, as well as the student and the college graduate, can here find a vast amount of valuable information. Among the thousands of topics treated in this volume we notice that Food and Drink has nine pages; Force, 12 pages; Forest Laws, 2 pages; Forms of Address, 4 pages; Fruit, 13 pages; Fuel, 6 pages; Fungi, 5 pages; Galvanism, 35 pages. There are also biographies of Rear Admiral Foote; Archibald Forbes; Benjamin Franklin; General John C. Fremont; James A. Froude; Robert Fulton; Galen; Galileo, and many other prominent men. The pronunciation of the words is another prominent and useful feature—especially in the case of proper names. This important work will be sent by mail prepaid for only 60 cents a volume in cloth, or 85 cents in half morocco binding, or, the entire 15 vols. now ready, if ordered at once, are offered prepaid, in cloth binding for \$7, or in half morocco, for \$10. The price is advancing slightly with the issue of each new volume.

THE CIGARETTE ABOMINATION.

VILE EXPEDIENTS USED TO ENCOURAGE A VILE HABIT.

Editor McLaughlin of the *Metropolis* has fallen into line with the *AMERICAN ANALYST* in denouncing the cigarette habit, and in his issue of October 14 he gives the "stinking weed" a counterblast in the vehement style that is one of his amiable characteristics. We quote the following extract from the article in question:

But the fault is not altogether with the boys, nor must they alone be held responsible for the prevalence of the disgusting vice. The manufacturers are even more to blame than the boys. There is a law forbidding the sale of cigarettes to minors; but the law is respected more in the breach than in the observance. No boy with a cent in his pocket encounters any difficulty in exchanging it for the paper rolls of offence. Nor are the lads permitted to forget the hateful thing, however strong may be their resolution to abandon it. On every dead wall and fence the flaming posters in gorgeous colors remind them of the latest brands. In the windows of every tobacco shop they see displayed viciously fascinating pictures advertising the cheap and nasty goods. Broad-sides of the great newspapers are filled with announcements of them. As an additional attraction, every package sold contains a highly colored picture of some famous actress or noted character, presenting, not merely a portrait of female beauty and loveliness—which in itself might not be unattractive—but so draped and postured as to appeal to the basest senses of the budding youth. The enormous expense these cigarette makers incur in advertising their goods, when considered in connection with the extremely low price at which the goods are sold, furnishes the most convincing evidence of their lack of intrinsic value. Take a package of twenty cigarettes, usually retailed for five cents, and estimate the retail and wholesale profits on them; then consider the cost of manufacture—labor, rent, machinery, etc.; and the enormous amounts paid for advertising and for the gift pictures which accompany them, and it will require a skillful mathematician to figure out any margin left for the purchase of tobacco with which to make them. Yet they are all advertised as made of the very best quality of tobacco, which, of course, should cost the highest price, when, in fact, the best is the worst. Is not this a clear give away? Is it not evidence that only refuse tobacco, or the scrapings of the gutters, can be utilized by the manufacturers in filling these alluring but worthless contrivances? Such is the fact, no matter how loudly the maker may boast of the purity and excellence of the tobacco used. Good tobacco could not be used in them, at the prices at which they are supplied, without bankrupting the manufacturer. They are made, as *The Metropolis* has heretofore pointed out, from the half-smoked cigars thrown away by cigar smokers, with an admixture of drugs, principally opium, to destroy the rank flavor and impart an agreeable odor. This shows the profitability of the occupation of the swarms of Italian boys, working under the immediate supervision of the lazy padrones in the early hours of the morning, searching the gutters for discarded cigar stubs.

CRAZE vs. CULTURE.

CHRISTIAN SCIENCE AND MENTAL THERAPEUTICS AT
THE HUB.

One of the facts brought out in the discussion before the legislative committee of the Massachusetts "general court," relative to the passage of a bill restricting the practice of medicine in Massachusetts to only qualified and diplomated practitioners (the bill, by the way, was reported upon adversely by the committee), was that large numbers of respectable and intelligent, indeed "highly cultured" people in Boston and other New England cities consult and employ "Christian scientists" when their health is in any way deranged. This may be true of Boston. In certain other cities of that State, where a few years ago this delusion had many adherents, there is now not a practitioner of the "Eddy School" able to get a living by the exercise of this kind of therapeutics. Some of these practitioners have become itinerants, going about from place to place, and meeting some success in new localities; others have ceased trying to obtain a living from "Christian science," which they now only cultivate to gratify some of their friends. Doubtless, Boston, which has for years been the hot-bed of quackery, will for some time to come cherish Christian science along with clairvoyance and other humbugs. The "intelligent and cultured" often show a sad want of intelligence and culture when it is a matter of choosing their medical practitioners. They are almost certain, however, to call in the well-educated and skillful physician when serious disease presents itself. There is no error but contains some truth, which gives it all its vitality, and "Christian science" has a certain sound basis in the undeniable facts of mental therapeutics. Intense occupation of the mind with some subject of interest will drive away a headache; the love-sick swain will re-

cover his appetite and his sleep if "Chloe" will only relent; the reward of \$10,000 damages has helped put many a victim of "railway spine" on his feet; hysteria and functional paralysis and neuralgia has often proved tributary to hypnotic suggestion, and a severe fright has sometimes cured nervous aphonia. But the Christian scientist, not being content with taking his stand on such facts as these, and affirming the power of mind over bodily states within a certain limited range, prates a great deal of nonsense about the non-existence of matter, the non-reality of disease and pain, self-identification with the Divine reality which permits no imperfection, etc.

PETROLEUM DETERGENT.—Attention has been drawn recently to the cleansing effect of petroleum on soiled clothes. The best way to employ it is to fill an average boiler, say of fourteen gallons, with water, adding half a pound of soft soap, and when all is boiling thoroughly pour in one and a half tablespoonfuls of petroleum. Then put in the clothes and boil them for half an hour before lifting them out and rinsing them in several waters. A little more soap, water and paraffine should be added to make up for loss as successive lots of the clothes are boiled.

BRICKS AND HYGIENE.—Statistics show that people live longer in a brick house than in stone, and that wooden houses are the healthiest. This suggests the idea of using paint on masonry. An authority states that 100 years ago it was fashionable to paint brick buildings white, and many charming structures remain to attest the value of a coat of paint in preserving the masonry, and its pleasant, home-like effect is a foil to the vines and shrubs with which even city houses are now commonly adorned. If it should prove, as might be easily ascertained, that the painted brick houses preserve their inhabitants more effectually from sickness and premature death than the unpainted ones, it would be worth while to revive the ancient fashion, and, with our greater resources in the way of materials and ideas, exterior coloring might become as important an accessory to the architecture of the twentieth century as it was so that of the twelfth or thirteenth.

CHILDREN IN AUTUMN.

The meteorological peculiarities of this season of the year present almost as great a degree of danger to the physical health of children as do those of the midsummer season. Most mothers consider the dangers of the hottest part of the year the greatest of all; but the mortuary statistics demonstrate that the deaths from croup, diphtheria and kindred diseases are at least as numerous as those resulting from dysentery, summer complaint and cholera infantum during the torrid months. The limited epidemics of diphtheria, which occur almost every year, are to be attributed not so much to any peculiar quality of the atmosphere, as many medical men assert, as they are to hygienic errors perpetrated by mothers, who, while of course desiring to protect their offspring against any and all ills, make fatal mistakes in the ordinary care of their young. The cause of many of the troubles affecting children during the early winter is to be laid to ignorance of the general principles of hygienic treatment. Mothers and nurses are apt, in the first place, to bundle up children with too great a warmth of clothing as soon as the first chill of autumn makes its unwelcome appearance. This is a most serious fault, and is, unfortunately, a very common one. Observations made within a week by the writer have unearthed the causes of a number of cases of serious cough, threatening to develop into something still more serious. During a visit to a charming family, it was learned that the loveliest little golden-haired of all was in a bad way with a hacking cough. The rest of the children, four in number, were well, and at the time were amusing themselves in the nursery. A call on them revealed the harrassing fact that a great fire had been built in the open fireplace, and that the temperature in the room was about 80 degrees. The temperature of the air outside at the time was less than 60 degrees, and therefore the most conducive to physical welfare. It is apparent to all who exercise their logical

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. **THE FAMILY CYCLOPEDIA OF USEFUL KNOWLEDGE** is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar.** It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

ADDRESS ANALYST PUBLISHING CO.,
—19 PARK PLACE, NEW YORK.—

functions, that the sudden opening of a window, with a resulting draught of air 20 degrees colder, must be injurious. That was the cause of golden-hair's cough. Children on these autumn days should never be overburdened with clothing when taking their constitutional promenade. Experience has taught adults to adapt the weight and warmth of their clothing to the weather, the resulting garments being top-coats and light fall wraps, respectively. There can be no earthly reason why children should not be attired according to the same rule. To bundle them up in this warm weather is simply criminal. Such "care" exposes them to sudden changes of temperature which no sensitive organism can stand. The diet of the little ones is another serious consideration. It should be confined principally to cereals, boiled, stewed or otherwise prepared. Meats should always be well cooked and cut up. Hash, Hamburg steak, meat stews, fricasees and ragouts are the advisable forms. Stewed fruits are to be recommended before raw ones; but tamarinds, oranges, apples and bananas, in moderate quantity at times, should not be objected to. At this season, children should never be given pineapples, lemons or woody pears, for these act respectively as hyper-acids or mechanical irritants on the digestive organs. The nurture of children should be based upon common sense views of the care of the body, as far as external influences are concerned, and, as well, of the proper treatment of the internal mechanism. The greatest danger lies in an irrational conception of the demands of these two cares. The control of the exterior is comparatively easy, and errors in that direction are inexcusable. But, as far as the physiological mechanism is concerned, more troublesome difficulties have been encountered, and hitherto mistakes made in the care of the internal physical organism have had some excuse. At present, however, every mother or nurse should be considered responsible, for the care of the human body has been brought to a degree of perfection by science, never before equalled. Proper hygienic treatment, based entirely upon the natural logical activity of the mind, is assumed to be an essential. But the digestive organism, which cannot be observed by the eye, must be regulated by rational mediums. The best of these thus far discovered is Ayer's Sarsaparilla, and the results of this preparation are too well known to need special comment. If the other hints given in this article be followed, the use of Ayer's Sarsaparilla will insure the health of the rising generation.

A Century of Talking

Is not worth a Minute's Proof

It don't take many minutes to prove that

Pyle's Pearline

will wash clothes, will clean house—will do it well—will save you time; labor; wear and tear; will reduce drudgery; will not hurt your hands; your clothes or paint, and besides will cost you no more than common bar soap. One honest trial will prove all that. Why not accept the testimony of the millions who use it, as proof of its virtue. Among your friends you'll find those who have used Pearline for years—ask them—they will tell you "can't do without it."

Beware

Pearline is the original Washing Compound—used by millions, but imitated by thousands who peddle their stuff or give worthless prizes. Pearline is never peddled, but sold by all grocers. 151 Manufactured only by JAMES PYLE, New York.

REASONS WHY

Should be preferred to all others:

Because—It is genuine-pure, just as it existed in the hepatic cells of the living fish, not depleted of its natural virtues by any process of refining, nor weakened by being made into an emulsion with an equal quantity of water, glycerine, etc., which latter device makes water bring the price of Oil.

Because—In taste and smell it is not offensive, but instead, sweet and agreeable.

Because—Its administration is always followed by satisfactory results.

Because—It is more easily assimilated than other Oils.

Because—It is more nutritious than other Oils.

Because—Of its perfect digestibility, perfect limpidity.

Because—This perfect Oil costs consumers no more than the poorer qualities abounding in the stores.

Because—It is readily obtainable; all well-stocked Drug Stores have it.

Because—It is unquestionably the purest and best COD-LIVER OIL IN THE WORLD.

W. H. SCHIEFFELIN & CO.,
NEW YORK.

Sole Agents for U. S. and Canada.

RESERVED RESOURCES.—Mother (severely)—"That dress is altogether too low, Lillie. I am surprised at you."

Lillie (turning very red)—"I hope you don't think it immodest, mamma. Helen Alstrip's are ever so much lower."

Mother—"But it is her fifth season and your second. If you exhaust your resources so soon what are you going to do next year?"

THANKS NOT EXPECTED.—Because a begging deaf mute in Dorchester last Saturday kindly said "thank you" at the end of the route, after his heart and his pockets could hold no more, the donors were greatly incensed. Is not politeness always in order?"

BUSINESS NOTES.

FOR NERVOUS DEBILITY

USE HORSFORD'S ACID PHOSPHATE.

Dr. A. M. BILBY, Mitchell, Dak., says: "I have used it in a number of cases of nervous debility with very good results."

HOSPITAL REMEDIES

THE Favorite Prescriptions of the Brightest Medical Minds in the world, as used by them in the Hospitals of London, Paris, Berlin and Vienna.

VALUABLE TO ADVERTISERS.

You have determined to make money by vigorously pushing your business. As the AMERICAN ANALYST has determined to do the same thing, we have a community of interests. Our way of making money is to increase our circulation, and we can only do so by publicity; that is, by bringing our journal to the notice of a great number of people, who have the intelligence to appreciate a good journal when they read it and the money to buy what they want. You must necessarily want to reach the same class. Even if you do not sell directly to the consumer, it is necessary for you to tell the consumer of the quality of the goods you have to offer to induce him to ask the dealers with whom he trades for them. We propose this Fall and Winter to send a sample copy of this journal to the address of every person in the United States whose name we can find in any of the *elite* directories or blue-books of the various cities and villages. We will thus reach several millions of new readers in addition to our already large subscription-list, covering every State in the Union. Previous experience with this method of getting new subscribers war-

rants us in undertaking the expense, believing that it will pay us. This large addition to our circulation will put any advertisement in our columns before a multitude of readers. Our advertising prices remain the same, and are so arranged as to give the lowest rates to larger and longer-continued advertisements, and will be sent on application. All respectable advertising agencies will take orders for us. If we find this system profitable, advertisers surely will. Those who have advertised with us always renew as their season comes around, and you will do the same when you have tried it. We have found that in the great competition now existing we must keep our journal prominently before the public, and, in our mutual interest, we ask you to join us. Our system is more effective than a circular, and you will find it just as effective for your business and the cost very much less. Try us. For any further information write, and it will be forthcoming.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

MRS. F. M. G. PENDER,
47 West Twenty-second Street.

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,
By MISS M. E. BRADDON.

THE GIRL AT THE GATE,
By WILKIE COLLINS.

A BRIDE'S TRAGEDY,
By MISS MULOCK.

THE RECTOR'S DAUGHTER,
By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,
By MARY CECIL HAY.

GABRIEL'S MARRIAGE,
By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,
By ETTA W. PIERCE.

THE RIGHTFUL HEIR,
By M. T. CALDOR.

THE DOUBLE HOUSE,
By MISS MULOCK.

TWICE SAVED,
By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, *profusely and handsomely illustrated*, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only **Twenty-five Cents**.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the AMERICAN ANALYST.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. F. VANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only three possessed the power of acting on starch. These brands were **MALTINE**, Corbyn, Stacey & Co.'s Extract, and Keppeler's Malt Extract. **WILLIAM ROBERTS, M.D., F.R.S.**

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alternatives.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Ferrated.
MALTINE with Hypophosphites.	MALTO-VERBINE.
MALTINE with Potassium Bicarbonate.	MALTO-BURNIN.
MALTINE with Pepsin and Pancreatine.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analysis by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauternes is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough, to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, 1 inchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR BRASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

COOKING BY LAMPLIGHT.

A phase of social evolution which is beginning at length to receive the attention that its importance challenges is the simplifying of the domestic cooking process. During the past few years, several ladies prominent in the line of culinary education have lectured, generally to large audiences, upon the advantages of one or another of the numerous patent cooking appliances that Yankee ingenuity is incessantly evolving, and the suggestion of advertisement embodied in these lectures has been condoned in consideration of the genuine and practical instruction they conveyed. If anybody has invented a gas or kerosene stove that will perform the cooking for a family with a notable reduction of the cost and inconvenience of the old-fashioned apparatus, it is the public, more than the patentee, that is benefitted by the publication of its merits. It is something novel, however, to see a man mount the rostrum in behalf of cooking reform, as was done on the evening of October 23d, at the meeting of the American Public Health Asso-

ciation, in Brooklyn. The speaker was Mr. Edward Atkinson of Boston the well known economist, whose investigations in the department of food have earned him a world-wide distinction. Mr. Atkinson was assisted in his manipulations by a couple of professional cooks, and waiters in dress suits were on hand. The cooking was done by way of illustration of a paper which was read by Mr. Atkinson before about 500 delegates of the convention. The cooking was done after a process which Mr. Atkinson asserts combines economy and convenience. The only fuel used was kerosene oil contained in a lamp of rather large size. The lamp stood under a square box-shaped object made of wood pulp with the outer edges lined with tin. This is known as the "Aladdin oven," and is one of Mr. Atkinson's patents. Here meats, fish, vegetables and puddings were cooked while the originator of the system was discussing the science of cooking and exhibiting the new process. Afterward the waiters served up the dishes to the audience, who tasted them critically and pronounced them excellent. There was plenty of bread, which had been baked in the "Aladdin oven" during the afternoon. Mr. Atkinson says that eight ordinary loaves of bread can be baked in two hours, while you are reading your evening newspaper or doing your evening sewing, and all by the heat of the lamp with which you see to read or sew. "The true science of cooking," he says, "consists in the regulated and controlled application of heat by which flavors are developed and the work of conversion is accomplished. For this purpose a quantity of fuel is required which is almost absurdly small compared with the quantity commonly used."

WINE AND LIQUOR STATISTICS.

The Chief of the Government Bureau of Statistics in his recent report to the Secretary of the Treasury on the production, consumption, etc., of spirituous and malt liquors and wines, extended his investigations through a series of twenty years in order to compare the relation born by the liquor industries in the United States to those of Great Britain, France, Germany, Denmark, Sweden and Canada. The report embodied many interesting and significant facts, though, owing to insufficient data attainable several points upon which it would have been desirable to be informed were necessarily omitted. Thus it is to be regretted that official statistics were not procurable showing the product and consumption of wine in Germany or of malt liquors in France, or even of the quantity of material consumed in the manufacture of malt liquors in this country. The following are some of the leading characteristics exhibited, so far as relates to the countries mentioned: First—The rapid increase of the consumption of malt liquors in the United States. Second—In the consumption of beer per capita Great Britain stands first, Germany second, the United States third, and Canada fourth. Third—France is the largest consumer of wine per capita. Fourth—Denmark appears to be the largest consumer of spirituous liquors per capita. From a report by the United States Con-

sul at Marseilles, dated February 27, 1889, the production of wine in the principal wine growing countries of the world, vintage of 1888, is given in gallons as follows: Australia, 1,902,024; Austria, 92,459,500; Algeria, 72,072,788; Cape Colony, 4,490,890; France, 795,294,534; Greece, 46,493,920; Hungary, 184,919,000; Italy, 798,242,489; Portugal, 132,085,000; Roumania, 18,418,900; Russia, 92,459,500; Servia, 52,834,000; Spain, 607,591,000; Switzerland, 29,058,700; Turkey and Cyprus, 68,684,200; United States, 32,000,000. It may interest Prohibitionists to know in detail that during the year ending June 30, 1888, there were consumed in the United States distilled spirits as follows, the figures representing proof gallons: Domestic, from fruit, 888,107; other:—Bourbon whiskey, 12,190,013; rye whiskey, 5,148,244; alcohol, 10,487,938; rum, 1,114,544; gin, 803,288; high wines, 1,044,586; pure neutral, etc., 28,289,687; miscellaneous, 14,174,979. Total domestic, 74,291,386. Imported: alcohol, 153,143; brandy, 437,519; cordials, etc., 143,780; other, from grain, 646,107; from other material, 236,408. Total imported, 1,643,966. Total spirits, 75,845,952.

A SWINDLER CHECKED.

The exposure of a contemptible fraud, affecting in some degree the integrity of eastern dinner tables as well as those of the Pacific coast, is related in the following paragraph in the San Francisco *Call* of October 13: An injunction was granted by Judge Sabin, sitting in United States Circuit Court, at the suit of Lea & Perrins against Jacob Klein, doing business under the name of the California and Oregon Cider Company. The cause of action as set up by the plaintiffs is that they are the manufacturers of the Lea & Perrins' Worcestershire Sauce; that the defendants had been buying up their emptied bottles, bearing their imprint and stopper, refilling the bottles with an inferior article, and by putting a label closely resembling the plaintiffs' label on the bottles with the fictitious firm-name of Lee & Perkins as manufacturers, have damaged plaintiffs' business to the amount of \$10,000. David P. Belknap is the attorney for the plaintiffs. This is the first of some twenty suits which Mr. Belknap has been instructed to bring against these imitations, which, owing to their cheapness, have flooded the market, and will now be stopped.

THE PHONOGRAPH.

There is a prevalent impression that Mr. Edison has perfected the phonograph, and brought it to the ultimate practicable state of simplicity and perfection of action necessary for its general adoption. But we are informed by an editorial writer in the *Scientific American* that the instrument has not yet quite attained to that state of perfection. It is true that a number of them are in use, and many interesting experiments have been made. At the Paris exhibition the instruments were shown in operation, and the perfection of the results in

For use at the Soda Fountain and in all Pharmaceutical preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

DRYDEN & PALMER,
19 Hudson St., New York.

recording and delivering speech was marvelous. But in most cases, in order to get really satisfactory results, we believe it needs the employment of an expert to watch, adjust and work the instruments. We are informed the machine has recently been improved so as to dispense with all adjustments, thereby rendering it entirely automatic, and making it practical in the hands of every one. If the phonograph has reached this stage of simplicity and perfection, we predict for it a bright future.

CALIFORNIA WINES.

One of the great obstacles California wines have had to contend with is the ridiculous attitude of some of those who pretend to deal only in pure wines, and yet issue circulars and advertisements which show at a glance that they are doing nothing of the kind. Among these is one Charles Stern of Chicago, and New York, who not long ago urged the California Viticultural Commission to take strong measures against wine adulterations, and especially against those who would sell California wines under French and German labels. In a circular lately issued by this individual he offers California wines under the names of Hochheimer, Niersteiner, Deidesheimer, Laubenheimer and Hock, also as St. Julien, Chateau Margaux, St. Emilion, St. Estephe and Zinfandel. Consistency is a jewel.

AN ELECTRIC PLANT.

There has been discovered in the forests of India a strange plant, which possesses to a very high degree astonishing magnetic power. The hand which breaks a leaf from it receives immediately a shock equal to that which is produced by the conductor of an induction coil. At a distance of six metres a magnetic needle is affected by it, and it will be quite deranged if brought near. The energy of this singular influence varies with the hours of the day. All powerful about 2 o'clock in the afternoon, it is absolutely annulled during the night. At times of storm its intensity augments to striking proportions. During rain the plant seems to succumb, and bends its head during a thunder shower. It remains there without force of virtue, even if one should shelter it with an umbrella. No shock is felt at that time in breaking the leaves, and the needle is unaffected by it. One never by any chance sees a bird or insect alight on the electric plant. An instinct seems to warn them that they would find their sudden death.

Subscriptions \$1 per year. Now is the time to subscribe.

OLEOMARGARINE.

OPPOSITION TO THAT PRODUCT PURELY MERCENARY AND SELFISH.

The lard and the oleomargarine questions, as they have been presented to the legislative bodies of this country, are worthy only of slight consideration from a sanitary stand-point. So much activity in the matter as has been exhibited around and within legislative halls is not from any demand for better or different products, but solely an effort of producers and dealers to secure a more advantageous position in the markets of the world. The struggle is and has been almost entirely a monetary one. The placing of a tax by the national government on oleomargarine was at the instance of the agricultural interests of the country; and for the same reason the Legislature of New Hampshire enacted a law requiring this article to be colored pink before it could be legally sold in the state. No evidence was submitted to show that it was unsuitable for food, and the color act was passed to prohibit its sale, which could not be done by direct legislation. It was simply a method of excluding from the state a product likely to be used to an extent that might slightly lower the price of butter, and perhaps be fraudulently substituted for it. Since oleomargarine is known to be a healthful article of food—infinitely better than poor butter—sanitary authorities have taken no part in the oleomargarine question. The same is substantially true regarding the lard question, although some public good may come from a careful examination of the subject from the stand-point of health. In the first place, it may with propriety be questioned whether the fat of the hog is, or ever has been, a healthful article of food. But waiving that point for the present, we must admit that there are some degrees of difference in the various brands of lard that are found in our markets, which merit the consideration of the sanitarian. The attempt on the part of certain packers to secure legislation solely in the interests of the hog products as against any healthful substitute should be understood by health authorities, that the latter may be prepared to act strictly in accordance with facts, and not unwittingly endorse an error. As we stated in the last issue of the *Sanitary Volunteer*, the only substitutes for lard, offered for sale, are beef fat and cotton-seed oil, both of which we are safe in saying are healthful food products. Thus the producers of beef and the manufacturers of cotton-seed oil have an equal right in the struggle for trade with the producers of lard; and if the sanitarian is called to testify, it can only be in behalf of the very products which the producers of "pure lard" are declaiming against. Oleomargarine, beef fat, and cotton-seed oil are all healthful articles of food, and from a health stand-point we have no ground upon which to ask their exclusion from the public markets. The trade aspect of the matter is one thing, the hygienic quite another.—*N. H. Sanitary Volunteer, Oct.*

PICKLES, GOOD AND BAD.

HOW PICKLES AND CATSUPS ARE ADULTERATED AND POISONED.

Dr. C. Q. Jackson, of Pittsburg, has recently analyzed a number of samples of pickles and catsups, and we condense the following from his published report on the subject:

Samples of six brands of tomato catsup were bought from retail dealers in this city, and subjected to careful microscopical and chemical analyses, with the following results: Salicylic acid was found in five samples; coloring matters were found in five samples; fungi or molds found in four samples; arsenic (traces) found in one sample; sulphuric acid found in one sample. With regard to the salicylic acid found, it may be stated that it is almost universally used by tomato catsup manufacturers for the purpose of cheaply preserving the catsup from

fermentation—in other words, to make it "keep." Almost every housewife who annually puts up a number of bottles of excellent tomato catsup is much annoyed by the certain tendency it has to ferment either before the bottle is opened for use or immediately after. The manufacturer overcomes the difficulty by adding salicylic acid to the preparation. He also uses it to preserve the large quantities of tomatoes which he buys when they are cheapest. The salicylic acid enables him to make up a sort of mash or "pulp" that will keep until such a time as he may wish to prepare and bottle it. The catsup consumer will want to know if salicylic acid is injurious. It is certainly, when partaken of in anything more than very small doses not very frequently repeated. The person who takes a teaspoonful of catsup containing sufficient salicylic acid to preserve it, not oftener than once a week, will not, perhaps, do himself any great injury; but the man who is in the habit of consuming a tablespoonful daily of such a catsup will inevitably injure his stomach. The long-continued administration of salicylic acid or its salts causes emaciation, or wasting of the tissues, and large quantities may cause death. The coloring matters found in five samples were cochineal, cochineal lake, aniline red and some vegetable colors. Aniline red, if pure, is not in any way deleterious to health when swallowed; but, as a practical matter of fact, aniline colors often contain arsenic, and for this reason their use to color food stuffs is dangerous. Cochineal is in no way deleterious, and is not liable to contain injurious impurities. But it is wrong in principle to color food stuffs at all. If an article is pure, it ought to sell without any dye. How any one can imagine that tomatoes could give such a color to catsup, as is possessed by this article, it is difficult to conceive. The presence of fungi or molds indicates that the tomatoes had begun to ferment and grow moldy before the salicylic acid was added, which latter would of course stop the growth of the fungus. With regard to the effect of the ingestion of this dead mould, it is only necessary to state that a number of years ago an experimenter found that when rabbits were fed on mouldy bread their ears sloughed off, deep ulcerations made their appearance, and finally death resulted. The traces of arsenic detected in one sample were probably derived from the aniline dye used to color the catsup. While the quantity found was exceedingly small, yet it must be remembered that arsenic is not to be trifled with, and that, like all metals, it accumulates in the system, and even in small doses, if kept up, may eventually produce dangerous symptoms. Of course, the presence of arsenic in the above-mentioned case was entirely unknown to the maker of the catsup; he did not know that aniline colors often contain arsenic. The sulphuric acid found was probably added to give an extra tartness to the catsup, without the use of vinegar, which latter was entirely absent. Sulphuric acid of itself is not injurious in small quantities and well diluted, but it, too, often contains arsenic. With regard to the physiological effect of catsup and pickles, it must be said that when pure they are not of any value as foods, but as relishes to add zest to the appetite and thus indirectly favor digestion, and also directly by the stimulating effect of the pepper they contain on the stomachal secretory apparatus, they are on the whole quite beneficial. Of course, the eating of pickles between meals, or in large amounts at any time, is in most cases a very bad practice; and a craving for this kind of thing is often the result of over-indulgence in candies and alcoholic stimulants. Ten samples of domestic and foreign pickles were examined, with the result of finding impurities and adulteration in 32 per cent. This may seem rather startling, and it will be queried whether cucumber pickles can be made out of anything other than cucumbers. It has been stated on good authority that certain vegetable marrows have been fashioned into clever imitations of cucumber pickles; and turnips, too, have been made to masquerade as pickles so successfully that it is said neither epicure nor botanist could detect the fraud. However, none of these spurious pickles were found in

this series of analyses. The adulterations referred to were chiefly in the vinegar, while the impurities were in both vinegar and pickles. Pure cider vinegar is, or ought to be, a 4 or 5 per cent. solution of acetic acid in water, with various extractive matters. There are many different varieties of vinegar, according to the source; thus in commerce we have cider, wine, sugar, malt, wood and beet vinegars. Of these the cider and wine products, or what is sold as such, are the most commonly used. Each kind of vinegar, if pure, has a decided color, flavor and aroma, derived from the vegetable from which it is prepared. At the examination of ten samples of pickles from the general market, including an analysis of the vinegar containing them, yielded the following results: Copper present in two samples. Sulphuric acid (oil of vitriol) present in seven samples. Lead present in one sample. Iron present in two samples. Zinc present in one sample. The copper found in two samples was present in considerable amount, and had been added for the sole purpose of dyeing the pickles a bluish green color. A few years ago it was a very general thing to color all kinds of pickles with copper; an examination of the pickle shelves of any retail grocery would show rows of jars containing the cucumbers, etc., of the most unappetizing color imaginable. But within the last few years quite a reform has been established in this respect, and the public are being educated up to the fact that pickles of a vivid green color invariably contain copper, and in some instances when the hue is quite natural a slight amount of copper is present, having been used to recolor cucumbers which have been bleached by too long immersion in brine, or by some other cause. It is still a common practice with many housewives to "green" their pickles by allowing them, with their vinegar, to stand in brass or copper kettles for 24 hours or more; and it is also advised in some cook books to place a few pennies in the pot while cooking the pickles. How it is that any one should be so ignorant as to do these things it is difficult to conceive, yet it is done. Whether the copper found in the two instances mentioned came from the vessels or was added in the form of sulphate of copper (bluestone), makes but little difference; it existed in the pickles as sulphate and acetate of copper, both of which are highly poisonous. Many cases, some fatal, of poisoning from eating pickles colored with copper have been reported. The oil of vitriol found in seven samples is evidently a very common sophistication. Its cost is so little, and its strength is so great, that the temptation to use it as an adulterant of vinegar is powerful. In addition to adding tartness to a weak vinegar, it increases the antiseptic or preserving power, and for this reason the admixture of a small amount (1 part to 1,000 parts) is permitted by the English "food adulteration act." But even this is unnecessary, as shown by the fact that where the proportion of the acetic acid and other ingredients are what they should be, no vitriol nor anything else is required to give it preserving power. The amount found in the samples was, in all but one instance, very much greater in amount than allowed by the English act, and in all cases where present there was a notable deficiency of acetic acid, the normal sour ingredient of vinegar. In addition to its own deleterious effects, commercial sulphuric acid very often contains arsenic. The lead, iron and zinc found were present as a result of the action of the acids on these metals, with which they had come in contact, soluble salt of the metals being produced. All these substances are injurious, though this statement may seem strange to those who would think iron an exception on account of its known tonic properties; but it must be remembered that iron is only a tonic when given in small doses and not too long continued. If its use is kept up it will eventually impoverish the blood. Coming to the remedy for this state of things, it may be stated that all pickles containing sulphuric acid and copper should be rejected. You may detect sulphuric acid in vinegar and pickles in this way: Place a few drops of the vinegar on a small piece of granulated

white cane sugar in a saucer; then set the saucer over the top of a tea kettle or other vessel in which water is kept boiling for some time. This will evaporate the water and acetic acid of the vinegar, and then if sulphuric acid is present it will become concentrated and char the sugar. This charring of the sugar is a certain and simple test for the presence of any important quantities of sulphuric acid. Copper is usually indicated by the bright green color of the pickles. Chemically, it may be discovered by simply immersing a clean polished knife blade into the vinegar. If a salt of copper is present even in small quantities it will be deposited in the form of metallic copper on the knife blade. Catsup: In the first place avoid a highly colored article, for the chances are that much coloring matter has been added to disguise the dark color of half-ripened or rotten tomatoes. Again, don't buy a low-priced article. When you see an array of catsup bottles in a window with a price card on them, showing they are being sold at half the first grade price, don't buy that catsup; it is not fit to go into a human stomach. The writer has known of a bargain hunter who walked four squares out of her way to get a catsup that was sold five cents cheaper than better grades. Examination showed that catsup to be filthy; it was a network of moldy fibre. Considering how long a bottle of catsup will last, five cents is a very small saving to the purchaser, yet that much difference in price means a great deal to the manufacturer, consequently he cannot afford to put as good tomatoes in it nor to make it up so carefully as the better quality, so that this grade contains most of the rotten tomatoes, the sweepings, etc., all colored up nice and red with rosaniline. Whose fault is it that this kind of preparation is on the market—the manufacturers'? Not exactly. It is the fault of the bargain hunter, who wants to get something for nothing—the bargain hunter who holds a 5-cent piece so close to her eye that she cannot see the dollar behind it.

SOME OF THE LET GO'S.

PETTY POSTPONEMENTS OF DAILY LIFE AND LIVING.

It is rather strange, when you come to think of it, how many little things are "let go" in the house, that really fret the inmates and add friction to the household machinery, which should run smoothly. Most of these "let-go's" are in the kitchen. I might philosophize about that fact, but I will not, just now. A dull vegetable knife is one of these. The kitchen which contains a sharp one is the exception, yet it is very exasperating to peel potatoes or apples; cut up beans, or slice turnips, with a knife as dull as a "hoe." In the first place one begrudges the money for a fine steel knife "just to pare potatoes with," never stopping to think that the better the knife the cheaper it is for this sort of work. A sharp knife will pare thinner and waste less than a dull one, and will last longer. A good, small whet stone should accompany it, with instructions to use it, and not the stove pipe, stove edge or sole of the cook's shoe. There is an old saying, that one of the few questions the devil cannot answer is, "What is a woman's whet stone?" Another annoyance is leaking tins of various kinds, notably, quart measures, dippers, dripping-pans and sauce-pans. Bits of rag drawn through the tiny holes, or flour-paste rubbed on the bottom to form a patch are common devices for getting along with these let-go tins, instead of carrying them to the nearest tin shop some morning and getting them back whole and strong in the afternoon for a very small outlay of time and money. There is for sale, and I doubt not it is quite commonly used, a certain kind of solder that the dealers claim can easily be used at home. I think I bought some once, but was not very successful in using it, probably from lack of skill. It in no way lessened my conviction that tins should not be allowed to continue leaky, when time or service has made them so. A clothes wringer that will not wring, is another annoyance. Perhaps one of the rollers will

not turn. We oil the gearing, and fuss with it week after week, on washday, and forget it the other days, all the time vaguely hoping it is only a "conniption fit" and the matter will "right itself," if only we wait long enough. It does not "right itself," and so the annoyance continues, the clothes are half-wrung, or wrung by hand, when it would be so easy to drop a postal to the man who repairs wringers, and then have this cease to be a "let-go." Dull scissors—who does not know them? Day after day, some people "saw away" with such a pair, working their jaws meanwhile, and getting a "pain in their tempers," all because this is one of the "let-go's" that has grown to be chronic. Isn't it queer? Why is it so? I only know it is, and that I rarely have a friend who visits me and uses my scissors, fail to say, "Why, how nice and sharp your scissors are!" Also, I never go anywhere, taking my work, without being very sure my scissors are with it, because I know what I will meet, nine times out of ten, if I borrow scissors. Another "let-go" has a connection with tidies. Now, tidies are very nice things, and very saving to the furniture, if they are properly made and adjusted; but how few are. Most of them are "everlastingly falling off," and all because we fail to sew on little tapes for tying, or little tapes for pinning underneath. We mean to, each of the fifty times we pick them up and lay them on the sofa or chair; but somehow we let it go, and fret ourselves and others by so doing. The weekly repairing of garments is almost a religious duty in some few homes; but in how many are the little rents and rips, the lost buttons and hooks, the broken button-holes, and worn edges, and the tiny holes and thin places in hoisery, let go from time to time until nothing remains to be done but throw aside the garments. "The stitch in time saves nine" remark, may be trite, but it is just as good as ever, and when I find a home where mending is one of the "let-go's" I feel very sure there is a sad lack of thrift, and so of certain moral qualities that go with it.—*Good Housekeeping.*

INCOMBUSTIBLE CURTAINS.—There are many substances which have the property of rendering the fabrics to which they are applied incombustible, but they usually spoil them, either by changing the color or stiffening them to such a degree that they cannot be used. An easy and safe way of protecting curtains and mosquito nets against fire is said to be by steeping them in a solution of phosphate of ammonia, obtained by mixing half a litre of water (one pint) with 100 grammes (about three ounces) of phosphate. In this way the color and texture remain unaltered.

ARTIFICIAL COFFEE.—The Prussian Minister of Industry has published an account from which it seems that the artificial coffee bean recently discovered on sale consists principally of lupines, and contains about half a per cent. of caffeine, derived from a slight proportion of kola nuts. The husks contain a tannin and some resinous matter.

A CHEMICAL COMPLEXION.—A Miss Chauncey, of Columbia, Ohio, has had a fright that will doubtless teach her a lesson. She used for her complexion a mixture of arsenic and nitrate of silver. Then she went to the White Sulphur Springs, and took the baths. The sulphur decomposed the silver salts in her skin and turned her so black that she has gone into retirement, and will not be seen again for a year.

THE GRAND PRIX.—The Grand Prix of the Paris Exhibition was awarded to the Margaux Souvenir from the Cresta Blanca Vineyards, Livermore Valley, of which Charles A. Wetmore, the President of the California Viticultural Commission, is the proprietor. It is a great and deserved distinction.

LONDON'S ENORMOUS MAGNITUDE.—London is believed to be the largest city in the world. In 1881 that portion of it included within the registration area had 3,814,571 inhabitants, occupying 75,362 acres. "Greater London," as the entire London police district is called, had 4,764,312 inhabitants, occupying 687 square miles. At present "Registration London" alone has hardly less than 4,250,000 souls, and "Greater London," or the whole city, has probably over 5,260,000.

NEW BOOKS.

SOME RECENT PERIODICALS.

OLD NEW YORK. A Journal relating to the History and Antiquities of New York City. W. W. Pasko, Editor, 19 Park Place, New York. Nos. 1 and 2. August and September, 1889.

In our issue of September 12 we referred at some length to a new monthly periodical under the above name, the purpose of which is to place within available reach of the public the memorable facts relating to this city's earlier history, hitherto stored away in archives difficult of popular access, and otherwise to preserve from oblivion the antiquities of Manhattan Island. The second number of the new venture has reached us, and affords a further development of the editor's intentions. We can, probably, best impart an idea of the scope of the publication and the method pursued in the selection of its material by referring in detail to the contents of these first two issues. "Notes in the History of Printing in New York" is a historical summary of the development of the local press from the time when in 1693 the provincial authorities determined to establish a printing press, in imitation of the earlier example of Massachusetts and Pennsylvania. The circumstances attending the arrival of William Bradford in Philadelphia from England in company with William Penn in 1682, and his subsequent vicissitudes, are treated at length, the portion of the narrative contained in the second number carrying the subject down to only 1686, several years prior to its direct relation to New York. These papers, written by the editor, Mr. Pasko, bear the marks of painstaking accuracy and extended research, and when completed they will constitute in themselves a valuable contribution to the history of this city. Other continued papers represented in both the numbers are the "Diary of Dr. Alexander Anderson," the father of American wood engraving; "The Claims of Nicholas Jones," a Bloomingdale farmer, whose property was devastated by the British and Hessian troops in 1776, and who strove in vain after the war to obtain indemnity for the damage he had sustained, his claim gradually increasing in amount as time passed on. A paper whose utility will suggest itself is an index to the illustrations in Valentine's Manual, here for the first time arranged alphabetically. Besides the foregoing, there are a variety of interesting complete sketches, including "The Introduction of Methodism," "Extracts from Early Newspapers," "Theatres in 1825 and 1826," "Supreme Court Attorneys in 1789," "Gleanings from the Surrogate's Office," and several others of similar character. From all of which it is apparent that in "Old New York" we shall have, as the work progresses, a mass of local information, curious and useful, nowhere else procurable in such convenient shape, and embodying historical features which the other excellent antiquarian magazines of the period, by reason of their comprehensive scope and their generality, do not feel constrained to treat in such detailed manner.

Since writing the above, we have received the third number of *Old New York*, being the October issue. The serial articles above referred to are continued, and among the noteworthy subjects otherwise discussed are "The City in 1805," "Rapelje's Boyhood," and an extensive variety of valuable notes, biographical and historical. The work develops increasing interest thus far with each successive stage of its progress.

ALDEN'S MANIFOLD CYCLOPEDIA. Vol. 16, Gal. to Gog. New York: J. B. Alden.

Splendid speed recently marks the progress of Alden's great popular Manifold Cyclopaedia. The sixteenth volume extends from Galvanized Iron to Gog and Magog. This odd beginning and ending illustrates the magnificent scope of the work, taking in as it does the very

latest discoveries of science and the remotest traditions of antiquity, and all between, including an unabridged dictionary of language as well as a cyclopedia of universal knowledge. The small handy volumes, contrasting so remarkably with the usual unwieldy quarto or octavo volumes of other cyclopedias, the large handsome type, the numerous illustrations, the excellent printing and the neat, strong binding, are features which everyone can appreciate; and not less will the majority of readers appreciate the wonderfully low price.

THE NATIONAL MAGAZINE. A Literary and Educational Monthly, devoted to Correspondence Teaching, and University Extension. Vol. 1, No. 1. Chicago. October, 1889.

This new enterprise is designed to serve as the organ of an institution modelled on the plan of the London University, and designated the National University. Much of the space of the initial number is devoted to an announcement of the university scheme, whose basis appears to be correspondence teaching, a method of imparting instruction which is strongly indorsed by high authorities. The faculty in the catalogue before us comprises thirty-five non-resident professors representing, among others, such institutions as the University of Virginia, Tulane, Boston, Madison and Lehigh Universities, who agree to teach pupils at home by correspondence and grant them the usual degrees on examination. The idea seems a good one for persons who cannot attend other colleges. Other articles are those, entitled, "Correspondence Teaching; Its Advantages," by Rev. J. C. Quinn, A. M., Ph. D.; "Hints on Collecting and Preserving Specimens of Natural History," by Prof. G. H. French, A. M.; "Lectures on English Literature," "The Reading Circle," "Literary Notes," etc.

GERMANIA. A Fortnightly Journal for the Study of the German Language and Literature.

The growing importance of an acquaintance with the German language in this country has given birth to numerous systems designed to facilitate its acquirement. The present one seems to be admirably adapted to the purpose, as its lessons are prepared to meet the varying requirements of the beginner, the intermediate and the advanced student. In addition to the elementary features, each number contains poetical selections and a regular contribution of two or more chapters of a serial novel from the pen of some prominent writer. A person wishing to teach himself to read and possibly to speak German will find this an agreeable method for achieving that end.

SANTA CLAUS, ALL THE YEAR AROUND.

This is the title of a new juvenile magazine published weekly in Philadelphia, at \$2 per annum. The first number appeared October 5th. The new venture gives promise of a brilliant future. It is printed on excellent paper, handsomely illustrated; its contributors are well known in that path of literature, and the opening issues bear indications of enterprise and tact on the part of the management which if sustained will doubtless insure success.

WHERE COLORS ORIGINATE.

THE SOURCES OF SOME OF THE MOST BRILLIANT COLORS.

The *American Druggist* has formulated a list of the choicest colors used in the arts as follows: The cochineal insects furnish a great many of the very fine colors. Among them are the gorgeous carmine, the crimson, scarlet carmine, and purple lakes. The cuttlefish gives the sepia. It is the inky fluid which the fish discharges in order to render the water opaque when attacked. Indian yellow comes from the camel. Ivory chips produce the ivory black and bone black. The exquisite Prussian blue is made by fusing horses' hoofs

and other refuse animal matter with impure potassium carbonate. This color was discovered accidentally. Various lakes are derived from roots, barks, and gums. Blue black comes from the charcoal of the vine stalk. Lamp black is soot from certain resinous substances. Turkey red is mud from the madder plant, which grows in Hindostan. The yellow sap of a tree of Siam produces gamboge; the natives catch the sap in cocoanut shells. Raw sienna is the natural earth from the neighborhood of Sienna, Italy. Raw umber is also an earth found near Umbria and burnt. India ink is made from burnt camphor. The Chinese are the only manufacturers of this ink, and they will not reveal the secret of its manufacture. Mastic is made from the gum of the mastic tree, which grows in the Grecian Archipelago. Bister is the soot of wood ashes. Very little real ultramarine is found in the market. It is obtained from the precious lapis lazuli, and commands a fabulous price. Chinese white is zinc, scarlet is iodide of mercury, and native vermilion is from the quicksilver ore called cinnabar.

DIPSOMANIA.

THE MODERN MEDICAL THEORY OF THIRST-MADNESS.

The periodical desire for strong drink which sometimes besets individuals, otherwise moral and exemplary, is a species of paroxysmal mania beyond the control of the patient. It is quite certain that there are thousands of cases of remittent drunkenness, which presents the specific symptoms of disease. The periodical drunkard is not an habitual dram drinker. But at particular times he appears to be attacked with a thirst-madness which deprives him of the power of volition, and hurries him into the most terrible excess. During the interval between the paroxysms, he may be a perfectly sober man. For many weeks, or even months, he may have steadily refused to taste a drop of liquor; may, indeed, have felt no inclination for it, but on the contrary regarded it with disgust. And yet, when the fit comes on, the raging thirst for alcohol utterly paralyzes his conscience and his will. A man in this condition is a monomaniac, and should be treated as one. If put under proper restraint at the commencement of this *furor*, the dipsomaniac, in nine cases out of ten, might be tided over his difficulty in the course of a week, and a perseverance in the course at the recurrence of the hallucination would probably eventuate in a complete cure. It is not easy to persuade the world that all drunkenness is not voluntary. The law does not recognize dipsomania. It treats all inebriates alike. This seems to be unjust, although it is hard to say where the line should be drawn between free-will excess and that which precedes from an uncontrollable mania.—*Munford's Magazine*.

LEFT-LEGGEDNESS.

MAN, THE RIGHT-HANDED AND LEFT-LEGGED ANIMAL.

A paper on "Left-leggedness" was read recently before the British Association by Dr. W. K. Sibley, who said that Professor Ball in "Le Dualisme Cerebral" speaks of man as a right-handed animal. Being right-handed, it is popularly assumed that he is also right-legged, but this does not appear to be the case. Standing working with the right hand, there is a tendency to use the left leg for balance. Many people find less exertion in going round circles to the right than in circles to the left. Race paths are nearly always made for running in circles to the right. So the majority of movements are more readily performed to the right, as dancing, running, etc. The rule in walking is to keep to the right, and this appears to be almost universal. It is more natural to bear to the right. Of a large number of people from the better educated classes asked about the existence of the rule, only 67 per cent. males and 53 per cent. females were aware of the rule. The large majority obey it unconsciously in walking. Crowds tend

to bear to the right. The left leg being the stronger, it is more readily brought into action. Hence troops start off with the left foot. It is the foot which is placed into the stirrup of the saddle or step of bicycle in mounting. So the left is the foot which a man takes off from in jumping. In the experiments of Mr. G. H. Darwin, blindfolding boys and telling them to walk straight, the right-handed one diverged to the right, and *vice versa*. From measurements of Dr. Garson of the skeletons of the two legs, in 54.3 per cent. the left was the longer, and 35.8 the right. For measurements of the feet, the author collected the drawings and measurements of 200 pairs, with the result that in 44 per cent. the left was longer, in 21.5 per cent. the right, and in 34.5 per cent, they were the same size. Measurement at the first joint gave 56 per cent. left larger, and at the instep 42.5 per cent. From the table of the figures it is observed that the left foot is more frequently the larger in the male than female sex, and the percentage of feet of the same size is greater in the female. The percentage of the right larger than the left is very constant, whereas the numbers of the left larger and those in which both feet were the same size are much more variable. Man, being naturally or artificially right-handed and left-legged, tends unconsciously to bear to the right; lower animals, on the other hand, appear nearly always to circle to the left.

CALIFORNIA INDUSTRIES.

THE REMARKABLE PRODUCING CAPACITIES OF THE GOLDEN STATE.

California is a rich State covering a great area and possessing within its limits varied climates and soils. It is therefore not to be wondered at that its products should be so varied and enormous. Let us give a few figures, which, though they may not furnish as clear an idea to the general reader, will furnish a text for further details. The Santa Clara Valley last season supplied of prunes alone fifteen millions pounds or 750 carloads. To put the matter in dollars and cents, California last year produced \$750,000 worth of honey, \$6,500,000 worth of peaches and apricots, \$4,000,000 in canned fruits, \$6,500,000 in dried fruits, \$3,500,000 of raisins, the same sum in oranges, \$50,000,000 of wheat, \$10,000,000 of lumber, \$35,000,000 of cattle, \$20,000,000 gold and silver. Her dairy products were worth \$7,500,000. The salmon off the Pacific coast shipped from San Francisco were worth \$5,000,000; \$10,000,000 in leather was produced. We have not enumerated figs nor olive oil which industries are both in their infancy yet. Of the latter commodity alone Elwood Cooper of Santa Barbara produced 50,000 bottles the product of 6,000 trees. The tenderest walnuts are grown here, and they are acknowledged as superior to the English walnut. About forty carloads of almonds were shipped. Lima beans are also rapidly becoming one of the staple shipping products. The dried fruits shipped from California during the year 1888 may be subsumed thus: Apricots, 3,200,000 lbs.; apples, 550,000 lbs.; pears, 150,000 lbs.; prunes, 8,050,000 lbs.; plums, 360,000 lbs.; Nectarines, 340,000 lbs.; figs, 175,000 lbs.; grapes, 2,340,000 lbs.; peaches, 8,600,000 lbs.; or a total of 23,765,000 lbs. There were raised in the year 1888, 950,000 boxes of 20 lbs. each of raisins, and 1,527,000 cases of fruit and vegetables, 20 cans each, were packed during the year, 18,000,000 gallons of wine and 600,000 gallons of brandy were produced in the same time.

(To be continued.)

THE FANGED ADDER.—Here's the liquor problem in a true form: Twenty-five snakes running through the streets—that's free whiskey. Twenty-five snakes gathered into a box in which twenty-five holes are made by authority of the court—that's low license. Ten of the holes are closed and the snakes all get through the other fifteen—that is high license. Drive all the snakes over to the next village—that is local option. Kill all the snakes—that is prohibition.—*The National Issue.*

NERVOUSNESS.

RELAXATION ITS CURE AND NOT PRETENDED BRAIN FOODS.

According to Dr. Allen McLane Hamilton, of this city, "Nervousness is the great brain trouble in this country. It is caused chiefly by the continued strain of business. Americans take too little time to think about their health, and to think especially about their brain. All the time they are thinking of business; how to get on in the world, and how to make a fortune. Many of them would work twenty-three hours out of the twenty-four if they possibly could, and would then complain that they hadn't time to attend to their business properly. This continued strain on the brain is also the cause of so much insomnia that is prevalent. People who live in foreign countries do not have anything like the amount of brain trouble that those who live in this country have. They give themselves more rest than we take here, they have more holidays, more times like the recent Centennial time when all thoughts of business are put on one side and the whole community give themselves up entirely to rest and pleasure. I think those three days' holiday in this city did those who availed themselves of the holiday more good than they will ever be able to know of. They may have got tired out physically, but it was a great rest for their brains. During the time of the festivities their minds were entirely removed from business thoughts and troubles. Another cause of the nervousness of Americans is that they keep their brains working in too narrow a channel. They don't seem to develop it enough. They keep working along in the same groove all the time; of course, I am speaking of the majority. The man of business, the merchant or the broker studies chiefly the market in which most of their transactions occur, and lets other subjects go by. Children's minds are not developed properly in my estimation. They want to have a wide range of study, and they want to have that study made as easy as possible for them. Their brains are not as strong as those of an adult. They must be trained carefully, and their studies should be made just as light as possible. Another great mistake that Americans make is in their diet. They take as adults too much of a vegetable and a farinaceous diet, drink too much beer and eat too many sweets. Children should have more farinaceous food, and adults should eat more meat and take more of an animal diet. Meat produces hysteria when eaten by young girls, and when taken by young boys is likely to produce convulsions. Insomnia and other nervous diseases are due to insufficient exercise, misuse of the brain and abuse of food; such as eating hot bread and hot cakes for breakfast. Adults want more meat than the average American adult eats. This climate demands that the inhabitants of the country should eat a more nutritious food than is eaten elsewhere; then again Americans are much less fitted to take stimulants than foreigners are, on account of the climate in which we live. I think that foreign vices are responsible in a very large degree for American nervousness. The habit of taking alcoholic drinks before meals is one of these bad vices; and very few know the tremendous amount of harm and injury that one drink before breakfast in the morning causes. The foreign habit of drinking absinthe, liqueurs and cordials, is another very bad one. Brain food is a misnomer. Many people claim that fish is a brain food because phosphorus is found in fish to a very large extent. This is not so. A great many advertisements set forth the advantages of cereals as brain foods. These are also mistakes. The best brain foods are cold fats and vegetable oils. I consider one of the most important articles of diet that we can possibly have in this country to be cotton seed oil. It is one of the best fats and much more healthful than lard. If persons would use more olive oil they would be a great deal better off. There are lots of ways in which they can take the olive oil without its being unpleasant for them. There are a great many adulterants of food which, if used under their own names,

would be much more valuable than the food which they are now sold to represent. I consider oleomargarine much more healthful than butter. Butter may contain, during its manufacture, products of decomposition, and unless the butter is of the best possible quality it may very often do a great deal of harm. Wheaten food or cereals taken to the exclusion of all else is very injurious to the brain and nervous system. It is unwise for anybody to live on a cereal diet to the exclusion of animal diet. If Americans would live more quietly, would not be in such a constant state of rush and excitement, and would eat more food that contained some nourishment rather than living on fancy dishes, there would be a great deal less nervousness, insomnia and general nervous disorders than there are at the present day. This nervousness has only come on of late years comparatively, and it is caused by the whirl of excitement in which Americans, and especially inhabitants of large cities, will live. They keep on the go from early in the morning until late at night, when half of that time should have been given up to rest and recreation. They try to crowd into a short space of time all the work they possibly can in order to gain the almighty dollar, and by doing so ruin their health and constitution. Men should rise early in the morning eat a good breakfast that contains a certain amount of nourishment and discard all such items as toasted muffins, corn bread, wheat cakes or anything of the kind, rest a little after their breakfast, go through the day's business with as little worry and as little excitement as they possibly can, and after their work is finished in the evening, say from 4 to 6 o'clock according to the time when their business hours close, they should have their dinner, eat it slowly and comfortably and then give themselves up entirely to rest and recreation. They should try to develop other parts of their brain than those which are exercised in following their daily vocations. And then they should get to bed early and get a good night's rest. Attempting to work without a proper rest at night is a mistake, and if a man is troubled with insomnia at all he should consult a physician and have it remedied before any dangerous result arises from it."

LIGHTNING BY RAIL.—A great many people seem to be laboring under the impression that a trip in the electric cars during a storm accompanied by lightning is exceedingly dangerous. Such, however, is not the case, for so excellent are the precautions taken to insure that the discharge is conducted to the ground that no harm can result. Each car is provided with lightning arresters, which protect the apparatus from all damage, and absolutely insure the safety of the passengers.—*Electrical Review.*

VICARIOUS PLEASURE.—It is related that Ira Tripp, a millionaire of Scranton, Pa., has a peculiar habit. For many years he smoked cigars until his physician told him he must stop smoking or die. Thereupon Tripp hired a negro to smoke all day near him and blow the smoke into his face. The negro did this for years until he died, and his place was taken by a white man. Mr. Tripp is in perfect health. His smoker uses about twelve fine cigars a day. Tripp seems to derive great enjoyment from his second-hand method of indulging in tobacco.

THE DANGEROUS BLONDE.—It is the blonde woman who does the mischief. Lucretia Borgia had yellow hair; so, according to Grant White, had Lady Macbeth, who was petite and slight. The mischief-maker, Mme. Montbazou, was a regal blonde. Mme. Simon's blue eyes looked unflinchingly at the guillotine when the still fairer head of the innocent criminal, Marie Antoinette, fell into the basket. Bloody Mary was slight and fair. Marie de Medici was a fleshy blonde woman, though her hair was streaked with gray when she died on her straw litter at Cologne, and Catherine, of the same noble house, was either fair or stained her tresses to make her appear so. I dare say the daughter of Herodias, who danced before Herod, was yellow-haired—the old masters made her so (those high-born Jewish maidens had the blonde tint)—and nobody doubts that Delilah's blue eyes bewitched the secret out of the soft-headed, soft-hearted, black-bearded giant.

CORRESPONDENCE.

A GREAT SUGAR REFINERY.

PHILADELPHIA, October 23, 1889.

Editors ANALYST: It had been expected that the big Spreckels' Refinery would be started to-day and from this time on would turn out 1,000 tons of sugar daily. Owing, however, to the delays of some of the contractors it is not ready, and will not be for about two weeks more. Mr. Claus Spreckels has returned from his trip to Europe and is now aiding his sons in the work of preparation for the opening. The 2,500 incandescent electric lights are all in place and the great buildings were illuminated by them for the first time last night. The building contractors attribute their delay in finishing the buildings to the continued bad weather. Mr. Spreckels says, however, that they are now through with their part, and that as soon as the necessary connections are made they will be ready to start. Work is now going ahead on the second, or duplicate, refinery, alongside of the present one. This will double the capacity, and the additional buildings will be completed early next year. Mr. Spreckels is still pushing his beet-sugar project and has already conferred with a great many farmers, who have made a conditional agreement to raise the sugar-beets if he will erect the necessary factory. This he has nearly determined to do. I will keep you posted.

H.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

October.

MEAT.—Beef, mutton, pork, venison.

POULTRY AND GAME.—Chicken, duck, geese, grouse, hare, partridge, pheasant, pigeons, rabbits, turkeys, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, whiting, salmon, trout, perch, smelts, oysters.

VEGETABLES.—Artichokes, broccoli, celery, potatoes, turnips, cauliflower, cabbage, carrots.

FRUIT.—Apples, pears, quinces, grapes, nuts.

PRACTICAL RECIPES.

CINNAMON BREAD.—Take some light yeast bread dough and roll out about three-quarters of an inch thick; cut into round cakes the size of a breakfast plate; cover with thin slices of butter, sprinkle well with cinnamon, then with sugar; let it rise till very light and bake.

FRIED BEEFSTEAK.—Hack the steak thoroughly with a sharp knife; have a frying pan very hot, put the steak on it, and in a few moments turn quickly with a knife; do this several times, turn on to a hot platter; season well with salt, pepper and butter; cover with another hot platter for a few moments; put a little butter and some brown flour into the pan and cook a few minutes; add milk to make it thin enough, season, pour into the gravy boat and serve with the steak.

MOCK TURTLE BEAN SOUP.—Let a pint of black beans soak over-night; in the morning put them into three quarts of water with a soup bone or small piece of lean salt pork, and let them boil for three or four hours; then strain through the colander, washing enough of the beans through to make it moderately thick; season with pepper, salt, lemon juice and cloves; pour into the tureen; put a few very thin slices of lemon on top and a hard-boiled egg cut into bits; serve with dice of toasted bread; the heart or liver of a chicken cut into little pieces may also be added.

TURNIPS.—Wash and peel them; cut in slices across the grain and steam until quite tender; season with salt and pepper and butter; mash fine and serve. If boiled they should have very little water put on them, and should be cooked as quickly as possible; they should be thoroughly drained; also they may be sliced and baked.

STEAMED BROWN BREAD.—Mix thoroughly one quart each of milk and sifted meal, one pint of rye flour, half a pint of molasses, one teaspoonful of salt, and a table-spoonful of Horsford's baking powder. Pour the batter into greased moulds, and steam four hours in a kettle half filled with water.

ALMOND LAYER CAKE.—For the layers use a cup cake batter, one cupful butter, two cupfuls sugar, three cupfuls flour and four eggs; two teaspoonfuls baking powder, one cupful cold water, and half the juice and grated rind of a fresh lemon; beat till very light and bake in jelly-cake tins. For filling put a cupful of rich sweet milk over the fire in a farina kettle; when hot stir into it three teaspoonfuls corn starch, one well-beaten egg, one-half cup sugar, one-half cup blanched and pounded almonds; let thicken before adding the almonds; flavor with vanilla, and when cool spread in thick layers between the cakes; ice the cake.

THE LARGEST OLEOMARGARINE FACTORY IN AMERICA.

Twenty miles east of Chicago, just inside the Indiana State line, on the Calumet river, lies the town of Hammond, of 5000 inhabitants. At this point is located the extensive plant of George H. Hammond & Co., who also have an establishment at Omaha. When it is remembered that it is but twenty years ago since George H. Hammond, a practical butcher from Boston, killed the first steer and shipped the meat in a crude refrigerator car to Boston, the extent of the present plant and the magnitude to which the business has attained, it is not only a surprise, but a worthy monument of what business enterprise and perseverance can accomplish. The plant now found here has just arisen like a Phoenix from the ashes. The old buildings, all frame, were struck by lightning in July, 1889, and partially destroyed; two weeks later another fire destroyed every building but one. But such obstacles cannot prevent pushing men from moving forward, so that at the present time (less than three months since the fire) we find this large array of buildings almost rebuilt of brick, very much enlarged and prepared for a larger business than ever. The establishment of George H. Hammond & Co. covers about twenty acres, and consist of the oil building, which is 160 x 112 feet, the basement being used for a cooperage—the first floor, to draw off the oil; the second floor, the room in which the stearine is pressed from the oil, and the third floor is where the caul fat is washed, cut up and fed into the hoppers of the machines. The tank building, where the tallow is rendered, is 160 x 180 feet. It has the charging room on the top or third floor—two floors are occupied by tanks and in the basement the drawing off is done. Here tallow, tallow oil, and neats-foot oil are made. The slaughter houses and coolers occupy another building, 227 x 348 feet, 125 feet of which is four stories high, and is used for tripe and paunch rooms. There are also here two ice houses, 300 x 90 and 390 x 248 feet. Car shops, 60 x 180, where the refrigerator cars are repaired and repainted. A fertilizer factory, for the conversion of blood and offal, 80 x 145 feet, is being constructed. In addition, they have the Illinois ice houses on the Calumet river, 300 x 200, and another on Wolf Lake, 312 x 60. A ware-house, 112 x 145 feet, with two floors above the basement, is in course of construction. An engine and boiler house, 41 x 227, furnishes power amounting to over 350 horse-power. The hog slaughter house, 70 x 40, and a sheep house, the same size, together with some small buildings, 120 x 20, occupied for tinsmiths, blacksmith and carpenter shops, complete this plant;

but we must not omit to describe the oleomargarine factory, which is 60 x 110, and three stories in height. The basement is occupied for storage purposes, the first floor for packing and shipping, and the upper floor for churning and salting. The capacity of this factory is 50,000 pounds of oleomargarine in 10 working hours. This product is put up in $\frac{1}{2}$, 1, 2, and 5 pound rolls, packed solid in firkins holding, 10, 20, 30 or 56 pounds each. In the town of Hammond this oleomargarine is sold for 15 cents per pound as against 27 to 28 cents for ordinary butter. About two-thirds of the substances used as butter in Hammond is oleomargarine. All the employees of Hammond & Co., and these form the bulk of the inhabitants of Hammond, use this oleomargarine. It is loaded at the door of the factory in refrigerator cars, and thus shipped in every direction. The shipping facilities of this plant should have been spoken of above. Five railroads center here, and ample sidings furnish means of reaching every point. It takes about 900 hundred cars to keep the business moving. Hammond & Co.'s own tracks completely surround the plant, and connect with every railroad centering in Chicago.

A more particular description of making oleomargarine may be given thus. Only the best and freshest fat can be employed. This is the caul fat, which, as soon as taken from the animal, is carried in clean vessels to the oil house. Here it is thoroughly washed in cold water, cut up and melted in steam-jacketted kettles at a low temperature, to prevent any tallowy smell or flavor, granulated, and then pressed in clean linen cloths by hydraulic pressure to separate the stearine. The remaining oleo oil is pumped from its containing tanks to the butter mixer. Oleomargarine consists of oleo oil and milk, with a little salad oil added in winter to keep it soft. The oleo oil added to milk brings the fatty percentage of the mixture up to about what cream would be. It is then churned, washed, salted, worked and colored the same as butter. It may be added that the manufacturer of one of the finest brands of gild-edge dairy butter informed the writer that good oleomargarine helped him to sell his best butter, while poor dairy butter injured the sale of choice varieties.

BUSINESS NOTES.

A GREAT SAN FRANCISCO COMMISSION HOUSE.

One of the most extensive shipping and commission houses in San Francisco is that of the Johnson-Locke Mercantile Company, who succeeded to the better part of the business of William T. Coleman & Co. They are the receiving and distributing house on the Pacific coast for the following well-known Eastern goods: Royal Baking Powder, Walter Baker & Co.'s chocolate, John Dwight & Co.'s soda and saleratus, Kingsford's Oswego starch, N. Y. condensed milk, Lea & Perrins' Worcestershire sauce, Burnett's flavoring extracts, Diamond matches, Frazer's axle grease, N. Y. Tartar Co.'s cream of tartar, Babbitt's soap, lye and saleratus, Kinney's cigarettes, Hazard's Shrewsbury catsup, the Cunningham & De Fourier Co.'s English potted meats. They also sell and ship all over the world Coleman flag brand of extra California canned fruits, dried fruits, raisins and Columbia River and Alaska salmon, and the canned fruits put up by the following packing companies: The San Lorenzo, J. Lusk, San Mateo, California Canning Co., Santa Clara Packing Co., and George W. Handy's prunes; Thistle Packing Co.'s Columbia River and Alaska salmon, Karluck Co.'s Alaska salmon, Scandinavian Packing Co.'s and Fishermen's Packing Companies' Columbia River salmon. With branches at Portland and Los Angeles and extensive connections in Australasia, China, Japan, the East Indies, Sandwich Islands, Mexico, Central and South America, an accurate knowledge of the markets, long business experience, good reputation and industry, and, above all, a record of great success, it is not to be wondered

at that they have become the most extensive house on that coast. They have large and commodious offices at 121 Market Street, San Francisco.

THIN IRON SHEETS.—Iron is rolled so thin at the Pittsburgh iron mills that 12,000 sheets are required to make a single inch in thickness. Light shines through one of these sheets as readily as it does through greased tissue paper.

TO MAKE HOLES IN STEEL.—Sometimes great difficulty is experienced in making holes in steel that is too hard to cut or file easily. This is effected by the following mixture: One ounce of sulphate of copper, quarter of an ounce of alum, half a teaspoonful of powdered salt, a gill of vinegar and twenty drops of nitric acid.

NEW TRACES.—The ordinary leather and chain traces for drawing carts have been superseded on the Eastern Railway of France by chains with spiral springs, which permit the horse gradually to bring its force to bear on the vehicle in starting it. They are found more serviceable than the rigid traces.

TOUGH PAPER.—Paper, tough as wood, is said now to be made by mixing chloride of zinc with the pulp in the course of manufacture. It has been found that the greater the degree of concentration of the zinc solution the greater will be the toughness of the paper. It can be used for making boxes, combs, for roofing, and even, it is added, for making boats.

PEARLS AND CORAL.—Set pearls which have become discolored by wear may often be improved by placing in a covered vessel with a mixture of whitening, ammonia and

water, and permitting them to remain a few hours. Coral may be cleaned by soaking in soda and water for some hours. A lather of soap is then made and brushed upon the coral with the softest of hair brushes. A frequent changing of the water is desirable.

FLOWERS AND HEALTH.—It is now established that flowers and the perfumes distilled from them have a salutary influence and constitute a therapeutic agency of high value, and that residence in a perfumed atmosphere forms a protection from pulmonary affections and arrests phthisis. In the town of La Grasse, France, where the making of perfumes is largely carried on, phthisis is unknown.

SAFE REMEDIES.—Sir William Gull says that when fagged out by professional work he recruits his strength by eating raisins, and not by drinking wine or brandy. Another good saying from the same source: A pint of warm water, taken on an empty stomach in the morning, is the safest and surest of all remedies for habitual constipation. It stimulates peristaltic action, thereby giving a normal action without pain. If the tongue is coated, squeeze a lemon into the water and drink without sweetening.

SHAVED ICE.—A saucerful of shaved ice, says the New York *Medical Times*, may be preserved for twenty-four hours with the thermometer in the room at 90 deg. Fahr., if the following precautions are observed: Put the saucer containing the ice in a soup plate and cover it with another. Place the soup plate thus arranged on a good heavy pillow, and cover it with another pillow, pressing the pillow so that the plates are completely embedded in them. An old jack-plane set deep is a most excellent thing, with which to shave ice. It should be turned bottom upward, and the ice shoved backward and forward over the cutter.

EGGS AS FOOD.—The food value of eggs, as compared with fruits, has been studied by Fresenius, who, after a long series of analyses, states that one ordinary hen's egg contains as much nourishment as 17 ounces of cherries, 20 ounces of grapes, 24 ounces of russet apples, two pounds gooseberries, and 4 pounds of pears. The same distinguished authority says that 114 pounds of grapes, 127 pounds of apples, 192 pounds of pears, and 327 pounds of plums are equal in nourishment to 100 pounds of potatoes.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,

By MISS M. E. BRADDON.

THE GIRL AT THE GATE,

By WILKIE COLLINS.

A BRIDE'S TRAGEDY,

By MISS MULOCK.

THE RECTOR'S DAUGHTER,

By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,

By MARY CECIL HAY.

GABRIEL'S MARRIAGE,

By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,

By ETTA W. PIERCE.

THE RIGHTFUL HEIR,

By M. T. CALDOR.

THE DOUBLE HOUSE,

By MISS MULOCK.

TWICE SAVED,

By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, profusely and handsomely illustrated, and making a most delightful and very interesting volume. We will send the book by mail post-paid to any address upon receipt of only Twenty-five Cents.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the AMERICAN ANALYST.

ANALYST PUBLISHING CO.,

19 PARK PLACE, NEW YORK.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Vandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

P. O. Box 1574. **THE NEW YORK PHARMACAL ASSOCIATION, NEW YORK.**

VALUABLE TO ADVERTISERS.

You have determined to make money by vigorously pushing your business. As the AMERICAN ANALYST has determined to do the same thing, we have a community of interests. Our way of making money is to increase our circulation, and we can only do so by publicity; that is, by bringing our journal to the notice of a great number of people, who have the intelligence to appreciate a good journal when they read it and the money to buy what they want. You must necessarily want to reach the same class. Even if you do not sell directly to the consumer, it is necessary for you to tell the consumer of the quality of the goods you have to offer to induce him to ask the dealers with whom he trades for them. We propose this Fall and Winter to send a sample copy of this journal to the address of every person in the United States whose name we can find in any of the *Elite* directories or blue-books of the various cities and villages. We will thus reach several millions of new readers in addition to our already large subscription-list, covering every State in the Union. Previous experience with this method of getting new subscribers war-

rants us in undertaking the expense, believing that it will pay us. This large addition to our circulation will put any advertisement in our columns before a multitude of readers. Our advertising prices remain the same, and are so arranged as to give the lowest rates to larger and longer-continued advertisements, and will be sent on application. All respectable advertising agencies will take orders for us. If we find this system profitable, advertisers surely will. Those who have advertised with us always renew as their season comes around, and you will do the same when you have tried it. We have found that in the great competition now existing we must keep our journal prominently before the public, and, in our mutual interest, we ask you to join us. Our system is more effective than a circular, and you will find it just as effective for your business and the cost very much less. Try us. For any further information write, and it will be forthcoming.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutics that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, ONLY THREE possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract, and Keppeler's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity.

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College.
At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alteratives.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Ferrated.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peptones.	MALTO-YIBURNIN.
MALTINE with Pepsin and Pancreatin.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analysis by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

AVOID LITIGATION! BE YOUR OWN LAWYER!

EVERYBODY'S LAW BOOK.

Litigation is a very expensive luxury; avoid it, for it doesn't pay. Thousands of lawsuits are brought because people do not understand the simple principles of law and their own and others' rights, and there are plenty of lawyers always ready to take advantage of this lack of knowledge. The object of this volume is to impart, in a simple, concise manner, the fullest information regarding legal matters. It is to be used as a work of reference, and in all ordinary emergencies will save employing a lawyer. It is a complete compendium of business and domestic law, by a prominent member of the New York bar, containing concise explanations of the general laws and the laws of the several States, regarding Administrators and Executors, Affidavits, Agency, Agreements, Apprentices, Arbitration and Award, Assault and Battery, Assignments, Attachments, Banks, Bills of Exchange, Checks and Promissory Notes, Bills of Sale, Chattel Mortgages, Citizens and Aliens, Common Carriers, Contracts, Corporations, Deeds and Mortgages of Real Estate, Descent and Distribution, Lower, Easement, Exemptions, Farmers' Law, Fences, Fixtures, Garnishment, Gifts, Guaranty, Guardian and Ward, Heirs and next of Kin, Homestead Exemptions, Husband and Wife, Infants, Interest and Usury, Landlord and Tenant, Libel and Slander, Liens, Limitation of Actions, Marriage and Divorce, Rights of Married Women, Master and Servant, Parent and Child, Partnership, Payment and Tender, Personal Property, Power of Attorney, Principal and Agent, Privileged Communications, Railroads, Railroad Real Estate, Receipts and Releases, Replevin, Right of Way, Seduction, Trustee Process, Warranty, Water Rights, Wills and Codicils. Together with complete forms of Acknowledgments, Agreements, Articles of Co-partnership, Assignments, Award of Arbitrators, Bills of Sale, Bonds, Chattel Mortgages, Contracts, Deeds, Executors' and Administrators' Accounts, Interest Table, Liens, Mortgages of Real Estate, Powers of Attorney, Releases, Satisfaction Pieces, Wills and Codicils, etc., etc., specially adapted for the daily use of those who are not lawyers, with directions for their preparation. Every farmer, mechanic, manufacturer, business man, professional man, merchant and householder will find the information contained in this book of great value, and will have occasion to refer to it nearly every day. It is the cheapest book of the kind ever published, and is quite as complete and valuable as other works for which four times the amount, or more, is asked. **Everybody's Law Book** is a large volume of 128 pages, 12mo, with handsome cover. It will be sent by mail, post-paid, upon receipt of only **Twenty-five Cents**. Send for it! It is worth ten times the amount asked for it to any man, young or old, in America.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

● The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the **AMERICAN ANALYST** a good advertising medium. Why should not you?

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by **E. McILHENNY,**
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, in China, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COLDEN." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

THE LOST CAUSE.

The retail beef conspirators overreached themselves so utterly in their "local inspection" scheme last winter that they have been for the past half year in a state of collapse that would be pitiful to witness were it not for the comical contrast it presents to the truculent attitude they so lately occupied. A majority of the more influential papers that advocated the exploded scheme have acknowledged their error, and are seeking the contrivance of new issues to warm up their constituents into a subscription-paying enthusiasm. Thus the *National Stockman* says: "In view of recent developments, we are forced into the belief that it is a waste of time and effort to pursue further the idea of regulating the dressed beef trade by enacting laws for the local inspection of cattle. The late decision of the United States District Court of Minnesota pronouncing all such enact-

ments unconstitutional, is a confirmation of other decisions of a like character so significant that its meaning cannot well be mistaken. The probabilities against a reversal of this in the Supreme Court of the United States are so great that an appeal seems almost hopeless." The judicious views above quoted express the general sentiment of the cattle industry press throughout the United States. The organs of the retail trade, however, are reluctant to confess their defeat so soon after indulging in the extravagant antics with which they announced their imaginary success. But it is to no purpose, and they may as well throw up the sponge, for their "jig is up" and their lost cause cannot be galvanized again into even a semblance of vitality. The politicians this fall decline to singe their fingers, as they did a year ago, by lending themselves to the scheme for raising the price of their constituents' beef; and even our sprightly contemporary, the *Butchers' Advocate*, which, with characteristic maladroitness, is frantically searching for the "lost ditch," and which declares with amusing valor in regard to local inspection, "For ourselves, we have nailed our banner to the masthead and shall defend it, at all hazards, until overwhelmed by the only power in the land competent to overthrow us—the Supreme Court of the United States," confesses in the same issue that it is virtually alone in its defiant attitude, and that in the shuffling of the political pack this year "no arrangements by which local inspection laws are to have 'friends at court' have yet come to the surface." The trouble is the Court is the very place where the local inspectionists encountered their overthrow.

A GREAT SCIENTIST GONE.

There died at Manchester, England, on October 11, one of the world's great original workers in physical science, who, though one of his discoveries gave him rank among the most distinguished investigators of his day was scarcely known by name outside of scientific circles. Dr. James Jones Prescott Joule who passed away in his 71st year, was the discoverer, in 1843, of the important principle of the "Mechanical Equivalent of Heat," which was the first experimental step toward the modern doctrine of the conservatism of force. It was, briefly, the discovery of the exact numerical relation or equivalence of any given amount of heat and the mechanical force necessarily expended in producing it. After a long series of experiments he discovered that the heat generated by one pound of water falling from a height of 772 feet, and thus converting all its moving power into heat by percussion or friction, is such as would raise the temperature of one pound of water one degree Fahr. Thus, knowing the weight of any body and the rate at which it is moving, and having deduced the height from which it would have to fall in order to produce the same velocity, we can estimate what amount of heat would be produced if its motion were to be suddenly converted into heat by collision or percussion, and, conversely if we know the amount of heat generated and the

weight of the colliding masses we can calculate the velocity of collision. Joule's father and grandfather were brewers, but he relinquished trade to devote himself to scientific pursuits, his instructor in chemistry being the famous Dalton, the propounder of the atomic theory. At the age of 19 Joule published an account of a new electro-magnetic engine, and his subsequent contributions to scientific literature were numerous and varied. He lived, a modest, retired life, and consequently was hardly known to the outside world, but he was highly-honored among those whose opinions alone he valued, gold medals and other marks of appreciation being showered upon him by all the leading scientific bodies of Great Britain and Europe. In 1878 Queen Victoria conferred upon him a pension of \$1,000 a year, and few pensions emanating from that source were ever better deserved.

ARTIFICIAL SILK.

In another column will be found an interesting account of the manner in which artificial silk is produced by the process invented by M. de Chardonnet, of Lyons and referred to by the *AMERICAN ANALYST* a few weeks ago. It will be seen that the method is almost a mechanical reproduction of the operations which take place in the production of the natural silk fiber. The worm consumes the mulberry leaves, digests them to a pulp, and finally dissolves the pulp into a gummy varnish, which it then forces from its glands through capillary apertures in spinning the cocoon. The chemical compositions of the silk and the collodion fibers are not greatly different, and really M. Chardonnet's process may be considered as a sort of mechanical silkworm imitating natural processes on a large scale. It is unnecessary to discuss the revolution which the general introduction of such a process would create in the silk industry, as it would remove many of the existing obstacles to the development of the manufacture of silk in this country and place it upon a purely mechanical basis. American inventors may develop further improvements in this process now that its practicability has been shown and it is not too much to expect that artificial silk will be a formidable rival to the natural article at no very distant date.

ANOTHER INDIANA DECISION.

The "local inspection" laws have been denounced in every court that has examined them. On October 16th the Criminal Court at Indianapolis, Ind., dismissed an indictment against the agent of the Chicago Dressed Meat Company who was arrested for selling meat in violation of local inspection law. The judge covered very much the same line of authority presented in other decisions touching the law in Indiana and Minnesota. He held the law to be unconstitutional, and in conclusion said in the interest of public health the State could enact rigid inspection laws and exclude from the State any articles offered for human food which, from its

noxious condition, put it without the pale of legitimate commerce, and could, under reasonable quarantine and inspection laws, meet at its borders such articles as by reason of their putrid or pestilential condition had lost their commercial character, and prohibit their introduction. The act in question went far beyond this. Pure and wholesome dressed meat was a useful commodity, recognized as property, and the subject of legitimate trade and lawful interstate commerce. This law he said did not discriminate between the good and the bad, but excluded all dressed meats—the sound and the wholesome as well as the unsound and the unwholesome. The same process of reasoning that would sustain its validity would sustain excluding from importation and sale flour or any other prepared or manufactured articles of human food, because the grain or other materials from which it was made had not been inspected in the State by officers appointed for that purpose. This would be to allow the State rather than the usages of the commercial world to determine what are articles of commerce, and to thereby control and regulate interstate commerce, thus usurping the powers of delegates to Congress.

A WOMAN'S BLUNDER.

The industrious and versatile newspaper reporter called "Nelly Bly," finding nothing better to do one day last week, contracted a convenient headache, and with that as her capital in trade set out to consult seven different physicians. The result of her interviews was written up in her most sensational style in the *N. Y. World* of Sunday, October 27. The article would have been very interesting if the headlines intended to give the gist of the story had been truthful but they were not. The patient claims that seven physicians, all of them competent and of good reputation, had made seven different diagnoses of her case and given her so many different remedies. The truth is that the seven different diagnoses to the mind of any competent medical man, prove conclusively that each one of the seven physicians had agreed with the other six as to her trouble, and the character of the medicines they prescribed proves this. As she states it in the headlines, the seven diagnoses were dyspepsia, malaria, stomach trouble, shattered nerves, defective eyes and neuralgia, but a comparison of what the physicians really did say, shows that they all found that she had a headache, arising like all headaches, from a painful sensation in a nerve caused by irritation of a nerve centre. Whether this irritation was caused by indigestion, strained eyes or malaria, the doctors all prescribed similarly tonics, lax-

atives and nerve sedatives. Three out of the seven were candid enough to tell her that they were not sure of the cause of her trouble, but wanted to watch her symptoms; three positively stated the trouble to be indigestion; two thought the eyes were involved; and all asked questions pointing to a lingering suspicion on their part, that the eyes were the source of the trouble, that is they suspected megrime; two agreed on nervous symptoms and anæmia, and one only suggested malaria. It is possible that all were right, and yet, Miss "Bly," to make her article sensational, endeavors to make the reader believe that they all seven disagreed. In the prescriptions given there is even more unanimity than in the diagnoses. Of the six physicians who gave her prescriptions, all gave her tonics and nervines, while two hit the nail more squarely on the head by prescribing cathartics. The wonder is, with her vague and entirely unreliable statements of her symptoms, consisting rather of her own conclusions and inferences, than of facts, that these physicians agreed so well. Dr. Grace Peckham, in an interview published on Monday, states the case exactly when she says that the doctors had all agreed on the case, and that any one of the prescriptions given would have cured the patient. It remains to be said that such a treacherous and uncalled for violation of all decencies as this publication of private consultations with reputable physicians, revealed in this sensational article, had so far, never previously occurred, and was hardly to be expected from even the most sensational newspaper.

A TIME WORN SUIT.

A Russian paper notes the termination recently of a lawsuit begun in 1490, or four centuries ago. The litigation was over a forty-acre tract of uncultivated land, has been handed down through numberless generations, and curiously enough has been finally settled by peaceful arbitration. This protracted litigation, as well as the satisfactory manner of its termination, reminds us of the celebrated case described by Rabelais in which Pantagruel acted as umpire. This classic lawsuit had lasted many years between two French nobles. Innumerable law papers had been prepared on both sides, and all the courts had been gone through, with the result of utterly befogging and mystifying the claims of both parties. The umpire above-mentioned being appealed to agreed to decide the matter provided that all the papers and documents should first be burned up and the claimants then should plead their own cause personally before him. As, owing to the lapse of time, they had both forgotten altogether what was the origin of the controversy, their respective arguments were made up of blind and incoherent repetitions of such of the legal jargon as they could recollect from reading the documents drawn up by their lawyers. Therefore, Pantagruel gave his decree in language equally unintelligible as the pleaders' statements. Both parties were fully content with the incomprehensible sentence he passed, neither of them seeing anything in it to make him think he had lost his cause. When this satire of Rabelais was published, somewhere about 1534, the Russian law suit had already been progressing over fifty years.

THE IDEAL BEEF INSPECTION.

At the concluding session of the American Public Health Association, held in Brooklyn, October 24, a paper was read on "The necessity for a more rigorous inspection of meat-producing animals at the time of slaughter," by Dr. D. E. Salmon, Chief of the Bureau of Animal Industry at Washington, who maintained that, in order to protect the health of citizens, to maintain the reputation of American meats in foreign markets, and to discover communicable diseases before they spread beyond control, inspectors having greater professional skill than those employed at present should have control of the work, and a more thorough inspec-

tion should be exacted. The concentration of the slaughtering establishment at a few points, which is objected to by some interests—the speaker of course meaning thereby the Eastern retail butchers—affords the opportunity for the adoption of the ideal system of inspection, he thought. The inspector should not be content with a view of the live cattle, but should be present at the time of slaughter and examine the viscera of each animal. The large slaughterers favor a rigid inspection. "There was no reason," he said, "to think that diseases are more prevalent among animals in this country than abroad. According to the information in possession of the United States Government, the charge made by English authorities of the prevalence of pleuro-pneumonia in cattle shipped to Europe from our Western States and Territories is unfounded."

SILK FROM WOOD PULP.

DESCRIPTION OF THE FRENCH DISCOVERY OF CELLULOSE SILK.

Among the varied exhibits connected with the display of textile industries at the Paris Exposition, there is one which, from the unostentatious manner in which it is displayed, has hardly attracted the attention which it deserves. This is the process of M. de Chardonnet, of Lyons, for making artificial silk, which was mentioned by the *AMERICAN ANALYST* in the issue of October 10. In an out-of-the-way corner of the Palais des Machines may be seen a case filled with what appears to be an exhibit of fine silk dress goods, while within the same railing is a wrought iron tank and a stand containing some curious looking apparatus, from which four tubes of glass project. Above these are four reels steadily revolving and reeling off fine silky like fibers, which come from the glass tubes. The semblance to natural silk is very great, and the manufactured goods in the case are undistinguishable from the product of the cocoon and loom. Yet, before the observer is the apparently endless thread running from what appears to be a glass tube filled with a clear transparent liquid. As a matter of fact this little exhibit is producing artificial silk made from a cellulose produced from wood pulp, and while the details of the operation are not entirely given to the public, a close observation revealed enough to show the line upon which M. Chardonnet is working. The fiber is really produced from a sort of collodion, not greatly different from that employed in photography and surgery. Collodion as used in the arts is generally made from gun cotton, or pyroxylin, dissolved in a mixture of ether and alcohol, and is remarkable for the ease with which a smooth, tough film may be produced by flowing it over a smooth surface, such as glass, where it soon sets and may be used as a base for a sensitive silver solution, as in photography, or may be stripped and used for any desired purpose. The nature of a collodion depends very largely upon the proportions of ether and alcohol in which the pyroxylin is dissolved, and an excess of ether renders the film very tough and strong, although the quick evaporation of the ether makes such a collodion very rapid in setting. M. de Chardonnet has taken advantage of this property and devised his process and apparatus to form threads of collodion and use them as a substitute for silk. Instead of using gun cotton for the pyroxylin, he uses a nitrated cellulose prepared from wood pulp, but by a process which he has succeeded in keeping secret, this otherwise dangerous explosive is rendered entirely unflammable. This cellulonitrin is dissolved in ether and confined in a close tank, as exposure to the atmosphere would permit the rapid evaporation of the ether, and cause the solidification of the entire mass. It will be seen that thus far he has produced a substance very much like the gummy liquid in the glands of the silk worm before it begins to spin its cocoon. The prepared collodion is subjected in the tank to sufficient pressure to be capable of forcing the gummy liquid through the

fine capillary apertures which determine the fineness of the proposed threads. In order to prevent the gumming up of these minute openings, which are made by drawing glass tubes out to very fine apertures, the openings deliver the threads into larger tubes filled with water, and as this is the only part of the operation which is visible to the spectator the rest of the process is not very evident. After the threads emerge from the water they pass through a space of about two or three feet before reaching the reel, thus giving ample opportunity for the evaporation of the ether and the setting of the silky thread of collodion. The artificial silk threads thus formed possess a brilliant silky luster, are exceedingly tough and elastic and appear in every way to be suitable to take the place of natural silk. Indeed, in some respects the artificial silk possesses superiority over the natural article, particularly in the matter of uniformity. Silk from the cocoon, as is well known, is very unequal in thickness, being thickest in its middle portion and tapering off toward each extremity. This variation is so great that the diameter of the fibre varies from $\frac{1}{1000}$ to $\frac{7}{100}$ of an inch in thickness at various portions of its length. The natural fiber is also not round, but somewhat flattened in cross section. The artificial silk is perfectly uniform in thickness, being produced continuously through a constant opening, and is also perfectly round, its section being determined by the shape of the aperture. The solution from which the silk is prepared may be colored with aniline, and in the apparatus at the Paris Exposition the different reels are winding different colored silks. The product requires no further treatment after reeling to distinguish it from natural silk, and as an evidence of its similarity it can be interwoven with silk from the cocoon without difficulty. The process as above described is the result of much careful experimenting, and has been developed in the midst of the silk industry of Lyons by those who have become familiar with all the requirements of the trade. The future of the process must depend wholly upon commercial considerations, for the perfection of the product and the practicability of the process seem to be assured. The use of the artificial silk as an insulating material for electrical conductors has been suggested, and it appears to be particularly fitted for this use. While no definite figures about the cost of the process can as yet be obtained, it is evident that upon a commercial scale it can be greatly reduced over the expense which must attend a small apparatus such as is exhibited at Paris, but even with this small plant the simplicity of the apparatus and the rate of production show the economy of the process.

CALIFORNIA INDUSTRIES.

THE REMARKABLE PRODUCING CAPACITIES OF THE GOLDEN STATE.

(Continued.)

In speaking of the industries of California, it can hardly be expected that justice can be done if the whole State is taken in consideration at once. California is as large as all the New England States, New York and Ohio combined. Let us therefore take the southern seven counties, San Diego, Los Angeles, San Bernardino, Ventura, Santa Barbara, San Luis Obispo and Kern. These cover an area of 56,576 square miles, a territory larger than the state of Iowa and containing over ten thousand square miles more than either of the states of New York or Pennsylvania. These seven counties unquestionably possess greater diversity of soil and climate than any other portion of the United States. This section shows a magnificent array of productions: Wheat, barley, corn, oats, potatoes, and all other farm produce yield more to the acre here than any other part of the country. The fruits from the apple and pear of the temperate zone to the orange of the tropics are equally at home. Honey is abundant and cheap. Walnuts yield enormously. Wines and brandies to the ex-

tent of nearly five millions of gallons per annum are manufactured here. Rasins equal to the best Dehesas are grown, the annual product reaching 400,000 boxes. Petroleum yields \$1,000,000 annually. The mineral deposits are enormous, and with the exception of silver, scarcely to be reckoned. The shipment of oranges from these counties aggregated 1,400 carloads last season, and will reach over 2,000 carloads the coming season. The following are the fruit trees which are cultivated: Lemon, orange, olive, apple, pear, peach, quince, fig, prune, plum, cherry, apricot, nectarine. The little city of Riverside alone shipped this year about one million dollars' worth of oranges, raisins, and apricots. The mineral productions of these counties are alabaster, asbestos, asphaltum, bituminous rock, borax, cement (pozzolana stone), chalk, coal (bituminous), copper, cinnabar, fire clay, fire sand, gas (natural), gold, granite, graphite, gypsum, iron, limestone, lithographic stone, lead, marble, mica, nickel, onyx, petroleum, potash, potters' clay, rock soap, soapstone, soda, salt (rock), silver, sandstone, sulphur, tin, talc, hydraulic lime. The wheat crop of Los Angeles county for this season is estimated at two million bushels, and the barley crop the same. Hay yielded fifty thousand tons. One of the important crops in this section is alfalfa, a species of clover similar to the sweet clover of the East but superior in prolific growth and nutriment. It has been estimated that weight for weight alfalfa contains as much nutriment as the best English hay. Among the other farm products are potatoes, beets, pumpkins, squashes and watermelons all yielding largely. Beans of all kinds flourish. Cabbages, cauliflower, asparagus, celery, onions, sweet potatoes, carrots, radishes, lettuce, turnips, cucumbers, tomatoes and every other kind of "garden truck" can be raised all the year round. It is upon these the canning factories depend. The finest horses, cattle, sheep, and hogs are raised here, and two large hog packing houses are already in full swing. The dairy interest is yet in its infancy, there being as yet, but two or three creameries in Los Angeles county. Of the small fruits, strawberries, blackberries, raspberries, currants and gooseberries grow nearly the year round. Ostrich farming with a present stock of about 360 ostriches, is constantly increasing. The ostrich product aggregated in value in 1888, \$20,000, a remarkable showing for an industry only five years old. Such is the wealth in produce of Southern California,

(To be continued.)

THE AMERICAS.

COMPARATIVE AREA OF THE CENTRAL AND SOUTH AMERICAN COUNTRIES.

The presence in the United States of the delegates to the Pan-American Congress suggests the reflection that Central and South America embrace an area a little greater than twice the extent of country in the United States and Territories, and a population of about fifty millions, or about one-sixth smaller than the population of the Republic. Mexico covers an area just about equal to that part of the United States east of the Mississippi River, exclusive of the States of Louisiana and Mississippi, and has 10,000,000 inhabitants. The five Central American Republics of Costa Rica, Guatemala, Honduras, Nicaragua and Salvador cover an extent of country about the size of the five States of New York, Pennsylvania, Ohio, Michigan and Illinois, and have a population equal to both New York and Indiana. Brazil's area is somewhat greater than that of the United States, exclusive of Alaska, and her population is about that of New York, Pennsylvania and Ohio. The Argentine Republic, with about half the area of the United States, has a population not quite as large as Pennsylvania. Colombia is nearly equal in extent to New York, Pennsylvania, Ohio, Indiana, Illinois, Michigan and Wisconsin, with a population probably a little less than that of New York State. Bolivia's territory

is somewhat greater than that of the Atlantic States, Pennsylvania, Ohio and Michigan, and has a population about Indiana's figure. Peru is a little larger than the Atlantic States and Pennsylvania, and her population is about that of Illinois. Venezuela is larger than Peru by about as much territory as is embraced in New Jersey, and her population is about equal to Indiana's. Ecuador could contain Ohio, New York, Pennsylvania, Michigan and Illinois, but her population is not quite up to that of Michigan alone. Chili's domain cut up would make States as extensive as Ohio, Pennsylvania and Indiana. Her population is somewhat greater than that of Indiana. Paraguay is big enough to include Ohio and New York within her borders, but her entire population scarcely exceeds that of Cleveland. Uruguay is not quite as large as Ohio and Indiana combined, and has just about the same number of inhabitants as Brooklyn, N. Y. The Guianas are English, French and Dutch colonies. British Guiana, twice as large as Ohio, has just about the population of Cleveland. French Guiana, somewhat larger than Ohio, has about as many inhabitants as Toledo. Dutch Guiana, nearly as large as Pennsylvania, has no more inhabitants than Columbus.

THE DEADLY CIGARETTE.

CIGARETTES DETHRONED HIS REASON.

"God is talking to me," was the exclamation of John Barry, when questioned as to his queer actions by his mother October 26, at their home in East Broadway. John is the twenty-year-old son of Policeman Patrick J. Barry, of the Leonard Street Station. He is a victim of cigarette smoking, having used of late from four to six packages a day, and the doctors say that his reason has been dethroned. He was taken to the insane ward at Bellevue Hospital.

MORPHINE ANTIDOTE.—Professor Bokai (London *Lancet*) believes that the best antidote for morphine is picrotoxin. The two substances act in an opposite manner on the respiratory centre—morphine paralyzing its action, while small doses of picrotoxin increase it. As in poisoning by morphine, death occurs from paralysis of the respiratory centre, and as picrotoxin hinders this paralysis, it follows that picrotoxin is likely to be of real use in morphine poisoning. Professor Bokai also believes that picrotoxin will be found of value in preventing fatal effects from asphyxia from too free administration of chloroform.

RUSSIAN PETROLEUM.—Vice-Consul Wopalenski has this to say about Russian petroleum: "About 300,000 cases of Russian petroleum from Batoum are expected—a quantity which will doubtless greatly influence the Java petroleum market, inasmuch as the monthly consumption of the whole island only amounts to about 160,000 cases. The contents of the case of both American and Russian petroleum is the same—two tins of ten gallons. Some of the above Russian petroleum has already been sold on delivery to retailers at 40 Java cents (about 16 American cents) per case cheaper than the price at which American petroleum, imported in sailing vessels, can be bought. The rate to consumers will be 8 cents a case less than American petroleum."

AN INGENUOUS IDEA.—An ingenious machine for writing and delivering messages to persons at railway stations, or in clubs and other public buildings, has been introduced into London. The apparatus consists of a desk at which to write the message, and a cabinet to contain the messages left in charge. In order to write a message, a penny is dropped into a slit of the desk, thus releasing a locked handle, which on being pulled out, discloses a paper on the desk. The message is written on this by a pencil provided, and the initials of the sender or other sign are written on a second slip of paper always exposed to view. On turning the handle back the message disappears into the cabinet above. The person who expects the message, on examining the machine, sees the initials or sign of the sender, and on dropping a penny into a slit in the cabinet is enabled to read through a window by turning a handle. The machine, while in working order, does not forget to reveal its secrets.

CALIFORNIA WINES MADE IN NEW YORK.

A RE-EXPOSURE OF A TWO-YEAR-OLD EXPOSE.

More than two years ago the *AMERICAN ANALYST* took occasion to expose the dishonest practices of P. Lenk & Co., an alleged California wine house doing business in this city. It was shown that this concern bought pomace, the remnants of grapes from which the juice had been expressed, and manufactured from it mixed with other cheap and frequently deleterious materials a "California wine," which of course could be sold at a price far below the genuine article. Shortly afterwards that concern failed and made an assignment which was set aside by the courts and the entire stock in trade of the bogus wine makers was sold out at sheriff's sale in June, 1888. At the sale all of these bogus wines were sold, bringing from one cent to twelve cents per gallon. Among the whole lot there were not one hundred gallons of any really pure wines and those that had not been made by the firm had been bought for the purpose of making the bogus article. Naturally it became a question who would buy such stuff and what honest mercantile purpose it could be used for. Some of the purchasers at the auction were shrewd enough not to give their real names as it was not necessary, but others did. As some of these men claim to deal only in pure California wines and talk loudly of the purity and honesty of their goods, it might puzzle them to explain why they purchased such stuff as they knew they were getting here. Every barrel was sampled and the samples were submitted to the purchasers in attendance. Either they purchased these fraudulent wines knowingly, in which case it may be asked: What reliance can be placed upon their guarantees of purity, or, what is very unlikely, they bought ignorantly, and then, of course, no one can trust their judgment. Among the purchasers of stock and materials at this Lenk sale were L. Siegel, who is put down in the directory as a dealer in champagnes, N. Gutmann & Co., of 311 Third Avenue, Henry Herrman, 1451 First Avenue, H. Sicher, 521 6th Street, D. Rich & Co., 33 Park Place, Spellman, Marshall & Co., Brooklyn Bridge, Schuchoff, Haehnlein, R. Fischer, B. M. Stern, Sohn Bros., B. Dreyfuss & Co., and A. Dreyfuss & Co. All of these are well-known wine dealers and some have a large sale for their goods which are offered even in the retail market under various fanciful names of California wine companies. The Lenk sale consisted of about 85,000 gallons of this miserable stuff. And when we add that less than \$5,000 was realized for it including numerous fixtures and a large plant of tubs and barrels, it can be judged what it was. All of this we reported it the time when it was new, yet to our surprise the generally wide-awake *Metropolis* publishes it as a new sensation in its issue of October 7. Brother McLaughlin, have the Dutch taken Holland yet? However the information is worth remembering as an illustration of why the California wine market is so dull.

PURE WATER.

GENERAL INADEQUACY OF ORDINARY FILTERING OF DRINKING WATER.

Pure drinking water, says *Medical Classics*, is one of the essentials of healthy existence. The reasons for this proposition multiply with every advance of our knowledge of health, of disease, and of morbid agents. Our recent knowledge of germs has given a new impetus to the study of drinking water. In many communities water is filtered because of its cloudy appearance, in others to get rid of some supposed unhealthful ingredients. The efficiency of ordinary filters has been frequently questioned, and as employed it remains an open question whether, on the whole, they do more good or harm. Dr. Charles T. Curries gives us the results of some extended studies of water, bacterio-

logically. As this bears upon the value of filters, we quote his results. Boiling sterilized water within thirty minutes kills harmful bacteria. No chemical agents sterilize water when used in amounts that are safe. The process of distilling water destroys all germs. Ordinary filters, even if satisfactory as strainers, fail to remove all bacteria from drinking water. It may, indeed, allow a more rapid multiplication of the micro-organisms in the filtering material itself. The finer the substance through which the water passes, and the lower the pressure, the more perfect is the action of the filter in holding back bacteria. Porous rebaked porcelain, carefully selected, is the best of all substances for domestic filters. If thick and strong enough to allow the use of a large surface, and the substance remains perfect, this may yield a fair flow of clear water free from all bacteria. To insure the permanency of this action, the filter should be occasionally sterilized throughout by steaming or other means. Where filtering is really necessary, it is, in general, best for the community that it be done carefully, on a large scale, through sand beds, upon which a fine layer of organic and inorganic matter is expressly produced by sedimentation, because of the valuable action of the latter in holding back the great majority of bacteria. A bad water filter is less desirable than pure water in its natural state. When, therefore, filtration is employed because of real danger of infection, the filtered water should, as a rule, be boiled, as the entire absence of sediment and cloudiness does not insure that the bacteria of disease have not made their way through the filter. The habitual drinking of boiled water would insure escape from sickness and death to thousands of the human race yearly.

CORRESPONDENCE.

AN IMPENDING ISSUE.

NEW YORK, October 16, 1889.

Editors AMERICAN ANALYST: As a constant and admiring reader of your weekly analysis of everything pertaining to man's physical needs and comfort, I desire to call your attention to a matter which, in my opinion, is one of the most important of man's needs—our schools. The Roman Catholic parochial schools in New York city, heretofore unable to obtain a share of the public schools funds, have taken a step of great importance by which they evidently think they can get hold of the school funds. All the parochial schools have replaced their teachers by graduates of the Normal College, and have adopted the public school curriculum—teaching their religious instruction afterwards. Most of the Catholic children have been withdrawn from public schools and put in the parochial schools, over six hundred having been taken from one school. What can this step mean but an insidious attack on our public school system?

TAXPAYER.

The question raised by our correspondent relates to a subject that, in our opinion, bids fair to become at no distant date one of the leading problems in our national politics. Its ultimate peaceful solution, if present signs do not fail, will depend upon a radical change of sentiment on the part of the element which, in the existing phase of the controversy, occupies the aggressive attitude—and of such change occurring there is unhappily no visible prospect or immediate probability. The argument of that side is simply this: the Catholics will not have the public schools; therefore the State must allow them their own educational system; and the day must come when the parochial school shall draw its support entirely from the State. This direct challenge we have seen stated in about the words we have used by the Roman Catholic organs in the explicit and uncompromising form known in logic as "the excluded middle." "The public must support our religious institutions," they say, "or we will make it do so." If that is not their meaning, then we fail to understand their language or conduct. The unreason of the thing is that, when the great majority of the public express their objection

to the State granting support to Catholic schools, as such, the minority set up the cry of "sectarianism." The patriotic and large-minded priest, Father McGlynn, paved the way to suspension from the priesthood by his earnest opposition to the efforts of his co-religionists to fasten their clutches on our school fund. The facts mentioned by our correspondent indicate clearly the subtle movement to that end that is constantly in operation, but which can never succeed—though possibly it may necessitate a severe rebuke of some kind to definitely end it.

CHAMPAGNE.

THE IMAGINATIVE FRENCH WINE AGENT AND THE UNSOPHISTICATED REPORTER.

One of the young men of the New York *Sun* has again fallen under the mystifying influences of a *great champagne importer*, as he styles him. He was evidently filled up in about equal proportions with champagne and ghost stories, the latter being retailed to his readers as gospel truths. According to this sapient youth, whose vaporings unfortunately escaped the proverbial office cat, the best condition for intellectual enjoyment is to be in the most receptive mood and calmest temper. No doubt he was receptive enough for the champagne, and his temper must have been considerably calmed, otherwise he could not have been so egregiously sold. The only thing the office cat seems to have gotten hold of was the name of this importer's favorite brand, which was chewed down to the generic description, a particular kind. Thus failed the direct advertising scheme of the aforesaid importer, which was probably the main object of ordering brut. The rest of the interview consists only in a stupid attack on every American wine, considerable falsehood about the character and quality of French wines, a tooting of trumpets about French wine makers' honesty, and a lot of rubbish equal to any of the absurdities with which Mr. Mumm, another alleged champagne maker, loaded up a *World* reporter. One of the statements made was: "There is not a quart of American product in the French clarets, cognacs, champagnes or burgundies that are imported in this country." If that is true, what becomes of the thousands of gallons of California wine, brandy and western high wines annually exported to Europe? "The trouble with American wine is that the land is too new," he said. This is richness, indeed. When we find nearly two-thirds of the vintage of France derived from American vines because of their ability to resist phylloxera, and when we well know that in California the best vines grow on lands that are absolutely so poor that they are useless for any other purpose and do not even grow weeds, it is simply ridiculous to read this prating about the land being too new. This sounds very much like the arrant nonsense another alleged French wine maker unloaded upon the verdant youth connected with another paper when he told him that the cuvet of all champagnes was a delicious and very high-priced still wine. As everybody knows, the cuvet from which champagne is made is disdainfully refused by French peasants when offered to them as a *vin ordinaire*. The only surprise is that these French champagne importers do not try to make newspaper men believe that the Spitzbergen apple flavor of one brand and the Jargonelle ether flavor of another, with the cognac and rock candy of all, are the results of a skillful fertilizing of the vine hills with Spitzbergen apples, Jargonelle pears, brandy or rock candy. Successful champagne making depends upon skillful blending and flavoring, while the popularity in selling largely depends upon the amount of money spent by the drummers. If this were not so, we would not find hundreds of champagne makers, whose brand is not known, selling their products in bottles to other and better known champagne makers to have their corks and labels put on a wine of which they know absolutely nothing but what tasting

can teach them. French champagnes are truly a prolific source of humbugging a gullible public. Any good, well made and natural American champagne, if it bore a popular French label, would be drunk without suspicion.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

November.

MEAT.—Beef, mutton, pork, venison.

POULTRY AND GAME.—Chicken, duck, geese, grouse, hare, partridge, pheasant, pigeons, rabbits, turkeys, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, whiting, salmon, trout, perch, smelts, oysters.

VEGETABLES.—Artichokes, broccoli, celery, potatoes, turnips, cauliflower, cabbage, carrots.

FRUIT.—Apples, pears, quinces, grapes, nuts.

PRACTICAL RECIPES.

BOILED BLUEFISH.—Make a rich dressing of rolled crackers well seasoned with pepper, salt, butter and sage. Stuff the fish and wrap it in a well-floured cloth, tie loosely or sew it up. Salt the water it is to be boiled in, put in the fish and place it where it will cook gently, allowing eight or nine minutes per pound.

SPICED TONGUE.—Make a mixture of half a pound of sugar, one tablespoonful of ground cloves, and a small bit of saltpeter, rub this well into a beef tongue. Make a brine of two quarts of water and three-quarter pound of salt, put the tongue in, being careful that it is entirely covered and let it lie for two weeks, then take it out and wash it well and dry with a cloth; roll out a thin paste of flour and water, wrap the tongue in it and put it in a pan to bake; bake slowly, basting well with lard and water; when done remove paste and skin and serve.

CAPER BUTTER.—Rub a tablespoonful of capers, finely chopped, through a sieve, with a wooden spoon; add one-fourth saltspoonful of pepper and one ounce of cold butter, one saltspoonful of salt. Put a layer of this under the fish to be served.

DELICATE CAKE.—Two cupfuls of sugar, three of flour, three-fourths of sweet milk, one half butter, and whites of six eggs; one and a half teaspoonfuls of Hoxford's baking powder, flavored with the grated rind of a fresh lemon; beat all the ingredients well and add the whites of the eggs the last thing.

SPONGE BREAD.—Boil six potatoes and mash them while hot; put to them two tablespoonfuls of butter and two of white sugar, and one quart tepid water; add three cupfuls of flour and after beating smooth add six tablespoonfuls of yeast, let it rise over night; in the morning knead in enough flour to make a spongy but stiff dough, knead for about fifteen minutes and then put to rise; when light knead for ten minutes, mold into loaves and when they have risen like sponge cakes, bake.

SAUCES FOR ROAST TURKEY OR FOWL.—1. Boil some veal gravy, pepper, salt, the juice of one Seville orange and one lemon, pour into a dish or boat.

2. Put a small piece of butter into a stewpan with some chopped parsley, one very small onion, thyme, mushrooms, and a few spoonfuls of gravy or brown stock. After slowly simmering them for almost a quarter of an hour, add a sufficient quantity of flour to imbibes all the butter, and continue stirring a few minutes over the fire. Then put to it a pint of stock; stir it well till it has boiled a little together; and taking it off the fire squeeze in some lemon juice and add a teaspoon-

ful of sifted sugar and a small quantity of pepper and salt to give it a more piquant flavor.

3. Egg sauce is made thus: Chop two hard-boiled eggs until quite fine, and put them into thin melted butter.

4. Put some grated breadcrumbs into a saucepan, and pour over them a little of the liquor in which mutton or fowls was boiled. When it has soaked, simmer with one small whole onion, white peppercorns, and a small piece of mace. When done, take out the onion, mace, and peppercorns, and add melted butter.

5. Stew two ounces of rice in milk, with one onion, white peppercorns, and a little sauce. When ready for use, take out the peppercorns and onion and rub through a colander. Heat this up with more milk and flavor it to taste.

FASHIONABLE TEA.

HOW THE 400 ARE SUPPOSED TO PREPARE THE
GENIAL CUP.

A pretty device for making tea Chinese fashion at the home table and at afternoon teas, and for serving delicate refreshment to callers, consists of a hollow ball of gold or silver about the size of a walnut, suspended from a finger ring by a slender chain four or five inches long. The ball divides in the middle, and the halves are hinged. It is perforated with innumerable holes. Sometimes it is made of gold or silver wire gauze. The hostess uses it in this wise: She opens the hollow ball, fills the halves with dry tea leaves, and clasps it shut. She then slips the ring from which it is suspended upon one of the fingers of the right hand. Filling a teacup with hot water, she lets the ball hang in the cup, and moves it back and forth and up and down until the water is colored to the desired strength. The strength of the tea, of course, depends upon the length of time the ball is dawdled in the cup. The little ceremony is much pleasanter to the eye than the old way of pouring out tea, especially if the hostess be graceful and have a prettily modelled hand and wrist. Moreover, it produces an immeasurably finer cup of tea than can be had by any other method. At afternoon teas the hostess sits upon her divan, with the trinket suspended from her finger, and makes the tea at a table by her side. The tea ball, as it is called, is moreover an encouragement to the custom, borrowed with it from the Chinese, of serving tea to callers—an adjunct to entertaining methods which is rapidly becoming popular. Hot water, of course, is always at hand, and this easy and graceful way of making the tea in the guest's presence forbids the suspicion that the hostess is putting herself to inconvenience in providing it. Besides being refreshing, the tea conduces to ease and sociability.

SAUCEPANS.

THE USE OF COPPER ONE SECRET OF THE FRENCH
COOK'S SUCCESS.

A Paris correspondent of the London *Truth* says: "English friends often ask me how it is that one gets in the humblest places in France appetizing and varied food and nice made dishes. My answer is: 'The French always cook in copper.' All meat, from veal to game, that is used in a made dish is first fried in butter, which can only be done properly in a copper vessel, because its heat is evenly diffused, and it does not grow rapidly very hot or cold. Butter melted in an iron vessel, even though it have a porcelain lining, soon blackens. Potatoes fried in butter in a copper saucepan take a beautiful golden tinge. In an iron one they get black. That glory of the French *cordon bleu*, 'canard aux navets,' would stick to the bottom of any but a copper stewpan, and get burned if not constantly stirred. Now, frequent stirring involves a loss of aroma. What

I have said of duck stewed in turnips applies to 'bœuf à la mode,' or 'poulet à la Marengo,' or shoulder of mutton braisé, or 'gibelotte de lapin.' When new to France, I set myself up with a *batterie de cuisine*, bought in Belgium. It was of iron, enameled, with blue without and with white within. Having one day invited a dozen or so friends to dinner, I secured the services of a chef. I shall never forget how, on being taken into the kitchen, he folded his arms and eyed the utensils with which he was to operate. 'You want, seriously,' he said, 'to lay before your guests a dinner which they will eat with pleasure?' 'Of course.' 'Well, as it is impossible to work with that *batterie de cuisine*, and it is too late to get another, I beg leave to go away. However, there is still time to order your dinner of Chevet or Potil and Chabot, if you make haste about it. The vessels you have are only fit to scald vegetables. *Et encore!*' In England there is an exaggerated fear of verdigris, which, however sickening, is really never fatal in its effects. But as the prejudice is strong, it might be well for manufacturers to guarantee absolute safety by using nickel instead of tin for lining. Nickel hardly ever wears out, and is easy to keep clean."

THE DIAMOND.

SPECULATIONS OF SCIENTISTS AS TO ITS PROBABLE
ORIGIN.

The origin of the diamond has been a fruitful topic for speculation among scientists; hence many contradictory theories have been advanced and argued with some show of reason; but after all that has been said and written upon the subject, we are still left pretty much in the dark. Theories answer a good purpose, since they often lead the way to truth. But this is not all; they illustrate the ingenuity in the human mind in seeking to account for the methods Nature takes for the accomplishment of her secret operations. Some of these theories about the origin of the diamond are very ingenious and interesting, though the amount of truth they embody remains to be proved. It has been suggested that the vapors of carbon during the coal period may have been condensed and crystallized into the diamond; and again, the itacolumite, generally regarded as the matrix, was saturated with petroleum, which, collecting in nodules, formed the gem by gradual crystallization. Newton believed it to have been a coagulated, unctuous substance, of vegetable origin, and was sustained in the theory by many eminent philosophers, including Sir David Brewster, who believed the diamond was once a mass of gum, derived from certain species of wood, and that it subsequently assumed a crystalline form. Dana and others advance the opinion that it may have been produced by the slow decomposition of vegetable material, and even from animal matter. Burton says it is younger than gold, and suggests the possibility that it may still be in process of formation, with capacity of growth. Specimens of the diamond have been found to inclose particles of gold—an evidence, he thinks, that its formation was more recent than that of the precious metal. The theory that the diamond was formed immediately from carbon by the action of heat is opposed by another, maintaining that it could not have been produced in this way, otherwise would have been consumed. But the advocates of this view were not quite on their guard against a surprise, for some quick-witted opponent has found by experiments that the diamond will sustain great heat without combustion.

WATER GAS ECONOMY.—Recent foreign experiments at Witkowitz, Austria, show that a furnace run with water gas requires only 58 per cent. of the heat which is needed for a furnace fired in the usual way.

A HEAVY STRAIN.—"I'm in the oil business," he explained. "I sometimes handle as much as ten thousand barrels of crude in a single day." "Is it possible!" she responded. Ten thousand? It must make you very tired."—*Harper's Bazar*.

A SENSIBLE MEASURE.

A PROPOSED LAW TO FIX THE RESPONSIBILITY FOR
FOOD ADULTERATION.

During the last session of the New Jersey Legislature a bill to provide for the protection of retail merchants in cases of prosecution for the sale of adulterated food, where said food is purchased with honest intent, was introduced in the Senate and passed that body, but the Assembly failed to act upon it. At the recent meeting of the Committee on Legislation of the State Association it was decided to introduce the bill at the opening of the next legislature. This measure, which we reprint from the *New Jersey Trade Review*, affords adequate protection to the retail trade, provided they take care to purchase only on a warranty of the purity of the goods. The following is the text:

AN ACT

TO PROVIDE FOR PROTECTION BY WARRANTY IN CERTAIN
CASES.

1. BE IT ENACTED, by the Senate and General Assembly of the State of New Jersey, That any person accused, before any court, of selling or offering for sale any article adulterated within the meaning of an act entitled "An act to prevent the adulteration of food or drugs," approved March 25, 1881, and the supplement thereto, or an act entitled "An act to prevent the adulteration and to regulate the sale of milk," March 24, 1882, and the supplements thereto, who shall prove that he procured such article under a warranty, in the form hereinafter set forth, that said article was pure and unadulterated within the meaning of said acts, said person shall be discharged from prosecution; provided that such proof in defence shall be filed in court prior to the trial of such case and a copy thereof left with the attorney for the prosecution of the case.

2. And be it enacted, That no warrants shall be considered as within the meaning of this act unless in the form hereinafter given, and unless the article or articles warranted shall be specifically named and described in the body of said warranty; and no warranty shall be a defence if the said person offering it shall have been notified prior to the sale complained of that the articles mentioned in said warranty, are adulterated within the meaning of said acts.

3. And be it enacted, That any person uttering or giving a false warranty or swearing falsely in relation thereto shall be guilty of a misdemeanor, and on conviction thereof shall be punished by a fine of not more than five hundred dollars or imprisonment at hard labor for not more than one year, at the discretion of the court.

4. And be it enacted, That the warranty herein provided for shall be in the following form, to wit:

WARRANTY.

It is hereby warranted that the following described article or articles ——— are pure and unadulterated within the meaning of the acts of the Legislature of the State of New Jersey, regulating the sale of food, milk or drugs.

Signature ———.

Dated at ———, this ——— day of ———, A. D. ———.

5. And be it enacted, That this act shall take effect immediately.

EXOTIC FRUITS.

INTRODUCING INTO THE UNITED STATES THE FAVORITE
FRUITS OF FOREIGN LANDS.

The United States government is making earnest efforts just at present to introduce new and improved fruits from tropical lands into the United States, and messages are being sent from the Agricultural Department to the farthest corners of the earth, requesting small consignments of seeds and plants, such as are likely to make luscious additions to Uncle Sam's orchards and plantations. About the middle of October, the first importation of named varieties of cocoanuts ever received in this country reached Washington from the Philippine Islands; five distinct kinds the consul at Manila sent with their proper designations attached, and fourteen more kinds unclassified. They were sent at once to Lake Worth, Fla., for planting and cultivation. From Turkestan and Bokhara, too, seeds are shortly expected of certain superb varieties of peaches that

shall be proof against that destructive disease of the fruit in this country, the "yellows." Grafted trees have been ordered, also, of the famous mangosteen, from Southern China—the finest of all tropical fruits, as the people in south Asia think. Though grown in India it has never been brought hither, nor even to England, owing to its perishable quality, though frequent efforts have been made to convey specimens to the queen. It is of medium size, roundish and of most delicious sweet flavor. It has a delicate yellowish pulp. Southern China is also being drawn upon for grafted trees of the mango, and a new Japanese fruit called the "myrica rubra," small and shaped like an olive, has just arrived. Six varieties of the banana, from the Philippine Islands, should not be forgotten, and most important of all is the persimmon, desirable samples of which are to be brought from Japan and particularly hardy ones from Korea, such as may be able to stand the climate far north on this continent. Nearly all these fruits are strictly tropical, and so they will be sent, or have been sent already, to Lake Worth, which is so far south in Florida that frost never touches it, there to be propagated from, so that it may be discovered how profitable it will be to cultivate them on American soil. There are more queer fruits already grown in this country, than are probably dreamed of. For instance, there is the pomegranate, which grows on a bush and is semi-tropical. In ancient days it seems to have been much prized, but nobody cares for it nowadays, though it grows abundantly in California and the Gulf States. The date bears well in Southern California, Arizona and New Mexico, and it is only a question of time when its cultivation will become a great industry in this country. The tree is a very beautiful one, with bluish-green leaves, all growing from a single stem, with a central bud at the point of the leaves' outspringing, where hang great clusters of the yellow dates, as sweet as honey to the taste. The date needs very peculiar conditions for its growth. The soil must be rich and very moist about the roots of the tree, while the air must be exceedingly dry. Of course, then, it is easily cultivated in any dry climate where water can be supplied to the roots by irrigation. The fig, like the date is semi-tropical, extending up to the Carolinas and running around the Gulf coast, where it is largely grown to California. The raising of this fruit is becoming an extensive industry in California, where the best authorities think its cultivation has a gigantic commercial future. It grows there no better than on the Gulf, but in the latter region there is not the climate necessary for natural drying, and artificial drying in evaporators is costly. Among strictly tropical fruits, which technically include all those that will not stand a touch of frost, are, to begin with, the coconut which is largely grown in southern Florida. There are already five thousand trees in bearing at Lake Worth alone, and orchards are found from Jupiter Inlet down to Key West, and up the west coast as far as the Caloosahatchie. The guava is extensively grown in Florida, in the Indian River region and on the west coast, particularly in the neighborhood of Tampa and Manatee. It is a soft little fruit, too perishable to reach Northern markets, save in the shape of jelly and marmalade. The tamarind is found nowhere in the United States, except at Lake Worth. It resembles a small greenish bean, curled up, and grows upon a very ornamental tree with pinnated foliage.

AMBERGRIS AND AMBER.

THEIR NATURE, ORIGIN, AND COMMERCIAL USE.

Ambergris, which is used as a basis for nearly all standard perfumery, was first found an unattractive mass floating on the surface of the sea or lodged upon the shore. How so unlikely a substance ever suggested itself as a perfume is unknown, but it has been in use for centuries, and it is only in comparatively recent times that its origin has become known. It is nothing

more than the morbid secretion of the liver of a sick spermaceti whale. It is described as a fatty, waxy substance, disagreeable to sight or touch, but even in its crude state exhaling a pleasant odor. The crude substance is subjected to chemical action to extract the active principle, called amberine. It was recently reported that a Maine fisherman picked up a mass of the substance which nearly filled a barrel, and is worth \$25,000. This is probably an exaggeration both as to size and price, for the largest piece on record was found on the Windward Islands, weighing 130 lbs. This was sold for about \$2,600. Amber was also first found on the shores of the sea after severe storms. For a time its origin was unknown, but it was early put to use and regarded with a superstitious awe by the ancient Greeks and Romans, its peculiar electrical qualities being noted by them. It is now thought to be the gum of forest trees which perished ages and ages ago, the lands upon which they flourished having become the ocean's bed. Amber has no fixed value, the price being regulated wholly by size, quality and other considerations. Drops of amber in which are embedded insects of those ancient times command fancy prices, while the more common kinds are used for making a certain kind of varnish and even in medicine. The world's supply of the two, amber and ambergris, does not wholly depend on what may be accidentally found. Dredging for amber is now systematically carried on by regularly organized companies, and all spermaceti whales killed by whalers are subjected to a pretty thorough post-mortem examination, the find of ambergris in the monster's interior often being vastly more valuable than the oil extracted from his blubber overcoat.

A COMPREHENSIVE CYCLOPEDIA.

The seventeenth volume of Alden's *Manifold Cyclopaedia* extends from Gogo (a town and seaport of British India) to Haliography (a description of the sea), and compares favorably with its predecessors in its skillful editing, handy form, excellent typography and binding, and its remarkable economy in cost. The publisher formerly announced the work to be published "30 or more volumes;" now it is definitely promised to be completed in 40 volumes, and they are promised hereafter at the speed of at least one volume a month, which is very rapid for good work. While in magnitude the *Cyclopaedia* compares closely with Appleton's or Johnson's, and is considerably larger than the latest edition of Chambers's, it is vastly more comprehensive than either of them. Besides covering the usual ground of a universal Cyclopaedia, it includes also an unabridged dictionary of the English language, every important word to be found in Webster's or Worcester's, and not a few besides which have grown into the language since their latest revision. Considering this comprehensiveness and its editorial and mechanical excellence, its price is hardly less than marvelous, the first seventeen volumes in cloth binding being offered for \$8, or for \$11.40 in half morocco. This price is gradually advancing as the publication progresses, earlier patrons of the work being considered entitled to more favorable rates than those who come later.

FRANK SIDDAL'S SOAP.—This extensively advertised soap is one of several hundred similar soaps manufactured throughout the country, and generally known as cold-process soaps. They are neither good nor economical. It is an improvement on the old-fashioned boiled soaps only in that it is very much cheaper. They are very nearly all alike in their component parts. Tallow, coconut oil, caustic soda, silicate of soda (a cheapener), and so-called mineral soap stock. This latter is only the residue of coal oil stills and is very cheap, giving the soap a soft, smooth appearance. Very little machinery is necessary in making such soap; it does not shrink and costs only about five cents per pound for material, labor and all. The most costly part of Frank Siddal's business is his advertising.

A Tonic

Horsford's Acid Phosphate.

A most excellent and agreeable tonic and appetizer. It nourishes and invigorates the tired brain and body, imparts renewed energy and vitality, and enlivens the functions.

Dr. H. K. Clarke, Geneva, N. Y., says:

"It has proved of great value for its tonic and revivifying influence."

Dr. J. H. Stedman, West Brattleboro, Vt., says:

"Best nerve tonic I ever used."

DESCRIPTIVE PAMPHLET FREE.

RUMFORD CHEMICAL WORKS,

PROVIDENCE, R. I.

Beware of Substitutes and Imitations.

CAUTION.—Be sure the word "Horsford's" is PRINTED on the label. All others are spurious. Never sold in bulk.

CHICAGO: C. JEVNE & CO., 110 Madison St.
ST. PAUL: C. JEVNE & CO., 114 E. Third St.

RECOGNIZED THE NOTES.—Pat (in gaping wonder at the letters on a Hebrew butcher's sign): Here, Mike, 'tis yerself has the foine l'arnin'. Can yez rade that now? Mike: I cannot; but if I had me flute here I belave I cud play it.

UTILIZING SEWAGE.—The whole of the sewage of Paris will soon be used for the purpose of market gardening. Gennevillier now absorbs and purifies a third of the Paris sewage water. Achires and Mery will soon utilize the rest.

HE DID. Miss Beacon (of Boston)—Do you never feel an insatiate craving for the unattainable—a consuming desire to transcend the limitations which hedge mortality, and commune, soul to soul, with the spirits of the infinite? Omaha man—Ye-es. Kinder.

PURCHASING AN AILMENT.—Actress—Doctor I don't feel as if I could possibly go on the stage to-night. Doctor—What, madam, seems to be the matter with you? Actress—Oh, I don't care much, Doctor. Give me the worst ailment you can for a hundred dollars.

TO PREPARE A MUSTARD PLASTER.—Mix the mustard with the white of an egg, instead of water. The result will be a plaster which will "draw" perfectly well but will not produce a blister, even upon the skin of an infant, no matter how long it is allowed to remain upon the part.—*Medical Classics*.

GOOD STYPTIC.—There is nothing better for a cut than powdered rosin. Pound it until fine and put in an empty clean pepper box with perforated top, then you can easily sift it out on the cut, and put a soft cloth around the injured member, damping it with cold water once now and then. It will prevent inflammation and soreness.

HYDRAULIC BRICK.—A new hydraulic brick is now manufactured in eight different shades of red and brown which, on cheap houses, is designed to supply the place of brownstone or sandstone for trimmings. The shades of color run from a rather dark brown to a reddish hue, and at a superficial glance might well be taken for the stones the places of which they supply.

DELICATE WORK.—A process of engravings on glass crystal by electricity has been communicated to the French Academy of Science by M. Plante. The plate to be engraved is covered with a concentrated solution of nitrate of potash and put in connection with one of the poles of the battery, and the design is traced out with a fine platinum point connected to the other pole. The results are said to be of marvelous delicacy.

GRAPE SYRUP.—A syrup is being manufactured in California containing seventy-five per cent. of saccharine matter. This syrup is made by concentrating grape juice in a vacuum pan. One ton of grapes yields 160 gallons of juice, which is reduced to one-fourth of its bulk. At the price which this syrup ought to bring, it seems a good outlet for the overproduction of grapes. Mission and Malvoisie grapes principally are used.

DELICATE SOLDER.—An account is given in a German paper of a soft alloy which adheres so firmly to metallic, glass, and porcelain surfaces that it can be used as a solder, and which, in fact, is valuable when the articles to be soldered are of such a nature that they cannot bear a very high degree of temperature, the composition consisting of finely pulverized copper dust, which is obtained by shaking a solution of sulphate of copper with granulated zinc.

BUSINESS NOTES.

FOR NERVOUSNESS

Use Horsford's Acid Phosphate. Dr. W. C. Hanscome, Minneapolis, Minn., says: "I used it in a case of acute rheumatism, during convalescence; the particular symptoms I wished to relieve were sleeplessness and nervousness, and the results were all I desired."

PENS AND POTATOES.

In using new steel pens the ink sometimes will not flow readily. This can be avoided by sticking the pen into a potato. Try it the first Esterbrook's Pen you use.

CATARRHAL
DEAFNESS

A NEW TREATMENT.
Sufferers are not generally aware that these diseases are contagious, or that they are due to the presence of living parasites in the lining membrane of the nose and eustachian tubes. Microscopic research, however, has proved this to be a fact, and the result of this discovery is that a simple remedy has been discovered which permanently cures the most aggravated cases of these distressing diseases by a few simple applications made (two weeks apart) by the patient at home. A pamphlet explaining this new treatment is sent free by A. H. Dixon & Son, 337 and 339 West King Street, Toronto, Canada.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

VALUABLE TO ADVERTISERS.

You have determined to make money by vigorously pushing your business. As the AMERICAN ANALYST has determined to do the same thing, we have a community of interests. Our way of making money is to increase our circulation, and we can only do so by publicity; that is, by bringing our journal to the notice of a great number of people, who have the intelligence to appreciate a good journal when they read it and the money to buy what they want. You must necessarily want to reach the same class. Even if you do not sell directly to the consumer, it is necessary for you to tell the consumer of the quality of the goods you have to offer to induce him to ask the dealers with whom he trades for them. We propose this Fall and Winter to send a sample copy of this journal to the address of every person in the United States whose name we can find in any of the *Elite* directories or blue-books of the various cities and villages. We will thus reach several millions of new readers in addition to our already large subscription-list, covering every State in the Union. Previous experience with this method of getting new subscribers war-

rants us in undertaking the expense, believing that it will pay us. This large addition to our circulation will put any advertisement in our columns before a multitude of readers. Our advertising prices remain the same, and are so arranged as to give the lowest rates to larger and longer-continued advertisements, and will be sent on application. All respectable advertising agencies will take orders for us. If we find this system profitable, advertisers surely will. Those who have advertised with us always renew as their season comes around, and you will do the same when you have tried it. We have found that in the great competition now existing we must keep our journal prominently before the public, and, in our mutual interest, we ask you to join us. Our system is more effective than a circular, and you will find it just as effective for your business and the cost very much less. Try us. For any further information write, and it will be forthcoming.

ADVANTAGES TO ADVERTISERS OFFERED BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the **AMERICAN ANALYST** a good advertising medium. Why should not you?

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

ELECTRIC HOMICIDES.

The repeated fatal accidents that have occurred recently in this city from contact with electric-light wires have impelled Mr. Thos. A. Edison to publish a paper on the subject that is not only valuable from a scientific standpoint, but clearly exposes the moral causes which yield so large an amount of mortality. Mr. Edison shows that there are four different currents in use, of which only one is harmless. This one is a low tension current; the other three are high tension, and are all dangerous to life. "The first," he says, "is harmless, and can be passed through the human body without producing uncomfortable sensations." This is the current employed in the incandescent lamps. "The second," he continues, "is dangerous to life. Momentary contact with the third, results in paralysis or death, and the passage of the fourth, or alternating current, through the living body means instantaneous death." It is a terrible condemnation of the companies which use the dangerous currents, when it is learned from Mr. Edison's positive assertion that neither of them is a necessity. "There is no plea," he states, "which will justify the use of high tension and alternating currents

either in a scientific or commercial sense." The necessary inference from this statement is that the companies under whose management so many deaths occur are constructively guilty of manslaughter, and possibly of murder. The sole reason why these dangerous currents are employed is the economy of copper wire. "The high currents are employed to save investment in real estate as well as copper," says the scientist. The wires are so small that tremendous pressure is required to force the currents through them over the long distances which they supply. With heavier wires and shorter circuits all danger would cease. Mr. Edison throws much light on the mooted question of underground wires. He scouts the idea that the system would be safer; on the contrary, he insists that the element of danger would be materially increased. This arises from the fact that the wires in the present system of conduits would form "earth contacts," and there would be a "fusion of wires, and the formation of powerful electric arcs, which would extend to other metallic conductors in the same conduit, and a whole mass of wires made to receive this current and conduct it into houses, offices and stores." The authorities of New York are sparing no effort to force the lighting companies to place their wires underground. The verdict of Edison is that this will increase the perils of the system. "The public may rest absolutely assured that safety will not be secured by burying these wires. The condensation of moisture, the ingress of water, the dissolving influence of coal gas and oxidation upon the various insulating compounds will result only in the transfer of death to man-holes, houses, stores and offices, through the agency of the telephone, the low-pressure systems, and the apparatus of the high-pressure current itself."

INFANT FOODS.

At the recent Montreal meeting of the American Association for the Advancement of Science, Dr. Fred'k Hoffmann spoke about the food preparations now so largely used for infants and children as substitutes for mother milk and other food. According to reliable estimates, the quantity of such artificial food annually consumed in the United States amounts, in money value, to about \$8,000,000 to \$10,000,000. The problem of artificial food for the rising generation, and particularly during the first period of its struggle for life and survival, is a very important one, not only to the state, the commonwealth and the family, but also to the sanitarian and the chemist. These artificial foods mostly claim to be perfect; a few have been analyzed by independent chemists, often with questionable accuracy or results, whilst many are of unknown composition. Many of such food preparations are evidently manufactured without due consideration to physiological and chemical principles in regard to the proper constituents and proportions of the true nutrient elements of food. Any such deficiencies or worthlessness are of much greater harm than similar shortcomings in foods and food luxuries of the adult popula-

tion. In consideration of the importance of this matter, such artificial food preparations should henceforth much more engage the interest of all authorities and sanitarians and receive more attention on the part of analytical chemists. It is particularly desirable that the chemists in the United States Agricultural Department, into whose domain this problem belongs, should take up the analysis of the ever-increasing class of food preparation mostly used for infants, children and reconvalescents. The speaker stated, in conclusion, that Professor Wiley, chief of the chemical laboratories of the United States Agricultural Department, has authorized him to state that the department will at once commence with the work of investigation of artificial foods.

GOVERNMENT MEAT INSPECTION.

With the waning year departmental reports are in order. The first received is that of the National Department of Agriculture, which, likewise, is the first report ever issued from that newly-constructed branch of the Government. The document bears testimony to the careful and intelligent study Secretary Rusk has given to the question of our agricultural interests, and his recommendations seem to be generally wise and commendable. The particular point in which the readers of the AMERICAN ANALYST are most interested is that in which he advises the establishment of a system of Government meat inspection, the adoption of which by Congressional legislation will probably meet with the approval of both producer and consumer—of everybody, in fact, excepting the clique of retail agitators who have been stultifying themselves during the past year in an effort to subordinate the entire meat interest of the country to their own personal pecuniary advantage. The language used by the Secretary in regard to a national meat inspection law is pointed and vigorous. The necessity for inspection at the time of slaughter is, first, to enable the authorities to locate promptly any centres of cattle diseases, and, secondly, to avoid the anomaly of leaving the inspection of our own meat products to the officials of other countries, thus giving foreign Governments some show of reason for the claim that they have better opportunities for learning of disease among American cattle than are enjoyed by our own Government. He accordingly advocates "such an amendment to the law under which the bureau is at present organized as will provide for such official national inspection as shall guarantee the fitness of our meat products for food consumption under the seal of the United States Government." Authority and means are also desired to enable the department to exercise a close supervision of the economic side of the cattle markets, the characteristics of stock commanding the highest price, variations as to age, weight and quality, and all facts bearing upon the cattle industry which will enable the bureau to supply to farmers such information as it is impossible for them to obtain for themselves. The Secretary recommends that the disease experiment station be removed to the Arlington estate, and be equipped

For use at the Soda Fountain and in all Pharmaceutical preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

DRYDEN & PALMER,
19 Hudson St., New York.

with all the laboratory and other scientific aids essential to successful investigation of diseases. The United States must not, says the Secretary, be behind any other country in this work. "Indeed," he adds, "this country ought to lead all others." A series of works is promised on animal diseases, giving a systematic statement of the current knowledge on the subject in popular form.

FOOD ADULTERATION.

They have come to the conclusion "Down East" that if the National Pure Food Association is not dead, it sleepeth. From all parts of New England come complaints of adulterated molasses, cod-fish, bogus lard, mixed spices, and so through the list. The agitation of the subject about the time of the formation of the association is about all the public have heard of it, and many who were then prominent in the movement now state that it is practically a dead issue. The remarks, in a recent issue of the Boston *Daily Advertiser*, upon the subject are pertinent. It asks why this is so: "Have the manufacturers and jobbers of food and drug products been acting a part, and having stood forth prominently as advocates of pure food gone back quietly to the old practices? Certain it is that the sophistication of food is prevalent in all parts of the country, even in our own State which stands relatively high, in the character of its food market. Preparations are already well in hand for introducing and pushing before the next Congress a measure to correct the lard evil, and the time would seem ripe for the reawakening of the Pure Food Association. As urged by it, what is needed is not special legislation to correct an evil here and there, but a general measure that shall secure the honest representation and sale of the food and drugs in our interstate and export trade, thereby protecting the home market and re-establishing confidence in such American products abroad."

GERMAN IN THE PUBLIC SCHOOLS.

The question as to the expediency of discontinuing teaching the German language in the public schools of this city is again under discussion, and while the Board of Education has not yet given official expression to its views on the subject it is generally regarded as favoring the abandonment of that branch of study. The discussion is invested with greater importance from the fact that from ten to twenty thousand children are excluded from schools for lack of accommodations. As most of these are the younger pupils, many of whom have never yet been in any school, the sentiment is growing rapidly in the direction of cutting off all unnecessary expenditure in order to give those young-

sters a chance to make at least a beginning in the process of obtaining their education. The question has not been very widely discussed in the newspapers as yet, but the little that has been indulged in indicates that the press quite generally favors the abolition of German as a study in the common schools. Among other things which contribute to make the proposition stronger is the fact that it is very badly taught. While the great number of Germans in New York render the German language very important to many business people, it is found in practice that the amount of it attained in the schools is not sufficient even to start the pupil well on his way toward a practical knowledge of the language. The probable outcome of the discussion is the entire abandoning of the teaching of German or any other modern language in the public schools, at least until the board of education has been able to provide facilities sufficient to accommodate all the pupils of the city in schools where they care to attend them.

A CITY OF THE FUTURE.

A UTOPIAN VISION OF A REMOTE SOCIAL POSSIBILITY.

In the year 2029 the leading Vanderbilt of his time came into his fortune. He had received a remarkable education, and one which the nineteenth century would have considered impossible. Without going into details, young Vanderbilt was evenly developed, physically, mentally and morally. He had been so educated that he found happiness in the full and constant use of his money and his brains for the good of humanity. But he was pre-eminently practical—a purified and perfected type of one of the industrial kings of the nineteenth century. He lived in a cottage in the hills, and he thought out his plans in long walks under his trees. He was the richest man in America, and yet he had as much freedom as any plain farmer. To sum it all up, he had become, without knowing it, the most unselfish and at the same time the most patient and persistent of living men. The friends he had were not numerous, but each one of them was capable of great things. And he and his wife understood each other in that complete way which happens once in a thousand or so. Remember, I am not trying to tell you how it all came about, because that would make a volume. Briefly, Vanderbilt wished to build a city, more pleasant and better to live in than any the world had yet seen. He wanted to see whether such a city could be established under new conditions of social and industrial life, and in such a way that the enormous capital he proposed to invest could be restored unimpaired at the end of a term of years. The site which was chosen for the city of Arachne was in a sheltered and fertile part of the great valley plain of California, which extends from Shasta to Tehachapi. The floor of the valley at this point was a sloping plain, looking west, with tree-clad foothills east, and hundreds of great oaks scattered here and there, like the ancestral oaks in the heart of England. The region was chiefly occupied by large wheat farms. Vanderbilt was able to purchase, through agents, a tract of land nearly twenty miles square. Then he sent for his engineers.

"What I want," he said, "is a city capable of indefinite extension. The plan is to be based on the web of the geometric spider. Streets, sewerage, water, light, transportation and the other requirements of this Utopia are to be perfected as far as the science of the day will permit."

The engineers made their report. It was a wonderful situation, they said. There was natural gas underlying the valley; water could be brought from the Sierras; railroads from all parts of the continent could centre in the heart of the city; commerce could occupy miles of wharves—if only people chose to come and live in Arachne. Then Vanderbilt sent for several great landscape gardeners to work with the engineers, and he and his wife went with them over the valley, the golden foothills and the sea-green tule lowlands by the sloughs.

As the work went on, so broad and beautiful were the plans developed, so magnificent the scale of operations, that the interest of the country was aroused, and many persons wished to buy and live in the as yet unbuilt city; but the reply sent out was: "Not yet. Wait until we are ready." The landscape gardeners said: "With this soil and climate every home can have its garden and every street can be an avenue of shade and fragrance. All the trees of the temperate zones, and many of the tropics, can thrive here, so we will have no street less than a hundred feet wide, and some of our great avenues shall even be a hundred and fifty feet across, and planted with date palms and magnolias, for twenty miles into the country. We shall lay out public squares on every street and two great parks, one on the lowlands by the river, another on the foothills which look down on the city. We shall so arrange our squares as to preserve the best of the oaks, sycamores and other trees of the valley. And, when the city is built, one of its officers shall be a city forester, educated and efficient, to preserve and develop all this beauty of streets, squares and parks." And that winter they planted miles of avenues and hundreds of acres of forests. There were four hundred specimens of deciduous trees, forty-eight species of broad-leaved evergreens and one hundred of conifers chosen to plant on the streets. Some streets had one row of trees down the centre; others had two rows near the sidewalks. The great parks were to be not only pleasure grounds, but also arboretums. A belt of forest, a mile wide, across the valley, was planted to protect the city from the occasional northers. The engineers arranged to have all the sewers of the city unite at the edge of a tule marsh, by the river, five miles beyond the city's possible extension, and there their contents were to be heated in vast furnaces, dried, ground to powder, and sold for fertilizers to farmers the world over. They arranged for water and natural gas for cooking and lighting, to be piped into every house, free to the consumer. They arranged for cable cars up and down every street and avenue, all managed by one system. They laid out the city so that every lot, besides fronting on a street, ran back to a twenty-five-foot alley, and they arranged for a freight cable system on all these alleyways. They arranged for telegraph, telephone and phonograph connections throughout the entire system. Railroad men in those days had come to run cars without smoke or noise, by electricity, and it was easy to arrange for the approach of all trains by two broad, sunken avenues, one north, the other south, over which the streets crossed. These avenues led to the centre of the city, where a union depot, the great public buildings and the offices of all the departments of public works were situated.

It would be too long a story to explain further the physical details of the system of organization, in which beauty and utility were joined in perfect union. When the time came, there appeared one morning in every newspaper in the United States an announcement: "Lots for sale in Arachne, to actual settlers. Two hundred and fifty million dollars have already been invested here, and sales will be so conducted as nearly to restore this capital intact, at the end of twenty years to the original investor. The object of this experiment is not money-making. Those who cannot read and write had better not come to Arachne, as the charter which it is hoped will be adopted does not allow such to vote at city elections. Copies of the proposed charter mailed to all applicants."

Within a year Arachne was a city. Vanderbilt and his friends succeeded in obtaining their charter, which could not be altered except by a three-fourths vote of the citizens. This charter was the most important part of Arachne, and so I will give a synopsis of some of its provisions. As Vanderbilt stated at the public meetings of the twenty or thirty thousand voters who finally adopted it, almost as it was written: "It is intended, in this charter, to give intelligence, thrift, and honesty the controlling power in Arachne. Some things the people can do unitedly; some must for ever be left to the individual. Arachne will probably contain both

rich and poor, weak and strong, wise and foolish to the end of time, but we hope it will contain less crime, less unhappiness, and fewer failures than any other city in the world. The charter of Arachne will suit neither nationalists nor silurians, but it is worth trying nevertheless." The charter provided for the absolute equality of men and women before the law, and for non-sectarian free schools in a chain from the primary grades through the university, with schools of the arts and industries. Then came the qualifications for voters: "City elections shall be conducted separately from all other elections. Voters at city elections must be able to read and write, and must be freeholders owning one 'unit of real estate.' 'The unit of real estate' is a lot of fifty feet frontage and not less than one hundred feet in depth extending to a rear alley. This unit cannot be subdivided, though it may be held in several undivided interests. If used for residence, only one house can be built on such a lot, and it must have at least five full feet of space left on each side, ten feet in front, and twenty-five feet in the rear. If used for business, the plans of the building must conform to the general ordinances of the board of building commissioners." The sections relating to "qualifications of officers" were remarkably simple: "All candidates for offices in the gift of the people shall have passed through at least the grammar grade of the public school system. Heads of departments shall have passed through at least the high school grade." The system of voting provided for was unique. Voters were registered by residence. Besides telephonic and phonographic apparatus, and pneumatic tubes for receiving and sending mail, every house contained a "voting tube," connected with the city hall. At night, between the hours of six and nine, every voter sent from his own house or room, to the central voting office, his vote, recorded on a phonographic piece of metal, which passed at once without any human agency into a mechanical contrivance which counted and recorded the entire vote, and preserved the cylinders and tallies intact for twenty-five years. This gigantic machine was mathematically perfect, and had been tested in every possible way. The entire vote of the city was announced within an hour after the closing of the polls. The introduction of a single unregistered vote, or of a vote from the wrong place, would cause the machine to throw out the entire vote of that house or room. Any voter could give his number at any time within twenty-five years, and hear his own vote read off by the machine. The city had printed on its ballots the names of all persons nominated by fifty or more freeholders. The voter merely read off the names of those he wished to vote for, and his phonograph recorded it. The voting-tubes and the machine were securely closed at all other times of the year except during the three voting hours. The register of the city was posted, page by page, in many prominent places, for weeks before the election, and the city had a standing offer of a reward for the discovery of any fraudulent entry.

After a few years it became evident that machinery had triumphed and hopelessly broken up all the political machines. Voters stayed at home, after dinner, long enough to vote, and then went to the theaters, libraries, or art galleries, returning in time to hear their phonographs report the results of the election. The organization of the city was said by the charter "to be for the purpose of carrying on, as cheaply and efficiently as possible, the business of the city." The officers were expected to give their entire time to the city's service, and all were salaried. The head of the government was called "The city president," answering in some respects to the Mayor, but with greater powers. He sent all nominations for heads of certain departments to the legislative body, which consisted of twenty-seven members, nine of whom were chosen once in every two years. They were elected not from districts, but at large, and were termed "the city legislature." The officials nominated by the president, and elected by the legislature, were those belonging to what was termed the "Industrial Group of the City Depart-

ments"—the chief forester, the sanitary engineer, the city architect, the chief railroad engineer, and the heads of the water supplies, the gas wells, and the sewerage furnaces. These were all trained and educated specialists, for each department worked up to within certain test limits of error, just as the United States mints now do. The heads of the "Governing Group" of officers, the city attorney, the school superintendent and directors, the chief librarian, the head of the art schools, the insurance, banking, and fire commissioners, head of the tax department, chief of police, and similar officers, were elected by the people. The judiciary were twice elected, once by the people, and once by the president, legislature and other elected officers assembled in council on the following day. Usually they ratified the choice of the people, but there were many notable instances where they had reversed that decision. This being a veto power required a two-thirds vote. In that case the people presented new candidates. Taxes were arranged on the basis of the "Unit of Real Estate." This unit was taxed at a fixed rate, whether improved or unimproved. A fixed amount of water and gas was furnished free to each house—this amount being rated as "sufficient for the use of one family;" everything above this amount was charged at cost of production. The sewerage furnaces turned in a large annual revenue to the city. The transportation department, which included all the freight and passenger traffic, had rates of charges fixed from time to time by the city legislature. The income from this source added to the revenues of the sewerage department and the small fixed tax on the unit of real estate, was sufficient to pay all the expenses of the city government. The city had enabled its citizens to escape most of the indirect taxes of the cities of the nineteenth century, and the result was most astonishing in the tax department. It was not necessary to put a dollar of tax on the great buildings, for, as the city grew, the added transportation, at rates that lessened each year, paid all the expenses. The legislature had the right to raise the tax-rate on the unit of real estate, and even to levy a graduated tax on all buildings which cost more than \$5,000, but this was a right which it never exercised. The other sources of income were sufficient.

As Arachne grew from a population of fifty thousand to one of half a million, and before the close of its first century, to more than two millions, the wisdom of its founders became more and more manifest. It was a city of homes, of health, of happiness. Individuality had its proper play, competition had healthful activity, but the sense of brotherhood was cultivated, and, as the powers and duties of the city grew, the service of the city increased in honor and responsibility, and the organization of public life became more perfect.

The evils of cities like London and New York never existed in Arachne; there were no slums, no tenement houses, no pestilence-haunted rookeries, no dives and dance cellars and saloons, for the spirit of the community did not tolerate these things.—C. H. Shiinn in *The Argonaut*.

DENTAL ELECTRICITY.—An electric instrument has been invented which is designed to remove the pain incidental to the extraction of the teeth. It consists of adjustable, pivotally-connected prongs carrying buttons and connected with an electric battery, the buttons being placed on the face over the nerves leading from the teeth to the brain, and a circuit established the moment the tooth-extracting instrument touches the tooth to be removed.

SPARKS AT HOME.—A very simple apparatus for obtaining an electric spark is made by a German physicist. Round the centre of a common lamp chimney is pasted a strip of tinfoil, and another strip is pasted from one end of the chimney to within a quarter of an inch of this ring. Then a piece of silk is wrapped around a brush, and the interior of the chimney is rubbed briskly. In the dark a bright electric spark may be seen to pass from one piece of tinfoil to the other each time the brush is withdrawn from the chimney. Many other experiments can be tried with this apparatus.

GEOLOGICAL MYSTERIES.

SUPPOSED ORIGIN OF SOME OF THE PRECIOUS STONES OF COMMERCE.

Geology has been a revelation to mankind, and has told us wonderful things of the past history of the earth. But geology has secrets of its own that are as hidden from comprehension as the atmosphere of the moon or the belts of Saturn. Certain things have been done, says the geologist, through volcanic action or the agency of fire, and that is as near as he can come to it. So that, after all, we see effects, but know little or nothing of causes. There is a rock known as amygdaloid, one of the igneous rocks, which in some of the gigantic transformations of nature, we will say in cooling from a melted state, formed within itself cavities, from the size of a marble or bead to that of the closed hand. Now, as nature abhors a vacuum, she set to work to fill these cavities, and in doing so she used other materials, and these combinations produced some of what we call the "precious stones of commerce." Exactly how this was done we cannot tell, but we see some hint of the operation in every subterranean cave where stalactites and stalagmites are found. Every student knows that this is the result of dropping water which contains carbonate of lime. The water evaporating, leaves a minute particle of lime, which takes something to itself from the earth or atmosphere, and in the course of ages bodies are formed of a most remarkable character. In probably somewhat the same fashion have these cavities been filled in the igneous rocks, and then come time and storms and other agencies, earthquakes, perhaps, and the rocks are rent apart, and out drops a bead or a boulder, and a curious man picks it up, and hammers and breaks it, and then he puts a polish on it by some process more or less advanced, and lo! he holds in his hand an agate or an onyx. Many of the stones used in the arts have no other origin, and are deposits of silica, alumina, oxide of iron and other coloring substances. It is the color or arrangement of colors that gives the name, and thus we have agate, onyx, chalcedony, carnelian, sard, chrysoprase, sardonyx and others, all members of the quartz family, and all having a family resemblance. The agate has veins of different shades of color in parallel lines. Sometimes these are very close together, as many as fifty to the inch, but this is unusual. When there are alternate bands of color and a transparent medium, we have the onyx; but the latter may be obtained by cutting the stone in a different way. Agates are used chiefly for ornamental purposes, such as cups, seals, rings, handles for parasols, swords, table and mantle ornaments, but the material is so hard that it can only be worked by those who have practiced skill. The onyx was valued by the ancients for its application to cameos and intaglios—the first an object in relief, the latter a "cut in" process; and these objects are still made. Nature produces some very strange forms occasionally, and agates are found with exact resemblances of moss and other natural objects and figures, which are very curious and often very valuable.

A WOMAN'S INVENTION.—Mrs. W. A. Cockran, of Shelbyville, Ind., has placed her name on the roll with the great inventors of the world, the result of her genius being a practical dish-washing machine. She began experimenting ten years ago. Her husband, the late W. A. Cockran, was then Circuit Clerk of Shelby County, leaving her financially unable to complete her undertaking. By the aid of friends, however, she finally succeeded, and has a machine designed to do the work now done by the thousands of girls and women the land over. The machine is wonderful and intricate. It is made in different sizes for families and hotel purposes. It is also made for both hand and steam power, and is capable of washing, scalding, rinsing and drying from five to twenty dozen dishes of all shapes and sizes in two minutes, the number, of course, depending on the size of the machine. Mrs. Cockran has recently disposed of her machine to an Illinois manufacturing firm for a large sum of money, and will receive a good royalty on all machines sold.—*Kansas City Star*.

ELECTRICITY.

ITS LATEST APPLIANCES AND EXPLANATIONS OF TERMS, ETC.

Electricity is now so extensively utilized that, in one form or another, it is constantly before us and forms the theme of numerous newspaper articles. Naturally those who are engaged in any business connected with electricity will use technical terms in expressing their thoughts, which, while perfectly familiar to them, are not so comprehensible to the general public. A few hints in this direction may be of service to our readers. The terms we most frequently read of are electromotive force. This is the force that tends to start and which sustains the flow of an electric current, or which produces mechanical effects by means of electricity as a motive power. This power or force is measured in units called volts, or the force that will give a mass of a gramme a final velocity of a centimetre per second by alone acting on it for a second. An ohm is the unit of electrical resistance. Ohm's law is that the strength of a current is directly proportional to the electromotive force that tends to drive the current through the wires of the circuit, and it is inversely proportioned to the resistance which the whole circuit offers to the passage of the current. Ampere is the unit of strength of current. The ampere is the current produced by the electromotive force of one volt in a circuit whose resistance is one ohm. Crudely stated, the ampere represents the volume of electricity, the volt expresses the pressure, and the ohm stands for the resistance encountered. Arc is the space between the two carbon points in an electric lamp. When the electric current is on, the discharge of the same, or its leap across from one to the other of these electrodes, is called the arc. It is really the incandescent space between two carbon points. The carbons, in electrical parlance, are the sticks or rods employed in arc lamps, between the ends of which the electric arc is formed. They are made of powdered coke, mixed with some glutinous hydro-carbon substance, molded and baked. A dynamo is a machine for generating electric currents by the conversion of motive power into electricity. Incandescence is the luminous appearance of intensely heated bodies. Electricity is evolved from the joint action of motion and magnetism, and this practically what a dynamo-electric machine does. An armature revolving at great speed near to but not touching the magnets, develops electricity ready to be carried from the machine by wires. These dynamos being powerful and cheaper to operate on a large scale, have very largely supplanted the so-called primary batteries, where electricity was produced by the decomposition of metals in acid or alkaline solutions. Electric lighting is done either by the arc light, which has been already explained, or by the incandescent, which is due to the incandescence of a carbon filament, which being small so retards the flow of the current as to create incandescence through great resistance. Another use for electricity is that of electric motors, which being needed principally in the day time when electric lighting is not needed, gives profitable employment to electric lighting plants. It is simply the result of reversing the dynamo electric machine and converting it into electric force. Storage batteries are constructed to receive and hold electricity on the principle of secondary currents, to be given off again when required; so that electricity can be supplied in a small compass and at a distance from where it is generated without the aid of long conducting wires. The telegraph is too familiar an application of the electric current to require any further explanation than to say that late improvements have more than quadrupled the facilities for its practical use. In the telephone the atmospheric waves produced by the voice of the speaker striking against the transmitter into which he talks, cause a plate of iron called a diaphragm to move towards and from the pole of a permanent magnet, around which is wrapped a coil of insulated wire. An electric current thereby results, which, flowing over the wire, passes into the re-

ceiving instrument and causes in it a movement that exactly corresponds to the movement produced at the transmitter. One strange thing is to be noted here. While the voice of a speaker at one end of the line is thus reproduced at the other, the voice itself is not transmitted. It is not the sound of the voice that travels along the wire, but an electric current. The microphone, the invention of Professor Hughes, is an instrument by which minute sounds, like those of a fly walking, can be magnified so as to be distinctly audible. The action of the microphone is as yet but little understood, and is a cause of much discussion among scientists. The phonograph is an instrument wherein a cylinder, covered with prepared wax, is rotated by an electric motor. The voice of the speaker into the instrument vibrates a diaphragm, and a tiny metal point affixed to its under side marks lines of varying depth on the wax cylinder. By shifting the cylinder back to the starting point and revolving it, a delicate little membrane gives back in low but clear and distinct tones the very words that have been spoken before. Various ingenious mechanical appliances make the instrument practical. Such is a brief explanation of the more practical uses of electricity, its action, and the technical terms most generally employed.

CALIFORNIA INDUSTRIES.

THE REMARKABLE PRODUCING CAPACITIES OF THE GOLDEN STATE.

(Continued.)

In previous numbers we have spoken of the products of Southern California counties. We will now look at Sonoma County. This is situated twenty-five miles north of San Francisco, on San Pablo Bay, an arm of San Francisco Bay, and has the Pacific Ocean as its western boundary. Its area is about 1,500 square miles. It is the seventh county in size of California, and is about as large as the State of Rhode Island or half the size of the kingdom of Belgium. Some of the mountain peaks of the coast range in this county reach a height of 3,500 feet. It is in this and adjoining counties that the redwood trees of commerce grow to such immense proportions. Sonoma has four great valleys, the Sonoma, Petaluma, Santa Rosa, and Russian River or Cloverdale Valley. In this county the mountain ranges are of volcanic origin and the soil rests upon a hard bed of secondary formation. Trap or basalt is the principal rock, though carbonate, limestone, porphyry, granite, and sienite slate are found. Coal has been worked to a small extent, and petroleum has also been found. At present cordwood is too cheap to make coal mining profitable. The principal mining industry is for cinnabar or quicksilver. Borax, kaolin, iron or copper ores have also been found. Sonoma and Petaluma are two navigable tidal creeks in this county, and the largest stream is Russian River. There are also four other large creeks and innumerable small creeks, making this one of the best watered counties in the state. In 1887 the sale of redwood in San Francisco from Sonoma mills was 7,139,938 feet, and of pine 500,000 feet, making a total of 7,639,938 feet, while the real output was nearer 40,000,000 feet. Sonoma County was the pioneer of that part of California which lies north of San Francisco and was first settled by the Russians. Its fertile fields are developing a wealth greater than any mining industries could furnish and far beyond the most enthusiastic expectation of its early settlers. All this in a country under a warm sun, and cloudless sky, where not a drop of rain falls during five months of summer. Wheat is not a very large crop in this county, barley being grown more, nearly 25,000 acres being sown with it, and only about 22,000 acres are sown in wheat. The barley crop is estimated at nearly 800,000 bushels, oats were sown on only 5,000 acres, 80,000 acres of hay were also grown. The number of fruit trees in the county were reported by the assessors at 656,755 two years ago, and probably now reach a million, including 20,000 olive, 12,000 apple, 30,000 pear, 6,000

plum, 36,000 prune, 6,000 cherry, 4,000 apricot, 25,000 peach, and 15,000 walnut and chestnut trees. Nearly 30,000 acres were set out in vines. A total of three and a half millions of gallons of wine was the yearly production. Hops yielded 2,000,000 pounds. A great deal of stock is raised here, and nearly all blooded stock. Sonoma County farmers having long since learned that it costs less to feed a blooded cow or ox than a scrub, and that the former will always bring more money in proportion. About 1,500 tons of butter are made yearly. Of wool, about 1,500 tons are annually sold. Of the fruits, the apple, peach, prune, fig, and apricot grow side by side and to perfection. Besides these we have not mentioned the cherry, almond, nectarine, quince, mulberry, pomegranate, the strawberries, blackberries, gooseberries, and currants among small fruits, and besides these, oranges. All thrive and bring forth abundantly. Much more could be written about the products of this county, but we forbear. It has been wonderfully blessed by nature and the industry of its citizens has developed it to a large degree. Its wine industry alone would furnish material for a lengthy article.

(To be continued.)

WATCHES.

HOW A POCKET TIME PIECE SHOULD BE HANDLED.

A watch even of very good quality, can only give satisfaction if it is treated according to its subtle construction. Its possessor must prevent it from falling or being knocked about. A jump from a street-car has more than once caused a good time-piece in the jumper's pocket to change its rate. A watch must be kept in a clean place. Dust and small articles of the pocket lining gather continuously in the pockets, and even the best-fitting case cannot protect the movement from dirt finding its way to the wheels and pivots of the movement. Watch pockets should be turned inside out and cleaned at regular intervals. A watch ought to be wound up regularly at about the same hour every day. The best time to do it is in the morning, for two reasons. First, because the hours of rising are more regular than the hours of disrobing and retiring. Second, because the full power of the main-spring is more likely to reduce to a minimum the irregularities caused by the movements of the owner during the day. When not carried in the pocket a watch should always hang by its ring in the same position that it is worn. As a rule watches will run with a different rate when laid down. Only high-grade watches are adjusted to position, and will show only a few seconds difference in twenty-four hours, while common watches may be out of time several minutes in one night. Ladies often complain that their watches do not run regularly. This may be on account of smaller size and more difficult regulating, but the main reason for the faulty rate is to be found in the fact that ladies do not always carry their watches, and consequently often forget to wind them. Never leave a hunting-case watch open during a considerable length of time. A careful observer will find in the morning a layer of dust on the crystal of a watch that has been open during the night. The dust will find its way into the movement. The dust on the outside of the case will be unconsciously rubbed off by the wearer, but when the watch is closed the dust inside of the case must remain there. A watch ought to be cleaned every two, or at the utmost three years if it is not to be spoiled. The oil will change. It will become thickened by the dust that cannot be kept out of the best closing case. The dust will work like emery, and grind the surfaces of the pivots of the train. The best of movements will be spoiled if this requirement is neglected. Even after being cleaned and put in order they will not recover their former exactness. Many times it has been observed that a watch ran well for years, and that it was unreliable after having been cleaned. The reason is to be found in the fact that the pivots and their thick oil fit the jewel holes, and the cleaned pivots and their clean oil do not fit the same jewels.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

November.

MEAT.—Beef, mutton, pork, venison.

POULTRY AND GAME.—Chicken, duck, geese, grouse, hare, partridge, pheasant, pigeons, rabbits, turkeys, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, whiting, salmon, trout, perch, smelts, oysters.

VEGETABLES.—Artichokes, broccoli, celery, potatoes, turnips, cauliflower, cabbage, carrots.

FRUIT.—Apples, pears, quinces, grapes, nuts.

PRACTICAL RECIPES.

GRAHAM BREAD.—Three cupfuls of sour milk, 1 cupful of New Orleans molasses, a little salt, two teaspoonfuls soda, dissolved in a little hot water. To this add as much Graham flour as can be stirred in with a spoon. Mix thoroughly, pour into well greased bread pans, and bake immediately for about two hours.

PINEAPPLE PIE.—Line a pie plate with pastry, and fill with a mixture made of one-half cupful of butter and one of sugar, beaten to a cream; to this add the well-beaten yolks of five eggs, a grated pineapple, one cupful of sweet cream, and lastly the beaten whites of the eggs, beaten in lightly.

APPLE TARTS.—Boil nine or ten large tart apples that have been pared and cored in one-half teacup of water until they are very soft. Take from the fire and beat them until they are very smooth. Beat up one-half cup of butter and one and a half cupfuls of sugar to a cream; put to it the grated rind of two fresh large lemons and the beaten yolks of six eggs; beat well together, and add this to the apples; beat thoroughly. Have ready some little tart shells, lined with paste; fill with the mixture, and bake for a few moments; take from the oven, mix the whites with six tablespoonfuls of powdered sugar, spread over the tarts, return to the oven, and brown slightly.

BAKED CHICKEN.—Cut a chicken up in pieces; dip them in beaten egg and bread crumbs, well seasoned with pepper, salt and chopped parsley; pour a little water in a dripping pan; put in the chicken, putting little bits of butter over it; bake slowly, basting often. When tender, take the chicken out, and make a gravy by adding flour, butter, pepper and salt to the drippings, with enough of either cream or milk to make sufficient gravy; pour over chicken, and serve.

POTATO CROQUETTES.—Boil and mash some potatoes; add salt, pepper and minced parsley; form into little balls, dip in egg and bread crumbs and fry in hot lard.

POTATO CAKES.—Take cold mashed potatoes left over from a previous meal and form them into little cakes, using a little flour to form them, but not mixing it into the potato; arrange on a pie plate, glaze with beaten egg and bake a delicate brown.

LAYER CAKE.—One and a half cupfuls of granulated sugar, one-half cupful of butter, stirred to a cream; three eggs, two heaping cupfuls of flour, one and a half teaspoonfuls of Horsford's baking powder, one-half cupful of milk. Bake in three layers.

Filling: Boil one teacupful of sugar and a little water until brittle in cold water; take from the fire and add quickly the well-beaten white of an egg and a cupful of stoned raisins, chopped fine, or a cupful of hickory nut meats.

FINE OIL.—A very fine machine oil for extremely delicate machinery may be made by putting equal parts of lead and zinc shavings into good Florence oil and placing it in a cool place until the oil is colorless. This will not gum.

READY MADE MEALS.

HOW NEW YORK CATERERS SUPPLY FAMILIES AT THEIR HOMES.

"It would seem," said a New York woman recently, "that we have not taken very kindly to what might be called the itinerant catering service. A friend from a Western town who is in the city with a crippled child for treatment wrote me to secure for her a furnished room near her physician, and arrange to have their meals served there. I went at once, after engaging a very pleasant back parlor, to look up the New York Catering Company, which I hazily recollected used to be on Sixth avenue, somewhere among the forties. Not finding it readily, I inquired in the neighborhood and learned that the concern sold out and went out of existence two or three years ago, presumably on account of non-support. My informant told me besides that he knew of but one other similar enterprise in operation in the city that was conducted by a colored man further down the avenue on a much less extended scale. I found and interviewed this person, and was surprised at the moderate prices he gave me. Seven dollars per week for one, twelve dollars for two, or sixteen dollars for three. He gave me a list of dishes for that day's service, eggs, chops, a cereal, two kinds of hot bread, and coffee for breakfast, with soup, fish, roast beef and two vegetables, a salad, desert, and coffee for dinner. Only two meals are served. In answer to my inquiry he told me that the roast meat was sliced and served on a small platter, a generous portion being allowed for each. I rather objected to this, and after some further discussion he agreed to serve whole joints, entire puddings and pies and the like, for the two persons whose need I was endeavoring to supply, for \$20 per week. My friend is greatly pleased with his service, says everything that ought to come hot does, and all things come garnished and appetizing. Before I finished with the man I found out that most of his custom comes from furnished room occupants and small flats occupied by two or three adults, who can by this means dispense with a servant or need only an inexpensive one. Yet the fact that he has not all the customers he wants and that he is almost the only representative in the field (I heard later of one other, less prosperous even than he) indicates that the system is not a popular one."—Sun.

MUSICAL INSTRUMENTS.

THEIR CHARACTER, VARIETY AND CAPABILITIES.

All sound is caused by a vibration of the air. These vibrations, although analogous to those of the ether which are supposed to produce light and heat, are very much coarser, and are quite within the comprehension of our senses. The thirty-second part of a second is quite an appreciable interval of time, and a musical note giving thirty-two vibrations to a second is readily perceived by a normal ear. The opposite limit is quite variable, depending upon individual peculiarities, but 20,000 vibrations to a second may be given as the average limit for the highest perceptible note. The well-known experiment of striking a bell in a vacuum shows that the vibrations of sound are transmitted by the air itself, and not by some more subtle medium, as with heat, light and electricity. The art of music consists in the production of sounds of varying periods of vibration, at such intervals and in such a manner as to produce a pleasurable sensation upon the ear. It would be beyond the scope of this article to explain the complex mathematical laws upon which the science of harmony is based, and we will only describe the principles upon which the instruments used to produce musical notes are constructed. Nearly all musical instruments can be divided into two classes—the stringed, and wind. In the former the note is produced by a vibrating string or cord, while in the latter a column of air itself is set into vibration, and takes the place of a string.

The piano-forte is the most familiar example of a stringed instrument. In this case each note is produced by a separate string, which is carefully tuned to the right period of vibration. The note produced by any vibrating string depends upon its size, length and tension—the smallest, shortest and most tightly stretched strings giving the highest notes. Such a number of strings necessarily makes the instrument very heavy and expensive, and simpler forms have been devised, like the violin, guitar, banjo, etc., which are small and light, and have but a few strings, which are made to produce any desired note by varying their length by the fingers of the player. The harp and zither also belong to the piano class of instruments, but are not very much used. It has been found, however, that a material string is not necessary to produce a note, but that a vibrating column of air, enclosed in a pipe or tube, answers equally well. The air may be set into vibration, either by a vibrating tongue of metal called a reed, as in the cabinet organ and clarinet, or by a current of air passing through a narrow orifice in the pipe, which sets the adjoining column directly into vibration, as in the common type of church organ and flute. In the organ, like the piano, there is a separate pipe for every note, but in the smaller instruments a single column of air is made to produce different notes by varying its length. In the clarinet, flute, bassoon, and similar instruments, this is accomplished by opening or closing certain holes in their sides, which produces the same effect as the fingers of the violin player when they touch the strings. In the trombone, the length of the column of air is altered by sliding the tubes into each other, and the cornet is provided with valves, which open or close certain convolutions of the tube with a similar result. In this latter class of instruments, the lips are used in place of a reed, and aid in producing the different notes. The human vocal apparatus is a true reed instrument, and is most wonderfully constructed. Two delicate membranes, known as the vocal cords, which can be adjusted at will to produce any desired note, form a most perfect seed, and set the air in the windpipe, mouth and adjacent cavities into the most perfectly regular vibrations. In the act of whistling, the lips act as the vibrating body, and produce different notes according to the varying size of the orifice and the force of the breath. Drums, cymbals and bells can hardly be classed as musical instruments, although the vibrating brass or sheepskin produces sounds which may sometimes give a good effect in connection with more civilized instruments. The peculiar sound of the drum is partially due to the cords which are stretched against the lower end, and are struck by the vibrating leather. The air in the drum is also set into vibration, and adds to the intensity of the sound. This sympathetic vibration, or *resonance*, is a very important principle, by which any body having the same period of vibration as another, is set vibrating by the simple sound of the first—a sort of acoustic induction, as it were. Thus, if two strings are tuned to the same note, and one is sounded in the vicinity of the other, the second will also be thrown into vibration, and both will sound together. A certain note of a piano will often cause some article in the room to vibrate with it, as every musician has observed. Stringed instruments are provided with a sounding-board, a thin sheet of wood forming one side of a box over which the strings are stretched. The wood and air in the box vibrate in unison with the strings, greatly strengthening the comparatively feeble sounds of the strings themselves. The purity of tone of a fine piano or violin depends in a very large degree upon the care and skill with which the sounding-board is constructed. The distinction between sound and noise is not a very marked one, as every noise is to some degree a musical note, and, with proper care, music can be obtained from the most unpromising articles. Bottles, flower pots, strips of wood, and glasses of water, may be arranged to produce the notes of the scale when struck, and a skillful performer can obtain very pleasing results. The color, or *timbre*, of

musical notes should also be referred to. A note of the same pitch and intensity gives a very different sound when produced by a violin, for instance, than by a flute. The researches of Helmholtz have shown that this is due to the fact that musical sounds are generally compound—that is, made up of several distinct notes of different pitch, and known as over-tones, or harmonics. He devised several ingenious pieces of apparatus, by which he was not only able to analyze the tones of different instruments, and prove the presence of these harmonics, but also to recombine them and reproduce the original tones. The laws of harmony upon which our modern science of music is founded, are very intricate, but the best introduction to the science is the possession of that rather rare natural gift, "a musical ear," without which no amount of study will enable one to thoroughly enjoy good music or produce it for the enjoyment of others.—*Pop. Science News.*

ALDEN'S CYCLOPEDIA.

Careful examination of the eighteenth volume of Alden's *Manifold Cyclopaedia* shows that in many respects this remarkable work is superior to any of its competitors, especially in its adaptation to popular use. Its combination of an unabridged dictionary with the ordinary features of a cyclopaedia of universal knowledge is unique. The definitions and pronunciation of the words are clear and accurate, the illustrations are excellent, the topics are thoroughly treated, and embrace the results of the most recent investigations and discoveries. Then, too, the extremely low price places it within the reach of all. The eighteenth volume is fully up to the high-water mark of its predecessors. It is especially rich in its biographies. We find sketches of Hall and Hayes, the Arctic explorers; John Hall and Robert Hall, celebrated clergymen; Hallam and Herodotus, historians; Haller, the philologist; Alexander Hamilton, the statesman, and Sir William Hamilton, the scientist;

Handel and Haydn, the musical composers; Hannibal, the foe of Rome; Hegel, the philosopher; Heine, the poet, and Hengstenberg, the theologian; Herschel, the astronomer, and many other men of renown. Among important articles in other lines are Hallucination; Hand; Hanseatic League, the famous trade union of the Middle Ages; Harbor; Hartford Convention, unique and famous in our political history; Harvard University; Hay; Hayti; Heat; Heart; Heaven; Hell; Heredity; Heresy, and Hieroglyphics. The forty volumes in which this great work will be completed will make a splendid library.

PROPRIETARY MEDICINES.

There are two kinds of so-called proprietary medicines and they are as different as daylight is from darkness. One kind is the result of years of experience, scientific research, ability, large capital, and an honest purpose to give a fair equivalent for the purchaser's money. The other kind is simply a scheme to obtain the people's money, regardless of any equivalent therefor and without a thought of benefitting any one but the manufacturer. These latter, like parasites, thrive on the damage they do and dishonestly avail themselves of the industry of their fellow men. They are too well known to require any further description. We will, therefore, only speak of the former. Any well-educated pharmacist knows when a physician's prescription is shown to him, for what special purpose the medicine, so prescribed is intended, and long experience has taught him just what results can be expected from such medicine. Not infrequently a prescription comes under his observation, which is an unusually happy combination, and when, after long observation among the patrons of his pharmacy, with whom he is generally on confidential terms, he finds that such medicine has more than ordinary good effect he takes careful note of it. After a few years of such patient and conscientious investigation a

capable, pains-taking pharmacist will have on hand an array of tried and proven formulas which, if he were also a physician, would enable him to attend a very large practice with great benefit to his patients. Having thus succeeded in getting the most important part of his business—reliable formulas for valuable preparations—the pharmacist who would commence the manufacture of proprietary medicines needs something more yet. He must have capital to enable him to go out in the open market and command first choice of all the crude drugs he requires; he must be able to buy in large quantities at first hands; to store some, if not all, of these until they are sufficiently matured for his purpose; to have the most improved machinery to prepare his medicines, and a large stock of bottles, labels, cases, and boxes to put up his medicines for market. After this he must be able to place his wares before the public; for without calling the attention of the public to what he has to offer, he would find but few purchasers.

What has been thus far stated are only generalities. If a man had all that has been mentioned and then allow his desire for gain to get the better of his wisdom, he would in the end, make a worse failure than if he had not had the capital necessary to start him. It has been said that if one were to grind up brick-bats and put up the powder in an attractive form he would command a ready sale for it. Never having seen this tried, we do not know how true it may be; but we do know that a worthless or inferior article, no matter how well advertised, cannot keep the market. The public may be swindled once, but no one will be taken in oftener; and as the profit on every advertised article really lies in duplicated and constantly increasing sales, only meritorious articles—the quality always kept up to the highest standard—can hold its own for any length of time. Such preparations are honestly put together, kept up in quality, and offered to the public conscientiously and truthfully without misrepresentation or

BUFFALO LITHIA WATER

In the Uric Acid Diathesis, Bright's Disease, Chronic Inflammation of the Bladder, etc.

JAMES L. CABELL, M. D., A. M., LL. D., Professor of Physiology and Surgery in the Medical Department in the University of Virginia, and President of the National Board of Health.

"The Water of Buffalo Spring No. 2 contains in notable quantities two of the ALKALIES which are accredited as extremely valuable in the treatment of GOUT, LITHIASIS, and Liver Affections. I refer to the CARBONATES of POTASH and LITHIA.

"I have recently read with interest a paper in 'The New York Medical Journal' on the Buffalo Lithia Water in Diseases of the NERVOUS SYSTEM, in which the writer, Dr. Boyland, citing his own observations and those of other eminent physicians, ascribes to this water a special virtue as a direct tonic for the NERVOUS SYSTEM in cases of CEREBRAL exhaustion. I have only had occasion to test its effects in this direction in cases in which the NERVOUS SYMPTOMS may have been due to LITHÆMIC conditions. In these cases the relief following the use of the remedy was very decided."

Dr. WM. A. HAMMOND, of New York, Surgeon-General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the Buffalo Lithia Water in cases of affections of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION OF THE LITHIA SALTS, and is, moreover, better borne by the Stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from over-mental work—in which the condition called NERVOUS DYSPEPSIA EXISTS—and generally with marked benefit."

Dr. ROBERT BATTEY, of Georgia, SUGGESTER OF BATTEY'S OPERATION.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of CHRONIC INFLAMMATION of the BLADDER, whether induced by STONE, by enlarged PROSTATE in the aged or by NEGLECTED GONORRHOEA, AND HAVE SECURED EXCELLENT RESULTS, which encourages me to prescribe it for the future."

HUNTER MCGUIRE, M. D., LL. D., late Professor of Surgery, Medical College of Virginia, Richmond.

"BUFFALO LITHIA WATER, Spring No. 2, as an ALKALINE DIURETIC, is invaluable. In URIC ACID GRAVEL, and, indeed, in diseases generally dependent upon a URIC

ACID DIATHESIS, it is a remedy of extraordinary potency. I have prescribed it in cases of RHEUMATIC GOUT, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. WM. B. TOWLES, Professor of Anatomy and Materia Medica in the Medical Department of the University of Virginia.

"BUFFALO LITHIA WATER, No. 2, belongs to the ALKALINE or, perhaps, to the ALKALINE-SALINE Class, for it has proved far more efficacious in many diseased conditions than any of the simple ALKALINE waters.

"I feel no hesitancy whatever in saying that in GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE in the BLADDER, and in all Diseases of URIC ACID DIATHESIS, I know of no remedy at all comparable to it.

"Its effects are marked in causing a disappearance of ALBUMEN from the urine. In a single case of BRIGHT'S DISEASE OF THE KIDNEYS I witnessed decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of the disease."

Dr. THOMAS H. BUCKLER, of Paris (formerly of Baltimore), SUGGESTER OF LITHIA as a Solvent for Uric Acid.

"Nothing I could say would add to the WELL-KNOWN REPUTATION OF THE BUFFALO LITHIA WATER. I HAVE FREQUENTLY USED IT WITH GOOD RESULTS IN URIC ACID DIATHESIS, RHEUMATISM, AND GOUT, and with this object I have ordered it to Europe, from Coleman & Rogers, of Baltimore. Lithia is in no form so valuable as where it exists in the Carbonate (the form in which it is found in the BUFFALO LITHIA WATER), Nature's mode of solution and division in water which has passed through Lepidolite and Spondumine Mineral formation."

Dr. GRAEME M. HAMMOND, of New York, Professor of Diseases of the Mind and Nervous System in the New York Post-Graduate Medical School and Hospital.

"In all cases of BRIGHT'S DISEASE of the KIDNEYS I have found BUFFALO LITHIA WATER of the greatest service in increasing the quantity of urine and in eliminating the ALBUMEN. In certain cases of Melancholia, accompanied by excessive eliminations of URATES and URIC ACID, it is often the only remedy necessary. In GOUT and RHEUMATISM it is highly beneficial, and in many cases of Impotence its restorative qualities have been of undoubted assistance. I have long regarded BUFFALO LITHIA WATER as the most valuable mineral water in use."

Water in cases of one dozen half-gallon bottles, \$5.00 per case at the Springs.

THOMAS F. GOODE, Proprietor, Buffalo Lithia Springs, Virginia.

equivocation. The published certificates as to the results of their use are genuine and the originals are on hand for inspection and verification. Years of public trial in every land and climate increase a business so conducted, and the proprietors soon find themselves reaping the reward of their patient fidelity, not only financially but in reputation and public confidence. We have thus rapidly sketched the career of an honest proprietary medicine. The ideal thus pictured may be compared with the reality as found in the old-established house of Dr. J. C. Ayer & Co., of Lowell, Mass., the manufacturers of Dr. Ayer's well-known preparations, consisting of Ayer's Sarsaparilla, Ayer's Cherry Pectoral, Ayer's Ague Cure, Ayer's Cathartic Pills and Ayer's Hair Vigor, and it will be found that it is exactly correct. All over the world these preparations are gratefully known and beneficially used.

BUSINESS NOTES.

BAKING POWDERS.

The laboratory of the Inland Revenue Department of the Dominion of Canada under date of June 22, 1889, has issued a bulletin on baking powders, some extracts from which, *literalim et verbatim*, and not garbled, as has been done by interested manufacturers, may be of considerable interest to the reader. The first striking fact is a reference to the Royal baking powder manufactured by the Royal Baking Powder Company of New York, in the following language: "Thirteen samples show this to be a cream of tartar powder, containing about 18 per cent. of maize starch and about 1 per cent. carbonate of ammonia. The result of the examination of these samples was that they contained an average of 18.2 of maize starch, 52.26 of cream of tartar, and 11.35 per cent., or 109.79 cubic inches per ounce of available gas. Of this 8.46 was ammonia gas. There was an average excess of soda of 0.95 per cent.

Of Price's cream baking powder the analyst says that it contained an average of 20.7 per cent. of maize starch, 49.82 of cream of tartar, 10.98 per cent., or 106.21 cubic inches per ounce of available gas. This is

The World was ready for Pearline—received it with smiling face—outstretched arms and in a few years, has made the very name PEARLINE to mean perfect cleanliness, with ease, comfort and safety.

It's to your interest and ours to have you try it (we share the benefits with you). On coarse articles or fine; on anything washable.

Pearline has a thousand uses; if it pleases you for one only, you'll be well paid for the trial; but you'll like it for all.

It is coming to be as well known as flour—no wonder—it's almost as necessary to any first-class housekeeper.

Delightful in the bath. Millions use PEARLINE because it helps them—not us. It helps us most to make an article that helps woman.

Beware

Peddlers and some unscrupulous grocers are offering imitations which they claim to be Pearline, or "the same as Pearline." IT'S FALSE—they are not, and besides are dangerous.

155

Pearline is manufactured only by JAMES PYLE, New York,

an excellent powder, and seems to have good keeping qualities. The report then goes on to establish a standard of an ideal baking powder, and says: It will be seen that Price's Cream is the only brand approaching the limit fixed for an ideal baking powder.

The only fair way is to leave these facts to the public to judge, without comment from us.

SARDINES.

We hear a great many complaints about poor sardines, and an examination of many grocery stores seems to show that a large quantity of very poor sardines, to say nothing of fraudulent sardines, are in the market. If our readers would only remember that when they buy sardines one way of avoiding being imposed upon is to look upon the label, and if it reads "Poissons en huile" they may be sure that what are offered them are neither sardines nor olive oil, as the French law provides that on boxes containing any other fish than sardines the label must read "Poissons en huile," fish in oil. On genuine sardines the label reads, "Sardines en huile." A much surer way, however, is to ask for Billet Sardines. These sardines we have examined several times, and have always found them fully up to the standard. They are carefully selected and cleaned, cooked exactly to the proper point, and the oil used in packing this brand is fit to make a salad for the most exacting epicure.

JAMS AND PRESERVES.

Experience is the best teacher. That being admitted, let us suppose a person who thoroughly understands fruits, and how to select the best, watching the markets daily to pick out the very choicest and those which are most adapted for preserving, with plenty of ready money with which to buy them. Now, if this person also knows the most suitable way of preserving fruits and making jams, with every facility in the way of paring, cleaning, washing, cooking, sweetening and potting, and we know that they are absolutely clean, would we not conclude that we could buy the best preserves and jams from them at a lower price than we could make it ourselves. This is just the case when we buy the goods bearing the well-known trade mark of Gordon & Dilworth.

SOAP AT THE PARIS EXHIBITION.

Colgate & Co. received the only gold medal for American soaps at the Paris Exhibition. They also received

a gold medal for handkerchief perfumes, toilet waters and sachet powders. Their exhibit at Paris was tastefully displayed in a gorgeously carved case of Indian teakwood, and was said by one of the French Commissioners to be the most attractive exhibit in the American section. Among the handkerchief perfumes, for the excellence of which they took a gold medal, Italian Violet called forth the most enthusiastic praise from the Jury of Award.

HUNYADI JANOS.—There recently died in Buda-Pesth Andreas Saxlehner, the discoverer and proprietor of the well-known Hunyadi Janos water. He was a cloth dealer and a Hungarian patriot and a warm friend of Kossuth. In 1863 a cloth dealer from the country, chatting with Saxlehner in his shop, told the latter that he had upon his own land no fewer than ten places on which an oddly tasting and smelling water bubbled up, which neither man nor beast could drink. Saxlehner visited the farm, accompanied by Dr. Molnar, the analyst. The visit and analysis resulted in the purchase of the farm. Twenty years later the poor weaver's son had become the richest trader in Hungary, and had developed Hungarian industry and commerce in a direction and to a degree of which Kossuth never dreamed. He named the water "Hunyadi Janos," after his darling hero, John Hunyadi, the victor over the Turks.

HOSPITAL REMEDIES

THE Favorite Prescriptions of the Brightest Medical Minds in the world, as used by them in the Hospitals of London, Paris, Berlin and Vienna.

ONE MEDICINE FOR ONE DISEASE.

- No. 1—Cures Catarrh, Hay Fever, Rose Cold, Catarrhal Deafness.

- No. 8—Nervous Debility, Loss of Power, Impotence, an incomparable remedy.

RELIABLE AGENTS WANTED.

Every bottle guaranteed to cure its special disease if CURABLE and to give permanent relief ALWAYS. Descriptive Circulars sent free on application. HOSPITAL REMEDY COMPANY, Toronto, Canada.

TELEGRAPHIC PROGRESS.—The Western Union Telegraph Company's report for the year ending June 30, 1889, shows the wonderful growth of telegraphy in the United States. Since 1870 the company lines of wire increased from 112,191 to 647,697 miles, the offices from 5,972 to 18,479, the messages sent from 9,157, 46 to 54,108,326, the gross receipts from \$7,138,737 to \$20,783,194, the expenses from \$4,910,772 to \$14,565,152, and the profits from \$2,227,965 to \$6,218,041, while the average charge per message has decreased from 75.5 cents to 31.2 cents, and the average cost per message to the company has decreased from 51.2 cents to 22.4 cents. The profit per message was 24.3 cents in 1870, and in 1889 it was only 8.8 cents.

AN HONORED FAMILY.—The *Journal of Commerce* statistician after an exhaustive investigation is convinced that the Smith family in this country have attained all the honors and eminence to which their numerical strength entitles them. About one eighty-fifth of our population are Smiths. Four of the 226 Cabinet officers since the beginning of the Government, or one out of 56, have borne that name: One of the 55 signers of the Declaration of Independence was a Smith, as was also the writer of our two or three really excellent patriotic songs, "My Country, 'tis of Thee." Of the 679 members of the Chamber of Commerce in this city, nine (including the president), or one out of 77, are Smiths; of the 3,000 members of the Produce Exchange, 39, or one out of 77.

INFLUENCE OF PURE AIR.—A Dairy at Frankfort-on-the-Main made the following valuable observations. They kept in a standard stable eighty Swiss cows, extraordinarily well fed and treated. In the years 1878 to 1879, prior to the introduction of a ventilation system, the same yielded on an average per cow, 3,700 liters in 1877, same amount in 1878, and 3,716 liters in 1879. Subsequent to the introduced ventilation the amount of milk yielded, the food being the same, was as follows: In 1880, 4,050 liters milk per head; in 1881, 4,152; in 1882, 4,354 liters.

DOUBTFUL.—A German forest keeper, 62 years of age, not wishing to carry to his grave an important secret, has published in the *Leipsic Journal* a recipe he has used for many years, and which, he says, has saved several men and a great number of animals from a horrible death by hydrophobia. The bite must be bathed as soon as possible with warm vinegar and water, and when this has dried a few drops of muriatic acid poured upon the wound will destroy the poison of the saliva and relieve the patient from all present or future danger.

IMITATION BRONZE.—An excellent imitation of old bronze has been introduced in some of the art products of that character. It is well known that the repeated applications to copper or brass of alternate washes of dilute acetic acid, and exposure to the fumes of ammonia, result in a very antique green bronze; but a more rapid method of producing this beautiful appearance has long been a desideratum. It is now found that this may be accomplished by immersing the articles in a solution of one part perchloride of iron in two parts of water, the tone acquiring darkness with length of immersion, or the materials may be boiled in a strong solution of nitrate of copper. It is also found practicable to insure the desired effect by immersing the articles in a solution of two ounces of nitrate of iron and the same quantity of hyposulphite of soda in half a pint of water, drying and burnishing completing the process.

A PEOPLES' LIBRARY.—The National University of Chicago proposes to erect a \$50,000 library, museum and lecture hall to be devoted particularly to free lectures on political economy to workingmen, and to inaugurate in this country the university extension system of Great Britain, bringing the university to the people. \$25,000 are already subscribed, but subscriptions to the remaining stock at \$10 a share are solicited from the benevolent, payments of 10 per cent, to be made annually. One of the trustees of this fund is S. A. Kean, banker, of Chicago and New York.

LOCATION OF THE SOUL.—The soul, says Dr. A. H. Stevens, of Philadelphia, is located in the corpus callosum, a little spongy body situated at the base of the brain, which has defied the efforts of physicians in their endeavors to ascertain its uses in the human anatomy. "The corpus callosum," said the doctor, "is the seat of the imperishable mind, and is the great reservoir and storehouse of electricity, which is abstracted from the blood in the arteries, and conveyed through the nerves up the spinal cord to the corpus callosum."

REASONS WHY

Should be preferred to all others:

Because—It is genuine-pure, just as it existed in the hepatic cells of the living fish, not depleted of its natural virtues by any process of refining, nor weakened by being made into an emulsion with an equal quantity of water, glycerine, etc., which latter device makes water bring the price of Oil.
 Because—In taste and smell it is not offensive, but instead, sweet and agreeable.
 Because—Its administration is always followed by satisfactory results.
 Because—It is more easily assimilated than other Oils.
 Because—It is more nutritious than other Oils.
 Because—Of its perfect digestibility, perfect limpidity.
 Because—This perfect Oil costs consumers no more than the poorer qualities abounding in the stores.
 Because—It is readily obtainable; all well-stocked Drug Stores have it.
 Because—It is unquestionably the purest and best COD-LIVER OIL IN THE WORLD.

W. H. SCHIEFFELIN & CO.,
NEW YORK.

Sole Agents for U. S. and Canada.

TO CURE DRUNKENNESS.—A Russian physician named Portugaloff declares that strychnine is an infallible cure for drunkenness, administered in subcutaneous injection. He asserts that the experience of physicians has shown the cure to be as rapid as it is certain. The effect of the strychnine solution is to change the craving for drink into positive aversion, and this change is effected in a day. After a treatment of eight or ten days, a patient may be discharged. The strychnine is administered by dissolving one grain in 200 drops of water, and injecting five drops of the solution every twenty-four hours.—*Journal of Health.*

If any paper is desired, not mentioned in the above list, a postal card inquiry will receive a prompt reply. Address,

THE ANALYST PUBLISHING CO.,

19 PARK PLACE, NEW YORK.

VALUABLE TO ADVERTISERS.

You have determined to make money by vigorously pushing your business. As the AMERICAN ANALYST has determined to do the same thing, we have a community of interests. Our way of making money is to increase our circulation, and we can only do so by publicity; that is, by bringing our journal to the notice of a great number of people, who have the intelligence to appreciate a good journal when they read it and the money to buy what they want. You must necessarily want to reach the same class. Even if you do not sell directly to the consumer, it is necessary for you to tell the consumer of the quality of the goods you have to offer to induce him to ask the dealers with whom he trades for them. We propose this Fall and Winter to send a sample copy of this journal to the address of every person in the United States whose name we can find in any of the *Elite* directories or blue-books of the various cities and villages. We will thus reach several millions of new readers in addition to our already large subscription-list, covering every State in the Union. Previous experience with this method of getting new subscribers war-

rants us in undertaking the expense, believing that it will pay us. This large addition to our circulation will put any advertisement in our columns before a multitude of readers. Our advertising prices remain the same, and are so arranged as to give the lowest rates to larger and longer-continued advertisements, and will be sent on application. All respectable advertising agencies will take orders for us. If we find this system profitable, advertisers surely will. Those who have advertised with us always renew as their season comes around, and you will do the same when you have tried it. We have found that in the great competition now existing we must keep our journal prominently before the public, and, in our mutual interest, we ask you to join us. Our system is more effective than a circular, and you will find it just as effective for your business and the cost very much less. Try us. For any further information write, and it will be forthcoming.

Tabasco Pepper Sauce
OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

A BOOK FOR EVERY LOVER OF FICTION!

Ten Complete Novels by Famous Authors!

In one large and handsome volume, neatly bound in colored covers, we have published ten exceedingly interesting complete Novels, by popular and well-known authors, as follows:

JASPER DANE'S SECRET,

By MISS M. E. BRADDON.

THE GIRL AT THE GATE,

By WILKIE COLLINS.

A BRIDE'S TRAGEDY,

By MISS MULOCK.

THE RECTOR'S DAUGHTER,

By MRS. ANN S. STEPHENS.

UNDER LIFE'S KEY,

By MARY CECIL HAY.

GABRIEL'S MARRIAGE,

By WILKIE COLLINS.

THE HEIRESS OF EARNSCLIFFE,

By ETTA W. PIERCE.

THE RIGHTFUL HEIR,

By M. T. CALDOR.

THE DOUBLE HOUSE,

By MISS MULOCK.

TWICE SAVED,

By MRS. MARY A. DENISON.

In glancing over the above list, it will be observed that the authors represented embrace some of the most famous names in literature, both American and European. Each of the ten novels is extremely interesting, though they are not all alike in style, some being of the domestic or home order, and others of the dramatic and exciting kind. These ten complete novels, as above stated, are neatly bound in one large and handsome book, *profusely and handsomely illustrated*, and making a most delightful and very interesting volume. We will send the book by mail, post-paid to any address upon receipt of only **Twenty-five Cents**.

This valuable book will be sent free as a premium to any one sending us \$1.00 for a new subscriber to the **AMERICAN ANALYST**.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no constructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only THREE possessed the power of acting on starch. These brands were **MALTINE**, Corbyn, Stacey & Co.'s Extract, and Keppeler's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity.

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alteratives.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Ferrated.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peptonas.	MALTO-VIBURNIN.
MALTINE with Pepsin and Pancreatin.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analyses, by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.

Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M.D., F.R.S., and an endorsement by SIR ERASMUS WILSON, F.R.S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

INSTRUCT THE PEOPLE.

A striking illustration of the power of the press is afforded in the history of the local beef inspection agitation which was projected last year upon the people by a small ring of self-constituted representatives of the retail butcher interest. Ostensibly asked for to prevent the sale of unwholesome meat, but in reality pushed to secure local monopolies, influences were brought to bear upon several legislatures and the so-called local inspection bills were passed. The influences referred to were, generally, appeals to local pride and to geographical jealousies, and the mistaken conception that the people really wished for such laws. In sections where these influences prevailed these laws were passed and remained in force just long enough to prove the truth of the allegations made by the opponents of the bills, that as soon as a monopoly was secured the quality of the meat furnished by the local butchers would deteriorate while the price would be increased. The courts then

interfered and declared these statutes unconstitutional. Now the local agitators come out boldly and admit that the laws were not asked for in the interest of public health but to prevent the money paid for meat being concentrated in Kansas City or Chicago. This way of obtaining good wholesome meat at a reasonable price is called "an absolute calamity to any community from a financial standpoint." The AMERICAN ANALYST was the first to throw a flood of light upon the doings of these schemers. The absolute superiority of Chicago dressed beef and the animus of the attacks upon it were clearly shown by us. Our articles on the subject were copied far and wide by the newspapers of the country, and the consequences were soon manifested. As the people learned their true interest, they repudiated legislative help which they did not want, legislators soon learned that their constituents would not favor any such law-making, and the local inspection fallacy quickly fell into innocuous desuetude. Had a similar course been pursued when the oleomargarine laws were proposed those iniquitous and unjust measures never would have become a blot upon our statute books nor a precedent for competing foreign nations. It is not too late yet to obtain their repeal. All that is needed is to instruct the people. As the people and press set the key legislators will play the tune.

UNDRAWN POULTRY.

The custom of selling undrawn poultry, which still generally prevails, should be abolished as pernicious and dangerous. In former days, when cold storage was not yet in vogue, there could not be much harm done, but now it has become a serious hygienic evil and should be effectually stopped by legislation. Undrawn poultry cannot be kept even for a few hours without starting the processes of putrefaction. This poison is absorbed by the flesh, and therefore makes such poultry unfit for food. Keeping it in the atmosphere of cold storage warehouses, while it may arrest decomposition, will not undo the deterioration that has already taken place, and the instant such poultry is removed from the cold atmosphere putrefaction sets in again with greater force. In many instances such poultry has been kept for a year, and sometimes longer. What its condition must be we refrain from further discussing. Some time since the New York aldermen attempted to pass an ordinance to prevent the sale of undrawn poultry, but on a public hearing the dealers made it appear that drawn poultry, on account of its having so much more surface exposed to germs, would decompose more rapidly. This, no doubt, was true in one sense, but it was readily answered by the fact that no flesh is fit for human food that has been long exposed to germs. It is a poor argument to say that inasmuch as we must in any event eat putrefying poultry, that which is undrawn is the least likely to show its putrefaction. It is not exactly an appetizing subject, yet it is a very important one, and deserves popular agitation, until by applying the proper remedy

the public health is made more secure. Let us have a strict city ordinance against the sale of undrawn poultry, irrespective of the convenience and profit of the dealers.

"PRAISE FROM SIR HUBERT"

EDITORIAL OFFICE OF THE
"NEW HAVEN PALLADIUM,"
November 11, 1889.

Editors AMERICAN ANALYST: As a newspaper man, and one with a strong active instinct for good miscellany matter, I want to congratulate you on your publication. I can find in it more available items for my different departments than in any other exchange I receive. The ANALYST is certainly a unique and valuable periodical, and I feel sure that if you press its sale among classes who need its instruction, you will gather in thousands who are waiting only to see it before subscribing.

Fraternally,

AMOS P. WILDER.

The above warm commendation from a source with which we had never before been in communication otherwise than through the medium of our printed pages, is eminently gratifying and encouraging; the first, because it is always agreeable to receive appreciative praise, and, secondly, because the most desirable appreciation and praise are such as come spontaneously from a fellow-laborer in the same field of effort. That newspaper men should be the keenest critics of the quality of newspaper work, of course goes without saying. To meet that criticism and challenge its approbation, is to gain an important step in the way to the general acceptance of the public, which is the goal of all intelligent journalistic endeavor. We feel an especial pride, the statement of which we trust is not inconsistent with our native modesty, in the fact that the AMERICAN ANALYST is more extensively quoted and copied, with due credit given, by other newspapers, both here and in Great Britain, than almost any other weekly publication with which we are acquainted. We see these quotations not only in our regular exchanges, but our attention is frequently drawn to their occurrence in journals with which we do not enjoy such a relationship. But even more than of the favorable impression we have made upon our brother editors, we are proud of the successful hold we have gained, and are steadily increasing, upon the recognition of the reading and thinking public. The great community of "consumers"—the housekeepers of the United States—have learned to look to the AMERICAN ANALYST for information and instruction in the thousand-and-one problems with which they are daily confronted, relating to their comfort and physical needs, with the assurance of finding in its columns disinterested, practical advice on those points, such as they can nowhere else so readily obtain. The advertising community, always shrewdly on the alert, recognize this popular quality of the publication. An inspection of our advertising pages will show not only that all occupying space there are representative houses whose names are guarantees of the excellence of their productions, but it will also testify to the benefit our

patrons derive from identifying themselves with our enterprise, by their significant, we might almost say invariable, habit of year after year renewing their contracts. The success that has crowned our efforts of the past five years, justifies us in promising the steady introduction, as opportunity offers, of new features of interest, in the hope of making ultimately the *AMERICAN ANALYST* a welcome weekly visitor in every household in the land.

HOFF'S MALT EXTRACT.

Considerable acrimonious controversy has been carried on through the trade papers as to which of the two "Hoff's" Malt Extracts is the genuine. We have nothing to do with this question, but it may interest our readers to know what such an authority as Dr. Hermann Hager, the best known European writer on pharmaceutical subjects, has to say on the matter. Under the heading, "Malt Extract—health beer, Malt Extract of Johann Hoff of Berlin (a remedy in all diseases)," he says: "Originally (1861) a poor or watered fermented beer like Bavarian beer, adulterated with picric acid and extracts of various aromatics, such as coriander, cardamom, cinnamon, cassia, anise, etc. Later on the extractive matter in the beer was raised by the addition of glucose, glycerine and caramel. Although the presence of these ingredients has been denied by Hoff, it has been too often proven by analyses of competent chemists. The maker of this abominable slop evidently omits to add one or the other of these ingredients as the fancy takes him. The apparent beer extractive when this stuff first appeared was 4 to 5 per cent., but has gradually risen to 7, 8, 10 and 12 per cent." Further comment after what Professor Hager says is superfluous.

WOMAN WAGE EARNERS.

The American Economic Association of Baltimore announces that through the generosity of various persons interested in the subject, it has received \$500 to be awarded as prizes for the best essays on the subject of woman wage earners. The money is to be awarded in the proportion of \$300 for the first prize, and \$200 for the second prize. While the experience of foreign countries will not be excluded, it is expected that competitors will deal principally with the American aspect of the subject. It is desired to know the early and present condition of woman wage earners, their growth in numbers, both absolutely and in proportion to population, the present extent of their sphere of labor, the economic and social evils connected with their various

occupations as wage earners, and remedies for these evils. The essay must not exceed 25,000 words, and must be in the hands of the Secretary of the Association previous to Nov. 1, 1890. Each paper must be type written, signed by a fictitious name, and accompanied by a sealed envelope containing the name assumed as well as the address of the author.

THE MILK IN THE COCOANUT.

It is claimed that a German chemist has discovered in the cocoanut a fatty substitute for butter, and the United States consul at Mannheim, Germany, reports that the new product has begun to be manufactured on a large scale in that city. A single factory produces six thousand pounds of it per day, worth in the market fifteen cents a pound. The nuts used are obtained mostly from the South Sea and coral islands, Arabia, the coast countries of Africa, and South America. Natives in countries where the nuts grow have for a long time used the milk of these nuts instead of food oils. The butter contains sixty to seventy per cent. of fat and twenty-five per cent. of organic substances, of which ten per cent. is albumen. In a country where real butter runs all the way from twenty-five to thirty cents per pound, cocoanut butter at half that price is thought to have a great future before it. At present it is chiefly used in hospitals; but it is rapidly finding its way to the tables of the poor, particularly as a substitute for oleomargarine. It is free, also from germs of tuberculosis, which is said to afflict fully ten per cent. of the milk-giving cows in Germany. The consul recommends the adoption of this new butter as an article of manufacture in the United States.

THE QUEEN WINS.

HOW LOUIS XVI. FAILED TO APPRECIATE THE DISCOVERY OF BEET SUGAR.

The Bastille had not yet fallen. The thoughtless youth of the French aristocracy still danced through the saloons of the royal castles. Maurepas still reigned Prime Minister—that same friend of humanity who made the compassionate decision concerning the people's welfare: "Why build hospitals? Cannot the people die on the roads, if they like?"

This evening Maurepas had the honor of being permitted to lead the beautiful Marie Antoinette to the card table, but, complaining of a severe headache as they passed through the saloon, the good queen excused him from further attendance that the pain might not be increased. As he was hastening back through the ante-chamber to the dancing hall, where the king was taking his coffee, he perceived beneath the gobelin tapestry of the famous Louvois window a man in citizen's dress, who regarded him expectantly and bowed low before him.

"It is all right, Dumonet," whispered the asthmatic old man; "this evening his majesty will taste of it." And he forthwith thrilled out one of his hundred madrigals, which, in truth, were tame enough, but which his flatterers found very witty. In the royal apartment he saw just then Louis XVI. take from a sugar basin two delicately broken lumps of sugar and sweeten his coffee with them. As the king took a mouthful of the coffee the ministerial friend of the people approached and asked respectfully:

"How does your majesty find the coffee this evening?"

"As usual, excellent."

"The best mocha is always upon your majesty's table; but does the sugar sufficiently moderate the bitterness of the coffee?"

Louis XVI. was sensitive to mockery and irony even to timidity; therefore he said inquiringly:

"What do you mean by that?"

Maurepas laughed, "Your majesty, permit me one

question. How much, sire, do you think these two pieces of sugar cost?" The king looked uneasy.

"Do you wish to test my mathematical ability?" Maurepas continued to laugh. "Well then I will answer your problem: Sugar costs the people about eighty sous a pound. If I reckon 80 pieces to the pound it makes one sou for each piece; but since to me as king everything is quadrupled, I have this evening consumed eight sous worth of sugar."

"This sugar is the gift of one of your subjects, who counts himself happy that it is considered worthy of a place on your majesty's table; therefore it costs you nothing, sire, but the giver values every piece at a full Louis d'or."

"You are beside yourself, Monsieur de Maurepas, eighty Louis d'or for a pound of sugar! At that rate I should be compelled to sell Rambouillet to supply my brother with sugar for a year, for you know he takes a handful to every cup. But explain to me your jest."

"In a moment your majesty." And he took the sugar basin and emptied the contents upon the marble table and counted the pieces, "forty-three, with the ones used, forty-five, worth 1080 francs; but look, your majesty what dazzling whiteness and how light it is and how sweet, without any bitter after-taste."

"Come now," said Louis, interrupting his babble, "is sugar ever bitter?"

"And your majesty will never guess from what this sugar is made."

The king was not without some knowledge of chemistry; therefore he answered hesitatingly:

"Naturally from the sugar-cane."

"Pardon me, your majesty, it is beet-root sugar."

"Beet-root! What is beet-root?"

The Duchess of Chartreuse, who was listening, drew nearer and said, "Beets, sire, are little red leaves of which my servants make salad."

Monseigneur de Maurepas cut off her explanation with a malicious laugh. "Beets are edible roots, which people as well as cattle find palatable, and now they have been found to yield sugar."

Respect kept the brilliant company out of hearing distance and they watched eagerly the strange proceedings. All this examining, weighing and counting of the sugar tossed up the court gossip among them like a bright soap bubble. Who first whispered it?—"The king has been poisoned by a cup of coffee!"

"Heaven forbid! and we have drunk the same coffee!"

"No, not the coffee, it was the sugar."

"Some one go tell the queen!"

So whispered, murmured and chattered the excluded circle.

Marie Antoinette sat with the Duchess of Polignac, her tenderly-loved friend, at cards.

"What ails you, Agatha?" asked she kindly, as the favorite sighed.

Agatha de Polignac raised her roguish brown head and said saucily, "Three millions my adored queen!"

"Sigh not, my angel, I will beg Louis to grant them to you. We owe it to the great families."

The designing princess lifted the queen's lace sleeve to her red lips, whispered gratefully, "Oh! that I might be permitted to die for my beloved queen!"

"Live for me, you dear child, and, my word for it, I will provide the three millions, for which you will be willing to live."

At this moment a courtier approached and broke to them the dreadful tidings:

"His majesty has been poisoned by Monsieur de Maurepas with sugar."

A moment later the queen, white to the very lips, stood beside her husband.

"For heaven's sake, Louis!" cried she in her distress, unmindful of all ceremony.

"What is the matter, queen?" asked Louis in the gentle way which he never abandoned towards his beloved wife. "What brought you to me? You are very pale." He seized a glass of water, poured some of

the newly-discovered sugar in it, and handed her the glass.

"Drink! It is too warm in the saloon, and the company is too exciting; this sugar-water will refresh you."

The queen cast a penetrating glance at Maurepas, who now fully understood what he had only half heard. With a quick movement he took the glass from the king's hand and drained it at a draught.

Red with anger the king demanded an explanation of this insolence, but Marie Antoinette offered the minister her hand and was about to explain to the king, when suddenly the broad leaves of the great door flew open and the Palace Guard led in a man quite up to the feet of the king. The terrified appearance of the prisoner, his coarse coat, the brown waist-coat and pantaloons, the broad, clumsy shoes with leaden buckles, contrasted strangely with the gay silken attire, the gilded hangings, the laces and diamonds, of the surroundings.

"What does this mean?" asked the king astonished.

"Permit me, your majesty, to bring this man before you, who understands how to make sugar out of vegetables. Dumonet is trying to ruin our colonies and make them useless to us. This is the discoverer of beet sugar."

"Discoverer? No, that honor does not belong to me," exclaimed the Chemist Dumonet. "It was a learned Major Serre, who, during the Regency, deceived by the beautiful red color the beet gives out in cooking, fancied he could make red wine out of it. Instead of the desired wine he found the bottom of his retort covered with fine sugar. At that time France was rich in colonies on the Mississippi, therefore no one paid any heed to the discovery. Nor was it fully developed. I learned abroad, in Prussia, new improvements, expended my small possessions to test it, and I hope I have succeeded."

"It is not a poison then?" cried Marie Antoinette, meaningly. The king for the first time understood what had preceded, and discovered also that the chemist was bound. At a sign the bond was cut and the guard left the room without Dumonet.

Meanwhile the Queen bravely took a piece of sugar and put it in her lovely mouth. That was the signal for the young courtiers to rush upon the before distrusted sugar, vying with each other to exhibit their courage, their devotion through this harmless poison.

"Gently, my ladies, my lords," cried Maurepas, "every little piece of that sugar cost a golden louis."

"But the sugar is not one bit better than our ordinary sugar," remonstrated the queen, "and it is only a curiosity leading to ruin."

Dumonet dropped on one knee. "Your majesty is in a measure correct. Experimenting in a small way, at the same expense as a great trade, naturally makes this sample excessively dear; but if your majesty will advance me two millions for the development of larger facilities for manufacture, I shall be able to furnish a pound of sugar for ten sous, instead of four francs."

The king recoiled involuntarily, and Marie Antoinette grasped her famous necklace, which had cost two millions, as if the plain man before her had been a robber. Her disapproving glance gave direction to the king's answer.

"Dr. Dumonet, I honor enterprise; accept this snuff box as a recognition of it. But two millions the State cannot possibly lend you. That is too much money for the exhausted exchequer."

Dumonet received the gift respectfully. "Sire, sooner or later my enterprise will find the money."

The whole shallow, subservient swarm of courtier-lings cried out an excited echo of the royal words:

"Two millions for sugar! Two millions! The man should be in a mad-house. How can any one be so shameless? Just as if it were not all the same whether one pays ten sous or four francs for a pound of sugar; and if any can't pay it, let him take his food unsweetened."

"What has the government to do with that?"

And so Dumonet was dismissed. He had only needed one million; the second was the price demanded by the minister for the introduction. On this evening Maurepas composed the only good verse of his life, which, translated, runs somewhat thus:

"Altho' his life to sweeten
Is all his royal care,
Two million francs for sugar
The king finds rather dear."

The furore which his wit created at the court consoled him somewhat for the lost million, and was it not all the same whether at his death there should be a deficit of one paltry million, more or less? He left, in fact, a round ten million in debts. It was a noble sum; nine would not have sounded so impressive.

Dumonet migrated to Belgium, where he found more appreciation, and lived, safe and respected, while the revolution storm swept over his unhappy fatherland. "Who laughs last, etc."

"And my queen would have died with me?" asked Louis, as he accompanied her to their chamber that night. She was so beautiful, so dainty; in her wonderful eyes beamed the reflection of loving tears. The next morning the king granted three millions and a half out of the State coffers to the "unfortunate" Duchess of Polignac.

CORRESPONDENCE.

THE BOGUS CALIFORNIA WINE.

Gents: Regarding your article of California wines made in New York, appearing in No. 45 of your paper, I beg to say that probably for "valuable" reasons you forgot to mention the principal buyers, viz.: Roskam, Gerstley & Co.; L. B. Schuler, of Brooklyn; F. C. Neale and Morris Spiegel; also T. Altschul. Yours truly,
FAIR PLAY.

While we are not in the habit of noticing anonymous communications—and least of all, such as betray their Chatham Street old-clothing-dealer source by the use of the barbarism, "gents"—we feel disposed to depart from our custom in respect to the above effusion, in order to refute the covert innuendo its language conveys. We had reasons, in preparing the article referred to, though they were not of the "valuable" sort impertinently suggested by our postal card correspondent, for omitting the names of several buyers at the wine sale under consideration. The only means we had of ascertaining the names of the buyers at the sale were the auctioneer's books, from which we obtained our information. As the sale was for cash, no particular pains were taken by the auctioneer's clerk to record the names correctly, and in the majority of cases, apparently, they were written by him as they sounded. Of those given by "Fair Play," the name Roskam appeared on the books as Roskow and Roskof; that of Schuler as Schulloff. The other names did not appear at all, and if the persons bearing them bought anything at that sale, they must have done so under assumed names. After carefully referring to the city directory, as well as to the business directory, all the names that could be found therein as connected with the wine business were given. Not one of those named, either on the auctioneer's books or in the article in question, is known to any person connected with this journal, nor were they called upon.

NOVEL PRICE LIST.—A manufacturing company, of Cincinnati, is using a novel means of presenting its specialties to customers, by printing a price list of several pages in copying ink, the pages to be torn off and signed by a customer asking discounts, the added matter then all being made in copying ink, by the company, and a copy taken. By this means an exact record is kept, involving but little labor and one which cannot fail to be a great convenience in any following business transactions.

IMPORTED SALTS.

SOME VIEWS CONCERNING THE ALLEGED MINERAL BITTER WATERS.

The daily papers are filled with the loudest and most exaggerated sort of advertisements of the great virtues of such alleged imported mineral waters as the Hunyadi Janos, the Franz Joseph and Friedrichshall waters. An eminent German physician has just written an article on the subject which certainly reads like good common sense. He criticizes the manner in which these waters are advertised; says they are puffed like any nostrum, and even in strictly medical journals claims are made for them with which to induce medical men to recommend them to their patients, which should at once condemn them. This writer suggests that as the only virtue of these waters is in the sulphates of magnesia and soda they contain, to substitute for them these salts which are much cheaper and infinitely more safe and reliable in use. Professor Hager supplements this advice by furnishing a formula for a dry salt to be used instead of the varying imported waters.

	HUNYADI JANOS. Parts.	FRANZ JOSEPH. Parts.	FRIEDRICH- SHALLER. Parts.	PULLNA BITTER WATER. Parts.	BITTER WATER. Parts.
Bicarbonate of soda, fine powder....	10	15	5	10	10
Sulphate of soda, coarse powder.....	550	550	550	300	500
Sulphate magnesia, crystals.....	500	550	450	300	500
" potash, fine powder.....	2	...	8	5	19
" lime, " ".....	...	15	60	..	..
Chloride of soda, dry crystals.....	20	20	320	20	20
" " potash, coarse powder.....	...	..	160	..	..
Of the mixture use to one quart of water grammes.....	100	110	40	30	100

Professor Hager gives these formulas, but recommends that the sulphate of lime be omitted, as more likely to be harmful than beneficial. If it is desirable to have carbonic acid gas, plain carbonic acid gas water may be used with the salts. The mixtures of the salts should be kept dry. Any druggist can make them. A proper dose of the salt mixtures is 15 grammes or about half an ounce.

A NOVEL IDEA.—Hon. A. S. Hewitt, ex-Mayor of New York, is erecting a dwelling house at his country seat, at Ringwood, Passaic County, N. J., which for cheapness, originality, durability and fire-proof quality will probably excel any structure ever erected. Mr. Hewitt first erected a balloon frame. This he covered, inside and out, with woven wire fire-proof lathing. On this he placed a moderately thick coat of adamant plaster, serving the roof in the same manner. As a result, he will have a stone house, positively fire, damp and vermin proof, at less than one-half the cost of a cheap frame building, and a thousand times more durable.

CALIFORNIA INDUSTRIES.

(Continued.)

THE REDWOOD FORESTS.

But few persons have an adequate conception of the magnificent part redwood timber is destined to take in the near future in the markets and lumber industries of the United States. The California redwood, for symmetry of growth, productiveness of merchantable lumber to the acre, beauty of finish, durability, and general adaptability for variety of uses, is without a peer among the conifers for the general uses of civilized life. The eastern reader who has never seen a California redwood forest may be astonished to learn that one tree measured 349 feet nine inches in height, and another 19 feet in diameter underneath the bark, and the yield of one measured acre scaled in milled lumber 1,431,530 feet board measure. There are thousands of acres that will yield this amount. All Eastern lumbermen are familiar with the enormous losses by fire each year in pine lands. The immunity of the redwood from forest fires, is also peculiar to its congener, the *Sequoia Gigantea*, the famous big tree of the California Sierras. The botanical name of the redwood, *Sequoia Sempervivens* is appropriately suggestive of the resistant powers of the wood against fire and decay, as well as of the tenacity with which the redwood stump clings to its maternal lap of earth, and sends up a multitude of shoots and suckers when the tree has been felled. We do not say that the redwood tree is a salamander, or that the wood will not burn under any circumstances. When properly split and seasoned, redwood burns well and is a favorite with the housekeeper for kindling purposes in building fires. The immunity of San Francisco from extensive fires has been largely attributive to the extensive use of redwood for building purposes. There is absolutely no resinous gum in redwood, and a single dash of water from a hose will, in an instant, change the blazing side of a building into a fireless, blackened wall without a spark remaining. Mr. Allan McKay, of Eureka, gives the average yield per acre in some land near by at not less than 500,000 feet. Average the value of this at \$15 per thousand feet, and we have \$7,500 per acre. This is nearly ten-fold of the whole assessed value of property in California, and thrice the value of all the gold and silver mines of the Pacific Coast since 1848. There would be, therefore, more value in the redwood of the northern counties, than in all the gold found in all the mines of all the counties of California, from pioneer times to the present day.

The enormous productiveness of the redwood timber land of California is amazing to any one whose experience has been limited to pine lands. The average size of the trees is six to eight feet in diameter, occasionally running up to twenty feet, with one to two hundred feet of trunks free from knots or limbs. With such standing timber as this, the large proportion of clear lumber is apparent to any experienced lumberman. The yield is from fifteen to twenty times greater than of average pine lands. A plank recently shipped from California, ten feet in width and twenty feet long, would be an impossibility elsewhere than in the redwood forests. Items of the wonderful yield of single redwood trees are of frequent occurrence in the California press. As an illustration, a Sonoma County paper, in a recent issue, instances the fact that one of the largest churches in Santa Rosa, a city in that county, of over 7,000 population, was entirely built, including inside finish in wood instead of plaster, from a single redwood tree. In addition to building the church, 60,000 shingles were taken from the same tree. Another redwood tree in the same section has kept two men busy for two years in cutting it up into shingles. For architectural art, especially for interior finish, where rich, warm colors, beauty of grain and easy susceptibility to polish are desired, redwood is fast winning its way into favor. In California, redwood is almost exclusively used for outside rustic work

and general covering to buildings, and one of its merits is, that it does not hold fire when exposed to that element, a single dash of water extinguishing fire in it completely. Another merit which commends redwood to builders is the fact that it does not warp or shrink from exposure to the weather. Tight joints and a permanently neat appearance are thus assured by its use. For fine cabinet work redwood is becoming popular in an increasing circle of manufacturers. Nothing can be handsomer than the rich brown, warm effect and satin finish of selected redwood. Walnut, mahogany or rosewood are far inferior in pleasing effect to a good redwood buhl veneer with its charming intricacies of grain, or a selected piece of "curled" redwood, or the root of the tree. Redwood must soon be a necessity in the Eastern States as a finishing wood. California has a magnificent heritage in her redwood lands, and the man who secures a redwood tract and holds and uses it judiciously, has a better thing than national bonds or stock securities of any kind. During the last seven or eight years a quiet and growing movement in the way of acquiring redwood lands has been going on. By direct location from the Government and by purchase from holders of small claims of one hundred and sixty acres in many instances, the tracts on which mill owners depended for their supply have been taken and centered in the hands of moneyed men. When too late mill owners have awakened to the knowledge that the land they needed, and which, had they taken time by the forelock, they could have got at a small advance at the Government price, is unavailable to them except on the terms of men who can afford to keep them until they get their own price. It is plain to be seen, that in such cases the man who owns the land makes the money. There are many opportunities still left in the redwood country for the initiated ones to secure tracts that will bring fat returns. The area of redwood forests in California has been placed by Professor Kellogg, of the University of California, who has devoted much attention to the matter, at about three thousand square miles. Half of this limited area has been cut over.

MALT.

A PLAIN DESCRIPTION OF THE PROCESS OF CONVERTING BARLEY INTO MALT.

The process of malting, or the conversion of barley into malt, is accomplished in four successive steps. The first step is steeping the barley, which consists in introducing the grain into a large wooden or stone cistern and adding thereto as much water as will cover it. On being thus treated for twenty-four hours, the grains of barley absorb the water, and the contents of the cistern near the top even begin to feel dry. The barley swells up much, so as to increase considerably in weight. The amount of water that barley takes up in the steeping affords good evidence of the excellence of the grain. Thus, the better kinds of barley, on the average, take up sufficient water to increase their weight one-half. Occasionally, however, the increase is not more than one-tenth. The time during which the grain lies in the steeping-cistern is about forty hours, when the excess of water is drained off; but a regulation exists that the cistern cannot have a second charge of barley till four days have elapsed after the introduction of the first charge. The second step is termed couching. The grain is thrown out of the steeping cistern in a heap on the floor. At this stage the barley is soft, and when pressed between the fingers it is readily bruised. It lies in the couch or heap for twenty-six hours or so, and during that time it rises in temperature about 10 deg. F., and gives out some of its extra water. This *sweating*, as it is called, is the result of the partial germination or growth of the barley, and little rootlets or fibrils of the radicle, and a primitive stem, begin to form and present themselves. As the temperature rises, the radicles lengthen rapidly, and means are then taken to

check the germination. The third step is flooring. The heated barley is spread by the workmen with spades on the floor to the depth of about fifteen inches at first. It is repeatedly turned and respread over a large area with a thickness of layer decreasing to six inches. At this stage the radicles have attained their greatest length. The fourth step is kiln-drying. The half-germinated barley is now introduced into a kiln, on the perforated floor of which it is spread. The apartment beneath the kiln-room is fitted up with stoves which evolve much heat; and this rising and passing through the slits or perforations in the floor of the kiln necessarily dries any moist barley laid thereon, and the steam escapes through a pipe through the roof. The heat which the barley is subjected to in the kiln is, at the commencement, 90 deg. F., but this is gradually raised to about 150 deg. While drying, the radicles break off from the grain and are afterwards removed by a wire sieve. The color which the barley assumes as it becomes dry malt in the kiln is determined by the heat to which it is subjected, the higher temperature yielding the darker-colored malt. During the conversion of barley into malt, a loss of material occurs. Thus 100 parts of barley yield 80 parts of malt; but as the 100 parts of barley contain 12 of water, it follows that there are present only 88 parts of dry matter, and these yield 80 parts of dry malt, giving a loss of 8 per cent. of the original weight of the barley. While there is a decrease in weight, there is an increase in bulk, 100 measures of barley becoming 101 to 109 measures of malt. Certain chemical changes likewise occur as the barley is transformed into malt, which may be noticed by the following table:

	Composition of Barley.	Composition of Malt.
Hordein.....	55	12
Starch.....	32	56
Sugar.....	5	15
Gluten.....	3	1
Gum.....	4	15
Resin.....	1	1
	100	100

The principal chemical change is, therefore, the transformation of much hordein (a form of starch) into starch, gum and sugar. The mechanical condition of the contents of the grain is also altered. The grain is now of a fine mealy nature, between the fingers, when the flour in the interior is found to be soft and distinctly sweet to the taste.—*New England Grocer*.

ABORIGINAL MINING.

ANTIQUITY OF SOME AMERICAN MINING WORKS.

Writing on "Ancient American Mining in North America," Professor Newberry speaks, in the *American Antiquarian*, of the great antiquity of the aboriginal works. The ancient copper mines on Lake Superior were abandoned not less than four hundred years ago; for the heaps of rubbish around the pits made by the ancient miners were covered with forest trees that had reached their largest size. The old mica mines of North Carolina and the quarries of serpentine in the Alleghanies showed like evidences of antiquity. Some population in the Mississippi Valley worked the oil fields in various places. The author, visiting Titusville in 1860, when the first well had been opened, noticed pits in the ground, which proved to be relics of the excavations of primeval oil gatherers. A citizen, digging a well in one of the pits, had discovered and followed an old well, which was cribbed up with timber, and contained a primitive ladder like those which have been found in the old copper mines of Lake Superior. The cribbing had been rudely done with sticks from six to eight inches in diameter, which had been cut or split by a very dull instrument, "undoubtedly a stone hatchet." The oil was probably gathered by being skimmed from the water that collected in the bottom of the pit. Traces of a similar well were observed at Enniskillen, Canada, and depressions in the surface like those on Oil Creek

were noticed at Mecca and Grafton, Ohio. Ruins of an ancient lead mine exist on the Morgan farm, near Lexington, Ky., in the form, where they have not been disturbed, of an open cut, from six to ten feet wide, "of unknown depth, and now nearly filled with rubbish. On either side of this trench the material thrown out forms ridges several feet in height, and these are everywhere overgrown by trees, many of which are as large as any found in the forests of that region." Galena has been found in many of the ancient works in Ohio, but has never been smelted, and appears to have been valued merely for its brilliancy. Dr. Newberry does not believe that the mound builders were of the present Indian stock.

BEET SUGAR.

ITS HISTORY, QUALITY AND CHEMICAL COMPOSITION.

About the middle of the eighteenth century Marggraf made the important discovery that the sugars of the juices of beets, carrots and certain other fleshy roots are identical with one another and with the sugar of the cane. Proust, another investigator, showed that all sweet vegetable juices owed their sweetness to one or more of only three species: cane sugar, grape sugar and (amorphous) fruit sugar. Honey was found identical with grape sugar. A number of new sugars similar to these three have been discovered since, but none are at all widely diffused throughout the organic kingdom. Milk sugar was isolated and its individuality proved in 1619 by Fabrizis Bartoletti. It may be stated here that cane sugar, originally coming from India, was known before the seventh century. The sugar beet is a cultivated variety of *Beta maritima* (natural order Chenopodiaceae), other varieties of which, under the name of mangold or mangel wurzel, are grown as feeding roots for cattle. The plants are cultivated like turnips, and the roots attain their maturity in about five months after sowing, being gathered during September and October. The efforts of growers have been largely directed to the development of roots yielding juice rich in sugar; and especially in Germany these efforts have been stimulated by the circumstance that excise duty on inland sugar is there calculated on the roots. When this sugar is exported from Germany a drawback is paid for that on which no duty was actually levied, and hence indirectly comes the so-called bounty on German sugar. In France till recently the inland duty was calculated on the raw sugar; hence the French grower raised roots of a large size, and had no motive to aim at rich juice and economical production. Since 1884 the French manufacturers have had the power to elect whether duty shall be levied on the roots they use or on the raw sugar they make, and a large proportion chose the former. The nature of the seasons exercises much influence on the composition of sugar beet, especially on its richness in sugar, which may range from 10 to 20 per cent. The following represents the limits of average composition:

Water { 84.5 to 79.0 } Juice.
 { 11.5 to 17.0 }

Sugar and other soluble
bodies, cellulose and
other solids. } Solids... 4.0 to 4.0

Two distinct ways of obtaining the juice from beet are now principally employed—pressure and diffusion. The former is principally used in France, the latter process is all but universal in Germany. Formerly a modified diffusion process—maceration—was in use; but it has now been generally abandoned, as also a means of separating the juice by centrifugal action. The limits of an article of this nature prevent our going into the details of the pressure or diffusion process, the purification of beet juice, crystallization or the separation of the crystals from molasses. When beet root sugar reaches the refiner he deals indifferently with raw cane and beet root sugar, and by precisely the same series of operations. There are numerous modified and subsidiary processes connected with refining, as well as with all

branches of the sugar industry, regarding which it is not possible here to enter into detail. One of the strong competitors of beet sugar is sorghum sugar, the stem of the guinea corn (*sorghum saccharatum*), which has long been known in China as a source of sugar. The sugar is obtained by the same method as cane sugar. Sorghum has not found much favor in the United States, the total yield not averaging more than 60,000 lbs. annually. Though the agricultural department has always seemed to encourage the cultivation of sorghum more than sugar beet, the farmers do not seem to have taken to it so readily. At the present time, judging by the amount sent to market, cane and beet sugars are produced in about equal amount; but as there is a large amount of cane sugar grown and consumed in India, China and other Eastern countries of which we get no account, there cannot be a doubt that the annual production of cane far exceeds that of beet sugar. Still, as a growth of not more than forty years, the dimensions to which the beet sugar trade has attained are certainly remarkable. These dimensions would not have been so suddenly attained had it not been for the system of protection and bounties established in the producing countries. The largest beet sugar producing countries range in about the following order: Germany, Austro-Hungary, France, Russia, Belgium, Holland, United States. The cane sugar producing countries range as follows: Cuba, Java, Brazil, Manila, Mauritius, Demarara, Louisiana, Trinidad, Porto Rico, Barbadoes, Martinique, Peru, and several of smaller production than 35,000 tons per annum. At present, owing to improved processes, beet sugar has largely driven cane sugar out of Europe. Beet sugar manufacture was first attempted in the United States, in Philadelphia, in 1830. At that time the European beet yielded only 4 to 5 per cent. of sugar, though the present yield is as high as 14 per cent. In 1863 a large factory was established at Chatsworth, Ill. Other factories have since started in that region, but none have been very successful. In 1870 the Alvarado Sugar Company was formed in California. Other companies have since been established with good prospects of success. They have all met with difficulties. There are obstacles in making beet sugar which do not exist in the case of cane. The product of sugar is but two-thirds that of cane, while the juice is highly charged with impurities which need removal by expensive processes. The total annual product of beet root sugar in this country is estimated at 2,000 tons, but there are indications of a steady increase. Of the total world's product of sugar it was estimated that 66.47 per cent. was cane, 27.87 beet, 4.29 palm, and 1.28 maple. A few years ago the United States produced in one year 2,137,667,865 lbs. of cane sugar, 41,440,000 lbs. maple, 1,344,000 lbs. beet root, 896,000 lbs. sorghum. Mr. Claus Spreckels has given the beet root sugar industry a fresh impetus by the establishment of large factories in California and Pennsylvania. With new and improved machinery, a large experience gained from former experiments, and reasonable advantages of soil, climate and cultivation methods, it is to be hoped that the beet root sugar industry of this country will yet attain the importance it seems to deserve.

NO END OF GAS.—The Professor of Geology in the University of West Virginia declares that the rumors of failure of natural gas are idle and have no foundation. From his protracted study and investigation of these regions, aided by the best scientific light on the subject, he asserts that the production will largely increase for years to come.

CLOTHING.—Clothing possesses no warmth in itself, but as it is more or less a poor conductor of heat, it prevents the escape of the bodily warmth. Woolen fabrics contain a large quantity of air entangled in their meshes, which, being a poor conductor of heat, adds considerably to the warmth of clothing made from them. In hot weather we wear light cotton or linen clothing so as to allow as much of the bodily heat to escape as possible.

THE BISON.

THE HERD OF TEN YEARS AGO NOW ALMOST EXTINCT.

Stretching away for many miles from the western base of the hill was a plain, as level and unbroken as a sleeping lake. Far, far as the limit of human vision extended was scattered a vast drove of the long and eagerly expected buffaloes. To count such a herd, or even to guess approximately their number, was a task about as hopeless as to compute the leaves of a great forest. The ground was literally swarming with them, and their dusky, shaggy, grotesque bodies, thickly mingling and blending, scattered away indefinitely into the misty distance, until, like a black cloud, they faded away into earth and sky at the remote line of the horizon. Each huge creature was in restless motion. Some browsed on the luxuriant herbage: some wallowed in the moist earth; some gambled or engaged in playful contests. A subdued, continual roar was heard arising from the moan-like bellowing of the countless drove. The hoof strokes of the myriads of feet also produced a dull, heavy sound, which, combining with the other noise, reminded one of the distant lash of the surf on a rock-bound coast; only there was no ebb and flow—the sound was unbroken. The endless movements of the herd were as kaleidoscopic as the tossing of the troubled deep. On both sides of the road this mighty host grazed, browsed, wallowed and played, totally unconscious that human eyes were gazing on the scene. It was a spectacle that filled every breast with varied emotions—wonder, surprise, curiosity, apprehension (for all had read about or heard of the fearful stampedes of buffaloes), not unmingled with awe.

SLAUGHTER-HOUSE ECONOMY.

HOW THE ANIMAL CARCASS IS ALL UTILIZED.

The *Sunday Call* editor has discovered that after a steer goes to a Newark slaughter house nowadays, the only thing that is wasted is his dying breath, and if it were possible to find some use for that, no doubt it would be caught and preserved. Nothing else is wasted, from the tip of the tongue to the brush on the end of the tail. The blood is caught and sold to make albumen for sugar refiners and other manufacturers, one use of it being the cheap substitute for hard rubber and other plastic material used in the manufacture of buttons and other materials. Next the hide is taken off, and after the meat is dressed, the contents of the stomach are removed and dried and bailed for manure, and the stomach itself is prepared as tripe. The hide goes to the tanner, the head is skinned and denuded of flesh for the sausage maker, the horns are knocked off and go to the combmaker, who knocks out the pith and sells it to the glue manufacturer, who is ever ready to take all the refuse from any part of the steer. The horny coverings of the hoofs are almost as useful as the horns for making buttons, etc., and the feet make oil and glue. The shin bones make the finest bone handles for various purposes, and all the remainder of the bony structure which the butcher is unable to sell with the meat finds its way eventually to the manufacturer of bone fertilizer and bone black. With the bones there is usually considerable marrow, grease and glue stock, all of which is used by the bone men in various ways. A few of the tails are absorbed in cold weather in the manufacture of ox-tail soup, but usually "the tail goes with the hide," and becomes spoiled for domestic use while lying around the tannery. Every scrap of the skin of the animal, even the pate, as the skin of the head is called, is used in one way or another, and the refuse of the tanneries forms an important part of the income of the establishments.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

November.

MEAT.—Beef, mutton, pork, venison.

POULTRY AND GAME.—Chicken, duck, geese, grouse, hare, partridge, pheasant, pigeons, rabbits, turkeys, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, whiting, salmon, trout, perch, smelts, oysters.

VEGETABLES.—Artichokes, broccoli, celery, potatoes, turnips, cauliflower, cabbage, carrots.

FRUIT.—Apples, pears, quinces, grapes, nuts.

PRACTICAL RECIPES.

CLEAR BEEF TEA.—Put one pound finely chopped beef in a soup pot, and with it a bit of bay leaf, a little parsley, celery, and half an onion. Cover it with a pint of cold water and place the pot where the soup will scarcely simmer, for a little more than an hour, let it boil up and skim well, then set back to simmer for a couple of hours. Strain out the vegetable and season. To clarify, pour into the strained soup half a cup of cold water in which the white and shell of an egg have been well mixed, and let boil for ten or twelve minutes; add a little cold water and let it boil again, strain through a cloth and serve.

OYSTER PATTIES.—Take twenty-five or thirty oysters that are small and fresh, and let them boil in their own liquor, skimming well, for a few moments. Strain them quite dry, mix together about a tablespoonful of butter and a tablespoonful of flour, put over the fire and let cook for a moment. To this add a full cup of sweet cream and the liquor drained from the oysters, and season to taste with nutmeg, cayenne pepper and salt. Let boil ten or fifteen minutes, being careful not to burn; then strain and add the oysters, and if you like a bit of butter. Fill the patty shells which have been heated just before serving.

LEFT-OVER SALMON PIE.—Take out all skin and bones from the salmon. Mash some potatoes, making them light and palatable with milk and butter, pepper, salt and the beaten yolk of an egg. With this line a pie plate, put over it pieces of the fish, moisten with fish sauce, add another layer of the potatoes, and brown in the oven.

SAGO PUDDING.—Having buttered a pie dish thickly, put into it a teacupful of ground sago. Add two tablespoonfuls of sugar, and a little grated nutmeg, or lemon. Then nearly fill the dish with boiling milk. Pare and core two large apples, slice them into the pudding, place a lump of butter on it and bake in a gentle oven.

JELLY ROLLS.—Mix thoroughly together when dry, one cup flour, one teaspoonful Horsford's Baking Powder, and sift. Then add one cup sugar, four eggs, and one tablespoonful cold water. Bake quickly in long shallow tins, and as soon as it is ready to slip from the pans, spread jelly on the bottom and roll up; then roll a napkin tight around it until cooled.

PARSNIP CROQUETTES.—Boil some parsnips and then mash them adding a little butter, and milk or good gravy. Mix thoroughly and let it get cold. Then shape it into the form of corks, dip in egg and bread crumbs, fry in boiling lard.

SQUARE POTATO CAKES.—To two cups of mashed potatoes add a teaspoonful baking powder, a little flour, salt and pepper, and enough milk to enable you to roll it out very thin. Cut into squares and fry on the griddle.

CORRECTION.—By an inadvertence unusual to us, but none the less to be regretted, the recipe for pumpkin pies, in our issue of October 17, on page 496, states that the quantity given is sufficient for four pies. It should say one pie.

AMERICAN RAISINS.

MALAGA VINEYARDS FAILING AND THOSE OF CALIFORNIA IMPROVING.

According to Mr. A. B. Knapp, a vineyard owner from Napa, Cal., all raisin growers who have not signed contracts for this year's crop would make small fortunes. "The crop of the province of Malaga," said he, "has fallen off in half a dozen years from 1,900,000 to 700,000 boxes, and the shipments to the United States have declined from 1,000,000 to 112,000 boxes. Spain is no longer a competitor, and the recent storms in California have cut down the product by one-half. This shock struck the market after most of the Malaga crop had been disposed of, thus leaving a large deficiency hard to overcome. Prices will boom, and owners who have saved but a fractional part of their crop will realize as much as if they had the entire crop to sell. Our State now stands at the head of the line in producing raisins. One acre in our country will produce more grapes than three Spanish acres, and no climate is equal to ours for curing raisins. California has not only conquered the American market, but is stretching out for the markets of the world."

FASHION'S FANCIES.

THE LATEST THINGS IN ORNAMENTAL STATIONERY.

The following recital of the novelties in the line of stationers' goods this season is taken from *Geyer's Stationer*, the best local authority on that subject:

A beautiful speckled trout does duty as back and handle to a clothes brush. Three racing skiffs all in a bunch with oarsmen pulling for dear life make a neat silver bronze paper weight. A candle end, a half-used stick of ceiling wax, two burnt matches and a mouse are the details of a unique bronze paper weight. Bright with changeful metallic hues is a tray for an ink set made of olive wood simulating a turbot. The colors are laid under the polish. A card receiver simulates a shallow wicker basket in white silver bronze; on the rim is a cute, saucy little wren in natural colors. Realism *en extenso* is seen in a pair of old boots out at the toes and down at the heels, which serve as a hanging receptacle for matches. A Chinese mandarin with long pig-tail, mustache, almond eyes and finger laid against his nose makes a unique paper knife; his long skirts form the blade. A smokers' set consists of three thimbles standing on an ebony tray. A pair of scissors for cutting cigars and a match lighter are attached to the tray. An admirable imitation of three white cuffs fastened with gold buttons form, with the tray on which they rest, a very neat and serviceable smokers' set. Among odd and pretty German "favors" are perfume bottles made to simulate English walnuts. Ribbons or cords and tassels attach them to a button, or to the wrists of the dancers. On an old-fashioned blue plate lies a great, "rare-ripe" peach with its rich green foliage. The peach is a desk pin-cushion, and an old-fashioned, black-table knife which accompanies it does duty as a paper cutter. Novel in the extreme, and very perfect, is a tortoise with head and feet protruding from the shell. The reptile carries a cut-glass ink stand on his back. An elephant, with raised trunk and other evidences of excitement, makes a spirited paper weight, as, also, do two monkeys mounted as jockeys on two racing dogs.

A HEAVY METEORITE.—The heaviest purely metallic meteorite known, is the "thunderbolt," of the Arab Sheik, Kalaph Ben Assab. It fell in Central Arabia, and is one of the ten known meteorites that have been seen when falling. It was bought by English authorities, who have since caused it to be chemically analyzed. It contains 91.04 per cent. of iron, 7.40 nickel, 0.66 cobalt, traces of copper, phosphorus, and 0.39 of amorphous carbon. Its weight is 120 pounds. Much larger stony meteorites are known, including one of 25 tons.

CATARRH.

The word catarrh is derived from a Greek word meaning to flow down, and is a term employed to describe a state of irritation of the mucous membrane of the air passages, or what is called, in popular language, a cold. This complaint, so prevalent in damp and cold weather, usually begins as a nasal catarrh, or coryza, with a feeling of pressure about the forehead and some degree of difficulty in breathing through the nose, increased on lying down. Fits of sneezing accompanied with a profuse watery discharge from the nostrils and eyes soon follow, while the senses of smell and taste become considerably impaired. There is usually present more or less soreness of the throat and bronchial irritation, causing hoarseness and cough. Sometimes the vocal apparatus becomes so much inflamed (laryngeal catarrh), that temporary loss of voice results. There is always a degree of feverishness and discomfort, and frequently an extreme sensitiveness to cold. After two or three days the symptoms begin to abate, the discharge from the nostrils and chest becoming thicker and of purulent character, and producing, when dislodged, considerable relief to the breathing. On the other hand the catarrh may assume a more severe aspect and pass into some form of pulmonary inflammation. A peculiar catarrhal affection occasionally occurs, in an epidemic form, to which the name influenza is applied. Many persons appear to think that they can get rid of a cold most quickly by continuing to go about, and, happily in the majority of such cases, no harm results. It is always as well to remember that "neglected colds" sometimes bear evil consequences. Such, at least, is the experience of every physician.

The term catarrh is now used in medical nomenclature in a still wider sense than that mentioned above, being employed to describe state of irritation of any mucous surface in the body, which is accompanied with an abnormal discharge of its natural secretion, hence the terms gastric catarrh, intestinal catarrh, etc. Many remedies have been proposed with a view to cutting short a catarrh, but none of them are infallible, even when they can be safely employed. Entire abstinence from liquids of every kind for a period of forty-eight hours has been recommended as sufficient to cure any catarrh; but few will be found who are willing to submit to such a regimen. Some believe in the adage of feeding a cold and starving a fever, and make that an excuse for indulgence, not only in food, but in sundry alcoholic beverages, popularly supposed to have a curative effect upon a cold. A little reflection will convince any one that the true method of cure is to clear the way for nature to show her benign influence. Keep the digestive apparatus and bowels in good condition, relieve the irritation to the mucous surfaces, reduce inflammatory symptoms, and tone up the system. No better preparations for this purpose exist than those of Dr. J. C. Ayer, of Lowell, Mass. Dr. Ayer's Cathartic Pills put the digestive apparatus in good order without producing irritation. Dr. Ayer's Compound Sarsaparilla acts as a gentle alterative, relieving mucous surfaces, and Dr. Ayer's Cherry Pectoral exerts a healing and soothing influence upon the bronchial membranes. In all these remedies the reader will find a combination of the best materials, skillfully compounded from an experience of many years, and sold at a price within reach of all.

HUDSON RIVER TUNNEL.—Two hundred and fifty men are constantly at work on the great tunnel under the Hudson river at New York city. The whole will probably be completed within the next fifteen months. There are \$4,000,000 of British capital in the enterprise.

MOISTURE IN FLOUR.—Professor C. Richardson, of the agricultural department, says that the average amount of water contained by flours of eight Eastern States which he examined was 12.49 per cent., while Minnesota and Dakota flours only contained 8.96 per cent. From these figures he deduced that, "other things being equal, a barrel of Western flour would make more bread than a barrel of Eastern flour."

A Tonic

Horsford's Acid Phosphate.

A most excellent and agreeable tonic and appetizer. It nourishes and invigorates the tired brain and body, imparts renewed energy and vitality, and enlivens the functions.

Dr. H. K. Clarke, Geneva, N. Y., says:

"It has proved of great value for its tonic and revivifying influence."

Dr. J. H. Stedman, West Brattleboro, Vt., says:

"Best nerve tonic I ever used."

VIBRATING HOUSES.—The *Pittsburg Dispatch* relates an interesting example of preventing vibrations by discord in the case of a 10 horse-power engine, which on the upper story of a silverware manufactory created such a commotion as to rattle the silverware on the shelves a hundred feet distant. A change of twenty-five revolutions in the speed, which change was in the direction of increasing the speed, entirely stopped the vibrations.

PEAT CANDLES.—"Peat" candles are not made of peat, but of the paraffine that is distilled from peat in Brazil, where it is more plentiful even than in Ireland. According to the *Comercio des Amazonas*, John Grant & Co. are now having machinery installed at their works capable of producing 80 tons of peat paraffine a month. They are also extracting from the turf a valuable lubricating oil. They employ 300 workmen, and have 33 boilers, with purifiers, stills and refrigerators in their plant.

BUSINESS NOTES.

BUFFALO LITHIA SPRINGS.

The waters of these celebrated springs have lately become known to physicians as very serviceable in the treatment of the desire for ardent spirits, and as an antidote for the opium habit. It is not claimed, certainly, that this water is a specific against the thirst for, or the imtemperate use of, alcoholic drinks. It is unquestionably true, however, that, by virtue of their decided properties as a nervous tonic and stimulant, it supplies, to a certain extent, the nervous craving for a stimulant (the result in many instances solely of nervous exhaustion), and thus acts as a preventive of that feeling of necessity or desire for the use of strong drink which impels many to it, despite their own judgment to the contrary. It is undoubtedly one of the most potent of known antidotes to the pernicious acids of wines and liquors, and a preventive of their injurious effects upon the system. As this water, by virtue of its nerve tonic and stimulant properties, lessens the nervous craving for ardent spirits, so, upon the same principle, it lessens the nervous craving for opiates, and is an important adjunct to the physician in the treatment of the opium habit.

PARIS EXHIBITION.

W. R. Warner & Co. have received a silver medal at the Paris World's Fair, being the highest of its kind, in recognition of the following claims: 1.—W. R. Warner & Co.'s Pills, quick solubility and accuracy. 2.—Reliability and permanency unsurpassed. 3.—Perfection in coating, thorough composition and accurate subdivision. 4.—Excellence in solubility of the finished product in from 4 to 6 minutes. 5.—Quinine Pills, for accuracy in weight and purity of material. Also, for Warner & Co.'s Effervescent Salts: 1.—Superior effervescing properties. 2.—General elegance and excellence. 3.—Stability of the effervescing quality sustained by critical examination. This is the 13th World's Fair Medal which attest to their superiority. Physician's should be careful to specify Warner & Co.

FOR DYSPEPSIA

USE HORSFORD'S ACID PHOSPHATE.

Dr. Lorenzo Waite, Pittsfield, Mass., says: "From its use for a period of about eight weeks, to the exclusion of all other remedies, I attribute the restoration to health of a patient who was emaciated to the last degree, in consequence of nervous prostration and dyspepsia. This patient's stomach was in such an irritable condition that he could not bear either liquid or solid food. An accomplished physician of many years' experience, whom I called in consultation, pronounced his case an incurable one. At this stage I decided to use Horsford's Acid Phosphate, which resulted as above mentioned."

WHOOPING COUGH CURED

Or Prevented by Page's Vaporizer and Cresolene.

We have abundant testimony that Cresolene vaporized in a closed room is an almost infallible remedy for **Whooping Cough**, for which distressing malady no other assured remedy is known to us. A cure usually effected in five or six days, at a trifling expense and but very little trouble. It is also exceedingly efficient in Asthma, Croup, Catarrh, Diphtheria, Influenza and Scarlet Fever. It is a safeguard against the spread of contagion.

Vaporizer complete, including a bottle of Cresolene, \$1.50. Ask your druggist for it.

W. H. SCHIEFFELIN & CO.,

SOLE AGENTS,

170 & 172 William Street, New York.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it.

Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

VALUABLE TO ADVERTISERS.

You have determined to make money by vigorously pushing your business. As the AMERICAN ANALYST has determined to do the same thing, we have a community of interests. Our way of making money is to increase our circulation, and we can only do so by publicity; that is, by bringing our journal to the notice of a great number of people, who have the intelligence to appreciate a good journal when they read it and the money to buy what they want. You must necessarily want to reach the same class. Even if you do not sell directly to the consumer, it is necessary for you to tell the consumer of the quality of the goods you have to offer to induce him to ask the dealers with whom he trades for them. We propose this Fall and Winter to send a sample copy of this journal to the address of every person in the United States whose name we can find in any of the *elite* directories or blue-books of the various cities and villages. We will thus reach several millions of new readers in addition to our already large subscription-list, covering every State in the Union. Previous experience with this method of getting new subscribers war-

rants us in undertaking the expense, believing that it will pay us. This large addition to our circulation will put any advertisement in our columns before a multitude of readers. Our advertising prices remain the same, and are so arranged as to give the lowest rates to larger and longer-continued advertisements, and will be sent on application. All respectable advertising agencies will take orders for us. If we find this system profitable, advertisers surely will. Those who have advertised with us always renew as their season comes around, and you will do the same when you have tried it. We have found that in the great competition now existing we must keep our journal prominently before the public, and, in our mutual interest, we ask you to join us. Our system is more effective than a circular, and you will find it just as effective for your business and the cost very much less. Try us. For any further information write, and it will be forthcoming.

**The Edge Hill Wine Co.,**

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

TRADE MARKS.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing pure sodium—insures a purity and uniformity of product which cannot be obtained from any other known material. In making Bi-Carb. Soda from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of sulphate of soda, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

ALCOHOLISM IN EUROPE.

Our European brethren have become alarmed at the dangerous increase of alcoholism, and are seeking means to counteract it. They do not, however, seek to check the evil by prohibition, but adopt a more sagacious method that has already commended itself to the majority of thinking persons in this country also. They aim at purifying the liquor rather than preventing its consumption. They advocate government interference to regulate the trade, or the establishment of a State monopoly in the manufacture or sale of drink. A State monopoly has been established in Switzerland, and Bismark has contemplated something of the same sort for Germany. In France and Belgium Government Commissions have considered the question and suggested various remedies. Drunkenness until a few years ago was all but unknown in France. But now drunkenness is there in its worst form. The report of a recent congress held in Paris contains figures which prove that drink is now one of the chief causes of crime and of lunacy. The scourge of phylloxera which has swept

over the country and thinned the vineyards has in some measure caused this. Distillers have gone to other sources than the grape for their alcohol. The great drink of the French peasantry and the working people is eau-de-vie. This used to be distilled from fruit, but is now mainly extracted from vegetables. In 1850 only 70,000 hectolitres of this liquor were distilled from vegetables; in 1881 there were 1,759,448 hectolitres, of which potatoes and beet root supplied the most. The consumption for that year was 1,445,000 hectolitres or 12 litres for every adult man. Since 1881 it has increased at the same ratio. The habitual drinker of this poisonous stuff soon becomes a physical and mental wreck. Fourteen per cent. of the lunatics under treatment in France owe their insanity to alcoholism, and in 1885 it was the cause of 538 accidental deaths and 868 suicides. French statesmen are anxious to do something to check this growing evil, either in the way of purifying the spirituous liquors drunk, or limiting the number of liquor saloons. The statistics of the number of liquor saloons to inhabitants in different European countries are interesting and significant. In England there is a licensed house for every 223 inhabitants, in Austria one to 266 inhabitants, in Denmark one for every 194, in Italy one for every 175, in Holland one for every 149, in France one for every 90 people, and in Belgium one for every 43. The Belgians drink more than any other people in Europe. They consume 70,000,000 litres of liquor every year, which gives 60 litres to every male adult. Paris is pretty well provided with liquor shops, or cafes, having one among every 88 inhabitants. The quantity of liquor consumed per head of the inhabitants, women and children included, is 6 litres in England, 10 in Sweden, 16 in Denmark, 9 litres in Belgium, and 7 in Prussia and France.

ARCTIC REFUGES.

It seems a novel idea to establish depots of sailors' supplies, with detachments of men to take charge of them, along the coasts of remote Arctic seas. But Yankee enterprise is not interrupted by geographical limitations. The dangers encountered by our mariners in those hyperborean regions have called for prudent precautions, calculated in certain unfortunate contingencies to evoke showers of blessings upon the humane forethought that suggested them. We learn that last week the whaling community of New London were notified that an "Arctic House of Refuge" has been recently opened at Point Barrow, Alaska, and is in charge of Capt. G. B. Borden. The building has been heavily stocked with salt, cured, and canned provisions, flour and small goods, and it will accommodate 100 people. Heretofore when a shipwrecked crew were rescued it was the custom to scatter the men among the whole whaling fleet. Hereafter they will go to the house of refuge. It is expected that other houses of the kind will be provided soon at East Cape and Point Hope, the one projected for East Cape to be used by

shipwrecked crews on the Siberian coast. There are many straits and roads on the Siberian coast, and with a chart of the country with them, shipwrecked men could easily make their way to the East Cape house. A relief station at East Cape, it is thought, would help to do away with the illicit trading with Siberian natives, an end that was aimed at also in establishing the Point Barrow station.

SCHOOL FOR NURSES.

A training school for nurses, long in contemplation, is about to be established in this city, under the management of a number of public-spirited ladies. A sufficient fund has been gathered to make a beginning upon an experimental basis, and temporary quarters for the school have been secured at the Nursery and Child's Hospital, on Lexington Avenue. If the results reached are satisfactory, a permanent endowment will be raised, but meanwhile only the income from the fund on hand will be used, so that in case the project should be abandoned the money can be returned to the donors. It is intended that the course of training in the school shall extend over a term of six months, at the end of which time diplomas will be awarded. The course will embrace subjects relating to the proper care of young children, the making and administering of their food, the washing and dressing of the children, and the ventilation of their nurseries. A post-graduate course will be given to enable nurses to learn something of the medical treatment of children in emergencies. The nurses will be required to dress in a prescribed style while in the institution, and will be boarded free and allowed a sufficient salary to defray the expense of their clothing. Only unmarried women between eighteen and twenty-five years will be admitted. Their characters will be closely investigated, so that when they leave the nursery their diplomas will also be certificates of character. Women who pass creditably through the course will, it is expected, be able to command high salaries. The school will be in operation by January 1st.

A URANIUM MINE.

The important announcement is made of the recent discovery in England of a large deposit of uranium. It was just one hundred years ago that, in 1789, the German chemist, Klaproth, succeeded in isolating from a dark-colored mineral known as pitchblende, a yellow oxide, which, after carefully testing, he pronounced to be the oxide of a new metal. To this metallic substance he gave the name of uranium, so calling it after the planet Uranus, then recently discovered by Herschel, and it was at once classed among the rare metals, and still remains so. Its rarity is indicated by its market price, which is about \$12,000 per ton. There are several oxides of this metal, but the best known and most important is the sesquioxide, which

DRYDEN & PALMER,

For use at the Soda Fountain and in all Pharmaceutical preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

forms a number of beautiful yellow salts, largely employed for imparting delicate golden and greenish yellow tints to glass. The protoxide is much used in producing the costly black porcelain. Uranium is also useful in certain photographic processes as a substitute for the chloride of gold; but its rarity and consequent high price have hitherto caused its application to be very limited, although there are uses other than those already named to which it could be put if it were less scarce and less costly. It is found in Cornwall, Saxony and Bohemia, but up to the present time it has only been met with in isolated pockets and patches. The centenary of its discovery by Klaproth has, however, been marked by the finding of a continuous lode in Cornwall, which is believed to be the only lode in the world. This discovery is regarded as unique in the history of the metal, for the lode is what is known as a true fissure vein, and the ore is found to contain an average of 12 per cent. of the pure metal, the assays going up as high as 30 per cent. in some instances. Several tons of the ore have already been raised and sold, fetching high prices. It is anticipated that the present discovery will enable two important applications of the metal to be followed up. The first is a substitute for gold in electroplated ware, inasmuch as with platinum and copper it forms two beautiful alloys, each having the appearance of gold, and the former also resisting the action of acids. The second application is in connection with electric installations, where its usefulness consists in its high electrical resistance.

ADULTERATION IN EUROPE.

SUMMARY OF THE ANTI-ADULTERATION LAWS OF EUROPEAN COUNTRIES.

[Paper presented by Edgar Richards at the annual meeting of the American Public Health Association in Brooklyn, October, 1889.]

During the past year I have had occasion to look up the subject of the laws and regulations now in force in European countries in reference to the sale of unwholesome or falsified foods, and believe that brief resume of certain provisions of such legislation may not be uninteresting to the members of this association. To attempt to summarize what has been done in each country involves more or less of a review of its police administration, which would make this paper too long. Copies of these foreign laws, decrees and regulations, and a list of our State laws on the adulteration of food and drugs, dairy products and butter substitutes, will be found in the reports of the commissioner of internal revenue for 1888 and 1889, to which I would refer those specially interested in this subject. In examining this mass of legislation, I was impressed with the large scope of the powers of the police authorities in continental Europe,

and that there are many of these functions which our States might adopt with profit. For instance, in addition to what we consider the ordinary police duties relating to the enforcement of the laws and regulations respecting public order, the suppression of crime and violence, the supervision of the excise, of public places of amusements, etc., we find the following as being specified as part of the duties of the police administration in matters relating to public health, viz.:

(a) The registering and licensing, after previous examination by a board of experts duly appointed for that purpose, of all physicians, surgeons, accouchers, midwives, orthopedists, dentists, pedicures, trained nurses and veterinarians.

(b) The registering and licensing, after suitable examination, of all pharmacists and of their assistants; also the inspection of all drug stores, and the enforcement of rigid regulations concerning the sale of poisons.

(c) The supervision and inspection of all hospitals, whether public or private, public baths, prisons, schools, slaughter-houses, markets, stores and other public and private establishments, in regard to their sanitary maintenance.

(d) The enforcement of all laws, and the making of needful regulations to carry out their provisions, in regard to public health, especially those concerning epidemic or contagious diseases of men or animals.

(e) The supervision and inspection of all articles which serve as foods, properly speaking, or as beverages, as well as those which are employed in the preparation, production, manufacture, or preservation of such foods, including the places where such articles are sold, stored or manufactured (see the laws on sanitary police, of France, Belgium, most of the cantons of Switzerland, Germany, Italy, etc.).

It is to certain features of the laws and regulations on this last subject that I wish to call your attention. These may conveniently be divided into four heads, viz.: general, special, penal and executive provisions.

GENERAL PROVISIONS.

The word "food" may be said to include all commodities, materials or ingredients, of whatsoever character, intended for human consumption. A food is considered as adulterated or falsified (a) when any substance has been added which does not exist in the normal product, or is only found there in an appreciably lower proportion; (b) when any substance has been subtracted that is normally present in the product, and which is not found in the abnormal product or only in an appreciably lower proportion; (c) when it is an imitation of, or sold under the name of another article; and (d) when any substance has been substituted, wholly or in part, for the article. The selling, offering for sale, or otherwise putting on the market, as well as the use of any food commodity which is unwholesome, altered or decomposed, is prohibited under severe penalties. The selling and offering for sale, for the purpose of slaughtering, of animals infected with contagious and other diseases, as well as the selling and offering for sale of the meat from such diseased animals, is prohibited. Power to regulate the proper inspection before and after slaughtering is left to the competent authorities. The employment of poisonous coloring matters in the manufacture of clothing, wall-papers, toys, eating, drinking and cooking utensils, and other articles of common use as well as their use in wrappers and vessels intended for the packing or the preservation of food, are also prohibited. Every dealer in food commodities must be responsible for the quality of his merchandise, whether of foreign or domestic origin. Every food material must be sold under its true name. Every dealer having an artificial product imitating a natural product in his possession, whether the same is intended for sale or is claimed to be solely for his own use, must announce such fact by conspicuous placards in his shop. All such artificial products must be duly labelled in a conspicuous and legible manner, bearing the name of the merchandise accompanied by the prefix "artificial." The manufacture of, trade in and offering for sale of,

substances intended for the adulteration of articles for food is forbidden or restricted to certain prescribed methods and substances by stringent regulations of the competent authorities. The power to regulate and to supervise the methods and the means for carrying out the provisions of these laws is placed with the competent authorities.

PENAL PROVISIONS.

The penalties prescribed range from a small fine, to imprisonment in the house of correction or the penitentiary, with or without hard labor, for a term of years or for life, depending on the gravity of the offence. In occupations requiring a license from the authorities, said license may be rescinded, and the offender may be deprived of the privilege of carrying on such occupation for a longer or shorter period of time, in the discretion of the court. The repetition of an offence within a year is generally punished by doubling the penalty provided for the first offence. The selling, offering for sale, or otherwise putting on the market, of a product under a name other than that which its nature requires, although the value of the product may be the same, is considered a fraud, and so punished. Such products may be seized, confiscated, and rendered unfit for use, by the competent authorities.

EXECUTIVE PROVISIONS.

The police administrations are charged with the supervision and the execution of these laws, having power to make and enforce the necessary regulations. There is generally a State commission of control, composed of three or more experts, appointed with the necessary police powers, to whom this subject is entrusted. They have under their directions the inspectors, veterinarians and chemists necessary for the proper execution of the laws and regulations. The co-operation of the local police officials, whenever necessary, is obligatory. The commission meet at least twice a year for the transaction of business. They must also make at least two inspections a year of all factories and warehouses for food. The inspection and supervision of all establishments intended for the public preparation, manufacture, or sale of foods must be performed by the inspecting officials employed by the commission. The inspections of these establishments must take place at least twice a year, and without previous notification to the owners. Reports of such inspections are made in writing to the commission. The inspecting officials have the right to enter any establishment within their jurisdiction during the usual business hours or when such places are open to the public, and to take for examination such samples as are necessary. When the examination of samples cannot take place on the spot, but demands a chemical, microscopical or similar examination, two samples must be taken, and placed under seal, by the inspecting official, in the presence of the owners or their representatives, who likewise may affix their own seals thereto. One of these samples is forwarded to the commission with a report, and a request for the proper examination thereof, and the other is retained by the inspecting official. On demand of the owner, another similarly sealed sample may be retained by him. When there is reason to believe that a food is adulterated or unwholesome, the inspecting official may order it detained until a proper examination can be made. If the sample proves, on examination, to be adulterated or unwholesome, the cost of said examination is paid by the offender, but otherwise the State pays the cost of the samples taken and of the examination. All unwholesome foods are to be confiscated and destroyed without compensation to the owner. Private individuals may have samples of food examined by the experts of the commission on complying with prescribed regulations and by paying a moderate charge, or free of charge in many countries.

(To be continued.)

SEWAGE.—The whole of the sewage of Paris will soon be used for the purpose of market gardening.

SORGHUM SUGAR.

GLOOMY PROSPECTS FOR SORGHUM SUGAR IN KANSAS.

According to a writer in the *N. Y. Times*, sorghum sugar was the favorite topic in Western and South-western Kansas last summer. Thousands of acres of cane had been planted in the supposed sorghum-producing belt, five or six sugar mills were being erected in as many towns, and visions of wealth danced before the eyes of farmers who had suffered three successive crop failures. "Sorghum sugar will be our salvation," was the burden of their cry, and it was taken up throughout the State and believed by all interested in Kansas progress. Even the State Board of Agriculture caught the fever, and its reports were calculated to give one the impression that in the near future Kansas would outrank Louisiana or the Sandwich Islands in the production of sugar. To-day the State board is "singing low," the farmers are despondent, the mills are either closing down or going into the hands of receivers, and the word "failure" can be written against the industry which to the enthusiasts promised so much three months ago. Utter disregard of the experience of men who have experimented for years with sorghum in Kansas has characterized the operations of those who have sunk upward of half a million dollars this year in the attempt to secure a profitable output of sugar. They have proceeded with as much confidence as if the problem of converting cane into cash had long since been solved, overlooking the fact that for some time sugar mills have been in operation in Topeka, in Fort Scott and in Conway Springs, and the public has not been favored with statements concerning their success or non-success. If there has been a dividend declared by either of the companies owning these plants no outsider is aware of it. If there have been any profits they have quietly been pocketed. If the mills have ever paid expenses, a remarkable silence as to that important item has been preserved. Last spring several Kansas newspapers took up the question of sugar making, and asked the mill owners for statements of dividends or gross profits. The query was fruitless. The mill men made no public utterances, but at the same time did not try to undeceive those who thought that fortunes were to be made by extracting the sugar from Kansas cane, despite overwhelming evidence showing that the experimental stage in sugar making was not yet over. The farmers of the West and Southwest prepared last spring to increase the acreage of cane, and even those of Eastern and Southeastern Kansas planted larger acreage than formerly. Then a cry went up for more and better sugar mills. The enthusiasts declared that sorghum could not fail to mature in Kansas, that it grew regardless of the weather, and all that was needed was a sufficient number of mills to convert it into sugar. Early in the season the citizens of Attica, deluded by the optimists, bonded themselves in \$75,000 to build and equip a mill. Those of the town of Liberal went into debt a like sum for a like purpose, and those of Meade, Medicine Lodge, Arkalon and Garden City followed suit, the amount of each city's bonds ranging from \$40,000 to \$75,000. The machinery for each will come from Fort Scott, whose foundrymen were not among those who predicted failure, although they knew perfectly well that the experiments at the Fort Scott mill had not been successful. The mills were finished, the cane crops were harvested, and all agricultural Kansas awaited impatiently the result. It has just been announced. Very little of the vast quantity of cane grown reached maturity. It was dwarfed and it lacked the sugar producing qualities. The Liberal mill closed October 15, after having run about 700 tons of cane. The product of sugar did not reach 3,000 pounds and of syrup there were only 6,000 gallons. About 1,700 acres of cane were cultivated by contract, and probably 300 acres more were put in with the expectation that the mill would be able to use it. What is true of the

Liberal Mill is true of those of Arkalon, Meade, Garden City and Medicine Lodge, except that more work was done at Liberal, and its showing is more favorable. A few days ago the Attica Sugar Works went into the hands of a receiver, its liabilities being about \$70,000. Financially, the other mills are but little better off. Each had an acreage of cane planted sufficient to keep it busy during the season, but not enough good cane was raised at all of them to have kept one mill supplied. To increase the misery of the situation, the Topeka Mill, which had contracted for several thousand acres of sorghum, burned a short time ago, and the farmers were left with no means of disposing of their product. Many suits have been begun against the company. Now that disaster has come, the sufferers are extracting what comfort they can from a discussion of the alleged causes. Some declare that late planting is at the bottom of the failure, others that the season was too dry, others that it was too wet. The probabilities are that after the chemists and the State Board of Agriculture submit their reports on the subject, the sugar cranks will accept some one of the many theories put forth and prepare for another season's outlay of time and money. This plan may be followed for several years yet, but eventually all will have to acknowledge that the season in Kansas is too short to make sugar-producing cane in quantities sufficient to build up a great industry. That is the inevitable outcome of the situation.

LOST INSTINCTS.

HAVE THE SENSES OF MAN BEEN BLUNTED BY DEVELOPMENT?

If the doctrine be true that man is really the heir of all the various species and genera of the animal kingdom, it seems a little hard upon us that, even by way of exception, we inherit none of the most marvellous instincts of those species and genera, and have to be content with those greater but purely human faculties by which even the most wonderful of animal instincts have been somehow extinguished. Sir John Lubbock maintains with a good deal of plausibility that there are instincts, and very likely even higher animals, which perceive colors of which we have no glimpse, and hear sounds which to us are inaudible. Yet we never hear of a human retina that includes in its vision those colors depending on vibrations of the ether which are too slow or too rapid for our ordinary eyes, nor of a human ear which is entranced with music that to the great majority of our species is absolutely inaudible. Again, we never hear of a human being who could perform the feat, of which we were told only recently, of a bloodhound. In a dark night it followed up for three miles the trail of a thief with whom the bloodhound could have never been in contact (he had just purloined some rolls of tan from the tanyard in which the dog was chained up), and finally sat down under the tree in which the man had taken refuge. Why, we wonder, are those finer powers for discriminating and following the track of the scent, which so many of the lower animals possess, entirely extinguished in man, if man be the real heir of all the various genera which show powers inferior to his own? We see no trace in animals of that high enjoyment of the finer scents which make the blossoming of the spring flowers so great a delight to human beings, and yet men are entirely destitute of that almost unerring power of tracking the path of an odor, which seems to be one of the principal gifts of many quadrupeds and some birds. It is the same with the power of a dog or cat to find its way back to a home to which it is attached, but from which it has been taken by a route that it cannot possibly follow on its return, even if it had the power of observing that route, which usually it has not. Nothing could be more convenient than such a power to a lost child. But no one ever heard of any child who possessed it. Still more enviable is that instinct possessed

by so many birds of crossing great tracts of land and sea without apparently any landmarks or seamarks to guide them, and of reaching a quarter of the globe which many of them have never visited before, while those who have visited it before have not visited it often enough to learn the way—at least by any rule which, in like circumstances, would be of any use to human intelligence. The migratory birds must certainly be in possession of either senses or instincts entirely beyond the range of human imagination, and yet no one ever heard of the survival of such a sense or instinct in any member of our race. It may be said, indeed, that men have either inherited or reproduced the slave-making instinct of some of the military ants, though that unfortunate and degrading instinct does not appear to have been inherited by any of the higher animals which intervene between the insects and our own race; but this only enhances the irony of our destiny, if we do, indeed, in any sense inherit from these insect aristocracies one of the most disastrous instincts of the audacious but indolent creatures which fight so much better than they work. If we have not inherited the architectual instincts of bees or beavers, nor the spinning instincts of spiders, nor the power of the dog to track out its home, it is a little sad that we should have inherited the one disastrous instinct of the ant by which it makes itself dependent on a more timid and industrious species of its own race, and thereby loses the power to help itself. What is still more curious is that even where human beings have wholly exceptional and unheard-of powers they betray no traces of the exceptional and unheard-of powers of the races whose vital organization we are said to inherit. The occasional appearance of very rare mathematical powers, for instance, so far from being in any sense explicable from below, looks much more like inspiration from above. The calculating boy who could not even give any account of the process whereby he arrived at correct results which the educated mathematician took some time to verify, certainly was not reviving in himself any of the rare powers of the lower tribes of animals. Nor do the prodigies in music who show such marvellous power in infancy, recall to us any instinct of the bird, the only musical creature except ourselves. Still less, of course, does great moral genius, the genius of a Howard or a Clarkson, suggest any reminiscence of what happens in the world of animal life.

THE LADY AND THE FLOUR BARREL.—She objected to the last barrel of flour which the grocer had brought, and after using a few scoops from the top of the barrel, headed it up and told the grocer to take it away—she should use no such flour as that. The next barrel brought was perfectly satisfactory. "Now that is something like flour," she told the family. But when she reached the bottom of the barrel she found her old flour scoop, long missing, which had been headed up in the other end. The grocer had merely brought back the same barrel with the other end uppermost.

A "CHRISTIAN BUDDHA."—This was the title given by the grateful Chinese to the late Rev. J. Crossett, the independent American missionary, who is described in an official communication to the State Department at Washington, in the highest terms, as devoted to doing good to the poor: "He was known by the Chinese as the 'Christain Buddah.' He was attached to no organization of men. He was a missionary, pure and simple, devoted to charity rather than proselytism. He literally took Christ as his exemplar. Innkeepers would take no pay from him, and were ever glad to entertain him. It must be said that his wants were few. He wore the Chinese dress, had no regular meals, drank only water, and lived on fruit, with a little rice or millet. He aimed at translating his ideal, 'Christ into reality.' He found good in all religions. After a long conversation with him one day, I told him he was not a Christain but a Buddhist. He answered that there were many good things in Buddhism. He completely sacrificed himself to the good of the poorest of the poor. He acted out his principles to the end. He was poor, and lived as plainly as the poorest of his patients. On charitable subjects he wrote well. The ideal to him was practical. Let this American be enshrined in the annals of men who loved their fellow men."

DRESSED BEEF.

No. 1.

THE BUSINESS DESCRIBED FROM A CHICAGO STANDPOINT

[We propose in this and the following two papers to present to the readers of the AMERICAN ANALYST a full account from a local standpoint of the Chicago Dressed Beef interest, together with a detailed description of the several firms engaged in it, their business methods and statistics, showing the proportions of the industry. We believe the facts thus presented to be trustworthy, and to embody the most complete summing up of the subject that has ever yet appeared in print. EDS. ANALYST.]

CHICAGO, Nov. 19, 1889.

For some time past there has been a great deal of talk in the newspapers about the "dressed beef combine," as it is called, at Chicago. In fact, the question of furnishing dressed beef from Chicago slaughter-houses, for consumption all over the United States, has risen to the dignity of a national one. A Senatorial investigating committee has been recently traveling over the country looking up the question. If these learned Senators had spent a month or two at the Union Stock Yards in Chicago, we think they would have been convinced that it was over-production and not a "combination" that keeps cattle at the present low prices. As everybody knows, the shipments of cattle are expected to be light during the hot months, yet a glance at the receipts during the heated term shows an enormous influx. For the seven weeks from August 3d to September 21st, inclusive, the receipts of beef cattle aggregated 459,160 head, an average of 65,600 for every week, and this during the hottest weather of the year. During the week ending September 21st, 50,000 more animals were received than during the corresponding week of the preceding year, while the shipments out showed but very little increase over last year, the total shipments for the week being 82,616, leaving 138,300 head for slaughter at this point. To still further show the immense number of animals on the market, let us take one day's offerings at five different points. On September 23 the following number of cattle were for sale: at Chicago, 15,500; Kansas City, 11,003; East Liberty, Iowa, 3,720; St. Louis, 3,300; Omaha, 3,000; Sioux City, 589. Just think of it! Over 37,000 head of beef cattle on sale the same day within a radius of 500 miles! Can farmers expect the prices of five or six years ago with such a showing? With the foregoing facts and figures before us, there is but one conclusion to be arrived at, viz.: Without the large slaughter-houses at the Chicago Union Stock Yards, these yards would be filled to overflowing and farmers could scarcely give away their surplus cattle, sheep and hogs, let alone selling them at any price. Swift & Co., Armour & Co., Nelson Morris & Co., and Geo. H. Hammond & Co. have facilities for slaughtering over 10,000 head of cattle per day, and this alone prevents a glut in the market. Ignorant and uninformed people believe that the profits on every steer killed are very large; that there are millions in the business; but a comparison of the prices in the Chicago market for live cattle with the prices at which beef is sold at wholesale by the dressed beef shippers in New York, Philadelphia and other eastern markets, which sales are published each week in the principal papers of the various cities, will show that the profit, if any, must be small, and profit at all is only possible by a complete and thorough utilization of all the offal, which local butchers largely waste. Where large capital is invested, the workings of a slaughter-house are more perfect, and nothing is wasted. It is the savings in this respect alone that give the large firms a profit. Let a country butcher take off a hide and every nine in ten will have holes cut in them, greatly lessening their value. The French used to take off hides by blowing up the animal with a pair of bellows, but our American method beats that, and trained butchers take off the hide without a blemish, increasing their value over country or foreign hides, and giving American leather the front rank in regard to quality.

The hoofs go into the glue pot; the entrails are made into casings; the bones are ground up into bone meal; the contents of the paunch and entrails, and the blood, are made into fertilizers, while the horns furnish us with combs; the leaf tallow is made into oleomargarine, and not one particle of an animal but is used for some purpose. This is the reason that there is profit, though very small.

With the introduction of dressed beef in various cities and towns throughout the United States, a wall has gone up from the local butchers against its use. They declare that it is not good meat, and that people should patronize the home butchers. But the local butchers say nothing of the enormous profits they have been making for years, and when the people inquire into the matter, there will be but one result. They will take the Chicago dressed beef every time, for it is not only better, but much cheaper. The dressed beef industry benefits both the producer and the consumer of beef, and bears hard only on the monopoly of local butchers. In days gone by the housewife, on getting a steak from the local butcher, proceeded to wash it, for it was always dirty; then she would nearly exhaust herself in pounding it to try and make it tender, but usually failing to render it fit for the human stomach. The reason for its being so unpalatable was, the animals were driven overland or sent in by rail, were given no water, became overheated, and in that condition were killed, and even before the animal heat or life heat was out of the carcass, it was cut up and sold. As a consequence, it was tough, indigestible, and unfit for use. Now, cattle shipped in, are taken from the cars *en route*, watered and fed, and arrive in good condition. They are not slaughtered until thoroughly cool, and the slaughter houses are models of cleanliness. No decaying garbage or offal surrounds the Chicago slaughter houses. After the animal is killed, skinned and the entrails removed, it is hung up in a refrigerator house, where it is kept until all the animal heat has left it, and the result is, we get choice, juicy meats, nourishing to the human family. It is not the people of Chicago alone who are benefitted by this change from the old way of treating meats. By means of refrigerator cars, meats are transported all over the United States and placed on sale, at less price, by from 25 to 50 per cent. than are asked by local butchers for meat killed and treated by them in the old way. People in the Southern States never knew what it was to have a good, choice roast of meat until the present system of refrigerator cars enabled them to buy Chicago dressed beef, but now they get as good as there is in the land delivered at their homes. Some people think Southerners owe their lack of energy to their Southern climate, but beyond a doubt much of it was due to a former want of good, wholesome beef. We may look to see a marked change in the next generation amongst those people, now that they can eat the same quality of beef as their Chicago brethren. Not only do the Chicago slaughter-houses materially benefit the raiser and consumer of beef, pork and mutton, but they furnish employment to at least 25,000 employees at good wages. The slaughter and packing houses are veritable "hives of industry." These people are not employed in the winter only, but summer as well, for the work goes on unceasingly without regard to the seasons, though more men are employed in the winter than in the summer, because more animals are marketed.

Some of the State Legislatures, notably Colorado, Indiana and Minnesota, have passed laws aimed at the dressed beef industry. But attempts to enforce the laws in the States mentioned have resulted in their being declared unconstitutional by United States Circuit Court judges, so an appeal to the United States Supreme Court has not yet been found necessary. The constitution declares in plain language that "the rights of the citizen of one State shall not be abridged by those of another State." The attempt of the Minnesota Legislature, in passing a law requiring inspection on the hoof of animals killed, was so clearly an attempt to keep Chicago

dressed beef out of the Minnesota markets, that the judges the United States Circuit Court in session there at once declared the statute unconstitutional. The cattle in this country are healthy and the inspection at the Union Stock yards in Chicago is perfect. Every animal is subject to a rigid system of inspection, superior to any in this country, before it goes to the slaughter-house, while at each slaughter-house are stationed from three to five uniformed city inspectors, who inspect each animal during the process of slaughter, the slightest blemish on which subjects it to condemnation. There is one thing local butchers can make up their minds to: the dressed beef industry has come to stay, as it is of general good to the masses and an especial boon to the poor man.

After a careful study of the question from all sides, we are led to the following conclusions:

FIRST.—That the dressed beef industry creates a market for cattle raisers which they cannot do without, and that with the vast *over-production* of cattle any unfriendly legislation directed against that industry would react very injuriously on the cattle-raising interest.

SECOND.—That the Chicago dressed beef men have made it possible for the people of the United States to buy better beef at a lower rate than that charged by local butchers, thereby enabling the poor of our cities and towns to provide their children with the best meat, where heretofore they were only able to buy the poorest and cheapest cuts.

THIRD.—That they give employment to thousands of persons, at good wages, who but for these industries would be compelled to seek some other means of livelihood, which, in many instances, would be difficult, if not impossible, to obtain.

CALIFORNIA INDUSTRIES.

THE REMARKABLE PRODUCING CAPACITIES OF THE GOLDEN STATE.

(Continued.)

Placer County is one of the counties bordering on the State of Nevada, and having that beautiful sheet of water, Lake Tahoe, on its eastern edge. It is about 165 miles north-east of San Francisco, and is traversed its entire length by the Central Pacific Railroad. It has unequalled advantages of situation and general picturesque-ness of scenery. In length about one hundred miles, and in width from ten to thirty miles, it contains about 900,000 acres, half of which is good fruit land. Some of its scenery, especially towards the summit of the Sierras, reminds one of far-famed Switzerland. Trout fishing, deer, smaller game, including quail and duck shooting, are the attractions for sportsmen. The soil in the valleys is alluvial, in the lower foot hills of a granite formation until the altitudes are reached, when it changes into a red slate which continues nearly to the summit. Being very rich in iron and potash, it is especially adapted to the growth of fruits. The mountainous section is covered with snow during the winter, but in the foot-hill region, where the altitude varies from 200 to 2,000 feet, there is an almost winterless climate. The temperature seldom falls below the freezing point. The rainy season begins with slight showers in October, but the greater part of the rainfall occurs during December, January and February, gradually lessening until they discontinue in the latter part of April. Being above the fogs and out of reach of the cold sea air, the winters are most charming. Flowers bloom continuously during the year, and in summer when the rains have ceased the blue sky rivals in beauty that of Italy. Owing to the dryness of the atmosphere, the heat is never oppressive. As has been already said, this is the great fruit-growing county of the State. Strawberries, blackberries, raspberries, cherries and currants, and all the deciduous and citrous fruits, ripen here earlier than in any part of the State. There are three sources of water supply, the Yuba,

Bear and American rivers. Oranges and peaches are grown here in perfection without irrigation. Above the orange and peach belt, at altitudes of 1,500 feet or more, apples, pears and table grapes are plentifully raised. Olive culture is another industry which thrives here. Pears, plums, prunes, apples, apricots, cherries, persimmons, pomegranates, quinces and figs grow equally well as peaches. The first cherries sent from California to the East every season are always from Placer County. Orange trees here begin to bear profitably at the early age of three years. The land lying west of the American river from Auburn to the Bear river, is in the thermal belt of the Sierra foot-hills and is very favorable for the successful growing of oranges and other citrus fruits. The two great fruit shipping points of the county are Newcastle and Penryn. The former shipped 19 carloads of fresh fruits and 33 carloads of green deciduous fruits last season; Penryn, 7 carloads of green deciduous fruits. Fruit is, of course, the leading product, but Placer County has also other profitable industries. At Lincoln is the largest pottery in California, where all kinds of sewer pipe, tiling, and ornamental building material are manufactured. Forests of pine, spruce, fir, cedar, etc., in the mountainous region supply lumber to innumerable mills. Lath and blind factories and a large paper pulp mill are operated near Alta. The California Iron Company has an extensive iron mine at Hotaling. Coal is abundant near Lincoln. Several large granite quarries are in full operation at Penryn, Rocklin, Loomis and Lincoln. Mining is still prosecuted in many places, but the California law against placer mining to prevent the formation of sand bars has somewhat checked it. The southwestern part of the county is one vast grain field, where immense quantities of wheat, barley, oats, etc., are raised. A few large sheep and cattle ranches still exist, but are rapidly making way for orchards. Quite extensive vineyards are growing at Lauder, New England Mills and Colfax. It will thus be seen that as we have truly said, Placer County is one of the richest and most favored counties of California.

(To be continued.)

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

November.

MEAT.—Beef, mutton, pork, venison.

POULTRY AND GAME.—Chicken, duck, geese, grouse, hare, partridge, pheasant, pigeons, rabbits, turkeys, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, whiting, salmon, trout, perch, smelts, oysters.

VEGETABLES.—Artichokes, broccoli, celery, potatoes, turnips, cauliflower, cabbage, carrots.

FRUIT.—Apples, pears, quinces, grapes, nuts.

PRACTICAL RECIPES.

VEGETABLE SOUP.—Put a good-sized soup bone, which has been crushed, into the soup pot with a gallon of cold water, and cook for two hours. While it is cooking peel, slice and stew until smooth, a quart of tomatoes; add to them a pint of scraped or grated corn, stew up and remove from the fire. When the meat has cooked two hours add to it a few small potatoes, peeled and cut up, let it cook until they are quite soft, then take out the soup-bone, skim all grease from the liquor and add the corn and tomatoes, and half an onion for flavoring, cook gently for half an hour, season, strain and serve.

BROILED POTATOES.—Slice cold boiled potatoes and dip them lightly into the white of an egg, broil on a

gridiron and when brown pour over them a little melted butter seasoned with pepper, salt and chopped parsley. Serve at once.

SAUSAGE ROLLS.—Take one pound of sausage-meat and divide it into twenty-four pieces, flour your board, and roll each piece out to about the thickness of your little finger, and have them all of equal length; flatten out with the palm of your hand, and set aside; then roll down a sheet of puff paste one-fourth inch thick, and cut out in squares. Flatten them out with the rolling-pin, keeping them as square as possible; lay in a sausage, and fold over turnover fashion; flatten out a little with the rolling-pin, and trim off square with a sharp knife. Cut three or four slashes in the top with the point of the knife; wash over with egg; lay on clean tins, bake in a hot oven.

FINGERS.—Sift together one quart of flour, a teaspoonful of salt, three teaspoonfuls of Horsford's baking powder. To a scant pint of milk (scalded and cold) add an ounce and a half of melted butter and a tablespoonful of sugar; whisk it, and add it to the flour; mix quickly. Turn it out on a floured board; roll quite thin and brush lightly over it a little melted butter; fold and roll again; lift the dough from the board a moment to allow it to shrink. Now divide the dough into balls, and with floured or buttered hands roll them into fingers; brush a trifle of butter over them; arrange them quite closely together on the buttered pan, and bake in a hot oven fifteen minutes.

MINCE MEAT.—Peel and core $2\frac{1}{2}$ pounds of apples; they must weigh full weight when done. Pick $1\frac{3}{4}$ pounds of suet free from skin, and chop it up very fine without caking it together, but do not use any flour with it or it will be spoiled. Chop up $1\frac{3}{4}$ pounds of mixed orange, lemon and citron peel very small, and mix with the suet. See that $2\frac{1}{2}$ pounds of currants are thoroughly washed and picked free from all stalks and stones; when dry, mix with suet and peel. Now chop up two pounds of raisins; add to the other ingredients. Now add $2\frac{1}{2}$ pounds of sugar and one-half ounce of ground mixed spice, and then chop up with the apples as fine as you can, and mix in together with one-quarter of a bottle of whiskey and one-quarter of a bottle of Jamaica rum, and put it away in a crock covered up with several thicknesses of brown paper, and stand it aside till required for use.

CHICKEN OR TURKEY FRIED IN BATTER.—Make a frying batter, using an egg to a pint of milk; cut the meat from a cold fowl in good-sized pieces; dip them in the batter, and fry to a good brown, seasoning with pepper and salt while in the pan.

MAPLE CREAM WALNUTS.—Take one cupful of water and two cupfuls of maple sugar; cook without stirring, and when nearly done put in a small piece of butter; try in water, and when it begins to harden take off and stir rapidly until it becomes a waxen substance; then make in balls and put halves of English walnuts on either side, putting on a greased plate to cool.

AMERICAN HOMES.

HOW WE SURROUND OURSELVES WITH THE COMFORTS OF LIVING.

Nothing strikes an observing American upon his first visit to Europe with greater force than the lack of those comforts and conveniences in the dwellings of even the wealthiest classes, which in his own country are considered indispensable necessities. We are quick to seize upon the latest discoveries in science and the arts, which can in any way render our homes more attractive, or the cares of housekeeping less burdensome, while the more conservative Europeans are content to live as their fathers did before them, and would consider it a sacrilegious extravagance, to tear up the floors or walls of their dwellings for the purpose of introducing steam or water pipes. * The climate of England is

damp and cold, but the almost universal way of warming is by open fire-places of soft coal, which usually develop much more smoke than heat. Hot air or steam furnaces are practically unknown, and the only means of heating railway carriages is by cans of hot water placed upon the floor. Under favorable circumstances, these will sometimes prevent the soles of one's feet from freezing, but their influence rarely extends any further. Only the very wealthiest persons abroad allow themselves the luxury of a private bath-room, and the idea of a set bowl with hot and cold water faucets in a sleeping-chamber is a refinement of effeminacy and extravagance at which even a monarch would hesitate. The houses of London are provided with a tank, into which the water is allowed to flow for a certain length of time every day, after which it is turned off, and there is no more to be had until the visit of the water company's official the next day. The "bed-room candle," to which such constant allusion is made in foreign novels, is no figure of speech, but a very disagreeable reality, for gas is rarely or never introduced into sleeping-rooms. In a somewhat extended journey through Europe, we cannot recall half a dozen instances where any other means of illumination was supplied than a wretched candle, which sometimes gave light enough to enable one to see how dark it really was. What would be thought of a first-class American hotel which advertised as a special attraction to travelers the existence of a bath-room inside its walls? and yet this is a common practice with European hotels to this day. A modern American house, with all the recent improvements, is a most wonderful affair, and an inspection while being constructed gives one a good idea of the extent to which the arts and sciences are applied to minister to our comfort. The space between the wall is crowded with tubes and pipes of every description. Steam, gas, hot and cold water are carried to all parts of the building, speaking tubes and ventilating shafts are connected with every room, while great cables of insulated wire as large as a ship's hawser, illustrate the manifold uses to which electricity may be put. Call bells, automatic gas-lighting and incandescent lamps, are only a few of these applications, and the day is not far distant when some simple form of electric motor, to run the sewing machine and furnish a supply of power for many other purposes, will be found in every first-class dwelling. As regards sanitary and drainage arrangements, their construction has become a science in itself. Take it altogether, the American householder has no cause to regret his lot. A recent writer has said that in some things we are measurably behind the Europeans, but in many things we are immeasurably ahead of them, and in no respect is this more true than in our domestic arrangements. It may be safely said that there is not a royal palace in all Great Britain or Europe, which is as luxurious, or even comfortable, as the house of the average American of moderate means, and in no country in the world is the greatest blessing, of life—a happy and comfortable home—so readily within the reach of all as in our own land.—Pop. Science News.

NINE TO STAY.—There is not a man, woman or child living who will ever date a letter or document without using the figure 9, if the document is made complete. Why not? See. The 9 has come to stay many years. It is now on the right, 1889. Next year it will take a step to the left, 1890; stay there ten years, and then take another step to the left, 1900, and there it will remain until you are done dating letters.

PURE GELATINE.—The purity of gelatine may be easily tested thus: Pour upon dry gelatine a quantity of boiling water; if pure it will form a thick, gluey, colorless solution, free from smell; but if made of impure materials it will be of a very offensive odor and have a yellow, gluey consistence. No article manufactured requires such careful selection of material and such nice and cleanly manipulation to insure a good marketable character; and those anxious for purity should avoid all artificially-colored varieties, however temptingly got up, unless they are required for merely decorative purposes and not for food.

TEA EXPERTS.

HOW THE SPECIAL VARIETIES ARE DISTINGUISHED AND SELECTED.

There are various kinds of tea which have certain characteristics, and it does not require much training to distinguish between them, as the difference is so clearly marked. There can be no mistake in detecting a Kintuck or Ningchow Moning from a Chingwo, Kaiso, or a Souchong, and when to these are added the numerous distinctive flavors of scented Foochow and Canton teas, to say nothing of several kinds of green tea, it seems more reasonable to account for the sixty cups—as stated by one of our correspondents—being correctly placed. If the statement of the difference in the value being only one penny had been omitted, the difficulty of distinguishing the cups would not have been so hard of comprehension. In mentioning these kinds of tea our readers will no doubt notice the apparent omission of the numerous teas of decidedly different character imported from India, Ceylon and Java, and these form a host in themselves; but as our correspondent writes of a gentleman who performed the wonderful feat of pairing sixty teas more than fourteen years ago, when Ceylon tea was nearly unknown, and Indians were comparatively small, we have thought it desirable to leave them out altogether. In consequence of the letters in the *Grocer*, the more important subject (to the public) of blending and brewing tea has been brought into prominence by leading articles and letters in the *Times*, *Daily Telegraph*, and other papers. While a vast amount of nonsense has been written, still attention has been drawn to an important matter which it will be in the interest of all true lovers of the refreshing and cheering beverage to ventilate, with the view of bringing about some valuable practical results. First, with regard to blending, there can be no doubt that a knowledge of the characteristics of different teas is essential to ascertain which of them, when properly mixed, and not merely thrown together, will produce the most agreeable flavor to the palate. This knowledge can only be acquired by careful training; and, further, it is necessary to be conversant with the particular character of the water in which the tea will be ultimately made. For instance, in one part of England the water contains more lime than in another, and the variation in the hardness or softness, as the case may be, will materially affect the result of a blend. This and other considerations must be taken into account when mixing the several kinds of tea, and requires considerable experience and judgment to insure success. Some writers prefer an unmixed tea delivered in the original package, and what they lose in flavor they believe the gain in getting an overweight in the tea, and security against foreign matter being mixed with it; but in our opinion, having regard to the present low price of the article, there is little fear of anything else being substituted, and by blending there is a better chance of the quality of the tea being more evenly sustained. This is of no small importance to retail grocers having the sensitive taste of the public to consider, who look with suspicion and dislike on any variation in the flavor; in fact, if a grocer is unable, from any unavoidable cause, to make up the same blend as he usually sells, and has to put in one or two qualities of tea at even a higher cost to himself, he will not be long in hearing of complaints, and perhaps have to suffer loss of trade. It is, therefore, most desirable that the blending system should be encouraged in order to maintain an evenness in quality which could not so easily be obtained in tea as imported. With reference to the subject of brewing tea, most experts agree in the opinion that the water should only just boil—in fact, all the tasting of tea in merchants' offices is done on this principle; and, notwithstanding the experience of a doctor who has written in favor of water being boiled for many hours, there can be no doubt that the general practice adopted for so many years is the best. Thus, when the boiling water is poured on the tea, the infusion should take place for

five or six minutes, as after that time a portion of tannin is extracted, which spoils the fine flavor of the tea, besides being injurious to the system. Thus the pernicious plan too often adopted at railway stations and restaurants of allowing the tea to stew cannot be too highly deprecated. There is no doubt that the wretched flavor of this so-called tea prevents the more general consumption of it by travelers, and tends to cause an unreasonably high price to be charged, which in itself is prohibitive to the poorer classes. One large firm of tea dealers writes that one pound of tea will, when infused, make 128 cups, and at two shillings per pound, brings the cost considerably under 1 farthing per cup; and if to this is added the milk and sugar and cost of firing and utensils, there would be a fair margin of profit if it were sold at one penny per cup—a price few would object to pay and many would be glad to give, and the increased consumption would doubtless make it worth the while of purveyors to pay more attention to the sale of tea. Of course the time absorbed in drinking a cup of tea is a consideration when only a minute or two is allowed at a station, and the profit on beer and alcoholic liquors is so large that there is little desire to encourage the sale of tea. The tea at railway stations should be made as we have already indicated, and when properly infused the liquor should be put in another vessel, either glass or earthenware, kept hot. It would thus be ready for travelers immediately on their arrival. The addition of milk would reduce its heat, so that it would be drinkable at once; the avoidance of the stewing process would remove one of the present great drawbacks to the quality of the railway tea; and while not, of course, being equal to the fragrance and flavor of a fresh brew, it would still have an attractive taste, instead of the repellent character of the decoction generally sold. Although the correspondence on this subject has been of an interesting and instructive character, if an increased consumption of an improved cup of tea be the result of the publicity given to the matter, our readers will have reason to congratulate themselves, and the time of the writers will have been profitably employed.—*London Grocer*.

DISTILLING AND DISTILLERIES.

MEANING OF THE PROCESS AND HOW IT IS APPLIED.

If we boil water and allow the steam to strike against some cold body, or pass through a pipe surrounded by cold water, the steam is condensed back again into water, and all the solid impurities are left behind. Distilled water, as this product is called, is largely used in chemical laboratories, and is one of the purest forms of water known, being absolutely free from solid impurities, although still containing traces of any volatile substances that may have been present in the original water. Every shower of rain is but a repetition of this process of distillation in nature's laboratory. The heat of the sun causes the water from the land and ocean to rise as aqueous vapor into the higher and colder regions of the air, where the vapor is once more condensed into water, and falls again to the surface of the earth, separated from its impurities. It is on account of its great purity that this naturally distilled water is so wholesome to use, when stored in clean cisterns and reservoirs. Not only water, but any volatile substance can be distilled if heated to the temperature of vaporization, and the process of distillation thus becomes a most important one, both in practical and technical chemistry. Sulphur, mercury and zinc are readily purified by distillation, and it is only the excessively high boiling-point of many other metals which prevents the application of the same process to them. Iron, for instance, can only be volatilized in small quantities by the heat of the electric arc, but in the atmosphere of the sun the vapor of iron is certainly present in immense quantities, and is probably being continually condensed and re-volatilized, like the aqueous vapor in the atmosphere of the earth. If there are any inhabitants on the sun, they

must be so constituted as to be proof against constant showers of molten iron. When two liquids of different boiling-points, such as water and alcohol, are mixed together, their separation by distillation is by no means as simple a matter as at first appears. Water boils at 212 deg. and alcohol at 141 deg., but if a mixture of alcohol and water is heated, say to 145 deg., the vapors formed do not consist entirely of alcohol, but of a mixture of alcohol and water, the proportions depending upon the proportions in the original liquid. It is evident, however, that at the beginning of the distillation the vapor that passes over will contain a greater proportion of alcohol, while towards the last the alcohol will nearly all be vaporized, and only vapor of water will be formed. Therefore, the first portions that are distilled over are saved and re-distilled, until finally we can obtain a liquid containing about 95 per cent. of pure alcohol. If we desire a perfectly pure—or absolute alcohol, as it is called—we must use chemical reagents having a strong affinity for water, such as caustic lime, or chloride of calcium. Absolute alcohol is but very little used, principally in chemical laboratories, and the ordinary alcohol of the arts always consists of the weaker liquid. This process of separating two or more liquids of different boiling points is called fractional distillation. One of its most important practical uses is in the preparation of alcohol from fermented liquors, known as rectification, and many very ingenious stills have been devised which automatically separate the stronger from the weaker mixtures, and give as the product of the final condensation, commercial alcohol. They all depend upon the varying boiling-point of the different mixtures, which is lower in proportion to the percentage of pure alcohol present. Fractional distillation is often carried on in the laboratory, especially in connection with the study of organic chemistry. It is often the only available means of separating two or more liquids of different boiling points, and, if properly conducted, the mixture can be divided into different liquids, or fractions, the boiling-point of which will only vary within a part of a degree from the beginning to the end of their final distillation. It is, however, a most tedious operation, as every student of chemistry knows, and calls for the exercise of considerable patience. The manufacture of kerosene from crude petroleum is, in part, a process of fractional distillation. Kerosene oil is not a simple body, but a mixture of various hydrocarbons, and the quality and safety is indicated to a very great degree by its boiling-point and the temperature at which it gives off inflammable vapors. Destructive distillation is that where the original substance is decomposed in the process and broken up into other forms. The most common example is found in the manufacture of illuminating gas, where coal, upon the application of heat, is changed into nearly one hundred different volatile substances, while a large proportion of the carbon remains behind as the inorganic, non-volatile coke. Distillation was one of the favorite processes of the alchemists, and in their day the retort, the still and the condenser held a much more important place in the laboratory than they do at present. The volatility of mercury was discovered at an early date, and many were the experiments tried by the early investigators to transform the peculiar liquid metal into true silver or gold. One alchemist is said to have distilled the same quantity of mercury several hundred times, and it is a pity that such perseverance should have brought forth nothing but a few pounds of very pure mercury; but often there was a minute quantity of silver or even gold present as an impurity, and it is probable that they sometimes succeeded in separating it, and were thus encouraged to continue their researches. But even at the present time we do not know enough about the true nature of the elements to say just why mercury differs from silver. We can only say that so far we have no knowledge which would lead us to believe that one form of matter can ever be transformed into the other. More than this we must wait for future investigators to determine.—*Pop. Science News*.

FRAUDS ON INVALIDS.

EUROPEAN EXTRACT OF MEAT.

The following paragraphs relating to the material from which European extract of meat is made, appear in the English papers. Let us stand by our American manufactures. We know by whom they are made, and we are certain that they are clean extracts of American beef:

The Hamburg Article.

Some light has been thrown upon the extract of meat trade by a seizure which has just been made in Northumberland. Two horses in the last stages of senility and decay were seized as they were being shipped for Hamburg. The man in charge stated that they cost 15 shillings each, and were intended for conversion into extract of meat. He was paid two shillings per stone on condition that the horses reached Germany alive. Both animals were destroyed.

How Antwerp Beef Extract is Made.

A man at Colchester this week has been fined forty shillings for driving a dying horse with cruelty. He was taken into port for trans-shipment to Antwerp, where it seems they boil down old screws and send the results back to English invalids for beef tea. The newspapers have fully explained the process, and now compressed beef, extract of beef, and beef tea with an Antwerp brand are a drug in the market.

USE FOR OLD PAPERS.

NEWSPAPERS AS PRESERVATIVES AGAINST MOTHS.

Newspapers are invaluable for packing away the winter clothing, the printing-ink acting as a defiance to the stoutest moth as successfully as camphor or tar-paper. For this reason newspapers are useful under the carpet, laid over the regular carpet-paper. The most valuable quality of newspapers in the kitchen, however, is their ability to keep out the air. It is said that ice completely enveloped in newspapers, so that all

All hands want Pearline—it's handy. Enables one pair of hands to do the work of several; millions of hands use it; millions more will when they learn its value.

You can read, write, sew, wash dishes, prepare the meals, care for the baby—with your two hands, while Pearline is washing the clothes for you almost without the aid of hands. It's harmless; cannot hurt most delicate of hands or fabrics; most delightful for washing the hands. It saves your hands one-half the work in house-cleaning—in fact, when your hands have anything to wash or clean, do it with Pearline.

Beware of imitations and peddlers.

153

JAMES PYLE, New York.

air is shut out, will keep a longer time than under other conditions, and that a pitcher of ice-water laid in a newspaper with the ends of the paper twisted together to exclude the air, will remain all night in any summer room with scarcely any perceptible melting of the ice. These facts if such, should be utilized oftener than they are in the care of the sick at night. In freezing ice-cream, when the ice is scarce, pack the freezer only three-quarters full of ice and salt, and finish with newspapers, and the difference in the time of freezing and quality of the cream is not perceptible from the result when the freezer is packed full of ice. After removing the dasher it is better to cork up the cream and cover it tightly with a packing of newspapers than to use more ice. The newspaper retains the cold already in the ice better than a packing of cracked ice and salt, which must have crevices to admit the air.

BUSINESS NOTES.

CELERINA.

G. W. Watts, M. D., Auxvasse, Mo., says: I find Celerina very useful in cases of old persons, whose digestive powers are failing, and in the convalescing period of those old persons from acute diseases, such as pneumonia, bronchitis, gastro-enteric troubles, etc. In two cases recently treated of this kind Celerina seemed to restore both the nervous and digestive system. Both of these cases were very old persons; they are now apparently well.

A SURE CURE.

An editorial in the *Wayne Co. Courier*, published at Detroit, Mich., September 16, 1889, states as follows: "There is probably no disease to which mankind is heir which has brought out so many shams and frauds as catarrh has. Of all human ills this one seems to have been ordained specially to exercise the ingenuity of quacks in the production of nostrums as manifold as they are worthless. It is therefore actually refreshing to come across a remedy for this disease which affords positive assurance of relief if not actual cure to the sufferer. We refer to the treatment of A. H. Dixon & Son, Toronto, Canada. We have the name of a gentleman in our possession, which will be given to enquirers who has been a sufferer from catarrh for the past

twenty years. He tried many doctors and innumerable so-called safe-cures, but all left him in a worse plight than before, one treatment of A. H. Dixon & Son's remedy made a new man of him and effected, he believes, a perfect cure. The Messrs. Dixon have a theory of their own about catarrh, different from all others and upon this they work to eliminate the cause of the disease, with almost certain success. It is seldom that we are able to give so full and free an endorsement to anything as we are able to accord to this really wonderful remedy."

HE KNEW.—Mrs. Swiggles (at the opera) "Oh, isn't that a lovely viola?"

Swiggles (also at the opera), "Yes, that's a Strabismus."

MISFIT LANGUAGE.—Why do we always talk of putting on a coat and vest? Who puts on a coat before a vest? We also say putting on shoes and stockings. Who puts on the shoes before the stockings? We also put up signs telling people to wipe their feet, when we mean their boots or shoes. And a father tells a boy he will warm his jacket when he means to warm his pantaloons. We are a little eccentric in our phrases, ain't we, at times?—*Boston Courier*.

HOSPITAL REMEDIES

THE Favorite Prescriptions of the Brightest Medical Minds in the world, as used by them in the Hospitals of London, Paris, Berlin and Vienna.

ONE MEDICINE FOR ONE DISEASE.

No. 1—Cures Catarrh, Hay Fever, Rose Cold, Catarrhal Deafness.
No. 2—Coughs, Colds, Bronchitis, Asthma, Consumption. A Peerless Remedy.

No. 5—Fever and Ague, Dumb Ague, Malaria, Neuralgia.
No. 6—Female Weakness, Irregularities, Whites. A Golden Remedy.
No. 7—A Perfect Tonic, which gives Health, Form and Fulness, Clear Complexion, Good Blood and lots of it.
No. 8—Nervous Debility, Loss of Power, Impotence, an incomparable remedy.

RELIABLE AGENTS WANTED. Every bottle guaranteed to cure its special disease IF CURABLE and to give permanent relief ALWAYS. Descriptive Circulars sent free on application. **HOSPITAL REMEDY COMPANY, Toronto, Canada.**

GAS POWER.—Recent foreign experiments at Witkowitz, Austria, show that a furnace run with water gas requires only 58 per cent. of the heat which is needed for a furnace fired in the usual way.

REMARKABLE PROJECTILES.—At the Paris Exhibition the firm of Holtzer show a shell which pierced a steel plate ten inches thick and landed entire without a flaw 300 yards, or nearly half a mile, distant from the target. Only the point of the shell was slightly distorted.

VARNISH LEATHER GOODS.—Four ounces of shellac, half an ounce of camphor, and one ounce of resin are dissolved in one pint of methylated spirit and shaken at intervals for 48 hours. The mixture is then colored according to the kind of leather with which it is to be used. Other resins, solvents, and proportions may be adopted.

ORNAMENTAL BRICK.—A new hydraulic brick is now manufactured in eight different shades of red and brown which, on cheap houses, is designed to supply the place of brownstone or sandstone for trimmings. The shades of color run from a rather dark brown to a reddish hue, and at a superficial glance might well be taken for the stones the places of which they supply.

SMOKE SANITATION.—The belief that smoke from soft coal may have beneficial sanitary effects is gaining ground. It is claimed that the sulphur in the coal when burned becomes sulphurous acid gas, a well-known disinfectant. Further, that creosote and its allied products are thrown off with the fumes of bituminous coal, and that an atmosphere charged with carboic acid must be freer from germs of the disease than an apparently purer air.

BELIEVES IN PRINTER'S INK.—Professor Dickman, of the Edge Hill vineyard is a strong advocate of the use of "printer's ink," and says it is the only true road to success in any business in this enlightened age. He says that after our wine reaches New York it should be advertised on a large scale. "The American people," says he, "are willing to pay well for anything of a first-class nature, or that which suits them, and I am confident that \$1 per gallon can be obtained.—*Merchant and Viticulturist.*

NOISELESS CLOCK.—A Frenchman has invented a noiseless clock, for use, more especially, in sick rooms. In place of the usual pendulum, the hands are set in motion by the unrolling of a chain, the end of which is fastened to a buoy floating in a tank of liquid. This fluid escapes at a uniform rate, and can be utilized to feed a lampwick, thus giving the apparatus the double character of clock and lamp. When the lamp is lighted the necessary diminution of liquid takes place by combustion, and at other times by carefully regulated dropping.

THE WORLD'S SUGAR.—Beet root sugar was produced in European countries during one year, 1887-88, to the extent of 2,427,000 tons. The product of all other lands in cane sugar during the same period was identical in amount. The consumers of sugar *per capita* are in order: England, 66 pounds; United States, 47; France, 23; Switzerland, 21; Holland, 20; Denmark, 19; Germany, 19; Belgium, 18; Norway and Sweden, 17; Austria-Hungary, 11; Greece, 10; Portugal, 9; Russia, 9; Spain, 8; Italy, 7; Turkey, 4; Roumania, 4; Bulgaria, 3; Servia, 3.—*Pharmaceutical Record.*

GOOD SOLICITORS

For Advertisements or Subscriptions can hear of something to their advantage by applying to this office.

REASONS WHY

Should be preferred to all others:

Because—It is genuine-pure, just as it existed in the hepatic cells of the living fish, not depleted of its natural virtues by any process of refining, nor weakened by being made into an emulsion with an equal quantity of water, glycerine, etc., which latter device makes water bring the price of Oil.
Because—In taste and smell it is not offensive, but instead, sweet and agreeable.
Because—Its administration is always followed by satisfactory results.
Because—It is more easily assimilated than other Oils.
Because—It is more nutritious than other Oils.
Because—Of its perfect digestibility, perfect limpidity.
Because—This perfect Oil costs consumers no more than the poorer qualities abounding in the stores.
Because—It is readily obtainable; all well-stocked Drug Stores have it.
Because—It is unquestionably the purest and best COD-LIVER OIL IN THE WORLD.

Tabasco Pepper Sauce OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wit's end and what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only three possessed the power of acting on starch. These brands were **MALTINE**, Corbyn, Stacey & Co.'s Extract, and Keppler's Malt Extract. **WILLIAM ROBERTS, M.D., F.R.S.**

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined. **R. H. CRITTENDEN.**

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain). **MALTINE with Phosphates, Iron Quinine, and Strychnine.**
MALTINE with Alteratives. **MALTINE Ferrated.**
MALTINE with Cod Liver Oil. **MALTO-YERBINE.**
MALTINE with Hypophosphites. **MALTO-VIBURNIN.**
MALTINE with Peptones. **MALTINE with Cascara-Sagrada.**
MALTINE with Pepsin and Pancreatine.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analysis by 100 of the best Analytical Chemists in this country and Europe. We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

Profession for

INVALID'S BEEF TEA

[FLUID.]

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.

Essentially Different from all other Beef Tonics.

Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

"I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

THE CARE OF FINE BOOKS.

A representative of the AMERICAN ANALYST called upon a well-known bibliophile of this city for information respecting the care of fine books. "A book," said the expert, "is a delicate organization, whose foes are perpetually endeavoring to destroy it, and its foes are simply legion. Water, moisture or dampness on the one hand, and excessive dryness on the other are both extremely injurious. A high temperature dries paper, parchment and leather, and renders them very brittle. In the opposite direction great cold affects books in the same manner, but to a much smaller extent. For this reason a Swede or a Canadian has a harder time with his library than a Frenchman, an Englishman or an American. But the hardest time of all is experienced by the residents of hot climates like Southern India, Egypt, Brazil and Colombia. Another dangerous enemy to all books is what is usually termed mould. This is not a simple vegetable growth, as is popularly believed. Microscopists have discovered over a hundred species of mould with which libraries are afflicted. Some attack paper; others parchment; some fatten on sheepskin, while others prefer morocco for a diet. There is hardly

a substance of any sort used in bookmaking but what has anywhere from two to ten different moulds which find in it a home or a source of nourishment. Insects are a cause of endless trouble. Flies and spiders merely soil books; moths and butterflies lay eggs which hatch into voracious and destructive larvæ. These do any amount of damage. I have seen rare and valuable volumes which had been bored through and through by these minute pests. Ants do little or no harm in temperate latitudes, but are a scourge in the tropics. A colony of white ants has frequently been known to devour not only a library, but also the book-cases in which the books were kept. In providing against these dangers a little common sense will suggest all requisite remedies. A library should be kept clean, well-dusted and thoroughly ventilated. A hard-wood, marble or mosaic floor with rugs is far better than a carpeted one. For the same reason wooden or leather furniture is superior to the handsomest products in silk and wool of the upholsterer's art. In respect to heating, a grate fire either of coal or the old-fashioned one of wood is the best. Dry hot-air from registers or furnaces, is too desiccating, while a gas-stove or oil-stove is ruinous. For fighting mould and insect life there are a number of good methods. Pieces of camphor, menthol and tobacco are of great value. They should be placed in the book-cases on every shelf. Pulverized salicylic acid sprinkled over the books and shelves is probably the best. It is colorless, tasteless and odorless, and has no action either chemical or mechanical upon the books. Spraying a book-case with a weak solution of corrosive sublimate has been recommended, but I do not like the idea of playing with so powerful a poison. Last of all, in using fine books put on a temporary cover before you begin reading."

THE PEN OMNIPOTENT.

The pen constantly proves itself mightier not only than the sword, but than the most deeply rooted institutions of government. From some recent indications it appears to be possible that Mr. George Kennan has performed a service for the people of Russia scarcely second to Czar Alexander II.'s manumission of the serfs. A correspondent of the *Evening Post* writes from Kieff, in Russia, that it is reported there, on authority which cannot reasonably be doubted, that the Russian Government is about to abolish exile to Siberia, both as a penalty for political and criminal offences. This edict of abolition is attributed to two causes—first, to Mr. Kennan's articles, which are impossible of refutation, and which not only affected opinion profoundly in the civilized world outside of Russia, but also brought a good deal of enlightenment to the high circles in Russia itself; and second, to the steady efforts of General Ignatieff, Russian Minister of the Interior, who is said to have long advocated such a measure. If Mr. Kennan's efforts have really met with such a result, his work is to be regarded as one of the most magnificent achievements of the press in this century.

NEW JERSEY HEALTH.

The State Board of Health of New Jersey has ordered a thorough examination to be made of the sanitary condition of all premises where persons lodge or board. This class of premises includes all the hotels, restaurants, boarding houses, colleges and seminaries in the State, whose inmates have no control over the water supply, drainage and other local conditions which may affect their health. This action of the board is one of a series of precautionary measures which are being taken by the State authorities for the promotion of the general health. The inspections will be made under the personal direction of the officers of the State and local boards of health. One of the special features of this movement will be the searching examination which will be made of the premises of all hotels and boarding houses at the seaside resorts in Monmouth, Ocean, Atlantic, Burlington and Cape May counties before the opening of the next summer season. New Jersey is the first State to begin such an inspection by the State Board of Health.

SCIENCE, THE CIVILIZER.

While it is true, as the *Electrical Review* says, that the eloquent words of Lord Salisbury, the British Prime Minister, at a recent dinner of the London Institution of Electrical Engineers, will be read with pride by every individual engaged in electrical work, their significance extends to a far more extensive class than the scientific specialist. In this remarkable speech, the Premier placed electricity before gunpowder, the printing press and even the steam engine itself. In speaking of the electric telegraph, he said: "When you ask what is the effect of the electric telegraph on mankind, I would ask you to think what is the most conspicuous feature in the politics of our time, that occupies the thought of every statesman, and that places the whole future of the civilized world in a condition of doubt and question? It is the existence of those gigantic armies held in leash by the various governments of the world, whose tremendous power may be a guarantee for the happiness of mankind and the maintenance of civilization, but which, on the other side, hold in their hands powers of destruction which are almost equal to the task of levelling civilization to the ground. And what gives those armies their power? What enables them to exist? By what power is it that one single will can control these vast millions of men, and direct their destructive energies at one moment upon one point? What is the condition of simultaneous direction and simultaneous action which alone gives to these vast armies their vast power? It is nothing else than the electric telegraph." In relation to the probable development of the electric motor, Lord Salisbury ventured upon the following prediction: "Now an agent has been discovered by which the force of the steam engine, stiff, confined to its own centre, can be carried along far away from its original source to distances which are already great, and which

science promises to make more considerable still. I do not despair of the result that this distribution of force may scatter those aggregations of humanity, which, I think, it is not one of the highest merits of the discovery of the steam engine to have produced. If ever it shall happen that in the house of the artisan you can turn on power as now you can turn on gas (and there is nothing in the essence of the problem, there is nothing in the facts of the science, as we know them, that shall prevent such a consummation from taking place)—that distribution of power should be so organized—you will then see men and women able to pursue in their own houses many industries which now require the aggregation of the factory. You may, above all, see women and children pursue those industries without that disruption of the family, which is one of the most unhappy results of the present requirements of the industries; and if ever that result shall come from the discoveries of Oersted and Faraday, you may say that they have done more than merely add to the physical force of mankind. They have done much to sustain that unity, that integrity of the family, upon which rest the moral hopes of our race, and the strength of the community to which we belong."

A FALLACIOUS PANACEA.

Despite the fact that the whole fabric of our national organization is directly antagonistic to the principle of "paternal government," there are a large number of visionaries who look with vague longing upon that system as being competent to cure all the evils society as at present constituted is liable to. The tendency in that direction is apparently developing into an organized movement. The original Nationalist Club of Boston, the first organization founded upon ideas suggested by Edward Bellamy's book, "Looking Backward," now has two hundred members, including many active business men. The membership is about equally divided between men and women. The following-named flourishing clubs are definitely organized and many more are in process of organization: California, three in San Francisco, three in Los Angeles, one each in Oakland, San Diego, National City, Pasadena, San Jose, Fullerton, Otay, Ocean View, Kaweah; Colorado, two in Denver; Connecticut, one in Hartford; Illinois, two in Chicago; Iowa, one at Des Moines and Lehigh; Massachusetts, two in Boston, one in Charlestown, one in Lynn; Minnesota, three in Minneapolis; New Hampshire, one in Portsmouth; New York one in Albany, three in New York city; one in Cincinnati and Columbus; Pennsylvania, one in Philadelphia; Washington, two in Tacoma;

District of Columbia, one in Washington. A Nationalist league, formed of the different clubs in the country, will soon be organized.

ADULTERATION IN EUROPE.

SUMMARY OF THE ANTI-ADULTERATION LAWS OF EUROPEAN COUNTRIES.

[Paper presented by Edgar Richards at the annual meeting of the American Public Health Association in Brooklyn, October, 1889.]

Concluded.

SPECIAL PROVISIONS.

These include clear and concise definitions of the different food products, as well as very often an accurate statement of what shall be the minimum chemical composition of such foods or their ingredients. The latter feature, however, is owing to the constant advance made in the methods of chemical analysis, and also, it must be said, to the shifting character of adulterants used, much better left to frequently revised regulations by competent authorities than to the precise wording of a law.

1. *Butter and Cheese.*—These must be made from milk or cream, or both, and with or without common salt. Any admixture of a foreign fat not derived solely from milk makes the product artificial, and it must consequently be so labelled and sold. Most of these countries have special laws on the manufacture and trade in artificial butters (see reports of the Commissioner of Internal Revenue for 1888 and 1889).

2. *Confectionery.*—This must only be colored with harmless materials, such as (black) chinese black; (blues) Berlin blue, indigo, litmus, Prussian blue, saffron blue, ultramarine; (brown) caramel; (greens) chlorophyll (as spinach juice), mixtures of yellow colors with blue (a mixture of Prussian blue, Berlin blue, and Persian berries gives a green rivaling in brilliancy Schweinfurt's green; (reds) annatto, Brazil lac, carmine, carmine lac, cochineal, orseil, the juice of beets and red berries (such as cherries and currants, etc.); (yellows) Avignon berries, curcuma, fustel, marigold, Persian berries, quercitron, safflower, saffron, turmeric, chalk and the ochres. The use of substances known to be injurious to health is forbidden in this and other food commodities. Among these injurious substances are included salts of antimony, arsenic, barium, except the sulphate; bismuth, cadmium, chromium, cobalt, copper, iron, the chloride and sulphate, though most iron salts are harmless; lead, magnesium, nickel, zinc, and some of the potassium and sodium salts; oxalic acid, picric acid, cocculus indicus, (Indian berry, Levant nut), picrotoxine, gamboge, aniline, aloes, eosine, fuchsine and its immediate derivatives; coloring matters containing nitrous vapors, as naphthol yellow, victoria yellow, coloring matters prepared with di-azo compounds.

3. *Distilled Beverages.*—These, (such as kirsch, brandy made from grape residue, from lees, or with juniper berries, gentian, etc.), must only bear the name of "natural" when they are produced by the fermentation and subsequent distillation of the fruit or material of which they bear the name, without any addition whatsoever. The sale of these beverages made artificially with alcohol, or increased by alcohol and other substances, is tolerated, provided the mixture contains nothing injurious to health and is properly labelled.

3. *Flour and Bread.*—The sale of any flour containing ergotized grains is forbidden. The addition of any flour of an inferior value constitutes a fraud if the mixture is not specified. Wheat flour shall be composed entirely of ground wheat, free from bran, perfectly white, or having a faint tinge of yellow; must not show red, grey, or black specks, nor possess a disagreeable odor; must contain no foreign meals, as rye, corn, barley, peas, beans, rice, linseed, buckwheat and potato starch; no alum to disguise the presence of damaged flour in mixtures, or to improve the appearance of an inferior grade, etc.

5. *Fruits and Vegetables.*—The sale of unripe or of rotten fruits or vegetables is forbidden.

6. *Honey.*—Honey must consist of the saccharine substance collected by the bee (*Apis mellifica*) from the nectaries of flowers, and deposited by them in the cells of the comb. It must not contain any added starch-sugar (glucose), cane-sugar or inverted sugar.

7. *Lard.*—This must be made exclusively from the rendered fat of the hog, and must not contain any foreign fats.

8. *Liquors.*—These must be free from unwholesome materials, toxic bitter substances, fuchsine and other coloring matters, etc.; and as they are all artificial products, they must be duly labelled.

9. *Malt Liquors.*—These must consist of the fermented alcoholic infusion of malted barley with water, and flavored with hops. This replacement of these substances by others is considered, if these are inoffensive as a violation of, and, in case they cause injury to health, as an offence against the law. They must not contain antiseptics, salt (except that derived from the water used in brewing), or alkaline bicarbonates. The beer-pumps used must be so fitted as not to produce any alteration in the beverage. The pipes must be as short as possible, and formed of pure block tin. They must be washed out every day with boiling water, and every eighth day with a solution of soda. The air used must be drawn from without and caused to traverse a bed of pounded and sifted charcoal. The whole apparatus must be kept in a state of perfect cleanliness.

10. *Meat.*—Every animal, before being slaughtered, must be inspected by a competent veterinarian, who will issue the necessary health certificate. An inspection is again made when the carcass is ready to cut up, before the removal of the viscera. The inspector will give a permit of sale if he considers the meat sound. Meat is considered injurious which is derived from animals (a) dying from internal disease, (b) poisoned, (c) affected by a contagious disease, or (d) by a malady involving the decomposition of the blood; also all meats containing any parasites, as trichinae, capable of developing in the human body, and all meats entering into putrefaction. The sale of all meat derived from a sick animal is forbidden, whether it may or may not be injurious to health. The slaughtering of calves under sixteen days old, as well as the sale of such veal, is forbidden.

11. *Milk.*—The sale of milk coming from sick cows is prohibited. Persons coming in contact with invalids suffering from contagious diseases should abstain from the handling of milk. The use of vessels of copper, brass, zinc, pottery poorly glazed or made with lead enamel, must be avoided. Places for storing or retailing milk should be clean, airy, and located at a distance from sleeping or sick rooms. The use of carbonate of soda, salicylic and boracic acids or their salts, as well as other materials intended as preservative agents of milk, is prohibited. The removal of cream, the addition of water, foreign fats, or coloring-matter, are considered as adulterations. Milkmen are required to mark upon their cans in an indelible manner the kind of milk they contain: (a) whole (pure) milk; (b) mixed or half-skimmed milk, resulting from the mingling of the skimmed milk, with the morning's whole milk; and (c) skimmed milk, *i. e.*, milk entirely without cream. In the two latter cases milkmen must notify their customers of the character of the product. A specific-gravity test at 15.5 degs. C. (60 degs. Fahr.) of 1.03 is generally recognized as the minimum for pure milk, though chemical analysis is depended upon in cases of dispute.

12. *Spices and Colonial Produce.*—These must be sold in a pure and unmixed condition.

13. *Tinning.*—The tinning of all copper and iron utensils used in the preparation or preservation of foods must be made with pure tin, or one containing not more than one per cent. of lead. Galvanized (*i. e.*, coated with zinc) vessels are not allowed.

14. *Vinegar.*—This must be composed only of acetic

acid, and must not contain any other acid, either mineral or organic.

15. *Wine*.—Nearly every wine-producing country in Europe has special laws on this subject, in which a sharp distinction is drawn between natural and artificial wines. A natural wine is defined as the liquid product which results from the alcoholic fermentation of the juice of fresh grapes without any addition whatsoever. Every wine which has not been made solely from the juice of fresh grapes must be sold under the denomination of "artificial wines." Artificial wines may be divided into two classes,—viz., imitation and demi-wines,—defined as follows: Artificial wines are alcoholic liquids which resemble natural wines, but which are not derived from the fermentation of unnatural grape-juice, and are made with a mixture, such as water, brandy, alcohol, glycerine, sugar, tartaric acid, cœnanthic ether, etc., to imitate wines; demi-wines are those resulting from the addition to the must or natural wine, of water, sugar, alcohol and other substances, intended to produce the taste or appearance of wine in such diluted and attenuated liquids, or made in the same manner with grape marc, already used in the preparation of must. Provisions are made for the proper branding and labelling of all vessels and packages containing wine, and for distinctive way-bills, invoices, etc., used in the shipment and the sale of wines. All wines not labelled as artificial are considered as being genuine wines, and severe penalties are imposed for violations of this provision.

CALIFORNIA INDUSTRIES.

THE REMARKABLE PRODUCING CAPACITIES OF THE
GOLDEN STATE.

(Continued.)

Monterey County is about 100 miles south of San Francisco. It has an area of 3,600 square miles, or more than two and a quarter million acres. It is four times as large as Rhode Island and twice as large as Delaware, or one-fourth larger than these two States combined. The population of those two States is nearly half a million of people; Monterey County has not quite eighteen thousand. The county consists of the Salinas Valley, more than one hundred miles in length and from three to fifteen miles in width. The Gabilan Mountains are on the east and the Santa Lucia Mountains on the west, with the Pacific Ocean forming its western boundary. This is the banner grain county of the State. Wheat, barley and oats are its principal crops. Hay made from the wild oat, beans, potatoes, buckwheat, mustard, rye, corn, peas and other vegetables, melons, citrons and deciduous fruits, grapes, berries, olives, almonds and other nuts, sugar beets, etc., are successfully raised. There are immense deposits of limestone and some fine coal. Quicksilver, asphaltum, gold and silver have also been found. This section of the Pacific coast is said to be rougher than any other part of California, and these mountains bear testimony of a fearful contortion of the earth's surface. In this vast mountain area of about fifteen hundred square miles there is produced a considerable growth of pine, while many of the cañons near the coast are densely covered with redwood. Most of this area is grazing land, and much of it adapted to agriculture. In these mountains are found some of the finest trout streams, and deer are numerous. Quail, wild pigeons and rabbits are to be found without hunting. Grizzly bears were numerous here in earlier days, but are seldom seen now. The leading industrial features of Monterey County are stock raising, dairying, agriculture, horticulture and mining. The sheep industry has been on the down grade for several years. Cattle and horses are raised by the thousand. Hogs are raised to a limited extent, fattening from acorns. The grain crop last year, half wheat and half barley, amounted to 70,000 tons, or two and a third million bushels. The average yield is twenty bushels

of wheat and thirty bushels of barley to the acre. As much as forty bushels of wheat and sixty bushels of barley are not unusual yields under favorable circumstances. There are in this county some of the finest vegetable lands in the world. On one ranch thirty-one potatoes were dug which filled a large barley sack, and weighed more than one hundred pounds. The coming agricultural industry, however, is raising sugar beets. The factory erected by Claus Spreckels at Watsonville in an adjoining county, has stimulated this industry. Some of the beets raised in the Salinas Valley went as high as twenty-two per cent. of sugar, and none lower than eighteen per cent. The yield is from ten to twenty tons per acre, worth six dollars a ton. A factory is to be built in Salinas with a capacity of five hundred tons a day, requiring five thousand acres of beets to run it. Apples, pears, all kinds of pitted fruits, vines, citrus fruits, olive and almond trees, all do well. At Salinas is one of the largest flouring mills in the State, with a daily capacity of five hundred barrels. The lumber interests of the country are also important. Besides the redwood, oak and pine already mentioned, there are the yellow, nut, Monterey and Coulter's pine, western juniper or cedar, arbor vitae, live oak, chestnut oak, white oak, cañon live oak, Monterey cypress, Gove cypress, laurel, madrone, manzanita, mescale, sycamore, willow, cottonwood, buckeye and many other trees. Among some of the remarkable plants found here are the amole or soap plant, the mistletoe, Spanish moss, yerba buena and yerba santa (valuable in medicine). The Hotel del Monte, the queen of American watering places, is situated on Monterey Bay. The celebrated Los Burros gold mines are also located in this county. While we have not given many statistical figures in this article, we have shown that Monterey County is not in any way behind her sister counties in contributing to the wealth of the Golden State.

(To be continued.)

NUISANCES IN LAW.

A BRIEF INQUIRY INTO THE LEGAL MEANING OF THE
WORD NUISANCE.

The law relative to the abatement of nuisances rests on one of the most fundamental principles of government: Every man shall so use his own as not to injure another in the enjoyment of his rights. We call Government a "social compact." In the savage state society is a jungle for wild beasts, in which every rattlesnake has an inalienable right to bite, when life is a battle—a struggle for existence. Society is organized to do away with this struggle and to guarantee to all equal rights. We form a social compact. I give up my liberty to murder you and you give up your liberty to murder me. Your hobby may be a hog-pen, another's a cess-pool, mine a slaughter-house, but we mutually give up our liberty to injure one another with our hog-pens, cess-pools and slaughter-houses. Strictly speaking, any use of property annoying to another's rights is a nuisance. Two things are necessary: a right and an injury. No matter how much your refined taste may be violated by the architectural structure of your neighbor's house, it is not a nuisance, because no right is violated. So I may not like the looks of your pig-pen, but I can look the other way. When, however, your pig-pen gives off offensive odors it is a nuisance, because every man has a right to pure air. There must be not simply a violation of a right to constitute a nuisance, but the violation of the right must make somebody uncomfortable. One cannot urge that he is especially dainty or fastidious, but any use of property which renders uncomfortable a plain ordinary American is a nuisance. The nuisance need not be injurious to health; it is enough if it is annoying to the senses. Nuisances are sometimes classified as public, private, and mixed,—the latter being a public nuisance in which some private person is entitled to special damages

for some special injury. Nuisances are also classified as (1) nuisances *per se*—in themselves, and (2) occupations which may become nuisances through neglect or improper use. Decaying matter is a nuisance in itself; a slaughter-house may become such because of its improper location. Most nuisances may be classified as violations either of our rights to pure air or pure water. Every man has a right to air uncontaminated by noxious vapors, odors, and noises. Among the trades which under certain circumstances have been declared to be nuisances because of the contamination noxious vapors may be mentioned: Bone mills, chemical works, veterinary stables (where horse's hoofs were burned), dye houses—all legitimate occupations but carried on so near dwellings as to interfere with rights to pure air. The courts have held that a blacksmith's shop was a nuisance when the cinders discolored well-water and entered an adjoining house; glass works are nuisances when the smoke from them produces an unpleasant taste in the mouth, also lead works and breweries which give off noxious vapors. If a neighbor is cultivating foreign plants, smoke which destroys them is a nuisance even though this smoke is not injurious to ordinary vegetation. Among those occupations which are nuisances because of the offensive odors which they give off may be mentioned: Tallow factories, soap factories, tanneries, boiling carrion, pig-pens, vaults, cess-pools and slaughter-houses. A slaughter-house located in the suburbs of the city may not be a nuisance, but if the city grows out to it it may become one. Dust in the air may become a nuisance, also a hospital located in a public place. Livery stables may become nuisances because of offensive stenches, the collection of flies, or the noise of horses' feet. Thus we see that our rights may be violated by noises, dogs barking at night, the shop of a tinsmith who works nights, discharging guns, singing at unreasonable hours are nuisances. If your neighbor "blows on a cracked clarinet" it is a nuisance. Brass bands and whirligigs have been declared to be nuisances. You see how careful the courts are to guard the rights of man to air uncontaminated by vapors odors and noises. Every man has a right to pure water. Polluting rivers used for drinking purposes by refuse from mill, brewery, or sewer is a nuisance. It has been declared a nuisance where the contents of a vault percolate into a neighbor's well.

RATHER DISAPPOINTED.—A gentleman who returned from Havana a few days ago informs us that the English syndicate which purchased several cigar factories there are not hungry for more. Profits have not been what they expected.—*Tobacco Leaf*.

USEFUL INVENTION.—A very useful invention, tending to lessen the possibility of accidents in factories, is now being extensively adopted in England. The break-ieg of a glass, which is adjusted against the wall of every room in the mill, will at once stop the engine, an electric current being established between the room and the throttle valve of the engine, shutting off the steam in an instant. By this means the engine was stopped at one of the mills recently in a few seconds, and a young girl, whose clothes had become entangled in an upright shaft, was released uninjured.

A HEAVY CONTRACT.—"I want employment," said a desperate man, entering a Market Street cigar store. "All right," said the proprietor, calling an employee; "give this man a Lancaster County cigar and plenty of matches."—*Philadelphia Record*.

A RURAL RISK.—It will not add to the peace of mind of the many lonely night operators of this country if it becomes fashionable in insane circles to visit telegraph offices in country towns. The recent battle for life that a telegraph operator in Connecticut had with an escaped maniac was an experience he will never forget, and only the timely arrival of a railroad track watchman saved the dot and dash artist from death. We suspect there will be few unarmed night operators hereafter.—*Electrical Review*.

A FOOLISH TOY.—Smoking dolls for the holidays, imported from Paris, and costing fifty dollars, are the latest fads. They smoke with a charm that is entertaining to behold.—*Newsman*.

THE GARTER, PRO AND CON.

ITS HISTORY, UTILITY, AND ALLEGED HARMFULNESS.

A writer in the London *Truth* says he suspects there is no better way for doctors to get their names well before the public than by abusing the most time-honored garments of their lady patients. We know how the stays have been pulled about by medical critics, he says, and now they have held their own and kept their shape in spite of all the efforts of their opponents. I now hear that the English doctors at a recent congress have been handling garters roughly on the pretext that they injure the circulation of the blood. But how are stockings to be worn if garters are to be discarded? As our foremothers for centuries were gartered, and not only a few complained of the varicose veins, it strikes me that the evil lies not so much in the wearing of the garter as the way in which it is worn. It may be a loose fit (which does just as well to keep the stocking from falling or getting wrinkled at the ankles) or it may be a tight fit, which of course is injurious. I have been interviewing a couple of weavers of surgical stockings for persons troubled with varicose veins. Would it surprise you to hear that the greater number of their customers never wore garters since their childhood, they being of the non-gentle sex! Perhaps this is because sons take after their mothers, and inherit their acquired weakness in exaggerated forms. Nor is it persons who walk the most that want these special stockings. The demand for them is chiefly made by full-fed men who lead sedentary lives and drink more wine than is good for them. A wearer of the anti-varicose stocking feels worse after a series of dinner parties, when the tempting varieties of the menu lead him to indulge too freely in the pleasures of the palate. It is rather odd that the crusade against the garter has not been made at a ladies' congress. My notion was that it belonged to the topics which should only be discussed at Eleusis, until I found that a congress of doctors took it up. I have been round to museums to ascertain to what remote antiquity we owe the garter. Chatelaines, in the Gothic times, before knitting was invented, used to wear in cold weather, gaiters made of warm stuffs covered with silk embroidery, and laced at the sides. I fancy that stockings were rarities when the Countess of Salisbury dropped her garter, to the scandal of the ladies of Queen Philippa's Court, and that the few which were displayed there came from Flanders, and were lacy-looking articles. An antiquarian has been showing me an old Flemish garter in goffered leather, with a handsomely embossed silver clasp, representing St. Martin and the beggar. What that high-spirited and generous saint had to do with garters my friend is at a loss to think. Garters at any rate, were not so hidden as is generally supposed when Edward III. instituted a Guard of Honor for those of the Countess of Salisbury. They were shown by ladies who went out riding to hawk. When the side-saddle later came in it did not involve the use of the long riding habit, and so the leg-gear meant to be used on horseback became of more costly and curious workmanship. Brantome casts side lights on the grand and proper dames who were aided by their valets-de-chambre to dress for the hunting field and were particular in learning from them how their *chausses*, (shorts,) *chaussettes*, (stockings,) and garters impressed them. A garter was adorned with armorial bearings or with fanciful conceits. They were often richly jeweled and might have served as armlets for knights who gloried in displaying such tokens. At weddings, brides' garters were cut up and the pieces given to the young men who attended. They wore them as decorations. In Italy and the South of Spain, when stockings came in there, daggers were stuck by the wearers thereof into their garters, a sign that they wanted no order of chivalry to defend them. A very beautiful English lady whom I knew tried some years ago to revive this fashion in Florence. Her husband had deserted her, and she had to go about with a kind of *cavalier servente*. As she spoke much of her dag-

ger, sometimes allowed part of it to be seen, and was lovely as she could be, she found imitators. But they were not Lucretias. The garter, I find, is becoming more than ever an *objet de luxe*. When it is so it is got up with exquisite taste. There are garter *ecrins* for dressing tables as there are bracelet *ecrins*. Jewelry enters into the arrangement of elastic band and quilted silk. So does skilled needlework. I am told that the *article de Paris* which is to top the market at the opening of 1890 will be the garter. In the United States there is a movement in favor of ribbed socks for ladies. Those who promote it must have lovely skins. I do not see why the sock should not dethrone the long stocking. There is really no indelicacy in going without stockings, as every one must have observed who has watched the humors of a French watering place where there are extensive sands. Canvas buskins protect the feet, but legs are bare and the skirts are trundled up to the knees. French seigneurs went to England to enjoy themselves at the court of the merry monarch, extolled the beauty of the bare legs which they saw at Tunbridge Wells. English farmers and shopkeepers' daughters then preferred to go without stockings when they could not get them of the finest quality, and in their neatly-made shoes and short, tidy skirts, they presented an agreeable contrast to the French women who wore clumsy hosiery and clumsy sabots. Under Louis XIV. fine lords were as handsomely gartered as Court belles, who, however, did not show their garters unless they made journeys on horseback in masculine habiliments. This mode of travelling was not unusual, the roads being too bad for carriages, and the side-saddle being too fatiguing to the horse. I dare say the garter will look up wherever there are lady cyclists. It need not press against the limb that it encircles. Why not wear stockings wrinkled, like the mousquetaire gloves of Sarah Bernhardt? To do so would do away with the temptation to have tight garters.

DRESSED BEEF.

No. 2.

LEADING REPRESENTATIVES OF THE INDUSTRY.

CHICAGO, Nov. 19, 1889.

SWIFT & COMPANY.

This firm are among the largest slaughterers of cattle, hogs and sheep, and their establishments cover many acres of ground. The firm began business in 1877, and were incorporated April 1, 1885. The company is officered as follows: President, G. F. Swift; Vice-President, E. C. Swift; Treasurer, L. F. Swift; Secretary, D. E. Hartwell. The firm do an extensive business as packers of pork and shippers of beef and mutton. Their general office is at the Union Stock Yards, and they are right in the heart of the greatest live stock market in the world. They also have offices at South Omaha, Nebraska, and Kansas City, Missouri. This gives them the advantage of the three largest live stock markets in the country in which to buy for their slaughter and packing houses. In order to give an idea of the volume of business transacted by this firm, it is only necessary to state that in 1888, Swift and Company slaughtered 678,937 cattle, 573,230 sheep and 359,195 hogs.

NELSON MORRIS & CO.

The house of Nelson Morris & Co. started business in 1880, with a capital of \$50,000. This was soon increased to \$250,000, then to \$750,000, and last year to \$3,000,000, which is now the capital stock of the company. But this large sum does not include the capital used in exporting cattle by Mr. Nelson Morris himself. The slaughter, packing and refrigerator houses cover thirteen acres of ground, and they are all two and three stories high. The first year the firm were in business they killed 75,000 head of cattle. In 1886 they killed

344,487; in 1887, 433,563; in 1888, 468,498 head, and in 1889 they confidently expect to exceed half a million head of cattle. They are killing now on an average of 2,500 head of cattle per day, about 800 head of sheep and 300 head of hogs. They employ in the neighborhood of 3,100 hands, and pay out \$38,000 per week in wages. Morris & Co. own and have in constant use 1,000 refrigerating cars. In the use of these cars three hundred tons of natural ice are consumed daily, and beef is kept in these cars in as good condition as when taken out of the refrigerator house, though shipped a thousand miles. But it is not alone to this country that Nelson Morris & Co. confine their operations. Two train loads of dressed beef are shipped each week to London and Liverpool. These shipments take from 800 to 1,000 head per week, and to that extent is the home market relieved of its surplus. This meat is all canvassed, conveyed to the seaboard in refrigerator cars, and loaded on steamships specially provided with refrigerator compartments and natural ice. Nelson Morris & Co. are extensive canners of beef, and sell in all countries of Europe, the South Sea Islands, Caribbean Sea, etc. Last year they sold 734,550 cans of meats of all descriptions. Many of these cans weighed up to ten pounds.

ARMOUR & CO.,

were among the first to embark in the pork packing and dressed beef business at the Union Stock Yards. P. D. Armour, the head of the firm, is one of the best known men in the United States, if not in the entire world. He rarely visits the Stock Yards now, his business keeping him at the down-town office, but he has an able lieutenant on the grounds, in the person of Michael Cudahy, a member of the firm, who supervises all the transactions at their vast slaughtering and packing houses, and who keeps a vigilant eye on everything. Mr. Cudahy is a thorough business man, and much of the success achieved by the firm is due to his superior practical intelligence and vigilant supervision over the work at the yards. Young Mr. J. O. Armour promises to follow in the footsteps of his father. He is now well up in the mysteries of the business, dividing his time between the down-town office and the office at the yards, so that in the natural order of things, he will be fully competent and well prepared to fill the shoes of his distinguished sire, and maintain the high standard of business now so thoroughly established and widely diffused by the house of Armour & Co. That our readers may understand more fully the vastness of the business transacted by Armour & Co., we give a few facts regarding the area of the buildings, animals killed, etc., during 1888. Total ground area covered by buildings, 40 acres; total floor area in buildings, 125 acres; chill room and cold storage area, 30 acres; storage capacity of buildings, 120,000 tons; refrigerator cars, 1,800; hogs killed, 1,140,000; cattle killed, 561,200; sheep killed, 164,540; number of employes, winter, 6,000; summer, 5,000; wages paid for the year 1888, \$3,000,000. During 1888 the Armour Glue Works turned out 6,000,000 pounds of glue, 4,000,000 pounds of oil and grease, 7,000 tons of bone meal and other fertilizers. Five hundred men are employed at the glue works, and the buildings cover an area of 11 acres. Vast as is the above showing, the year 1889 promises to even surpass it. The number of animals killed will show a large increase, while the firm have recently added by purchase, to their already very extensive area of ground and buildings.

GEORGE H. HAMMOND & CO.

The business of George H. Hammond & Co., as now conducted at Hammond, Ind., was organized in the year 1869 by Mr. Geo. H. Hammond in connection with Mr. Caleb Ives. A refrigerator car had been patented in the City of Detroit, more particularly for handling fresh fish, but the scheme of shipping dressed beef in the car looked so feasible that experiments were at once commenced by Mr. Hammond, who started the first shipment of dressed beef during the above named year. Experiments were continued for perhaps six months or a year, which proved successful and ten cars were ordered

built. These were constructed by the Michigan Car Company, at Detroit, and the killing was continued at Chicago for a year or two, until the number of cars was increased, and it was determined to locate on the Calumet River in Indiana, the facilities for procuring an ample supply of ice there, seeming very favorable. Some few changes in the company were made during the interval until 1781, when it was incorporated, its principal offices being in Detroit, the home of Mr. Hammond. The business has increased from year to year, until the company now operate and own some 750 refrigerator cars; kill about 225,000 cattle per year at Hammond, have a storage capacity for about 17,000 tons of ice, and use about 100,000 tons annually. They now employ in the conduct of the business at Hammond something over 600 men. They have invested in the plant and machinery over half a million dollars. They also operate a large elomargarine factory in connection with the slaughtering establishment, which has a capacity for turning out from 30,000 to 40,000 pounds of the manufactured product per day. Every portion of the animal is utilized, even to the tank water, from which glue is manufactured. The business has steadily increased every year since it was established, the increase of 1888 over 1887 aggregating about 10,000,000 pounds of beef, or say 500 carloads per day, and the increase for 1889 will be approximately greater. The officers at the present time are: Andrew Comstock, President; J. C. Melvin, Vice-President; G. W. Simpson, General Manager; J. D. Standish, Secretary and Treasurer.

THE PHONOGRAPH.

SOME SUGGESTIONS AS TO ITS POSSIBLE PRACTICAL USE.

Now that the phonograph is approaching the degree of perfection which will permit its universal introduction, the question is beginning to be mooted as to what useful purpose it can, after all, be made to serve. There are not wanting in the community intelligent persons who regard the phonograph simply as a curiosity; wonderful, even in this age of wonderful scientific achievement, but likely to be capable of very limited practical utility. These persons, however, are premature in arriving at such fixed conclusions on the subject, as the instrument is yet in its infancy, and its marvellous properties invest it with wondrous suggestiveness as to the benefits it will ultimately confer on mankind. The subject has been brought to our attention by several newspaper paragraphs that have appeared within the past couple of weeks, indicating a disposition in business circles to bring the phonograph into practical use without delay. For the information of the readers of the AMERICAN ANALYST we have compiled some of these, but we recommend such as are desirous of knowing all that is claimed for the invention to refer to a detailed discussion of the subject by Mr. Edison himself and published in *The Forum* some months ago:

The Possibilities of the Phonograph.

Edward Bellamy, the author of "Looking Backward," has just written a fanciful sketch entitled, "With the Eyes Shut," in which he describes an approaching phonographic age. The uses which are found for the phonograph are novel and amusing. Passengers on the railway trains are supplied with phonographic literature so that their eyes are not injured by reading in a jolting coach. The names of the stations are announced by phonograph in clear tones which form a striking contrast to the incomprehensible gibberish of the ordinary brakeman. Mr. Bellamy describes a night's experience in a hotel. He was startled from his dreams by the sound of a voice. He continues: "What had startled me was the voice of a young woman who could not have been standing more than ten feet from my bed. If the tones of her voice were any guide she was not only a young woman but a very charming one. 'My dear sir,' she had said, 'you

may possibly be interested in knowing that it wants just a quarter of three.' His terror vanished when he discovered that the voice issued from a clock which was equipped with a phonographic announcing apparatus.

A Physician's Novel Suggestion.

Dr. A. H. Phelps, of Glens Falls, suggests that Mr. Edison build a phonograph large enough to send the sound of the human voice or of instruments several miles, and place one of the great phonographs in the World's Fair to be held in New York in 1892, so that the people in Brooklyn and Jersey City could hear the records reproduced.

An Adjunct to Stenography.

"Even if the phonograph, or any of the kindred machines, could do all that is claimed for it," remarked a prominent stenographer the other day, "it would not affect stenographers adversely in the least. Indeed, it would be welcomed with open arms by the court reporters, as they could then dictate their matter when they pleased, and as fast as they could read their notes. Transcribing a day's testimony, you know, is a most tedious and tiresome thing, and usually a busy reporter has two or three amanuenses to whom he dictates his matter, but, of course, he must go slow on account of the inability of his amanuensis to take it correctly at a rapid rate. And as to the amanuensis stenographers, I fail to see how it can hurt even them. When the typewriter was introduced it was not favorably received by amanuenses, but now typewriting and shorthand are inseparable. In my opinion, when the phonograph is perfected sufficiently it will be used as an adjunct to shorthand and typewriting."

Phonographs for Post Offices.

On November 22, Lawyer Edwin M. Fox returned from Mexico, whither he went in the interest of Thomas A. Edison to arrange the legal features of a contract with the Government for the general introduction of the phonograph in the post offices of that country.

The contract was obtained for a company now forming. It gives the proposed company the exclusive right for fifteen years to place phonographs in the post offices of the Republic for the use of people who cannot read or write. The charge for a single phonographic message has not yet been fixed; it may be but a medio, or six and a half cents, and it may be a real, or thirteen cents. To this charge must be added one of ten cents for postage, which is the rate at which letters are carried from one part of Mexico to another, although a letter may be sent from Mexico to this country for only five cents. The higher charge seems moderate when it is known that the sender of a message will be entitled to talk a thousand words into the phonograph. When he has said his say, the cylinder containing his message will be enclosed in a paper box, addressed by a Post Office clerk to its destination, and, after being stamped, will be mailed like an ordinary letter. The recipient of the cylinder can either have the message spoken out to him by the phonograph in the nearest post office, or he can have it transcribed on paper for future reference. The persons who are expected to use the phonograph now employ scribes to write their letters for them. The scribes will probably have to do something else when the phonographs are set up. The company is to get a rental for the use of the machines, and what remains of the proceeds after deducting a small percentage for the Government. As all expenses are to be borne by the company, whatever the Government gets will be clear gain. Only the large post offices will at first be provided with phonographs, but it is expected that in the course of time the use of the instruments will become quite general. Mr. Fox took three phonographs to Mexico with him, one as a present for President Diaz, which poured out the instrumental and other music Mr. Edison had poured into it at the laboratory in Orange, where concerts are still given, with phonographs for auditors, several times a week. President Diaz was quick to learn how to use the machine, and he sent back by Mr.

Fox a cylinder containing a message in Spanish congratulating Mr. Edison on his great invention and himself that Mexico was to get the benefit of it.

Machines Preferable to Stupidity.

The November number of *The Office* has a long and well-considered article on the relations of clerks to the new mechanical devices of the day, from which we extract the following: "The young man who seeks a business position simply on the strength of his penmanship—no matter how good it is—having nothing else to recommend him, will fail. The typewriter is there ahead of him. The young man who seeks to make a living by simply putting on paper, machine fashion, what is spoken in his hearing, caring nothing about what it means and having no interest in the work except to draw his weekly stipend, must take very low wages because he is competing with the phonograph and graphophone. Again, the entry clerk, the cashier or the book-keeper who puts neither brains nor business snap into his work must likewise fail of success, because mechanical devices on every side are gradually but surely doing all the work that he is fit to do. Machines work when they are driven. They must be wound up or have power applied to them in some other way. Men, on the other hand—that is, men deserving the name—can go without driving."

GIRLS AS ATHLETES.

NECESSITY FOR CAUTION WHEN PRACTICING IN A GYMNASIUM.

"Girls should never be allowed in a gymnasium unless they are in charge of a thorough master of calisthenics and gymnastics," said a professor to a reporter recently. "It may seem strange to say, but the girls are more daring and much more reckless than boys when they get the athletic fever. It seems to be very catching nowadays. Only a short time ago a young lady came into this gymnasium. She had never been in a gymnasium before. As soon as she got her suit on she was trying to pull herself upon a horizontal bar, and before I could stop her she had strained the tendons in both arms and couldn't come back to exercise again for nearly three months. Girls have to take much more systematic training than boys. They are not so strong and have to be treated more tenderly. There are hundreds of ways in which a girl can hurt herself in a gymnasium unless she is very careful. She can strain her arms and hands by too much exercise at anything. She can sprain her back by jumping too far on the spring board. I have known girls to sprain their toes in the running high jump even when the bar was only a foot from the ground. High-heeled shoes press the toes downward and girls who wear them always land on their toes when they jump instead of the ball of the foot." "What exercise should a girl practice at home?" asked the reporter. "Gymnastics, to be healthful, should only take a portion of the strength of one's muscle, and the constant exercise of these muscles is what develops them. I have seen some delicate girls exercising with five-pound dumb bells, when some of the strongest athletes of the country only use two-pounders. A girl who wishes to expand her chest can do so if, each morning after her bath, she will stand erect, feet together, shoulders back, arms straight down, and take twenty-five full, deep breaths. Better begin fifteen times the first week and then gradually increase it. Keep up the increase until it reaches the number of fifty. By that time her lungs will be much stronger and the chest will begin to expand. A round-shouldered girl can become straight by moving the shoulders and arms backward in regular motions until the elbows are only a few inches apart. Let the first exercise be twenty times and increase it until 125 times can be done without fatigue. The throat can be made round and firm by judicious exercise of the head. I make my throat pupils throw the head far back and then forward slowly,

and then from side to side in the same way. There is no reason why any girl or woman not deformed, and about 25 or 30 years of age, should not have a graceful and well developed figure, and gymnastics will give it to her, but not unless she is taught them properly.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

December.

MEAT.—Beef, mutton, pork, venison, veal.

POULTRY AND GAME.—Chickens, fowls, ducks, geese, turkeys, grouse, capons, hare, rabbit, partridge, pheasants, pea-fowl, Guinea-fowl, snipe, widgeon, wild duck, woodcock.

FISH.—Brill, carp, cod, crabs, perch, salmon, smelts, soles, sprats, tench, turbot, whiting, halibut, sturgeon, oysters.

VEGETABLES.—Jerusalem artichokes, beets, broccoli, cabbage, carrots, celery, endive, winter spinach, eschallots, turnips.

FRUIT.—Apples, oranges, bananas, nuts.

PRACTICAL RECIPES.

HERB SOUP.—Put four ounces of butter in a saucepan, with a handful each of chopped onions, celery, turnips and carrots; add a little salt and pepper, and let them steam for half an hour, but be careful that they do not burn; pour in a quart of clear soup or the water in which meat has been boiled; cook gently until the vegetables are soft, thicken a little with flour, and serve with toasted bread.

CHESTNUT STUFFING.—Chestnuts, roasted or boiled, may be added to almost any stuffing for fowl, etc. To prepare a stuffing, roast a pint of chestnuts and peel off the outer and inner skin; weigh them, and simmer half a pound of them for twenty minutes in as much veal gravy as will cover them; drain and let them cool; then pound them in a mortar with four ounces of butter, three ounces of bread crumbs, a trifle of grated lemon peel and powdered mace, salt and a pinch of cayenne; bind the mixture with the yolks of three eggs.

BREAD STUFFING.—Grate sufficient bread to fill the bird; moisten with milk, and season with salt, pepper, sweet marjoram and the grated rind of one lemon; add a tablespoonful of butter, and bind the mixture with yolk of egg; add a few raw whole oysters, if desired.

STEWED TRIPE.—Take a pound of tripe and cut it into narrow strips, put it in a saucepan, and cover it with gravy stock; add about a third of a can of tomatoes, some chopped onion, a dash of olive oil, Worcestershire sauce, and a whole red pepper, salt and pepper; stew gently until very tender and rich; serve.

CHOCOLATE TARTS.—Put one-half cup milk and one-half cup water over the fire in a bright saucepan; add one cupful sugar, one teaspoonful butter, pinch of soda, one-half cake grated chocolate; then, when it boils, add one-third cup of water, in which has been dissolved one tablespoonful of corn starch; let the whole boil for a few moments and take from the stove; when cool add teaspoonful extract of vanilla. This will make about a dozen tarts. Line patty pans with good flaky pie crust and bake; when done put in this mixture, ice the tops, and let the frosting harden in the open air.

RISSOLES.—Mince finely the remains of cold veal or any left-over meat from which all skin, bone and gristle have been removed; season to taste with pepper, salt, spices, grated lemon peel, sauces; moisten with beaten egg or cold stock, and form into little balls; roll out very thin some good pastry, cut into round pieces large

enough to enclose the balls; pinch the edges firmly over the meat, brush with beaten egg and fry in boiling fat; when a fine brown drain out the rissoles, and serve dry and crisp on a napkin.

SILVER CAKE.—One cupful of sugar, half a cup of butter, the whites of three eggs, half a cup of corn starch dissolved in nearly half a cup of milk, one and a fourth cupfuls of flour, half a teaspoon of cream of tartar, one-fourth of a teaspoon of soda, and vanilla or almond flavor; beat the butter to a cream, and gradually beat in the sugar; add the flavor; mix the flour, cream of tartar and soda together and sift; beat the whites to a stiff froth; add the corn-starch and milk to the beaten sugar and butter; then add the whites of the eggs and the flour; mix quickly and thoroughly; have the batter in sheets, and about two inches deep; bake in a moderate oven for about half an hour; cover with white or chocolate icing.

CORN GEMS.—One-half a pint finely-bolted corn meal, one-half pint flour, one tablespoonful white sugar, half a teaspoon of salt and two heaping teaspoonfuls of Horsford's baking powder; mix together thoroughly while dry; then add two well-beaten eggs and cold sweet milk, or milk and water, to make a moderately thin batter; bake in gem pans or muffin rings.

ALDEN'S MANIFOLD CYCLOPEDIA.

We are pleased to note the appearance of the nineteenth volume of the admirable Alden's Manifold Cyclopaedia. It was apparent from the first that this was to be the Cyclopaedia for "the people," and each succeeding volume emphasizes the great superiority of the work for popular use over its far more costly competitors. It is remarkably comprehensive. The fields of literature, science, art, and of all knowledge are thoroughly gleaned. The topics are ably treated, many illustrations are given, and a vast amount of information is condensed into small space. The articles are written by experts in their various lines and are carefully and skilfully edited. The results of the latest discoveries and inventions appear, many of the subjects being brought down to June, 1889, and some even later. Among the important topics treated in this volume we notice Home Rule in Ireland; Homestead Entry, and the Homestead Laws for all the States; Homeopathy, nearly 7 pages; Hop; Horology; Horse, Horse Racing; Horse Shoeing, and Horse Taming; Hospitals, 8 pages; Howard University; Hydropathy, over 6 pages; Hypnotism, 4 pages; Hysteria; Ice; Immigration, with valuable statistics; Imports and Exports, with figures for the United States covering 100 years and brought down to June, 1889; Indians, 7 pages; Induction of Electric Currents, 8 pages. In the line of biography we find articles on Homer; Hood; Hopkins; Horace; Howard; Howells; Hugo; Humboldt; Hume, and Hunt; while among the Countries and States noted are Honduras; Hungary; Iceland; Idaho; Illinois; India, 35 pages; Indiana, 8 pages; and Indian Territory, including the opening of Oklahoma. The price of this great work is almost incredibly low.

AMERICAN WOOL.

THE INITIATION OF WOOL RAISING IN THE UNITED STATES.

The first sheep introduced into the United States were taken to Jamestown, Virginia, in 1609. Great efforts were made to encourage the woolen industry, and some years later a law was passed which compelled every family to spin three pounds of wool, cotton or flax per week during thirty weeks of the year. About the same time the first weaver settled in the country and received a grant of thirty acres of valuable land. In 1662, Virginia prohibited the exportation of wool, and offered five pounds of tobacco as a premium for every yard of woolen tissue produced in the colony.

The breed of the sheep at the time in America was, however, inferior, and it was not until the commencement of the present century that the Spanish government consented to sell a flock of fine merino sheep at an exorbitant price for exportation to America. It is stated that even in 1810 there were only about 5,000 sheep of good breed in the country, but from them sprang the large flocks which are now found in the United States. The first cloth mill worthy of the name was erected in 1788 by several of the inhabitants of Hartford, Connecticut, and its annual production amounted to 5,000 yards. It is stated that the proprietors of this establishment presented Washington with a suit made of their cloth in 1791. Other works soon arose, and in 1810 there were five mills producing fine woolen tissues, and nineteen which manufactured coarser descriptions, their aggregate production being 200,000 yards, and a considerable quantity was also produced on hand looms. The war in 1812 gave a great impulse to the American woolen trade, but when peace was concluded British tissues were imported in enormous quantities and completely crushed the industries of the States. Congress then found it necessary to protect the American manufacturers, and imposed in 1816 an import duty of 25 per cent. *ad valorem* on woolen tissues, and in 1824 it applied a duty of 15 per cent. on raw wool, costing less than ten cents per pound, and of 20 per cent. on wool costing more than thirty cents per pound.—*Draper's Record*.

VALUABLE LIQUID GLUE.—Liquid glue possessing great resisting power, and particularly recommended for wood and iron, is prepared, according to Hesz, as follows: Clear gelatine, 100 parts; cabinet-makers' glue, 100 parts; alcohol, 25 parts; alum, 2 parts; the whole mixed with 200 parts of 20 per cent. acetic acid and heated on a water bath for six hours. An ordinary liquid glue, also well adapted for wood and iron, is made by boiling together for several hours 100 parts glue, 260 parts water and 16 parts of nitric acid.

THE WORLD'S VINTAGE.—According to a report made by the United States consul at Marseilles, France, on February 27, 1889, the production of wine in the principal wine-growing countries of the world, vintage of 1888, given in gallons, is as follows: Australia, 1,902,024; Austria, 92,459,500; Algeria, 72,072,788; Cape Colony, 4,490,890; France, 795,204,534; Greece, 46,493,820; Hungary, 184,919,000; Italy, 798,242,489; Portugal, 132,085,000; Roumania, 18,418,900; Russia, 92,459,500; Serbia, 52,834; Spain, 607,591,000; Switzerland, 29,058,700; Turkey and Cyprus, 68,684,200; United States, 32,000,000.

CREMATION.—There is a general feeling of repugnance against cremation among people of all classes in all countries. Sanitary considerations, on the other hand, are leading many intelligent and thoughtful persons to the conclusion that it is very desirable in crowded cities, especially in the disposal of the bodies of those who die from such diseases as diphtheria, scarletina, phthisis, etc. Sir Spencer Wells shows that the practice of cremation is on the increase. In Rome 119 bodies were cremated in 1886, 155 in 1887, and over 200 in 1888. At the Woking Crematorium in England over 70 bodies have been cremated since the British Parliament authorized this method of the disposal of the dead.

RHEUMATISM.

Among the diseases which must necessarily be quite prevalent until warm weather comes again, one of the most painful is acute rheumatism, from which almost every one suffers, more or less at some time. In the beginning, it is well to have it understood that the term rheumatism is often wrongly used to cover an immense range of pains which are in no way due to that disease; in fact, it is customary to apply it to almost every pain the cause of which cannot be made out. The purest type of the disease is acute articular rheumatism, or what passes under the name of rheumatic fever. No one needs to be told its symptoms; there is no mistaking it when it makes its appearance. It is sufficient to say that it is a disease which involves the entire system, in other words, it is constitutional; but its most

A Tonic

Horsford's Acid Phosphate.

A most excellent and agreeable tonic and appetizer. It nourishes and invigorates the tired brain and body, imparts renewed energy and vitality, and enlivens the functions.

Dr. H. K. Clarke, Geneva, N. Y., says:

"It has proved of great value for its tonic and revivifying influence."

Dr. J. H. Stedman, West Brattleboro, Vt., says:

"Best nerve tonic I ever used."

pronounced manifestation is in the joints, which are inflamed and undergo characteristic changes. And besides the joint affections certain internal organs not infrequently share in the inflammation. As to the cause of rheumatism, physicians of the present scarcely know more than those of a century ago. Once it was attributed to exposure to cold, damp, or other atmospheric changes, but that such influences are alone capable of exciting rheumatism is now no longer believed. In order for that disease to be developed, there certainly must be present some morbid peculiarity of the system, some special tendency to it. When such peculiarity, such susceptibility to the disease, does exist in a person, then exposure to cold, and a variety of other conditions are doubtless capable of exciting it. In other words, there must be present a spark, or a flame cannot be lighted. Any impairment of the general health from defective nutrition seems to specially increase the liability to an attack of the disease. There are certain diseases during, or after, which the affection under consideration is exceptionally prone to occur. Prominent among those alluded to are dysentery, scarlet fever, erysipelas, scrofula, consumption, and cancer—a connection between them is recognized. Now, as to that peculiarity of the system which must always be present in order for rheumatism to be developed, no one knows just what it is. A number of theories have been advanced the most popular of which is, that it is an excess of lactic acid in the blood. The most of the physicians of to-day believe in that theory. As to why there should be an excess of that acid in the blood, again we are in a fog. Certainly it would seem that there must exist one of two unnatural conditions, either there is some peculiar derangement of the liver, or there is a lack of alkalies in the blood. Almost every one knows that patients suffering from rheumatism seldom die of that disease, and hence its importance is very often underrated and treatment is indifferently applied. It is true that the death rate from rheumatism is small, probably not more than three out of a hundred cases of the acute form die. But death often does occur as an indirect consequence of that complaint; for during an attack in many cases seeds are sown which sooner or later develop into the gravest of diseases. Hence, painful as it is, the suffering of the victim is not the feature of the disease most to be dreaded; it is the trouble which is so very likely to follow in its trail. Rheumatism is a disease which very readily yields to skilful medication. The best remedy which can be offered to the sufferer from rheumatism is Dr. J. C. Ayer's Sarsaparilla. It is so well combined as to hold within a small compass, and with a pleasant flavor, all the drugs which long experience have shown to be most effective in so changing the secretions of the body as to expel the noxious matters which produce the symptoms we call rheumatism, and stimulate the secretions of normal and health-giving fluids. Try it and you will be convinced that it will save you present pain and future risk.

BUSINESS NOTES.

FINE PRESERVES.

No better preserves, jams and jellies, than those put up by Gordon & Dilworth, New York, can be bought anywhere. They are absolutely the best fruits in market, cleanly prepared and preserved with sugar only. No chemicals of any kind are ever employed.

FOR SLEEPLESSNESS

USE HORSFORD'S ACID PHOSPHATE.

Dr. C. R. Dake, Belleville, Ill., says: "I have found it, and it alone, to be capable of producing a sweet and natural sleep in cases of insomnia from overwork of the brain, which so often occurs in active professional and business men."

CATARRH
HAY FEVER
CATARRHAL DEAFNESS

A NEW TREATMENT.
Sufferers are not generally aware that these diseases are contagious, or that they are due to the presence of living parasites in the lining membrane of the nose and eustachian tubes. Microscopic research, however, has proved this to be a fact, and the result of this discovery is that a simple remedy has been discovered which permanently cures the most aggravated cases of these distressing diseases by a few simple applications made (two weeks apart) by the patient at home. A pamphlet explaining this new treatment is sent free by A. H. Dixon & Son, 337 and 339 West King Street, Toronto, Canada.

393 Degraw Street, Brooklyn, N. Y.

❖ WHOOPING COUGH CURED ❖

Or Prevented by Page's Vaporizer and Cresolene.

We have abundant testimony that Cresolene vaporized in a closed room is an almost infallible remedy for **Whooping Cough**, for which distressing malady no other assured remedy is known to us. A cure usually effected in five or six days, at a trifling expense and but very little trouble. It is also exceedingly efficient in Asthma, Croup, Catarrh, Diphtheria, Influenza and Scarlet Fever. It is a safeguard against the spread of contagion.

Vaporizer complete, including a bottle of Cresolene, \$1.50. Ask your druggist for it.

W. H. SCHIEFFELIN & CO.,

SOLE AGENTS,

170 & 172 William Street, New York.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

SCOTT'S EMULSION

OF PURE COD LIVER OIL WITH

HYPOPHOSPHITES OF LIME AND SODA.

THE STANDARD EMULSION OF COD LIVER OIL THROUGHOUT THE WORLD.

A BEAUTIFUL CREAMY MIXTURE—ALMOST AS PALATABLE AS MILK.

Having much greater remedial power than the crude Cod Liver Oil, without any of its nauseating effects. Its PALATABLENESS, EASE OF DIGESTION, and long tolerance by most sensitive stomachs as well as its reliable therapeutic effect, has given it special favor with the medical Profession, and receives their unqualified endorsement and support.

Possessing as it does the tonic and stimulating properties of the Hypophosphites in combination with the strengthening and fattening qualities of the Cod Liver Oil—gives it a remedial value in WASTING DISEASES, ANÆMIA or IMPOVERISHED BLOOD, EMACIATION and CONSUMPTION—unequalled by any single or combined remedy in existence. The rapidity with which delicate children fatten and grow strong on this palatable Emulsion, is very remarkable.

Samples will be sent free except express charges to any wishing to try this preparation. For sale by all druggists.

Vineyards at St. Helena, Napa County, Cal.
STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The **Sauterne** is superb—much better than most of the imported that costs five times as much. The same is true of the **Claret** and the **Blesing**. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by **E. McILHENNY,**
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making Bi-CARB. Soda from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

A NATIONAL STANDARD OF FOOD.

In Cleveland, Ohio, on November 27th, the "National Dairy and Food Commissioners' Association of the United States" was organized by delegates appointed by the Governors of the several States. Hon. Hiram Smith, of Wisconsin, was elected temporary chairman; F. A. Derthick, food and dairy commissioner of the State of Ohio, secretary and treasurer. The objects of the association are "to establish a uniform standard for the purity of human food and drink, and to encourage the honest manufacturer and protect the consumer." A constitution and by-laws were adopted, which will be placed before the readers of the AMERICAN ANALYST when an authenticated copy is received. The organization of this association is an important step in the direction of what would presumably be a universally demanded reform. The difficulty, however, is to induce the consumer to co-operate in being protected. So long as people insist upon receiving a dollar's-worth for half a dollar, greedy tradesmen and unscrupulous manufacturers will fill the market with goods prepared to meet

the public demand. The average housekeeper seems to be more keenly alert to compass so-called "bargains" than to secure pure food for the family. A more intelligent sentiment on that subject is, however, becoming more apparent each year, and this "National Commission" started in Cleveland, is one of several concerted efforts in the direction of food reform which have been brought into activity within the past five years through the teachings and monitions of the AMERICAN ANALYST. We welcome the new organization heartily, and shall watch its efforts in behalf of a "uniform standard," with interest. The Chicago Herald of December 1, says of the Commission—though our contemporary's statement in relation to the prevalence of adulteration is considerably exaggerated—

"This is the first step toward what many people in this country have been praying for and writing and lecturing about for many years. While it is to be hoped that the association has not 'bit off more'n it can chew,' it certainly has a stupendous contract on its hands. There is not one article of food eaten by man from the time he leaves the cradle until he enters the grave that is not adulterated in some way or sold in a condition that renders it unfit for food. The list of food adulterants would fill this column—adulterants that are in common and every-day use. However cheap a food may be, there is always something cheaper with which to adulterate it. Among the most important of the things that the association can learn from our transatlantic brethren is to make use of the skill of chemists in detecting impurities in foods. The countries of Europe, taken on an average, spend dollars on food investigations where this country spends cents. In this comparatively thinly settled country it should not be necessary to spend a proportionate amount; but as a matter of fact, the proportion of adulterated to the pure food sold here is higher than in any European country. The adulterators and many of their foolish victims say in extenuation of this, and against legal interference, that this is a free country. So it is; and it is about time that people were permitted to indulge the God-given liberty of eating pure food—if their systems can stand such a surprise."

EDUCATIONAL STATISTICS.

From present indications the eleventh census will embody the most comprehensive statistical survey of the country's social status that has ever been attempted. We have had several opportunities to call attention to the extensive preparations making, under the able superintendence of the Hon. Robert P. Porter, for securing the requisite data for this great work. We are in receipt of a communication from that official under date of December 1, relating to the statistics of education, which will interest, or should interest, every reader of the AMERICAN ANALYST. The Superintendent says: "This office desires to secure the best results possible regarding the schools of the country with a few salient inquiries. James H. Blodgett, A. M., of Rockford, Ill., a gentleman of long experience in educational work and in public affairs, has been appointed a special agent for the collection of statistics of education for the United States. Public schools are so related to systems of public record that their statistics are obtainable

through established methods. Incorporated private schools have a place in public records. Parochial schools generally render stated reports to some controlling body. Unincorporated private schools form a considerable element of usefulness hitherto unmeasured. It is desirable to gather reports of the number of teachers and pupils in such schools, without troubling them for the financial statements that schools supported by public funds owe to the taxpayers. The enumerators of population will report each person who has attended school within the year, and whether at a public school or at a private school; and, for all persons ten years of age and over, those who can read and write. This will be more than has been done heretofore. Other educational statistics must be reached by different methods, in which every one interested may render some aid. Any lists of private schools, no matter how brief, or names of single schools, no matter how humble, 'open in any part of the present school year,' with the address of the principal teacher of each, will be of assistance to this office."

NEW YORK AND LONDON.

The population of the city of New York according to the census of 1880 was 1,206,577, and next year's census will show it to be upwards of 1,500,000. The population of London is estimated in round numbers at 4,220,000. Some interesting points of comparison between the health of the two communities are summarized in the *Medical & Surgical Journal* of Boston. The deaths in London last year numbered 78,848, or 18.5 per 1,000, in New York, 40,175, or 26.33; and in Paris, 22.6 per 1,000. The birth returns for New York are incomplete; but the birth-rate in London was 30.7 per 1,000; in Paris, 27.0. The male births in Paris were 30,723; the female births, 29,913. In London the numbers were, males, 66,629; females, 64,451; but in the total population of London there is a majority of 250 females. Premature births in New York numbered 1,155; in London, 2,099. To be equal, the figures referring to New York should only be a third. New York compares unfavorably with London in the matter of suicides. There were 247 in New York, and 400 in London. Between 800 and 900 persons take their own lives in Paris every year. In New York 1,138 were killed by accidents; and in London 2,516. There were only 1,892 deaths from bronchitis in New York, while in London there were 10,085. But while some hundreds die every year in London as the result of idleness and obesity, 61 deaths were recorded last year from starvation. A decreased death-rate is invariably accompanied by a lower birth-rate. The deaths in London last year were the lowest on record; the births, the lowest since 1841. In the western districts where the wealthy reside, and where the degree of comfort is high, the deaths fell to 16.4 and the births to 25.5; but in the impoverished and overcrowded east, where the poor never get a breath of fresh air, and are huddled together in unhealthy alleys, the deaths rose to 27.2, and the births to 36.5. The

D. & P. ROCK CANDY.

Dissolved in Rye Whiskey, (5 lbs. Rock Candy in 1 gallon Whiskey), cures Coughs, Colds and Consumption.

Read "A Lecture in a Horse Car," published in the New York Sun, containing an account of the celebrated case of the Hon. Ellis B. Schnable, who, while in the last stages of consumption, was entirely cured by the liberal use of Rock Candy and Rye Whiskey.

D. & P. Rock Candy in 5-lb. boxes is sold by leading confectioners, druggists, grocers and wine merchants. Not genuine unless the letters D. & P. are on the label. Full directions in every box. Send for recipe.

DRYDEN & PALMER,
19 HUDSON STREET, NEW YORK.

people least able to support children are the most prolific; and the higher the degree of social comfort and well-being, the less the increase of population.

A HUMAN MAGNET.

We learn from Baltimore, under date of December 4th, that the scientists connected with the Johns Hopkins University are engaged in investigating the peculiar powers possessed by the fingers of Louis Hamburger, the twenty-one-year-old son of Phillip Hamburger, a well-known merchant of that city. When the hands of the young man are thoroughly dried and touched to any polished object, they hold it like a magnet. He can thus raise up a quantity of pins, which will dangle from them, his index fingers possessing the quality more than any others. He also raises up a glass tube freighted with a six-pound weight. Prof. William Simon has him in charge and proposes to give some scientific experiments before the Johns Hopkins Scientific Association. A detailed account of this peculiar freak of nature will be found in another column of this issue of the AMERICAN ANALYST.

DRESSED BEEF.

No. 3.

THE BUSINESS DESCRIBED FROM A CHICAGO STANDPOINT

Inspection in the Union Stock Yards.

CHICAGO, November 19, 1889.

Realizing that the outside world might regard our account of it as liable to be influenced by our proximity to the industries at the Union Stock Yards, we give the following from the St. Paul, Minn., *Dispatch*, a newspaper that sent down a special reporter to spy into and find out regarding the system of inspection, and write it up just as he found it. It is well known the Minnesota butchers are fighting Chicago beef, so this article must be regarded in the light of coming from a party not biased in favor of Chicago industries, and is, therefore, all the more satisfactory. The decision of Judge Blodgett of the United States Circuit Court for the Illinois district and of Judge Nelson in the Minnesota district, declaring unconstitutional the law enacted by the State legislature of Minnesota prohibiting the importation of dressed beef, have created the liveliest interest in the recently annexed suburb of Lake, where several thousand people are directly or indirectly identified with the industry. Despite, moreover, the fact, that the decisions but follow similar action by the district courts of several other States, these pronouncements of federal authority are likely to be important and far reaching in their effects. Judge Blodgett is a careful, painstaking

jurist, with the law on about every question at his finger ends, and his opinions are regarded by the legal profession as only second to the deliverances of the Supreme Court. As an exponent of constitutional law, especially, he is probably without a peer, and when he says, as he has said, that the enactment of such laws as those of Minnesota is a violation of the Constitution of the United States, it may be taken for granted that he is simply laying down a principle that will be reaffirmed, and that with emphasis, should the occasion ever arise, by the highest judicial tribunal of the United States. It has been the stock-in-trade argument of many of those who have been prominent in the anti-dressed beef crusades of the various States, that they were actuated solely by the desire for a protection of the good health of the people. At one time it has been declared that the system of inspection at the Chicago Stock Yards was notoriously lax and inefficient. At another and in other places it has been just as vehemently insisted that there was no inspection at all. It is more charitable to assume that the people who have been instrumental in spreading these stories broadcast knew nothing of what they professed to talk about than to assume that they wilfully perverted and misrepresented known facts in order to serve their own purposes. Probably both suggestions, however, would not be wide of the mark. It has been a campaign of demagoguery and ignorance on the part of some in this anti-beef crusade, and of deliberate and wilful lying on the part of others. Those concerned can take their choice of adjectives. Despite all that has been said, however, and may be said hereafter, it may be laid down as a fact that if the legislatures and health authorities of the various States, counties and cities would devote as much proportionate attention to the health of their several jurisdictions as is exercised at the Union Stock Yards to the end that traffic in diseased meat shall be an impossibility, the mortality rate of the country would decrease to an astonishing degree and deaths from longevity, instead of being the exception, would come to be the rule. No other conclusion, at least, could be formed by any disinterested observer, who, as did the representative of the *Dispatch* yesterday, would take the time and trouble to spend seven hours within the Stock Yards and gain from personal observation a practical insight into the methods of inspection in vogue. And the man who having gained such information, would still insist upon the necessity of legislation for the interstate prohibition of the traffic in dressed beef would partly lay himself open to the charge of being certainly a fool, and perhaps a knave. The method of inspection now employed at the yards in question may be classed under three heads—State, city, and general. The State inspection is controlled by the board of stock commissioners, a body appointed by the Governor, and the duty and authority of which is defined by several acts of the Legislature. This board is represented at the Stock Yards by two agents, John McDonald and William Mitchell, both men of years and experience. Either of them can detect any sickness in an animal, however slight, almost at a glance.

The routine of the State inspectors is simple, but, in the opinion of the writer, too rough. They are expected to superintend the unloading of every consignment of cattle arriving at the yards. It is optional with them to kill instant or to quarantine any emaciated or sick animal or animals that may be found in any such consignment. Their word is law and like the laws of the Medes and Persians, unalterable. There is no appeal, and a decision once given is generally accepted with good grace by all concerned. This part of their duties is performed in the early morning when the trains come in. All the rest of the day they may be found on horseback, riding from pen to pen and closely scrutinizing the animals confined. Whenever one is found that appears to be ailing, its immediate removal to the sick pen or hospital is effected, the owner or commission merchant, as the case may be, being provided with a certificate to that effect. Nor is this all. They are required to person-

ally inspect for the third time every animal prior to its being taken to the slaughter-house, and the rules of the company operating the yards and governing their employees are so strict on this point that for a man to open his pen and allow even a single animal to go to the slaughter-house until satisfied that the proper inspection is made, is punished by the forfeiture of his position. In this connection the following extract of a law by which the inspectors are governed and under which they are clothed with police powers is of interest.

* * * * * Any person who, knowing that any contagious or infectious disease exists among his domestic animals, shall conceal such fact, or knowing of the existence of such disease, shall sell the animal or animals so diseased, or any exposed animal, or, knowing the same, shall remove such diseased or infected animals from his premises to the premises of another, or knowing of the existence of such disease or exposure, shall drive or lead or ship the same by any car or steamboat to any other place in or out of this State, and any person or persons who shall bring any such diseased, or shall knowingly bring any such exposed animal or animals into this State from another State, and any person or persons who shall knowingly buy, receive, sell, convey or engage in the traffic of such diseased or exposed stock, and any person who shall violate any quarantine regulations established under the provisions of this act, shall for each, either, any and all acts above mentioned in this section be guilty of a misdemeanor, and on conviction thereof, or of any one of said acts shall be fined in any sum not less than \$25 nor more than \$200 and imprisoned in the county jail until the fine and costs are paid.

Inspection on the hoof is also carried on under the supervision of the city health department. The three inspectors charged with this duty—and who are at present Messrs. Lamb, Root and O'Hern—are required to be practical butchers and to have a general knowledge of the diseases of animals. On both points all appointees are compelled to undergo a searching examination prior to receiving their certificates. Their duties are similar to those of the State inspectors, with whom they work harmoniously, although entirely independent. They look over the animals as they come from the cars, approve or condemn in their discretion, and kill when necessity demands. Their monthly report by days they are required to regularly file with Commissioner Wickersham, of the City Health Department. The city officers who are enrolled on the books of the Police Department and have full power to make arrests when obstructed in their duty, also make their ceaseless rounds of the pens.

So much for the inspection on the hoof. At the slaughter-house the system is even more rigorous. Every animal is closely examined by city agents as it goes through the doors. If there is anything about it that has escaped the vigilance of the other inspectors it is turned back. In the slaughtering beds the operations are superintended by one or two agents. After the animal has been killed and the hide stripped they closely examine the carcass. If any of it appears to be diseased or even bruised, it is condemned and ordered to the rendering tank. Itemized reports are duly made of the result of their acts. As for example:

Six quarters of beef, bruised. Tank.
Seven quarters beef, bruised. Tank.

Inspected on the hoof and re-inspected after killing, it might be imagined that the meat would be allowed to go to its destination without further parley. Not a bit of it. The system goes still further. On every platform where a refrigerator car is loaded, a man with a metal badge on his breast will be found standing. He is still another of the city agents whose duty it is to examine critically every carcass to be loaded for shipment, and to permit none to go into the car until by a wave of his hand or a nod of the head he indicates that it has passed the final ordeal. When the car has been filled, he locks and seals it with his own hands, and then the shipper is provided with a certificate setting

forth that the contents of the car, say No. 10, is so much dressed beef, sheep, lambs, calves or hogs, that it has been loaded under the supervision of the inspector, whose signature is attached; that it is the product of healthy animals, duly inspected alive immediately before slaughter, and also during slaughter, and that the animals in question were found to be externally and internally sound, healthy and fit for human food purposes. Then, and not till then, is the shipment allowed to go its way. A duplicate of the certificate is kept in the stub of the inspector's book, and every month he is compelled to swear that the record is correct. The general rules of the health department for the inspection of live stock and meat for the refrigerated carcass trade are very positive and specific, including the following: If there is any evidence of disease, the carcass will be rejected, and the inspector is ordered to personally see that said carcass is thrown into the rendering tanks. The inspector will be held responsible that no carcass is placed in the refrigerators except those they have inspected as above ordered, and when cars are loaded from these refrigerators an inspector will seal the closed doors of the car with his seal, and deliver to the shipper of said cars a certificate of inspection for each car which shall state the contents, the number and initials of such car, and be signed with his own hand, in ink, and he shall keep a record of such certificate on a corresponding stub. The general inspection referred to comprises that given by the stock yards employees, numbering several hundred, and who are under instructions to immediately report to the proper officers any sudden sickness that they may observe in any of the animals. Sometimes it happens that a steer or a cow is taken sick soon after the inspector has passed its pen. In such case it is the duty of the stock yard employee to drop instantly any work upon which he may be engaged, mount his horse and find the inspector, who issues the necessary order for its removal. In this way there is an extra and independent check on the inspection, and the possibility of a sick animal remaining in a healthy pen for even a single hour is reduced to a minimum. What becomes of the animals and beef condemned? may be asked. Every one of them, every pound of it, goes forthwith to the rendering house. Here a record is kept of all receipts, and this is periodically compared and footed with the reports of the inspectors. Should any discrepancy appear, explanations will be in order from the inspector. So far, however, no case of the kind has arisen.

Consequently, then, the extent of the supervision by the system now employed may be summed up as follows:

1. An inspection of the animals by the State and city authorities as they are unloaded in the yards.
2. Continuous inspection of the cattle in the pens by the State and city authorities, with the co-operation and aid of the stock yard employees.
3. Inspection of cattle in the pen by the State authorities when about to be taken to slaughter.
4. Inspection of the cattle upon arriving at the slaughter-house by the city authorities.
5. Inspection of the meat immediately after slaughtering by the city authorities.
6. Inspection of the meat while being loaded into cars by the city authorities.

It will be granted by every impartial and honest individual that the system of inspection thus roughly outlined is so rigid and complete as to fulfil every requirement. There is absolutely no loophole through which a single pound of diseased meat can get through the stock yard gate, and this fact once known and understood by the people of the States in which opponents of the industry have been the most active, the latter will be compelled to find new grounds for their opposition. It remains to be added that both the State and city inspectors have the hearty co-operation of the packers and commission men, both classes realizing that it is to their own interest to have nothing but the best product go out over their names, and that to countenance for a moment any traffic in diseased animals would simply result in practical ruin to their interests. The Humane Society also takes a general interest in the work and through its agent for a decade the veteran, William Mitchell, sees to it that while in the yards the cattle are well cared for, fed and watered and consequently kept in prime condition.

A HUMAN MAGNET.

A PHENOMENON FOR THE SCIENTISTS TO PONDER OVER.

A Baltimore correspondent writes from that city, December 4: Louis, the sixteen-year-old son of Philip Hamburger, is possessed of a mysterious power which is puzzling scientific men. This power enables him to make objects of considerable weight adhere to his finger tips, contact only being necessary. The young man, who is quite small, has been studying chemistry some time at the Maryland College of Pharmacy, and has shown his parents and friends some astonishing feats and bits of magic. By merely pressing his fully distended fingers against a heavy cane, he holds it suspended in the air for a long time. He is also able, by placing the balls of three fingers against the sides of a glass tube, to raise the weight of five pounds attached thereto. He says he has always remarked a peculiar feeling when touching small objects which are wet or greasy, and in order to get the best results in his experiments he must have both the hands and the objects dry and very clean. For this purpose he always washed his fingers in alcohol and ether and wipes them and the objects dry. In the presence of friends he gave an exhibition of his powers. The first experiment was to place a number of pins around the palm of his hands and on the tips of his fingers. On holding the palms vertically the pins are found to drop only after a long time. He next showed his ability to pick up from the table by pressing his dry finger tips against it any highly polished, smooth body, such as a pencil or a pen. Much more striking, however, was the manner in which the pen held perpendicularly stuck to the ends of his fingers. Both hands have the same remarkable power, though the right one does the better work. The tips of the fingers, which are more than unusually fleshy, are capable of the greatest feats. He touched his fingers against a glass tube three-quarters of an inch in diameter, and they stuck with such force that, as he pulled them away from it one after another, there was a click. The end of the tube thus raised was freighted with a plaster of paris block, and on this were gradually piled leaden weights until five and a half pounds were reached. This he was able to raise with the open palms. The young man loses control of his secret force when the objects become damp by perspiration or otherwise, and can only show its action on very smooth bodies. Prof. William Simon of the Maryland College of Pharmacy has developed whatever strength and remarkable powers the young man displays from the very smallest beginnings. He has hopes of making him perform yet more wonderful feats. At present he is engaged in experimenting with him in a scientific manner in order to present the case to the public in a technical journal. He has called the attention of a number of medical specialists in this city to the case, and all are at a loss to give an adequate explanation. On the 11th inst., young Hamburger, accompanied by his preceptor, will give an exhibition of his remarkable powers before the Scientific Association of the Johns Hopkins University.

CULTURE AND MUSCLE.

BOSTON PROFESSORS DISCUSSING THE ADVANTAGES OF PHYSICAL EXERCISE.

The subject of physical training in schools and colleges is receiving unusual attention at present. A conference on this subject was held in Boston, November 29th and 30th, and was participated in by President Eliot, of Harvard College; President Walker, of the Institute of Technology; Dr. Edward Hitchcock, Secretary Dickinson, of the Board of Education; the Earl of Meath, President Warren, of the Boston University; President Helen Shaefer, of Wellesley College, and others. Dr. D. A. Sargent, of Harvard College, read a

paper on the system of physical training at the Hemenway Gymnasium. He said in part: "Every student is entitled to an examination, and the most of them avail themselves of it. The student is then required to go through certain exercises, and measurements of the different portions of his body are taken. These are kept for comparisons, and to show what advance he is making. The gymnasium is now so managed that a student is not required to compete with men stronger than himself, but can exercise alone. Gentle running exercise is recommended, as it promotes circulation and starts perspiration. This renders bathing necessary, which is very important to the health of the student. Sponge, or shower baths are regarded as the best. Heavy gymnastics are no part of the college training, but are carried on by the students belonging to athletic clubs. It is believed that it is better to have 100 men strong, healthy, and athletic, than one man, or a team, who can break records. There are in Harvard College 245 students to-day, who can surpass the tests applied to the strongest men of 1880. Although attendance on the gymnasium is entirely voluntary, there are 1,200 students who make use of its advantages." Dr. Sargent expressed pleasure at witnessing so much interest taken in physical culture, but thought there was danger of its being carried to an extreme. This was to be seen in books of instruction issued by manufacturers of athletic apparatus for advertising purposes and by the advocacy of exercises requiring no apparatus. He insisted upon the necessity of a student working with the object of developing his muscles. Although he may be engaged in something else that will bring the same muscles into action, it will not have the same good results. There must also be resistance, and there must be vigor and rapidity in the movements. As many muscles as possible must be brought into action. There must be no restraints when taking exercises, as the wearing of tight clothing. Rest must follow action and there must be a change of activity. The speaker condemned all gymnastics that required constant tension, such as attitudinizing, and the compelling of children to remain in one position. He believed that it would be far better for children if they were turned loose in a carpeted room without chairs, during their periods of instruction, than to keep them in cramped positions in the school room. Another essential is the development of heat in the body. In order to realize the best results, muscular efforts should be followed by a bath and vigorous rubbing. In every kind of physical exercises, the qualities at first required are the qualities at length developed. A man can be made courageous, active, vigorous and self-reliant by appropriate physical training. The men who kick foot-balls are the very men who have to lay off after the season for rest and recreation. Those who have been the most successful in heavy gymnastics are the very ones who are subject to nervous complaints.

WATERPROOF WHITEWASH.—A waterproof whitewash is in use in Germany. The powder from three parts silicious rock (quartz), three parts broken marble and sandstone, two parts of burned porcelain clay and two parts freshly slaked lime, still warm, are mixed together. This forms a silicate if often wetted, and becomes after a while almost like stone. It is applied quite quickly to a wall or other surface and allowed to dry one day. The next day it is covered frequently with water, which makes it waterproof.

SICK HEADACHE.—Professor Stewart, after telling us that the seat of nausea is not in the stomach, but in the brain, informs us that relief from this distressing sensation may be obtained by cooling the base of the brain. He has tested this often and thoroughly in the case of a sick headache, bilious colic, cholera morbus, and other ills in which the nausea is a distressing symptom, without a single failure, and once relieved the nausea resulting from a cancer of the stomach by the application of ice to the back of the neck and occipital bone. The ice is to be broken and the bits placed between the folds of a towel. Relief may be obtained by holding the head over a sink or tub and pouring a small stream of water on the back of the neck. This is worth remembering as a relief for sick headache, to which so many women are subject.

CORRESPONDENCE.

INTERNATIONAL AGRICULTURAL EXHIBITION.

AUSTRIAN CONSULATE, NEW YORK,
November 9, 1889.

Editors AMERICAN ANALYST: I beg to announce that the Imperial Royal Agricultural Society of Vienna will hold there, in the year 1890, a General Forestal and Agricultural Exhibition. It will take place in the "Rotunda" and the adjoining park grounds of the "Prater," and will last from the 15th of May to the middle of October, perhaps to the 1st of November. The aim is to exhibit a complete picture of the present standing of all branches relating to agricultural and forestal efficiency. The management of the undertaking is in the hands of a general committee [especially selected for the purpose. The programme issued by this committee contains the following divisions, intended for international participation: Machines and implements for agriculture and forestry and their industries; for horticulture, orcharding, viticulture, and hop culture; for the breeding of poultry and bees, and the keeping of silk-worms; for dogs, and the art of hunting and fishing. Auxiliary means employed for farming, viz.: artificial manure, food produced for the market, veterinary products, etc. Models, plans, drawings and statistical dates (a) of agricultural and forestal works of melioration and engineering; (b) of the system of agricultural and forestal instruction and experimenting, literature included; (c) of the use and the sale of waste matter; (d) of the support of large cities with provisions; and, finally, (e) the division "poultry and dogs." To these divisions all foreign countries can contribute. The essential success of the exhibition through its international divisions depends to a great extent upon a numerous participation from foreign countries. I beg leave to ask you to call by means of an item in your esteemed journal the attention of those in the United States to this exhibition, in whose interest it would be to participate.

I have the honor to be, sir,

Yours most respectfully,

B. A. LITNHEL.

Consul of Austria-Hungary.

CALIFORNIA INDUSTRIES.

THE REMARKABLE PRODUCING QUALITIES OF THE
GOLDEN STATE.

(Continued.)

Santa Clara County lies south-east of San Francisco, and is separated from the Pacific Ocean by Santa Cruz County; it is twenty miles from the coast and fifty miles from San Francisco, being connected by three railroads. It has an area of one million acres. The county seat is at San Jose, a city of 25,000 inhabitants, which is only seven miles from tide water. There has been some talk of dredging Alviso slough, forming a land-locked canal which would make San Jose a sea-bound city. This county has a genial, equable and healthful climate, with a mean temperature of 55 deg. Fahr. It has a plentiful supply of water and no malaria. The main product of this county is deciduous fruits. Prunes, apricots, peaches, pears, apples, cherries, olives and almonds are the varieties mostly cultivated. There are 800,000 prune trees in this county, and several thousand acres of young fruit orchards set out. All kinds of small fruits, cereals and vegetables attain that perfection which only such a climate can give. In the mountainous parts stock raising is profitably engaged in. Dairying is also very extensively followed, and Santa Clara County cheese commands the highest price in San Francisco. Last year 28,000 tons of fruit and 125,000 gallons of wine and brandy were shipped from Santa Clara County. Manufactories are

numerous. There is a paper mill, agricultural implement works, foundries, tanneries, woolen factory, a silk factory, numerous fruit canneries, wineries, machine shops, box factory, glove factory, cigar factory, carriage shops, etc. The celebrated Palo Alto stock farm of Senator Stanford is in this county, and the Lick Observatory, on the summit of Mount Hamilton, is eighteen miles east of San Jose. During the past year there were sent from this county 8,974,430 pounds of dried fruits, 28,443,140 pounds of green fruits, and 18,675,470 pounds of canned goods. Santa Clara County has the richest quicksilver mine in America, the New Almadew. There are also large deposits of fine building sandstone. During the year 1888 there were shipped from San Jose 97 carloads of deciduous fruits, 6,635,360 pounds of fresh fruits. During 1888, 2,300,000 gallons of wine were produced in Santa Clara County. This county being contiguous to the vast pine and redwood forests of Santa Cruz Mountains, much capital is invested in lumber and milling. The largest brewery in California, the Fredericksburg, is situated here.

COSTLY DRUGS.

SOME EXPENSIVE MEDICINES OF THE MODERN
PHARMACOPŒIA.

Some medicines are very expensive. At a recent exhibition of the American Public Health Association in Brooklyn, one manufacturing chemist, E. Merck, exhibited a case of bottles about enough to fill an ordinary barrel, the total value of which was over \$30,000. The most costly drug in the case was labelled "Hom-atropine hydrobromate, cryst." It was all in one bottle, containing six pounds, and was valued at \$12,600, or at the rate of \$2,100 a pound. This drug is an alkaloid, artificially prepared from atropine. Its effects are similar to those of atropine, but not so lasting. It is a preparation of belladonna and is chiefly used in treatment of the eyes, and always in minute quantities. It expands the pupil of the eye. This substance is a striking illustration of the application of chemistry to well-known medicines. The physician does not deal so much with substances in their crude form as with the quintessences or active principles. By this means all superfluous matter is removed and only that part which is needed to be used in the healing art is given to the patient. Thus, not only have the roots, herbs, flowers, seeds, barks, juices, ores, and earths of ancient medicine been forced to give up their essential and active parts to the retort or crucible of the chemist and to reappear freed from dross or inert matter, reduced in quantity, but vastly magnified in intensity of action, but entirely new combinations of elements have been devised by chemical science and formed by chemical art; and wholly new and previously unthought of modes of action in the human organism have been achieved by some of these new formations. As the healing art has become specialized, and no one physician claims to be able to treat all ailments, so the use of special drugs for special treatment has become necessary, so that it is difficult to find even a druggist who is familiar with every one of the drugs now in the market. The United States Pharmacopœia is a huge book, with the contents of which but few are thoroughly familiar. Yet to get a list of drugs in actual use it will be necessary to study also the German Pharmacopœia and the British Pharmacopœia. In the exhibition referred to, one house showed 150 articles only out of 6,000 produced in the laboratories. Among the expensive drugs is aconitine alkaloid, an amorphous powder from aconitum napellus, produced from monkshood or wolfsbane. It is used in febrile diseases and neuralgia. A bottle of this containing about three pounds is valued at \$489.50. A bottle of anemonin containing 3¼ ounces, about the size of a pony of beer, is valued at \$191.45. There are thirteen different preparations of caffeine in small bottles at from \$16 to \$28 a bottle. This medicine has lately been applied successfully in Bright's disease. A small bottle of

chelidonine alkaloid, containing three ounces, made from tetterwort, used in skin diseases and scrofula and dropsy, is valued at \$88. Cocaine, which has the power when applied to any part of the body to render that part insensible to pain or touch during a short time, is rather an expensive drug. A bottle containing about four pounds was valued at \$420. A bottle of cantharidin crystals, the old-time blister in a new form, was valued at \$143. Codeine phosphate is a preparation of morphine used to produce sleep. A fifteen-ounce bottle of it was valued at \$135. A five-ounce bottle of cotoin, called "true cotoin," costs about \$70 an ounce. Digitalin Germaine, a powder used to decrease the action of the heart, costs about \$70 a pound. Elaterin crystals prepared from the South American Indian arrow, a poison used as a medicine in lockjaw and hydrophobia, costs \$45 an ounce. An ounce of Hyoscine hydrobromate crystals costs \$1,166.66, and 9½ ounces of hyoscyamine alkaloid costs \$1,406. These are preparations of henbane, and are considered excellent hypnotics. They are similar in general effect to atropine, but not followed by such dangerous symptoms. Among the other costly drugs in this collection were angaricin, 4½ ounces, \$43.75; colocynthin, 5½ ounces, \$114.75; conine hydrochlorate, 4½ ounces, \$98.43; cyclamin, 3¼ ounces, \$54.04; digitoxin, 1½ ounces, \$87.40; gentisin, 1½ ounces, \$91.15; heliotropin, 6 ounces, \$61.25; hydrastine hydrochlorate, 6½ ounces, \$94.80; papaverine alkaloid, a vegetable pepsin or digestive juice, found in the melon tree in tropical America, about \$120 a pound; papayolin, used as a solvent for the diphtheritic membrane, 13 ounces, \$189.58. There are various preparations from the Calabar bean that are very costly. They are used in diseases of the eye, and lockjaw. One preparation is called physostigmine alkaloid, and 4 ounces of it cost \$437.50. Physostigmine hydrochlorate crystals in a bottle about the size of a Coney Island glass of beer, containing 5¼ ounces, cost \$503.14. A small bottle of physostigmine salicylate crystals, containing three ounces, cost \$1,810.05. There is a preparation from the leaves of *taborandi pilocarpus pennatifolius* called pilocarpine nitrate crystal, used in consumption. A bottle of this containing 1 pound 6 ounces is valued at \$673.75. A preparation from quassia or bitter wood (*Picrena excelsus*) is used for dyspepsia and diarrhoea and also for worms. A small bottle of this containing ten ounces is valued at \$218.75.

ANCIENT SCIENCE.

THE SCIENTIFIC KNOWLEDGE OF THE ANCIENT GREEKS
AND ROMANS.

That we owe a great deal of our mathematical knowledge as the results reached by the ancients, is a familiar fact. It may not be so generally known that they applied their knowledge of mathematics to accomplishing practical results in the different departments of experimental science, and that many scientific appliances which are commonly supposed to be the inventions of modern genius were wholly or partly anticipated by them. In the department of mechanics they may have learned a great deal from the nation that taught them so much in other directions, the Egyptians, who must have acquired a great deal of knowledge in that line. The first Greek to whom independent mechanical inventions are attributed is Archytas of Tarentum, who was also distinguished as a general and a philosopher. He lived about 400 B. C., and was therefore a contemporary of Plato. Many of his inventions were merely mechanical toys or curiosities. Among these was a flying wooden dove, which excited great wonder and admiration. But he applied his talents to more serious and valuable ends, if those authorities are to be trusted who credit him with the invention of the pulley and screw. The first Greek to make mechanical principles the object of thorough scientific investigation was Aristotle. We are told that he knew the principle of the

parallelogram of forces, for the special case of right-angled components, and the law of virtual velocities. His knowledge of physics was, however, more theoretical than practical. Easily first among ancient Greek scientists is Archimedes, of Syracuse in Sicily, who was born about 287 B. C. He possessed inventive genius in a degree never excelled, except, perhaps, by Newton. The story is a familiar one that the discovery of the admixture of silver in a crown which Hiero had ordered to be made of pure gold, was suggested to him by the overflowing of the water when he stepped into a bath, and that he was so pleased that, forgetting to put on his clothes, he ran through the streets, shouting, "Eureka!" ("I have found it!") This complete abstraction from outward things reminds one of the stories of Newton sitting a great part of the day half-dressed on his bed, while composing the *Principia*. Archimedes was the pioneer in the study of statics, and his theory of the lever was the basis of that department of mechanics until the time of Newton, while no important addition to the principles of the equilibrium of fluids and floating bodies, as laid down by him, was made until the publication of Stevin's researches in 1608. His greatest fame in ancient times was due to his inventions of implements of war. In the second Punic War, while Marcellus was besieging Syracuse, he was said to have set fire to the Roman ships by the sun's rays, reflected from a series of mirrors. This statement, which is not mentioned by the historians Polybius, Livy or Plutarch, has been much discussed and written about in modern times. It is now generally regarded as a fiction, though one investigator, Buffon, while preparing a dissertation on the subject, succeeded in igniting wood at a distance of 150 feet by a combination of 148 plane mirrors. Of far greater real importance was the invention of "Archimedes' screw," which he devised for the purpose of pumping water from the hold of a great ship which he had built for Hiero. This instrument is also said to have been used by the inhabitants of lower Egypt for irrigating their land. Another celebrated invention of Archimedes was a sphere, representing by hydraulic power the movements of the heavenly bodies, but of this, unfortunately, we have no description. Next in rank to Archimedes were Ktesibios and Heron—or Hero, as his name is commonly written. The former was probably born in Askra, in Boeotia, in 150 B. C.; according to others, at Alexandria, a hundred years earlier. He invented a clepsydra, or water clock (which must have been of a complicated mechanism, since the hours were of different lengths at different seasons), and a water organ. He was the first to discover the elastic force of the air, and to use it as a motive power. His pupil, Heron, was more famous than his teacher, and was the author of a number of brilliant inventions, for which he has only in comparatively recent times received credit. His name is well known from the familiar pneumatic experiment called "Heron's fountain," in which a jet of water is maintained by condensed air. He also has the credit of inventing the first "steam engine," which acted exactly on the principle of "Barker's mill," except that steam, and not water, was the motive power. It consists of a boiler, having arms with lateral orifices, which were capable of revolving around a vertical axis; the steam issued from the orifices, and the uncompensated pressure upon the parts opposite these turned the boiler. He invented a double force-pump, used as a fire engine, and various other applications of the elasticity of air and steam. He did not use steam power for the performance of definite mechanical work. This was first done by Anthemius, of Tralles, in Lydia, who lived in the time of Justinian. Heron also gave his attention to the invention of mechanical toys and curiosities, and wrote a book on "How to Make Automata." Among his devices of this kind are recorded a self-lighting fire for sacrificial offerings, and an appliance for representing thunder in theatrical performances. Anthemius, who has been mentioned above, was not only a famous mathematician and architect, but somewhat of a practical joker. On one

occasion he is said to have arranged cauldrons of water in a lower room of his house, each vessel being covered with the wide mouth of a leather tube, which was conducted to the attic of his next-door neighbor, Zeno, against whom he had a grudge. The water was heated, and the steam, rising into the confined space under the roof, shook the adjacent house like a slight earthquake much to the amazement of Zeno and his family. At another time, when Zeno had friends to dine with him, the company at the table were startled by the dazzling light flashed into their faces by mirrors arranged for the purpose by the waggish Anthemius, while frightful noises, accompanying the blaze, suggested a sudden thunder storm. Philon of Byzantium, who lived some time before Heron, understood that air could be compressed or expanded, and explained correctly the working of a cupping glass. The foremost Roman in this branch of science was Vitruvius, the celebrated writer on architecture. His birthplace is not known; he lived during the first century, B. C. He invented a hoisting machine, which seems to have united the principles of the pulley and the windlass, and an odometer which measured the distance traversed on foot, or in a vehicle. The latter was practically the same in principle as the pedometers and cyclometers of the present day. He also knew and made practical use of the fact that water rises to the same height in communicating tubes of different shapes and dimensions. Frontinus, who lived in the time of Vespasian, wrote a work on "The Aqueducts of the City of Rome." In the course of his investigations, he was the first to observe that not only the size of the outlet, but also the elevation of the surface of the water above it, regulated the amount discharged in a given time, thus enrolling himself among the predecessors of Torricelli. The grammarian, Priscian, who lived at the end of the fifth century of our era, is said to have invented an hydrometer, which was, however, limited to determining which of the two fluids examined at the same time was the heavier.—*Dr. J. C. Rolfe, in Pop. Sci. News.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

December.

MEAT.—Beef, mutton, pork, venison, veal.

POULTRY AND GAME.—Chickens, fowls, ducks, geese, turkeys, grouse, capons, hare, rabbit, partridge, pheasants, pea-fowl, Guinea-fowl, snipe, widgeon, wild duck, woodcock.

FISH.—Brill, carp, cod, crabs, perch, salmon, smelts, soles, sprats, tench, turbot, whiting, halibut, sturgeon, oysters.

VEGETABLES.—Jerusalem artichokes, beets, broccoli, cabbage, carrots, celery, endive, winter spinach, eschallots, turnips.

FRUIT.—Apples, oranges, bananas, nuts.

PRACTICAL RECIPES.

CREAM OF CELERY.—Take six or eight stalks of celery and cut them into small pieces; put them into a saucepan with one red onion quartered, one blade of mace, salt, and six whole pepper-corns; add a quart of veal broth or stock, and boil one hour. Rub the ingredients through a sieve; put the pulp into a saucepan, and add one quart more of stock; boil; then draw to one side of fire to keep warm. Boil three pints of rich cream; strain it into the soup; whisk the soup at the same time (if not thick enough to suit your taste, add a little flour); taste for seasoning; pour it into a hot tureen; serve with small, square pieces of toast.

BEEF STEAK PUDDING.—Make a paste of six ounces of chopped suet and three-quarters of a pound of flour; or the same weights of butter and flour; butter a pudding basin; line it with the paste. Cut up some rump steak, with a moderate proportion of the fat; season with pepper, salt, a little chopped onion and parsley; fill the lined pudding basin with this, add a little stock or water, cover with paste, tie it over with a buttered and floured cloth; boil for three or four hours; serve with tomato sauce.

TOMATO SAUCE.—Tomatoes sliced; put them into a stewpan with a little butter, pepper, salt and a little sugar; melt them. Rub through a sieve, boil up, and improve the consistence with a little corn flour mixed in cold water.

DEVILED SOFT CLAMS.—Chop fine two bunches of clams; season with pepper, salt, butter, parsley, green pepper and a little sausage meat; add enough cracker crumbs to thicken slightly, and bake in clam shells or small dishes in which they may be served.

FRIED POTATOES.—Put two slices of fat ham in a pan, with half a sliced onion; when both are brown, remove them and put in the hot fat two cupfuls of cold boiled potatoes cut into small pieces; season with pepper and a little salt, and serve quite hot.

FIG PUDDING.—Three-quarter pounds grated bread, half a pound of figs, six ounces suet, six ounce brown sugar, one teacupful milk, one egg—nutmeg.

Figs and suet must be chopped fine. Mix bread and suet first. Then the figs, sugar, nutmeg, egg beaten well and lastly the milk. Boil in a mold (pudding steamer) four hours. Serve with sweet sauce. Orange peel is an improvement.

Sauce.—Powdered sugar and butter worked to a cream; one egg well beaten, yolk and white separately a little boiling water, wineglassful of sherry.

SPONGE CAKE.—Sift together a pint of corn meal, a quart of wheat flour, a full teaspoonful of salt, a tablespoonful of Horsford's baking powder; beat together the yolks of four eggs, half a pint of sugar, three ounces of melted butter and a pint and a half of rich milk; put the two mixtures together, add the beaten whites of two of the eggs, and bake in bread or cake tins.

HICKORYNUT MACAROONS.—To hickorynuts pounded fine add mixed ground allspice and nutmeg; make a frosting as for cakes; stir in the meats and spices, putting in enough only to make it convenient to handle; flour the hands, and make the mixture into balls about the size of a nutmeg; lay them on tins well buttered, giving room to spread; bake in a quick oven; use washed butter for greasing the tins; lard or salt butter gives an unpleasant taste.

BRACELETS.

ONE OF THE FIRST FORMS OF HUMAN ADORNMENT.

The history of the bracelet is a chapter of the history of coquetry. It is one of the most ancient of jewels. Among the Israelites the gold bracelet was used alike by the two sexes. When Juda encounters Tamar, the latter asks in exchange of favors his staff, his ring and his bracelet. When Saul had perished by his own sword, a warrior despoils him of his bracelets with which his arms were covered. "For the construction of the tabernacle," it is said in the Exodus, "both men and women offered their jewelry, among which were quantities of rich bracelets." The Greeks and Romans also wore bracelets. After a time the latter abstained from wearing them daily. They were conferred as a mark of distinction, as a souvenir of some great act, and the possessor guarded them consequently as glorious decorations, and contented himself with suspending them upon his breast on days of ceremony and triumph, in the same manner as a general to-day wears his orders and insignias. In this manner the bracelet became the insignia of the warrior. The plebeian classes, dancing

girls and others, wore them around the wrists and ankles. The Gauls were also great lovers of the bracelet. At Pont-Audemer is to be seen a magnificent gold bijou of this kind, very finely worked. It is attributed to the first part of the reign of the Merovingians. At the commencement of the sixth century no trace is found of the bracelet in France. A revolution has been effected in wearing apparel as well as morals. Ladies' wrists are ornamented with large, colored silk cuffs, embroidered with gold and pearls. This fashion ends with the Carolingians. When was the time that fashions prevailed longer than one dynasty? Later on ladies wore tight and buttoned sleeves, terminating at the wrist. In the twelfth century, Jean de Garlande specifies the works made by goldsmiths—hanaps (large cups) of gold and silver, necklaces, pins, knots and rings; but nothing is said of bracelets. Finally, "manacles" were used; they were a sort of bracelet composed of a piece of stuff upon which jewels were sewn, until finally in the last half of the 14th century, the true metal bracelet appeared. It seems that it was worn by gentlemen, although secretly, as a kind of vow, a badge of servitude which they pledged to the lady of their thoughts. The history of Jehan de Saintre, chamberlain of King Charles VI., and one of the Lady des Belles Cousines, bears witness to this. When Jehan de Saintre vows eternal fidelity to his lady, she demands of him to constantly wear an emblem of attachment. "On the first day of May, which will be to-morrow," she tells him, "you will place a gold bracelet of some kind or other on your left arm, and wear it for a year." Next day he comes with the bracelet, which he is to wear, and the lady herself puts it on. From about that time this piece of jewelry has been called "bracelet." From about the middle of the 15th century the bracelet became a distinctive piece of ornament among the French ladies. At the time of the "Directoire," the women who had adopted the fashion of wearing a

robe à la Romaine ornamented their arms with six bracelets, three on each arm—one high up, another above the elbow, the third at the wrist. This is not all, however. They also wore rings on all their fingers, including the thumb; encircled their waist with a large sheet as belt, and wore large hoops in their ears. About 1830, bracelets assumed a great importance, and ranked even with literature and painting; in other words, they became "romantic." Although it may appear rather bombastic to assign so high a place to a piece of jewelry, nevertheless, nothing will qualify so well the artistic tendencies in this direction of the goldsmiths of that epoch. Bracelets appeared on the arms of ladies, composed entirely of pointed arches, in the midst of which ironclad warriors kept watch and ward. It is easy to imagine the enthusiasm with which they were received, being so well in keeping with the tendency of the people. At present, finally, the fancy and caprice of the day dictate to the jeweller the shape, either new or copied from former ages, to be given to their bracelets; sometimes a serpent twisting itself around the wrist, gold hoops with a long jewel, a chain, etc. The shapes vary to the infinite at present, and many of them are due to the ingenuity of our jewelry designs.

PLEASANT PROSPECT.—New Yorker: "Just think of Chicago's criminal record. How could people attend a world's fair in Chicago without running the risk of being robbed and murdered?"

Chicago Man (confidently): "Oh, there won't be any danger at all then, not a particle. Just as quick as the fair opens all the robbers will stop burglarizing and go to keeping hotels."—*New York Weekly.*

PAPER EXPORTS.—The Valley Paper Company, Holyoke, Mass., has recently sent to Mexico 1,500 reams of linen paper to be made into postage stamps. It is expected that the 1,500 reams will produce about 75,000,000 of stamps. The company is also finishing several cases of linen bond paper which will be sent to France.

UTILITY OF THE SPARROWS.—To the enemies of the English sparrows, who are making an unavailing attempt to eliminate the plucky little creature from the list of European immigrants to this country, the British consul at Baltimore points out that as a result of the terrible mortality resulting from the blizzard of March, 1888, there has been an increase of grubs and caterpillars corresponding to the decrease in sparrows. The sparrows eat the larvæ of destructive insects, preferring, so to speak, the egg to the chicken; but they get little credit for their usefulness.

FAITH FOLLIES.

CURRENT EXPOSURES OF CRIMINAL CHRISTIAN SCIENCE.

Should be Made an Example of.

On the evening of November 30 an officer of the Society for the Prevention of Cruelty to Children arrested Ole E. Larssen, aged twenty-nine, of No. 23 Woodhull Street, Brooklyn, for refusing to give medicine to his child, aged three years, who was sick with diphtheria. Dr. Prendergast, one of the physicians of the Society for Prevention of Cruelty to Children, was called to attend the sick child and he prescribed for it, but the father refused to administer the remedy. He said that he simply called in the doctor to comply with the law and would do no more. "If God wishes," he said, "to give my child diphtheria, let Him do so. He knows his business best and I won't interfere. I won't give any medicine. I have another child two years old, and if God wishes to give it diphtheria it is His will and I won't interfere." It was found to be useless to reason with Larssen, who is an adherent of the faith-cure belief held by many Scandinavians, and appears to be a fatalist. The matter was brought to the attention of the Charities Department, and it was decided to treat the case as one of contagious disease, bringing it under a clause of the Penal Code. Larssen was locked up and the child was cared for.

BUFFALO LITHIA WATER

In the Uric Acid Diathesis, Bright's Disease, Chronic Inflammation of the Bladder, etc.

JAMES L. CABELL, M. D., A. M., LL. D., Professor of Physiology and Surgery in the Medical Department in the University of Virginia, and President of the National Board of Health.

"The Water of Buffalo Spring No. 2 contains in notable quantities two of the ALKALIES which are accredited as extremely valuable in the treatment of GOUT, LITHIASIS, and Liver Affections. I refer to the CARBONATES of POTASH and LITHIA.

"I have recently read with interest a paper in 'The New York Medical Journal' on the Buffalo Lithia Water in Diseases of the NERVOUS SYSTEM, in which the writer, Dr. Boyland, citing his own observations and those of other eminent physicians, ascribes to this water a special virtue as a direct tonic for the NERVOUS SYSTEM in cases of CEREBRAL exhaustion. I have only had occasion to test its effects in this direction in cases in which the NERVOUS SYMPTOMS may have been due to LITHÆMIC conditions. In these cases the relief following the use of the remedy was very decided."

Dr. WM. A. HAMMOND, of New York, Surgeon-General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the Buffalo Lithia Water in cases of affections of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION OF THE LITHIA SALTS, and is, moreover, better borne by the Stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from over-mental work—in which the condition called NERVOUS DYSPEPSIA EXISTS—and generally with marked benefit."

Dr. ROBERT BATTEY, of Georgia, SUGGESTER OF BATTEY'S OPERATION.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of CHRONIC INFLAMMATION of the BLADDER, whether induced by STONE, by enlarged PROSTATE in the aged or by NEGLECTED GONORRHOEA, AND HAVE SECURED EXCELLENT RESULTS, which encourages me to prescribe it for the future."

HUNTER MCGUIRE, M. D., LL. D., late Professor of Surgery, Medical College of Virginia, Richmond.

"BUFFALO LITHIA WATER, Spring No. 2, as an ALKALINE DIURETIC, is invaluable. In URIC ACID GRAVEL, and, indeed, in diseases generally dependent upon a URIC

ACID DIATHESIS, it is a remedy of extraordinary potency. I have prescribed it in cases of RHEUMATIC GOUT, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. WM. B. TOWLES, Professor of Anatomy and Materia Medica in the Medical Department of the University of Virginia.

"BUFFALO LITHIA WATER, No. 2, belongs to the ALKALINE or, perhaps, to the ALKALINE-SALINE Class, for it has proved far more efficacious in many diseased conditions than any of the simple ALKALINE waters.

"I feel no hesitancy whatever in saying that in GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE in the BLADDER, and in all Diseases of URIC ACID DIATHESIS, I know of no remedy at all comparable to it.

"Its effects are marked in causing a disappearance of ALBUMEN from the urine. In a single case of BRIGHT'S DISEASE OF THE KIDNEYS I witnessed decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of the disease."

Dr. THOMAS H. BUCKLER, of Paris (formerly of Baltimore), SUGGESTER OF LITHIA as a Solvent for Uric Acid.

"Nothing I could say would add to the WELL-KNOWN REPUTATION OF THE BUFFALO LITHIA WATER. I HAVE FREQUENTLY USED IT WITH GOOD RESULTS IN URIC ACID DIATHESIS, RHEUMATISM, AND GOUT, and with this object I have ordered it to Europe, from Coleman & Rogers, of Baltimore. Lithia is in no form so valuable as where it exists in the Carbonate (the form in which it is found in the BUFFALO LITHIA WATER), Nature's mode of solution and division in water which has passed through Lepidolite and Spondumine Mineral formation."

Dr. GRAEME M. HAMMOND, of New York, Professor of Diseases of the Mind and Nervous System in the New York Post-Graduate Medical School and Hospital.

"In all cases of BRIGHT'S DISEASE of the KIDNEYS I have found BUFFALO LITHIA WATER of the greatest service in increasing the quantity of urine and in eliminating the ALBUMEN. In certain cases of Melancholia, accompanied by excessive eliminations of URATES and URIC ACID, it is often the only remedy necessary. In GOUT and RHEUMATISM it is highly beneficial, and in many cases of Impotence its restorative qualities have been of undoubted assistance. I have long regarded BUFFALO LITHIA WATER as the most valuable mineral water in use."

Water in cases of one dozen half-gallon bottles, \$5.00 per case at the Springs.

THOMAS F. GOODE, Proprietor, Buffalo Lithia Springs, Virginia.

ELECTRICAL PIANO PLAYING.

ONE OF THE LATEST WONDERS IN THE FIELD OF INVENTION.

The following description of an automotor electrical pianoforte from the *Boston Transcript* of November 22d, relates to an instrument, we presume, that was some months ago in operation in the Electrical Club of this city:

"A most interesting and surprising musical novelty has just been brought before the Boston public, and the first exhibition given in this city of an entirely new invention in electricity, being nothing less than an ordinary piano, played with marvellous execution and expression by simply introducing the electric current, and if the opinion of every person who has seen and heard it be taken as an indication, this wonderful invention is bound to immediately become a potent factor in musical circles and entertainments. Apparently it was the idea of the inventor to have the electrical appliance supply exactly the place of the absent human player, but in no way to obstruct or affect the ordinary use of the piano when desired to be played in the usual way. The electric stroke is made at the back of the key, throwing it up and thereby causing the hammer to strike the string, giving exactly the same motion and effect as produced by the human player when at the keyboard, and not changing the regular working of the piano in any way. The force of the electric blow to produce a loud or soft note is under perfect control. The *modus operandi* of all this is very simple, being nothing more than the old and well-tried appliance of the magnet and armature, familiar to every one who has ever seen a telegraph ticker. We all know how strongly attractive to any piece of iron or steel the magnet becomes when a current of electricity is carried through it, and that it at once loses its power when this current is broken. By application of this law and by making and breaking the circuit the stroke is given and repeated as often as desired. A rapid, certain and durable means of producing the alternations indicated was necessary to the success of a piano that would be acceptable in this age of musi-

irresistible. Beware of imitations.

Does it hurt the Clothes?

We hear that some woman said of Pearline—"it's the greatest thing I ever saw for easy washing and cleaning, in fact it does so much I'm afraid of it." She recalls the old saying, "too good to be true."

How absurd to suppose that the universal popularity of Pearline is due to anything but wonderful merit.

How absurd to suppose that millions of women would use PEARLINE year after year if it hurt the hands or clothing.

How absurd to suppose that any sane man would risk a fortune in advertising an article which would not stand the most severe (and women are critical) tests.

That's just what Pearline will stand—test it for easy work—quality of work—forsavingtimeandlabor—wearand tear—economy—test it any way you will—but test it. You'll find Pearline irresistible. Pearline is never peddled. Manufactured only by JAMES PYLE, N. Y.

cal culture, and it is here that the inventor has immeasurably gone ahead of all other attempts in this field of invention, and produced a most ingenious and simple method of accomplishing the desired result. A spool of paper represents the music to be played; in it the notes are perforated, instead of printed as on ordinary music, and this spool is placed over the keys, the paper passing over a small rest (called the tracker board), in which are a number of holes or air channels, corresponding to the keys of the piano, and through each one of these holes the air passes to a little pneumatic, placed under the rest (one of these to each key also) and all of them enclosed in an air-tight box. As soon as the piano is set in motion, the spool revolves the paper, passes over the rest, in which are the little air channels, and when a perforation in the paper comes to correspond with a channel in the rest, a current of air is drawn into the pneumatic, expanding it to its fullest extent. On the bottom of this pneumatic is a metallic spring, and as the expansion takes place, this meets a contact point arranged for it, the circuit is completed and the stroke made. When the perforation has passed the air channel and the solid paper again covers it, the pneumatic below, relieved of the exhaust and under pressure of the spring, closes, the circuit is broken, but the instant another opening appears, the operation is repeated, and so on. In the paper music sheet the perforation marks the duration of the note and its relation to the other notes of the piece being played. The tempo is governed by the speed with which the paper passes from its spool. As this is rotated by a small wind motor, moving fast or slow, much or little air is admitted, and a single slide stop brings the entire instrument under perfect control. The electric current required to operate this instrument is very light and the voltage low, not exceeding eight volts, and is absolutely harmless under any circumstances. The method adopted to obtain this light current has been to use storage cells charged from the ordinary gravity battery or from any of the street wires, and thus supply steadily the current required. To those who have been within the fascination of this electric siren, with its rippling notes and weird harmony, stirring our pulsations with some brilliant movement of Chopin, or compelling our admiration of the delicate fingering and intricate beauties of Liszt, or the sad, sympathetic chords of Gottschalk, all given with a precision of touch and beauty of expression that must be heard to be believed and appreciated, this invention seems most wonderful, and we can only say to those who desire to be entertained, gratified and astonished: See the electric piano."

HOSPITAL REMEDIES

THE Favorite Prescriptions of the Brightest Medical Minds in the world, as used by them in the Hospitals of London, Paris, Berlin and Vienna.

ONE MEDICINE FOR ONE DISEASE.

- No. 1—Cures Catarrh, Hay Fever, Rose Cold, Catarrhal Deafness.
- No. 2—Coughs, Colds, Bronchitis, Asthma, Consumption. A Peerless Remedy.
- No. 3—Rheumatism, Gout.
- No. 4—Liver & Kidneys, Dyspepsia, Indigestion, Constipation, Brights Disease.
- No. 5—Fever and Ague, Dumb Ague, Malaria, Neuralgia.
- No. 6—Female Weakness, Irregularities, Whites. A Golden Remedy.
- No. 7—A Perfect Tonic, which gives Health, Form and Fullness, Clear Complexion, Good Blood and lots of it.
- No. 8—Nervous Debility, Loss of Power, Impotence, an incomparable remedy.

RELIABLE AGENTS WANTED.

Every bottle guaranteed to cure its special disease if CURABLE and to give permanent relief ALWAYS. Descriptive Circulars sent free on application. HOSPITAL REMEDY COMPANY, Toronto, Canada.

RUSSIAN ICE.—An ice palace according to the American and Canadian style, is to be erected in January at St. Petersburg.

PAINT FOR IRON.—It is claimed that paint made with turpentine is a better protector for iron work than when it is mixed with flaxseed oil.

FEMININE ARTISTS.—Of late years the number of women entering the profession of painting and sculpture has enormously increased in France, Germany, and Russia.

VESUVIAN VISITORS.—Two hundred a day was the average number of tourists who ascended last month the Vesuvius railway to look down into the mouth of the volcano.

EGYPTIAN COTTON.—The Egyptian cotton crop is larger this season than ever before, and the cotton is of a superior quality, though not equal to that of the United States.

PAPAL RETRENCHMENT.—The Papal stables which used to have forty horses in Pius IX.'s day, have been cut down to eight horses, and instead of a dozen carriages they have four.

POPULARIZING RELIGION.—A museum of religion, the Guimet Museum was inaugurated in Paris two weeks ago. It is intended to facilitate the study of ancient religions by means of a collection of pictures, objects of worship, and books.

GOOD FOR THE SOLE.—A new sort of boot sole has been introduced in Neuremberg, consisting of a sort of trellis of spiral metal wire, the interstices being filled with gutta percha, and rosin. They can be fitted with nails like ordinary soles, are fifty per cent. cheaper than leather, and vastly more durable.

DUDE'S SLANG.—Parisian dandies are seeking for a substitute for the word *chic*. The words *pschutt* and *vlan* have been employed in its place, and *tres swell*, *tres sport*, and *felard* are being heard now, but none is thought to be so comprehensively or universally expressive as *chic*. So *chic* shows signs of coming back to stay.

ACCOUNTED FOR.—The origin of the word "hurrah" has for some time been a theme of discussion in the press. A writer in *Public Opinion*, an English journal, expresses the conviction that "it is nothing but an enlarged form of hurr (signifying a rapid movement), and is of purely Teutonic origin." Also, that the word "hurry" is its Anglicized form.

BENEVOLENT BREWER.—A recent rival of George Peabody has appeared in Sir Edward Guinness the great brewer, who has given £250,000 to the poor of London and Dublin, to be used in the erection of artizan's dwellings—£200,000 for London and £50,000 for Dublin. The sum has been turned over to trustees, of whom Lord Rowton is the chief.

PROCESS OF CREMATION.—There are now thirty-nine crematories in various parts of the world. Italy has twenty-three, America has ten, while England, Germany, France, Switzerland, Denmark, and Sweden have one apiece. In Italy there were two cremations in 1876; the number rose to fifteen in 1877; and in 1888 the number was 226. Since 1876, 1,177 cremations have taken place in Italy, while the combined numbers from all other countries brings the total only to 1,269.

NEW ANTISEPTIC.—Saccharine is regarded by a French writer as a valuable antiseptic. A strength of 1 to 500, as an addition to mucilaginous and other solutions, prevents the formation of low organisms. Thus a valuable, inexpensive dentifrice may be prepared by simply dissolving saccharine in water, to the proportion of six per cent. A teaspoonful of this in a half-pint of water forms an admirable antiseptic mouth-wash. In cases of malignant or other disease of the stomach, requiring the washing out of that organ, a solution of saccharine of the strength of two per cent, will be found very suitable.

A BOUDOIR LAUNDRY.—Laundrymen charge 5 cents for doing up a handkerchief, but ingenious young women with an eye to economy or when placed where it is difficult to get such laundry work done, manage to get along very well by doing their own washing in a basin and by ironing the handkerchiefs by spreading them out when wet flat upon the surface of a mirror. A handkerchief spread out in that way will come off when dry with as good a polish as could be put upon it by an iron.—*Sun*.

REASONS WHY

Should be preferred to all others:

Because—It is genuine-pure, just as it existed in the hepatic cells of the living fish, not depleted of its natural virtues by any process of refining, nor weakened by being made into an emulsion with an equal quantity of water, glycerine, etc., which latter device makes water bring the price of Oil.

Because—In taste and smell it is not offensive, but instead, sweet and agreeable.

Because—Its administration is always followed by satisfactory results.

Because—It is more easily assimilated than other Oils.

Because—It is more nutritious than other Oils.

Because—Of its perfect digestibility, perfect limpidity.

Because—This perfect Oil costs consumers no more than the poorer qualities abounding in the stores.

Because—It is readily obtainable; all well-stocked Drug Stores have it.

Because—It is unquestionably the purest and best COD-LIVER OIL IN THE WORLD.

W. H. SCHIEFFELIN & CO.,
NEW YORK.

Sole Agents for U. S. and Canada.

AMERICAN RUBBER GOODS.—American made gossamers, macintoshes, and other rubber goods of that sort are said to be driving the imported goods out of the market in this country. The foreign goods, either on account of being less well made, or because the climate here does not suit them, will not wear like those made in this country and for this climate. The imported garments turn stiff and hard after a while and even come apart at the seams when heated a little, while American manufacturers are alleged to have succeeded in avoiding both these difficulties.

"HEADS AND FACES; How to Study Them."

A new Manual of Character Reading for the people, by Prof. Nelson Sizer, the Examiner
 in the phrenological office of Fowler & Wells Co., New York, and H. S. Drayton, M.D., Editor
 of the PHRENOLOGICAL JOURNAL. The authors know what they are writing about, Prof. Sizer
 having devoted nearly fifty years almost exclusively to the reading of character, and he here
 lays down the rules employed by him in his professional work.

This is a most delightful study and every one should know "How to Read Character,"
 and in this way be able to understand the motives and character of people met daily. This knowl-
 edge will enable employers to choose wisely and will enable employees to meet the requirements
 of peculiar people whom they may be required to please.

A knowledge of Human Nature would save many disappointments in social and business life.
 This is the most comprehensive and popular work ever published for the price, 75,000 copies
 having been sold. Contains 200 large octavo pages and 250 portraits. Send for it and study the
 people you see and your own character, and if you are not satisfied after examining it, money
 will be returned to you.

We will send it carefully by mail, postpaid, on receipt of price, 40 cents in paper, or \$1.00
 on heavy paper, in extra cloth binding. Agents wanted. Address

FOWLER & WELLS CO., Publishers, 777 Broadway, New York.

N. B.—If you will state where this advertisement was seen, we will send you free a sample
 copy of the PHRENOLOGICAL JOURNAL, published monthly at \$1.50 a year, 15 cents a number.

Tabasco Pepper Sauce OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by
 Pressure.

The seed of this Pepper was obtained from Central
 America, and by careful cultivation in Louisiana for many
 years has been so improved in strength, flavor and aroma, as
 to have become a new variety of Red Pepper, superior to all
 others. The pulp is so handled as to retain all the flavor,
 strength, aroma and color of the ripe fruit, and to keep un-
 impaired in any climate. It excites the appetite, promotes
 digestion, and is pronounced, by connoisseurs, to be the finest
 condiment in the world. For medicinal purposes it recom-
 mends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

Established in London, 1831.

DEAN'S PATENT ARDENTER MUSTARD.

BEST IN THE WORLD.

Ardenter Mustard Pellets

— FOR —

Dyspepsia and Indigestion.

UNIVERSALLY recommended and prescribed by physicians.
 The medicinal property are English mustard seed coated with
 pepsin and sugar. You will find it will relieve you after using
 two or three doses. It is very beneficial for Heartburn, Sour Stom-
 ach and Headache. They are a beautiful confection for children.
 Each bottle contains full directions.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wit's end what to do.

J. MILNER POTTERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dinmock, **ONLY THREE** possessed the power of acting on starch. These brands were **MALTINE**, Corbyn, Stacey & Co.'s Extract, and Keppeler's Malt Extract. **WILLIAM ROBERTS, M.D., F.R.S.**

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity.

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College. At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alternatives.	Quinia, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Ferrated.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peptones.	MALTO-VIBURNIN.
MALTINE with Pepsin and Pancreatine.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any of the Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

The Edge Hill Wine Co.,
10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.
STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

Sura Cura

TO MESSRS. WM. R. WARNER & CO.

I have used Effervescing Bromo-Soda very extensively, and can cheerfully recommend it to my professional brethren. It is of great value to those practitioners making a specialty of Nervous and Mental diseases. The addition of the grain of Caffein Hydrobromate to the thirty grains of Sodium Bromide, I think a most happy idea. I recommend your Bromo-Soda, because I have used Sodium Bromide for years instead of the Potassium Bromide. Sodium Bromide is not a foreign salt in the system, is much less depressant, can be used where the heart is extremely weak, and does not impair the integrity of the muscular tissue. Does not cause bad breath, neither does it cause acne, nor impair pharyngeal sensibility. It is much more palatable, and has the happy faculty of agreeing with the stomach, where the corresponding Potassium Salt often gives us so much trouble. I find Effervescing Bromo-Soda very valuable in cases superinduced by over-work of a mental kind. In fact, at times when overworked, I have refreshed myself with a little in water.

I use Effervescing Bromo-Soda in dessert-spoonful, rather than tea-spoonful doses, desiring to spare myself the necessity of repeating. I put this quantity in a glass not quite half full of water, order it drunk while effervescing, and find it to operate as if by magic.

J. K. BAUDY, M.D., L.L.D.,

THE NATIONAL FOOD STANDARD.

The National Food Commissioners Association, organized on November 27th in Cleveland, to which reference was made in the last issue of the AMERICAN ANALYST, is evidently desirous of avoiding some of the most marked pitfalls into which its predecessors in the same interest have invariably fallen. It is eminently an organization for the benefit of the consumer, and if it can be sustained on the line it has set out upon, it will in all probability be of great service to that much abused and persistently humbugged element of society. Not having yet received a complete copy of the constitution adopted in Cleveland, we are limited in our discussion of the movement to such points as we have been able to glean from the western newspapers. The announced object of the association is "to establish a uniform standard for the purity of human food and drink, and encourage the honest manufacturer and dealer, and protect the consumer." Anybody can become a member who is connected with a dairy and food commission of any State, or any member of a State dairy association, or any member of the National Board of Health, or of any

State board of health, or any person appointed by the governor of any State to represent the production of pure food. The following gentlemen interested in pure food were present: H. D. Sherman, State food commissioner of Iowa; H. C. Thom, Wisconsin commissioner; H. K. Loomis, assistant, and Hiram Smith, also of Wisconsin; Lovejoy Johnson, president of the Elgin, Ill., board of trade; Colonel Littler, of Chicago, president of the National Cheese, Butter and Egg Association; W. L. Eberman, assistant commissioner and chemist of Minnesota; F. A. Derthick, food commissioner of Ohio, and his assistants, Henry Talcott, of Jefferson, and John J. Geghan, of Cincinnati; John Gould, a dairy farmer, of Aurora, O.; Dr. H. D. Beckwith, of Cleveland, president of the State food commission. An invitation was extended to the governors of all States in which there is no food commission, to send delegates. George M. Sterne appeared with an appointment from the governor of Illinois, but he was not admitted as a delegate because he is an agent of a manufacturer of food, and it was the unanimous sentiment that he was not eligible. In explaining the objects of the association, Commissioner Derthick said: "There have been so-called national food commissions in the interest of pure food, but they always admitted the representatives of manufacturers of food, who sent skilled attorneys, as a rule. The meetings never resulted in any good to the people. Our organization is a new departure. We are mostly public officials, and of course represent no interest except that of the people—the producers. We want to protect the consumer, the honest manufacturer and the dealer. I have been gathering full lines of foods on the market of Ohio," continued Ohio's commissioner, "in which adulterations can be practiced, and submitted them to our chemist. Seventy-five per cent. of them were adulterated. Cream tartar from drug stores, where we usually expect to secure pure articles, had 54 per cent. of alum and 20 per cent. of corn starch. That is a very serious matter, because cream tartar is used in physicians' prescriptions."

THE GOVERNMENT ENDORSES THE "AMERICAN ANALYST."

The new Department of Agriculture has at last given reason for its existence by the issuance of a report which shows that it has been giving much time to the investigation of a subject of great popular interest, and one which has been fully exploited in these columns. It may not be quite clear to the public mind what branch of agriculture the subject of baking powder belongs to, unless it bears a relation to the digestive organs of the horny-fisted husbandman, but nevertheless the full force and ability of Secretary Rusk's bureau has been brought to bear upon this matter. The attention of the department was directed to the question by the much-advertised discussions between the proprietors of rival baking powders, in which attempts are made to demonstrate that death lurks in the oven for the householder

who does not purchase wisely. The report of the department explodes many popular fallacies. Some idea of the importance, however, of the subject investigated may be formed from the fact that over \$25,000,000 are annually expended by consumers of different varieties of baking powders. The public fight has been between powders made from cream of tartar and those made from acid phosphates, also those containing burnt ammonia and alum in conjunction with other substances. A very bitter warfare, in which fortunes have been expended, has been waged between the proprietors of these different kinds of baking powders. The Government chemists find that this windy battle has been very idle; for their conclusion, after elaborate analyses, is that none of the baking powders are injurious to health, but that they vary in leavening power as well as cost. Some have additions of carbonate of ammonia, which is not officially endorsed. One recommendation in the official report should be remembered by every housekeeper, and it is that only fresh powders should be used, those that are old and stale having no raising power worthy of mention, and being more or less injurious to the digestive organs. This is the position which the AMERICAN ANALYST has always maintained, and for which it has been unsparingly abused by unscrupulous advertisers, whose bribes it refused and whose cajolery it turned a deaf ear unto. It is, therefore, doubly pleasant to be sustained and endorsed by the United States Government.

LIGHT AND ELECTRICITY IDENTICAL.

A paper was read before a body of scientists in Heidelberg last September by Prof. H. Hertz, the purpose of which was to establish the identity of light and electricity. The scientific world has long been impressed with the belief that such identity existed, the investigation of the subject having been partially carried out by Faraday and others, but the theory seems likely to be lifted out of the domain of bare speculation by the apparently conclusive results of Prof. Hertz's experiments. The thesis supported in the lecture referred to may be thus stated—Light is an electric phenomenon in its very essence; the light of the sun as well as that of a candle or a glowworm. Suppress electricity in the universe, and light disappears; suppress the luminiferous ether, and electric and magnetic forces no longer exert any influence through space. We shall not at present quote from the paper as we prefer giving it to our readers in extenso at an early date. The gist of the subject is well set forth by the *Electrical Review*, which comments editorially on Prof. Hertz's propositions, says:—"According to these wonderful experiments, light waves and heat waves only differ from electric waves in the character of their motion—all taking place in the same medium—the ether. Hereafter optics must be studied under the head of electricity, and a log fire must be considered as an electrical generator. Electricity plays a part in our organism hitherto unsuspected.

According to the new theory, the eye itself is an electrical instrument. The undulatory theory of electricity now seems to have as good a foundation as the undulatory theory of light, so that there is but one more of the mysterious 'actions at a distance' which remains to be explained—gravity. From its very nature, Prof. Hertz thinks that an explanation must ultimately be found, and that as a result of it all we may some day find that matter itself is simply ether in motion."

AERIAL PLAY-GROUNDS.

A plan for school play-grounds, which has obtained in London for some years, has, according to a writer in the *Scientific American*, been mooted in New York in connection with new school buildings in the crowded tenement district of the east side. In these regions space is limited and dear, and the play-rooms are usually in dark and damp basements. Now it is proposed to try the experiment of having play-grounds on the roof. The plan is to carry the walls up another story, but to have no roof. In wet weather a canvas top would be spread over the room, but at all other times the children would have the full benefit of the air and the sun. This experiment has been tried in London, and has been found to work satisfactorily, and in one case a glass roof—forming a "crystal room"—was set up, to the great delight and comfort of the little ones. The *Sanitary News* declares that the aerial experiment in play-grounds will certainly be tried in connection with one of our schools.

AN IMMENSE REFINERY.

In Philadelphia, on December 9th, the work of refining sugar was begun in Claus Spreckels's immense new sugar refinery. The capacity of the refinery is 2,000,000 pounds of sugar every twenty-four hours. The actual cost of the buildings, machinery and site will amount to more than \$3,000,000. Mr. Spreckels a short time ago decided to duplicate the whole of the buildings now in operation. This will give the refinery a capacity of 4,000,000 pounds, or 2,000 tons of sugar every twenty-four hours. Work was commenced on the duplication of these buildings a month ago by the erection of a dividing fence, so that the new work now in progress will not interfere with that which is completed. This duplication of the plant will, it is expected, be completed before the end of next year.

A VALUABLE DECISION.

The English courts have lately decided that in a case "where a wound is given, which, in the opinion of

competent medical advisers, is dangerous, and the treatment which they adopt is the immediate cause of death, the party who inflicted the wound is criminally responsible." This decision was reached in a case in which it was sought to shift the responsibility, from the person who inflicted the wound, upon the doctors, who sought to save the man's life. Thus the surgeon is free from more than ordinary responsibility in treating such cases. As a result he will be inclined to undertake operations that otherwise he would not, and so give the accused a better chance of avoiding the charge of murder.

GERMAN COOKERY.

A TEUTONIC CHEF SPEAKS OUT FOR THE COOKING OF THE FATHERLAND.

The superintendent of the Liederkrantz, one of the leading German clubs of this city, Mr. L. F. Seniza, has published over his name the following discussion of the German system of preparing food for the table. Mr. Seniza says: The difference between French, Italian and German cooking is in the sauces. To an American the cooking seems of each nationality to be the same, but a foreign epicure can select the difference instantly. The average American, if he likes cooking at all, is apt to affect the French style, because to use a slang phrase of the time it is "the proper caper"—it is considered the fashion. It is astonishing, and also amusing, to a German to see what curious culinary compounds an American will devour if they only have a French name attached to them. The plainest dishes served with a poorly made sauce, are to the American taste transformed into delicious repasts if they are only called by a high-sounding French name. I have witnessed this phenomenon myself at a certain prominent New York club with which I was some years ago, officially connected. The American will tell you that German cooking is too rich, it is too heavy for him; but, mark my words, when he once becomes acquainted with first-class German cooking he will have no other. That Germans, as a nation, appreciate the value of good eating is shown by their cookery schools in the old country. These schools are for young women who want to fit themselves to be housewives. A girl may be a countess or spring from the ranks of the common people, but the customs of the country require that whoever she is she should know how to cook, wash, iron, to clean rooms, to mend the linen and to plant a garden. There is only one difference between a baroness and the child of a tradesman; the latter learns the several duties which I have mentioned in her father's house and from her mother, while the former leaves home to learn the same details of domestic services in a strange house.

An idea of what is a first-class German dinner may be obtained by glancing at the following bill of fare:

Austern.		
Bouillon in Tassen mit Pastetchen,	Gefuellte Muscheln,	
Gestreifter Barsch mit Butter sauce,		
Hamburger Kartoffeln.	Rehruecken mit Rahm sauce,	
Frische Erbsen.		
Westphalischer Schincken mit	Braunschweiger Spargel.	
Roemischer Punsch.		
Rebhuehner mit Salat und compot.		
Ice Cream.		
Obst.	Kaese.	Cafe.

I will make a few comments on this repast for the benefit of the English reader. The dinner commenced with oysters, followed by a soup containing bits of dough, something like puff paste. This is made with a pound of butter to a pound of flour, great care being taken to make it of the proper stiffness before it is put in the oven to bake for about twenty-five minutes. When it is taken from the oven it is cut into pieces representing different figures. The next dish is an entree served in mussel shells. Sometimes it is made of sweet breads, sometimes chicken, or some kind of fish chopped up fine with eggs and different spices. Then comes

striped bass. This is boiled in a liquid containing half water and half vinegar, or some lemon juice instead. By this method of boiling the fish is kept hard. The spices used in the process are pepper, onions, carrots, celery, the roots of parsley, cloves, lemons and a good deal of salt. This is served with the next dish, which is a peculiar kind of imported potato, very small and as yellow as the yolk of an egg. Then we have a saddle of venison with cream sauce. After the venison is skinned and larded it is cooked for about an hour in a very hot oven. The side pieces from the saddle are not roasted, but served with the addition of carrots, onions, celery and other vegetables that may be in season, to make a rich sauce, after it is roasted brown and has added to it some flour and some meat gravy in which it is cooked; before being sent to the table some sour cream is added to it, which, by the way, gives the name—"Rahm Sauce." The fresh peas which follow are bottled in a pot containing a little onion, pepper, salt, a spoonful or two of meat gravy (an ingredient which the cook always keeps in stock), a teaspoonful of flour and a little sugar to give the dish a good flavor. The Westphalia ham which follows is an imported article and is eaten raw. It is cut into very small and thin slices and served with a sauce of which asparagus forms the principal part. The sauce is made in liquid consisting of half asparagus gravy and half meat gravy, mixed with the yolks of eggs, sweet cream, nutmeg, and at the last a dash of vinegar or white wine; to two quarts of sauce two dinner spoonfuls of wine vinegar, or, what would be the same thing, lemon juice, might be added. This is a very fine sauce and has the appearance of mayonnaise, though it has the taste of asparagus. The Roman punch is the kind that is commonly sold in the confectioners, from whom it is generally ordered; maraschino is sometimes added to it to give it a fine taste. The dish which follows this is partridges with salad. The birds are generally baked in an oven, not more than three-quarters of an hour, as otherwise they become too dry, then we put in the pan some carrots, onions, salt; they roast a light brown and are taken out, when some meat gravy is put in the pan. To thicken the gravy, two spoonfuls of corn starch are added and the gravy is cooked not to thicken, but so as to appear brown and clear. This is used for the partridge, which is served with a salad, prepared in the usual fashion, and some kind of preserves. The dinner concludes with ice cream, fruit, cheese and coffee.

There are certain dishes of which the Germans and many Americans, too, are particularly fond, and in the making of which they are adepts. The far-famed and oft-derided sauerkraut is one of them. To make a satisfactory dish of sauerkraut the cabbage sliced for use must be good and hard, the size of the vegetable being immaterial. It must be cut very fine, and if you want a great deal must be put in a barrel with a little salt; but you can make a small quantity in a stone jar. The cabbage must be packed in very hard and tight, so tight that the liquid will remain on top. It is well to let the sauerkraut rest on a few large leaves from outside of the cabbage; leaves should also be placed on top instead of a cloth, as the taste will thus be improved. The cabbage will ferment in two or three weeks, though it may remain in the barrel much longer, and, as a consequence, become more sour. When it is taken out it should be cooked slowly for three hours, and it tastes better if a piece of fresh fat pork is put in, but not enough to spoil the color. The sauerkraut, when fresh made, is of a light color; the older it is the darker colored it becomes. It must be boiled in cold water, not more than half a potful, because if too much water is used the vegetable will lose its color. The fire should be a slow one, so that the juice or gravy will not all boil away. Some like sauerkraut when it is made fresh; others like it when it has been made and warmed over. This last method of serving it accounts for the celerity with which orders for this dish are filled at the German restaurants. The highest or "toniest" style of cooking this dish is to add to it a glass, a half bottle or a bottle of cham-

pagne, according to the quantity of the food, just before it is sent to the table. The flavor of the champagne makes one of the best of German dishes taste better still. The Hungarian goulash which is served so constantly at the down-town restaurants in New York is really nothing more than beef stew, only, of course, it is prepared much more slowly and carefully than the similar dish prepared in the American style. The ingredient in the goulash which has most to do with giving the dish its peculiar flavor is a certain kind of red pepper imported from Hungary. "German cooking," however, is an exceedingly general term. Though there are some dishes, quite a number, which are cooked in substantially the same manner by all Teutons, there is what may be called cooking peculiar to high Germans and low Germans. The last named class of foreigners have dishes prepared after their own fashion, and entirely different from anything in the culinary calendar of the high German cook. They are good dishes, all the same, but suited only, through long generations of custom, to that branch of the great German race. Some people suppose that garlic is made considerable use of in German cooking, but this is not the fact. It is used in the preparation of only a few dishes and then in a very small quantity, but German Hebrews make use of it very largely. Oil is used, especially in boiling fish, which is coated with oil when it is to be cooked in that way. Of course, Germans, like other people, eat according to taste, their fondness for the good things of the table, and their financial ability to gratify the same. The American likes a great variety of food, and the haste with which his cook prepares the dishes for his consumption is in marked contrast to the care and patience bestowed by the German cook or housewife in the preparation of a meal. The ordinary German eats but little for breakfast, a cup of coffee, some Swiss or Limburger cheese, with rye bread or a bit of sausage. He is fond of "pumpernickel" and knows that it is a wholesome food, for scientists have testified that life can be sustained by its use alone. He is fond of vegetables and stews for his dinner, of meat of all kinds, more especially *wiener schnitzel*; he cares very little for pies or puddings, but likes to sip at his principal meal either a schoppen of good Rhine wine or a glass of homely lager beer, as the condition of his pocket-book will justify.

COCOA-NUT BUTTER.

OFFICIAL REPORT ON THE SUBJECT BY CONSUL MONAGHAN, OF MANNHEIM.

German chemists discovered in the cocoa-nut a fatty substitute for butter. The discovery was made by a Dr. Schlunk, practical chemist at Ludwigshafen, just over the Rhine from Mannheim. Shortly after the discovery was made a firm was established in this city under the name of "P. Muller and Sohne," which sunk a large amount of capital in an enterprise having for its object the production of the new article, to which they have given the name of "cocoa-nut butter." The results achieved have more than justified their expectations. The firm is not able to answer its constant demands. Although in existence only one year it employs twenty-five workmen, who get from 25 to 75 cents a day, has a 40 horse-power engine and produces daily 1,000 kilograms of butter, which retails at from 55 to 65 pfennings, or from 13 to 15½ cents per pound, or 25 to 30 cents per kilogram. The nuts are obtained from almost all lands lying in the tropics, especially from the South Sea and Coral islands, Arabia, the coast countries of Africa and South America. Natives in countries where the nuts grow have for a long time used the milk of these nuts instead of food oils. It contains 60 to 70 per cent. of fat and 23 to 25 per cent. of organic substances, of which 9 to 10 per cent. is of albumen. Liebig and Fresenius had already discovered the value of the cocoa-nut oil, of fat, but did not succeed in its production as a substitute for butter. The new butter is of

a clear, whitish color, melts at from 26 to 28 degrees Celsius and contains:

Water.....	0. 008
Mineral stuffs.....	0. 0060
Fat.....	99. 9932

Total.....100. 0000

It hardens at 19 degrees Celsius. It is better adapted however, for the kitchen than for the dining room, that is for cooking purposes, than for the uses to which butter is put on our tables. It is neither disagreeable to the taste nor smell. In a country where real butter runs all the way from 25 to 30 cents per pound, and cocoa-nut butter costs but 15 cents a great future must open up before the latter. At present it is chiefly used in hospitals and other state institutions, but it is also rapidly finding its way into houses or homes where people are too poor to buy butter. The working classes are rapidly taking to it instead of oleomargarines, against which so much had been said in the papers during the last two or three years. The new butter is said to be singularly free from acids and other disturbing elements so often found in butter, especially that made from milk taken from cows diseased with tuberculosis. Here it is estimated that fully 10 per cent. of the milk-giving cows are so troubled. This absence of acids and other matter renders its digestion much easier, hence the preference already shown for the new article by hospitals and such institutions. There are those who do not hesitate to declare this new substitute as healthier and infinitely preferable to the too often bad butter brought on the markets, and not to be named in the same breath with the oleomargarines made too often from the diseased fat of horse and sheep flesh. When it is remembered that Germany has already some fifty factories making oleomargarines and other artificial butters, and that some 180,000 centners are produced annually, it will be readily seen that regular butter will have hard work to hold its own in a hundred uses against its new rivals, and especially so since the oleomargarines and artificial butters of all kinds are placed under severe, careful and watchful State inspectors. It is hoped, however, that no losses, but gains rather, will arise; for, besides the profits resulting from the new substitutes, more meat and milk, as such, will come on the markets, and consequently into use. If with Konig, we assume that the principal nutriment—albumen, fats, and carbon-hydrates—are paid for in the ratio of 5: 3: 1, i. e., a kilogram of albumen costs five times, and a kilogram of fat three times, as much as a kilogram of carbon-hydrate, we arrive by a comparison of the nutritiousness of milk with other articles of diet, at the following results: If we pay for one kilogram of milk 15 pfennings, for a mark we get 21.33 per cent. of nutriment; for 1 kilogram lard (bacon) 172 pfennings, 16.08 per cent.; for 1 kilogram fatty cheese, 162 pfennings, 14.32 per cent.; for 1 kilogram pork, 131 pfennings, 14.01 per cent.; for 1 kilogram veal, 112 pfennings, 10.33 per cent.; for 1 kilogram beef, 128 pfennings, 9.11 per cent.; for 1 kilogram eggs, 200 pfennings, 4.97 per cent. Now, if these facts are once known milk, as an article of diet, will be more in demand, and the quantities no longer needed to make butter will find their way into the families where formerly pure butter was unknown, but where its substitute, cocoa-nut butter has taken fast hold. The principal purpose of this report is to call attention to this new article with a view to intercepting its introduction from abroad as an article of import. If it is what chemists and hospital supervisors say it is, its manufacture in the United States where such vast quantities of butter are consumed, should be undertaken.

A MINT FARM.—B. G. Hotchkiss, the father of peppermint culture, handles nine-tenths of Wayne County's (N. Y.) distillation of oil, which is equivalent to saying that he virtually controls nine-tenths of this world's supply of this essential oil, for Wayne County is practically the only peppermint growing district in the world. St. Joseph's County, Mich., is the only other district where the plant is grown and distilled.

BODILY FORCE.

CALCULATION OF THE ENERGY EXPENDED IN CLIMBING A MOUNTAIN.

The physical energy or force sometimes exerted by the human body under certain conditions is known to be astounding, but no one has ever taken the trouble to put before us that force in figures. Dr. J. Buchheister has now made a most interesting calculation on the "work done" by mountaineers in ascending heights, which will serve as an illustration. Supposing a mountaineer weighing 168 pounds is making the ascent of a summit 7,000 feet high from the point of starting, he has to expend an amount of physical force found by multiplying his weight by the height to be ascended. In the case assumed a weight of 168 pounds + a height of 7,000 feet = 1,176,000 foot-pounds: or, in other words, 1,176,000 pounds have to be lifted 1 foot. This is work performed merely by the muscles of the legs; but, besides this, the contractions of the muscle of the heart have to be taken into account. Its function consists, as is well known, in propelling the blood collecting in the heart, on the one hand, into the arteries, and, on the other, into the lungs. This is effected at an initial velocity of 1½ feet per second, which represents in the case of an adult a work of 4 foot-pounds for each contraction of the heart. The pulsations of an adult are on the average 72 per minute, but in ascending heights, owing to the additional exertion, their number is increased to an extraordinary extent. Assuming, for the sake of simplicity in calculation, only 100 beats of the pulse per minute, this would give 400 foot-pounds per minute, 24,000 foot-pounds per hour, and 120,000 foot-pounds for the five hours supposed to be required in ascending a height of 7,000 feet. The work performed by the muscles in breathing, by the expansion and contraction of the chest, may also be estimated at 4 foot-pounds. Assuming, further, that the number of breathings per minute is on the average only twenty-five, although, as a matter of fact, it will be found to be higher in a mountain ascent lasting five hours, we have to add further work of 30,000 foot-pounds. The total work performed during five hours by a mountaineer consequently amounts to 1,326,000 foot-pounds. In this estimate are not included the physical force spent in overcoming the friction on the ground, the exertions to be made in keeping the body erect at dizzy heights and in dragging heavy boots and foot-irons, nor the loss of muscle power in cutting steps in the ice, not to reckon the work performed in carrying an ice axe, or the physical force exerted in crossing fresh, loose snow. Taking all these conditions into account, Dr. Buchheister arrives at the conclusion that the work done in an ascent of 7,000 feet, lasting five hours, cannot be placed at less than 1,380,000 foot-pounds.

AMERICAN FIGS.—Fig growing is becoming quite successful in the Fresno and Tulare districts (Cal.), the principal varieties being the white Adriatic and San Pedro.

EXPORTING FRUIT.—The sale of California dried fruit in England has rapidly increased during the past few years. About fifteen years ago dried apples were unknown in England, and now they may be seen in the most aristocratic shops in the West End of London. Dark, rich, natural-looking fruit brings good prices.

KANSAS SALT.—The salt industry in Southern Kansas is assuming great proportions. The salt obtained at Wellington is the purest in the world. A dozen great salt plants are already in operation, and in a few years all the salt used for ordinary purposes west of the Mississippi River will probably be supplied by Kansas.

ARTIFICIAL COFFEE.—The Prussian Minister of Industry has published an account from which it seems that the artificial coffee bean, recently discovered on sale, consists principally of lupines, and contains about half a per cent. of caffeine, derived from a slight proportion of kola nuts. The husks contain tannin and some resinous matter.

CALIFORNIA INDUSTRIES.

SOME REFLECTIONS ON THE CLIMATE OF THE GOLDEN STATE.

(Continued.)

The classification of the seasons in California as wet and dry often misleads—for while the latter is all that the term implies, the rainy season has as much of sunshine as of storm, as the records abundantly show. A brief epitome of these seasons and the attendant phenomena will be given. Beginning with the month of October, the signs of a coming change are apparent. The winds, no longer constant and from one quarter, become variable both as to direction and force, or wholly cease. Sudden blasts raise miniature whirlwinds of dust and leaves, which troop over the fields, and the stillness of the night is broken by fitful gusts, and the sudden wail of the trees as the breath of the coming winter sweeps through them. These are the recognized precursors of the season's change, and are usually followed in the first ten days of October by an inch or more of rain; and this usually by weeks of the finest weather. The effect of these first rains is magical. The dust is washed from the foliage, and is laid in the roads and fields. The air has a fresh sparkle and life. The skies are deeper azure, and the soft brown hills seem nearer and fairer than before. It is the Indian summer of the east, but instead of the soft lassitude of the dying year, here it comes with all the freshness and vigor of the new-born spring. If in this and the succeeding months there are further showers, the grass springs up on every hand, and the self-sown grain in all the fields. The hills change their sober russet for a lively green. Wild flowers appear in every sheltered nook. Hyacinths and crocuses bloom in the gardens, and the perfume of the violet is everywhere in the air. In the latter part of November the rainy season is fully established. A coming storm is now heralded by a strong, steady wind, blowing for a day or two from the southeast, usually followed by several days of rain, and these succeeded by days or weeks without a cloud—and thus alternating between occasional storms and frequent sunshine, is the weather from October to April—the rainy season of California. The amount of rain that falls, varies materially with the locality. In San Jose it is from fifteen to twenty inches, while in places not ten miles distant, twice that amount is recorded. During this period there are from thirty to forty days on which more or less rain falls; from fifty to seventy that are cloudy; the rest, bright and pleasant. These estimates will vary with particular seasons; but taking the average of a series of years, it will be found that from October to April one-half the days are cloudless, and fully three-fourths such that any out-door vocation can be carried on without discomfort or inconvenience. Cyclones and wind storms are wholly unknown, and thunder is only heard at rare intervals, and then as a low rumble forty miles away in the mountains. With the month of March the rains are practically over, though showers are expected and hoped for in April. Between the 1st and 10th of May there usually falls from one-half to three-fourths of an inch of rain. Coming as this does in the hay harvest, it is neither beneficial nor welcome. By the 1st of July the surface moisture is taken up and dissipated, and growth dependent upon this ceases. The grasses have ripened their seed, and, self-cured and dry, are the nutritious food of cattle and sheep. The fields of grain are yellow and ripe, and wait but the reaper. Forest trees and shrubs have paused in their growth. This is the vegetable world is the season of rest. This is the winter of the Valley of Santa Clara—winter, but strangely unlike winter elsewhere, for here man has interposed. Here, by art and by labor, he has reversed the processes of nature, and constrained the course of the seasons. In gardens bright with foliage and resplendent with flowers, there is spring in its freshness and beauty; while in orchards teeming with fruits and vineyards

purple with ripening grapes, summer and autumn vie for the supremacy. And so with changing beauty and ceaseless fruition, pass the seasons of this favored clime.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

December.

MEAT.—Beef, mutton, pork, venison, veal.

POULTRY AND GAME.—Chickens, fowls, ducks, geese, turkeys, grouse, capons, hare, rabbit, partridge, pheasants, pea-fowl, Guinea-fowl, snipe, widgeon, wild duck, woodcock.

FISH.—Brill, carp, cod, crabs, perch, salmon, smelts, soles, sprats, tench, turbot, whiting, halibut, sturgeon, oysters.

VEGETABLES.—Jerusalem artichokes, beets, broccoli, cabbage, carrots, celery, endive, winter spinach, eschallots, turnips.

FRUIT.—Apples, oranges, bananas, nuts.

PRACTICAL RECIPES.

BEAN SOUP.—Soak one quart dried white beans over night. In the morning drain, add two quarts water; when it boils pour the water off and add two quarts of fresh boiling water and also about a quarter of a teaspoonful soda. Boil till the beans are very soft, then press them through a sieve and return to kettle; add salt and pepper to taste and a cup of cream, or a cup of milk and a bit of butter. If it is still too thick, thin it a little with water. Serve with slice of toasted bread.

OYSTER FRITTERS.—Drain and chop fine twenty-five or thirty oysters. Beat well two eggs, add to them one cupful sweet milk, two cupfuls flour, in which is sifted one-half teaspoonful baking powder, salt and pepper. Beat this batter until smooth, add the oysters, thoroughly drained of all liquor, mix well and drop by spoonfuls into boiling fat, turn when brown and when done remove with a skimmer.

RICE BLANC MANGE WITH APPLE SAUCE.—Wash a pint of rice thoroughly; scald it with hot water, drain and cool; add to the rice a quart of rich milk, a quarter of a pound of sugar, and a saltspoonful of salt; simmer gently an hour. When done beat it with a wooden spoon. Wet an oval mould with water; press the rice in it, and keep on ice until wanted. Peel, quarter, and core five fine apples; put them in a stew-pan with three half-pints of water, three cloves, two slices of lemon, and half a pound of sugar (dissolve the sugar in the water first); simmer until the apples are tender but will not break when removed from the pan. When done strain carefully and boil down the syrup until quite thick. Now turn out the rice on a glass dish, add the apples as a border, and pour the syrup over all.

POTATO SALAD.—Boil three or four good-sized potatoes without paring. When tender peel and slice them. As soon as they are cold mix with them a very small white onion finely chopped, make a mayonnaise dressing, add to it one or two chopped pickles, if liked: pour this over the potatoes and serve.

SAUSAGES WITH WINE SAUCE.—Stick the sausages well with a fork; place them on a baking-pan in the oven; when they are nearly done take off the fat, add half a wineglassful of good Maderia or Sherry wine, put them back in the oven for a few minutes, and then dish up with the gravy over them.

MUSTARD SAUCE.—Put a teaspoonful mixed mustard into a sauce dish, mix it smooth with half a pint of milk, season to taste with vinegar and salt. In a mo-

ment or so the vinegar will turn the milk to a cream without curdling it. This will keep for a couple of days and is used on fish and cold meats.

WHITE CAKE.—One-quarter pound butter, one and one-half cupfuls powdered sugar, one cupful water, whites of four eggs, two and a half cupfuls sifted flour, two teaspoonfuls Horsford's baking powder, almond or lemon flavoring; beat the butter to a cream, add gradually the sugar, beat well, add alternately, a little at a time, one cupful flour and the water, beat well; then add carefully the well whipped egg whites, stir in lightly the rest of the flour in which the baking powder has been sifted, add the flavoring the last thing and bake in a moderate oven about three-quarters of an hour.

A USEFUL FAN.

AT ONCE A FAN, A MASK AND A TOILET CASE.

Mrs. Kendal, the actress, has invented a fan which is at once a fan and a toilet case, and should a woman be wrecked on a desert island with this fan in her hand she need not be dismayed; she will still possess the means of making herself beautiful. The sticks are of silver and the leaf of black gauze, and in the centre is a black velvet mask, like those Venetians carry at carnival time. This has two eye-holes, and when the fan is lifted to the face it is concealed, but permits one to see everything. Behind this mask can be carried on the duties for which the fan contains conveniences, for on the broad outer stick being turned back a little mirror is revealed, and underneath the other is a place that holds twelve pins, six hairpins, a tiny pair of scissors and a bit of a glove-hook. At the bottom of the fan is a silver box in which is a minute powder puff, and they do say that besides powder Mrs. Kendal carries here a bit of rouge for her ears as well. She never allows paint to touch her milky cheeks, but her ears, under the waves of her chestnut hair, are always rosy. This is an improvement on Ellen Terry's fashion of carrying a puff and red lip-paste in her handkerchief, rolled up in a ball in her pocket, and surreptitiously applying them behind another handkerchief in the midst of conversation. Bernhardt never uses such crude methods. When she makes her appearance socially she is so exquisitely painted that one is only aware of a faint glow in her cheeks. Her powder is applied after her face has been kneaded and rubbed with cream, giving it a waxy softness, and as she is not excitable, her face needs no repair by the end of the evening. The powder over the cream retains its rose-leaf delicacy and the glow has not died away or rubbed off. Mrs. Kendal's patent fan is said to be very handsome without a suggestion of what is hidden under its decoration. Last year Mrs. Kendal patented a ring, which is a circle of gold ending in two tiny knobs of gold. It fits the finger as a bangle does the arm, the white skin showing between the knobs.

ORIGIN OF FRUITS.

HISTORICAL FACTS REGARDING SOME FAMILIAR FRUITS AND VEGETABLES.

What would become of the wanderer in the deserts of Arabia and Barbary if Providence suddenly decreed the extinction of the date palm? Thousands of human beings would inevitably perish, for the inhabitants of Fezzan live wholly upon its saccharine and delicious fruit for nine months of the year. In Egypt, Arabia and Persia it forms the principal food of the people, and a man's wealth is computed by the number of date palms he possesses. When dried the fruit becomes an important commercial staple. Cakes of dates pounded and kneaded until solid enough to be cut with a hatchet supply the provision of the African caravans on their toilsome journey through the sunlit Sahara. The date stones or seeds are roasted as a substitute for cof-

fee, or ground for the sake of their oil, and the residuum given as food to cattle. All are familiar with the manner in which dates in our markets are put up. There are several kinds known to commerce, the most important being "Fard" and "Persian." The former comes principally from Arabia, and the latter, of course, from Persia. Green Peas.—Green peas were not used as food in France until the middle of the sixteenth century. Some years later their edible qualities found approbation in England. Cabbage.—The cabbage was highly esteemed by the Egyptians and was the first "course" of all their repasts. It was no less valued by the Greeks and Romans. Cato pronounced it a remedy for all evils; Erasistratus recommended it as a panacea for paralysis; and Hippocrates as a cure for colic. Asparagus, was anciently cultivated on a very extensive scale; its stems in the Roman gardens weighing three pounds each. The Cherry originally came from Cerasus, in Asia, and came to us through England, and to England through Italy. The Apricot came originally from Armenia. The Plum was anciently cultivated in Damascus, though certain species seem to have been derived from Africa. The Apple came from Asia, according to some authorities; according to others, it is African, and reached Normandy through Spain and France. It is probable that the Baldwin is of American origin. The Orange is traced from the Celestial Empire, China. The Quince came from Ceylon, in Crete, so authorities tell us. The Fig is claimed by the Athenians, as indigenous to the soil of Attica; but it was probably brought from a region further East. The Pomegranate is the fruit of a species of tree belonging to the order *myrtaceæ*. The outside rind is thin but tough, and its juice stains everything it touches with an undefined but indelible blue. The average size is about that of an orange. Within the grains are arranged in longitudinal compartments as compactly as corn on the cob and they closely resemble those of pale red corn, except that they are nearly transparent and very beautiful. They are ripe about the middle of October and remain in good condition all winter.

FOR THE CONSUMERS' BENEFIT.

A PROPOSED ORDINANCE FOR SELLING VEGETABLES IN NEW YORK BY WEIGHT.

The question of selling fruit and vegetables by weight is still being agitated in this city. In the Western States, as on the Pacific coast, that is the only method in use, and its equitable features commend it for universal adoption. The association of retail grocers in New York, has prepared an ordinance and presented it to the Board of Aldermen for passage, and the Board has referred the matter to the Law Committee. The proposed ordinance provides that "every barrel of spinach shall contain not less than forty pounds; every barrel of sprouts not less than fifty pounds; every bushel of potatoes sixty pounds; every bushel of turnips, carrots, parsnips, or beets shall contain fifty pounds; every bushel of sweet potatoes or onions shall contain fifty-five pounds; every bushel of tomatoes shall contain sixty pounds; every bag of string or wax beans shall contain not less than forty pounds; every bag of cranberry or lima beans, or green peas shall contain not less than fifty pounds; every barrel of apples and pears shall contain not less than 135 pounds, and every basket of peaches not less than 25 pounds. And every barrel, bag, box, basket and crate of vegetables and fruit offered or exposed for sale, or sold within the corporate limits of the City of New York, not otherwise provided for in the previous section, shall be labelled stamped or marked outside thereof in plain letters and numerals of at least one inch in size, with the actual and correct measurement or weight of the contents thereof." The ordinance also provides that no person shall offer for sale any vegetables or fruits, except fruits and vegetables which are bought by count, except by weight, or if sold in baskets, bags, boxes, crates or barrels, the actual weight

or measurement of contents thereof, to be marked on each basket, bag, box, crate or barrel in letters or numerals of at least one inch in size. No person shall sell, offer, or expose for sale within the corporate limits of the city of New York any vegetables or fruits in any other way than provided for in the previous sections, except such vegetables and fruits are as now by custom sold by count and not by weight or measure."

Mr. Callanan, Chairman of the Committee, which has charge of pushing the ordinance, said in reference to the matter: "It is a well-known fact that at neither wholesale or retail until very lately (and now only in potatoes) has there been any known quantity of fruits or vegetables offered for sale. A barrel of kale or spinach meant, if the goods were cheap, 40 or 50 pounds; if high, 35 or 40; either could be made to fill a barrel. The same when the consumer went to the grocery store or market, one-half peck could be made to contain five pounds or it could be filled with three; the same with all kinds of fruits and vegetables. The retail grocer could not sell by weight because he could not buy by weight; he had to guess at the measure. Complaints became so loud from every person in the trade that three years ago the Legislature passed a law that every barrel of potatoes sold should contain 172 pounds and every bushel 60 pounds; that is as far as they would go. It is the law to-day. In order to get out of this difficulty the Retail Grocers' Union determined to try and have an ordinance passed regulating their sale by weight only. It was passed last year by the Board of Aldermen and sent to Mayor Hewitt for his signature. He stated that he would sign it, as it was the only fair way to sell fruits and vegetables, but that the retail grocers excepted themselves from its provisions—they wanting to buy by weight and sell by measure. If the ordinance were amended in that respect he would sign it. It was withdrawn to be so amended, but failed for want of time to get it through the Board at its closing session. It has been amended to cover every person in this city offering fruit and vegetables for sale. It is so directly in the interest of the masses of this city and in the interest of fair and honest dealing that we cannot understand why there should be any opposition to it.

PAINTS AND PIGMENTS.

THE PRIMARY FACTS REGARDING PAINT CLEARLY EXPLAINED.

These names are applied to the prepared or unprepared compositions by which wood, stone, and other materials are coated with a preservative surface of oil mixed with an earthy matter, to give it color and consistency; also to the materials used by artists to give color to the surfaces of their pictures. The art of painting, in its primitive state, consists merely in applying such natural, mineral and vegetable colors as were spontaneously yielded, without any vehicle to render them permanent; consequently, they had to be renewed as often as they were rubbed or washed off from the surfaces to which they were applied. The paints now used are nearly all mixed in a liquid vehicle, and are applied in a liquid state. The mixing materials are varied according to the requirements of the work. Thus, for some kinds of decorative work, and for water-color drawings, gum, glue, size, or other adhesive materials dissolved in water are employed; while for the painting of buildings and for oil-paintings, oils of various kinds are used for mixing and thinning colors. Thus, for painting work exposed to the weather, it is found that linseed oil boiled with the sulphates of lead (litharge), or zinc, or with the acetate of lead (sugar of lead), is the best. The preparation of boiled oil is one requiring particular care, as it is desirable to have it bright and clear. Hence the proportions of metallic salts is much varied by different manufacturers, and by some various other ingredients added. The time of boiling and the method of filtering are also much varied. For indoor work, plain linseed oil and spirits

of turpentine are used; if a glossy surface is wished the linseed oil must be in excess; if a dull or flattened surface is the kind desired, then the quantity of turpentine must be increased. Various compounds known as driers are also used in proper amounts. For artists colors, very fine linseed oil is used, unboiled, and in small quantity, and turpentine is used to dilute them. Paints for very rough purposes, such as ship-work, are often mixed with whale oil boiled with white vitriol (acetate of zinc), litharge, and vinegar, and they are diluted with common linseed oil and turpentine. Most of the paints used for ordinary purposes are composed first of the coloring matter, then of a quantity of white lead, which with the oil are worked into paste of the shade required, and afterward thinned down with oil or turpentine, when used. The white lead which forms the basis of most paints, and by itself a color, is a carbonate and oxide of the metal produced by exposing pieces of lead to the action of the steam of acetic acid in beds of fermenting tan. It is the principal white paint used, but is liable to discoloration from the gases contained in impure atmospheres. Other white pigments are prepared from the oxide of zinc, and the carbonate and sulphate of barytes. Pale yellow is made with chromate of strontian, orange yellow with sulphuret of cadmium, while several varieties of this color are produced by chromate of lead, sulphuret of arsenic, or king's yellow, and various native earths in which silica and alumina are combined with oxide of iron. Among these are yellow ochre, Oxford, Roman, stone, orange, Indian and American ochres. Reds are either purely mineral, or they are lakes, *i. e.*, organic colors precipitated on alumina bases. Of the latter, there are madder-lakes, prepared from madder-roots, and carmine lakes prepared from cochineal; of the former, vermilion (bisulphuret of mercury), Indian red (a native oxide of iron), Venetian red (also an oxide of iron), red lead (red oxide of lead, minium). A very beautiful red is used by artists called palladium red; it is formed of ammonio-perchloride of palladium. Blues consist of the artificial ultramarine, and for artists' purposes, of the real ultramarine, also the silicate of cobalt, and for water-colors, indigo and Prussian blue. Greens are either produced by mixtures of yellows and blues, or they are made directly from the phosphates, carbonates acetates, and arsenites of copper, also from the sesquioxide of chromium, and from *terre verte*, a native mineral, consisting of iron, silica, potassa and magnesia. The last two are the best for artists. Browns are numerous and various in their composition. Decomposed peat, burned madder, burned Prussian blue, burned *terre verte*, asphalt, manganese brown, catechu, umber, (which is an oxide of iron with manganese) and mummy, or the asphalt mixed with other matter taken from Egyptian mummies, are among the best known and most used. Blacks are made of lamp-black, bone-black, proude of manganese, and blue-black, which is made of the charcoal of burned vine twigs. In all cases the coloring materials of paints require to be very finely ground, and as many are very precious, great care is required in their preparation, and several forms of mill have been invented for the purpose. The principle on which all are made is to secure the operator from all kinds of dust and exhalations, and to reduce the coloring material, if ground dry, to an impalpable powder, and if mixed with the oil, to a perfectly smooth paste.—*N. E. Grocer.*

SMOKELESS FURNACE.—A new feature in furnace building is to be introduced at the power-house being erected in Alleghany City by the Pleasant Valley Street Railway Company. The novelty consists of a smokeless furnace. It is a contrivance by which the fuel is automatically dumped into the furnaces, causing regular combustion, proper feed of air, and, it is claimed, an economy of 20 per cent. in fuel. Last of all, this very economy in the burning of the fuel makes the furnace practically smokeless. There will be six stokers placed in the new plant, and it is estimated that they will save the labor of four men. This is the first machine of its kind to be put into practical use in this section, although it has been introduced with great success in the west.

BRONCHITIS.

Bronchitis is an inflammation of the mucous membrane of the bronchial tubes. It is one of the most common diseases of our climate and exists either in an acute or a chronic form. Acute bronchitis, like other inflammatory affections of the chest, generally arises as the result of exposure to cold, particularly if accompanied with damp, or of sudden change from a heated to a cool atmosphere. The symptoms vary according to the severity of the attack, and more especially according to the extent to which the inflammatory action spreads in the bronchial tubes. The disease usually manifests itself at first in the form of catarrh, or common cold; but the accompanying feverishness and general constitutional disturbance proclaim the attack to be something more severe, and symptoms denoting the onset of bronchitis soon present themselves. A short, painful, dry cough, accompanied with rapid and wheezing respiration, a feeling of rawness and pain in the throat and behind the breast bone, and of oppression or tightness throughout the chest, mark the early stages of the disease. In some cases, from the first, symptoms of an asthmatic nature greatly aggravate the patient's suffering. After a few days, expectoration begins to come with the cough, at first scanty and viscid or frothy, but soon becoming copious and of a purulent character. In general after free expectoration has been established the more urgent and painful symptoms abate; and while the cough may persist for a length of time, often extending to three or four weeks, in the majority of instances convalescence advances and the patient is ultimately restored to health, although there is not unfrequently left a tendency to a recurrence of the disease. One of the first effects of inflammation upon the bronchial mucous membrane is to cause some degree of swelling which, together with the presence of a tough secretion closely adhering to it, tends to diminish the caliber of the tubes. The respired air, as it passes over this surface, gives rise to the dry or sonorous breath sounds, the coarser being generated in the large, and the finer, or wheezing sounds, in the small divisions of the bronchy. Before long, however, the discharge from the bronchial mucous membrane becomes more abundant and less glutinous, and accumulates in the tubes till dislodged by coughing. The respired air, as it passes through the fluid, causes the moist rales above described. In most instances both moist and dry sounds are heard abundantly in the same case, since different portions of the bronchial tubes are affected at different times in the course of the disease.

Such are briefly the main characteristics presented by an ordinary attack of acute bronchitis running a favorable course. The case is, however, very different when the inflammation spreads into, or when it primarily affects, the minute ramifications of the bronchial tubes which are in immediate relation to the air cells of the lungs, giving rise to that form of the disease known as capillary bronchitis. When this takes place all the symptoms already detailed become greatly intensified and the patient's life is placed in imminent peril in consequence of the interruption to the entrance of air into the lungs, and thus to the due aeration of the blood. The feverishness and the restlessness increase, the cough becomes incessant, the respiration extremely rapid and labored, the nostrils dilating with each effort, and evidence of impending suffocation appears. The surface of the body is pale or dusky, the lips are livid, while breathing becomes increasingly difficult, and is attended with suffocative paroxysms which render the recumbent position impossible. Unless speedy relief is obtained by successful efforts to clear the chest by coughing and expectoration the patient's strength gives way, somnolence and delirium set in, and death ensues. All this may be brought about in the space of a few days, and such cases, particularly among the very young, sometimes prove fatal within forty-eight hours.

In the earlier stages of Bronchitis, the best remedy is Ayer's Cherry Pectoral, a dose or two of which medicine, promptly administered, allays inflammation of the

mucous membrane, promotes expectoration, stops coughing, and immediately arrests the further progress of the disease. For subsequent treatment, small and frequent doses of the Pectoral should be given until every symptom of the complaint is removed—a result that is certain to follow in a very brief time, if the patient is properly cared for and protected from exposure to cold and dampness.

BUSINESS NOTES.

FOR NERVOUS PROSTRATION

Use Horsford's Acid Phosphate. Dr. W. Graeyes, Northfield, Minn., says: "I have used it in cases of nervous prostration; and also in combination with other remedies in indigestion, it has proved as satisfactory as could be expected."

GELATINE.

Mr. James Chalmers, the largest manufacturer of gelatine in the United States, if not in the world, in speaking of gelatine he says that gelatine is rapidly becoming universal as an article of food. When properly made it is delicate, refreshing and to some extent nutritious, but can only be recognized as a luxury. It is easily digested and contains sufficient nutriment to make it a desired article for invalids. As it is so universally used as an article of food either as a jelly or when combined with milk to make ice cream, charlotte, russe, blanc mange, etc., it is of the most vital importance that only the very best gelatine should be used. The increasing demand for gelatine has induced, within a few years, a large number to commence its manufacture which has caused the market to be flooded with cheap and dangerous goods which, were the consumer to realize the danger of using such gelatine, he would not accept it as a gift. It too often occurs that, finding the profits do not meet their expectations, unscrupulous manufacturers resort to purchasing cheap raw material which is decomposed. Such raw material is bought at a low figure and eventually finds its way into the market as gelatine. It is a well-known fact to a practical manufacturer of gelatine that there are no known methods whereby decomposed animal matter can be converted back to its original condition. Hence unscrupulous parties resort to the use of acids to cover such defects and destroy the putrid odor which gelatine made from such material would have when being dissolved in boiling water or milk. All gelatine having a putrid smell or an acid taste should be discarded. The greatest danger to health in using impure gelatine is when it is used as an article of food in conjunction with milk. How often do we hear of late years cases of poisoning from eating ice cream, and what is the reason? Some firms, to swell their profits, buy glue at from 12 to 15 cents per pound, and sell it as gelatine to be used in the manufacture of ice cream, etc. What is the result? Such goods are invariably impregnated with decomposed matter, and as milk is one of the most susceptible articles of food to its surroundings, we find that its coming in contact with an impure gelatine hastens decomposition in the milk, which is then converted by a chemical action into a deadly poison known as tyrotoxin, which without doubt, is the mysterious and deadly agent which has caused so many fatal results after partaking of ice cream. The meagre knowledge which scientists possess of the fabrication and composition of gelatine has very often been the cause of their erroneous conclusions when investigating the cause of sickness or death produced from eating ice cream. Gelatine is well known to be the best cultivating medium of microorganisms. It is simply appalling to think of the danger to health in using gelatine as a food unless it is absolutely pure. There are many varieties of gelatine that look handsome, but are death-dealing agents, some kinds so thoroughly impregnated with acid that they have curdled milk when amalgamated. As it would be tedious and difficult for users of gelatine to

determine the pure from the impure article it is advisable if they appreciate health, to use no gelatine but that which is branded by reputable manufacturers. A wise and safe method for those using gelatine in combination with milk, especially in making ice cream (for therein lies the greatest danger), is to make it themselves. Buy nothing but the best gelatine and other ingredients, which cost but a trifle more than that which is dangerous, thereby compelling, to some extent at least, unscrupulous parties to keep and sell nothing but pure, reliable goods which are indispensable to those who value their health. It is evident that the lesson to be drawn from this is to be sure of getting good gelatine buy only Chalmers.

ROCK AND RYE.

The celebrated prescription of Rock and Rye, or white rock candy and rye whiskey, seems to have originated with the Hon. Ellis B. Schnabel, a member of Congress from Pennsylvania, and was first published in the New York *Sun* several years ago. Mr. Schnabel claimed that he himself had been in the last stages of consumption and had been cured by this remedy. It is made as follows: Take five pounds of pure white rock candy and dissolve it in a gallon of old rye whiskey—the older the better. The whiskey must be distilled in the old-fashioned way, with a copper worm. Always get the pure white rock candy. The clear white rock is pure crystallized sugar, and saccharine matter, you know, is the most nourishing of all substances. Put your five pounds of white rock candy into a gallon of whiskey, and set it on your table. Let it remain there until the candy dissolves. A week may go by before it is absorbed by the whiskey. Whenever you pass the demijohn, stop and give it a good shaking, and have your wife and daughter or the servants do the same. In this way it will sooner dissolve, and you will find yourself the owner of a cordial, soothing and delightful, as far superior to cod liver oil as maraschino to catnip tea. Mr. Schnabel's theory of the pathology of consumption is peculiar, and not worth entering into. It will suffice to say that he claims that the condition of the lungs is similar to that of chronic ulceration, and that the rock and rye converts it into an acute inflammation, when the alcohol by oxydizing and the saccharine matter by building up the tissues will produce a cure. Be that as it may, cases are cited where this course of treatment has stopped the cough, built up the system, and the patient has rapidly gained flesh and become well. The directions for taking the mixture are: Take a sherry wine glassful on going to bed. On waking in the morning take two-thirds as much on an empty stomach. Carry a flask in your pocket, and take a spoonful a half dozen times a day, whenever you think of it. Your object should be to keep your stomach continuously employed in taking up rich and nourishing matter. The cordial will check cold night sweats, and the patient will secure long and refreshing sleep. All lung fever will disappear. You will feel no more pain in your chest; may finally become so enraptured with the elixir that you will find it difficult to drop it when its use is no longer necessary for the preservation of your health. Now, as to your diet while feeding on this elixir. You must avoid all vinegars, pickles, sour wines, malt drinks and salt provisions of all kinds. Touch fresh pork under no circumstances. Acids and fresh pork promote ulceration, and increase the very difficulty you are trying to cure. No coffee should be used, for it fevers the blood and neutralizes the agency of the saccharine matter. Drink black tea. Eat roast beef rare, broiled steaks, mutton chops well done, toasted bread, and all kinds of vegetables. One of the best articles of food is a rum omelette, made exclusively of the yolks of eggs. There is no nourishment in the white of an egg. The object is to enrich the blood. The blood is the great agent to build up weak and dilapidated constitutions, and it must be furnished with the necessary materials to reconstruct them. This treatment and diet so enriches it that it is bound to win in the end.

A Tonic

Horsford's Acid Phosphate.

A most excellent and agreeable tonic and appetizer. It nourishes and invigorates the tired brain and body, imparts renewed energy and vitality, and enlivens the functions.

Dr. H. K. Clarke, Geneva, N. Y., says:

"It has proved of great value for its tonic and revivifying influence."

Dr. J. H. Stedman, West Brattleboro, Vt., says:

"Best nerve tonic I ever used."

TO REMOVE PAINT.—Four pounds of Irish moss, 3 pounds of methylated spirit, and 3 pounds of fuller's earth are mixed with 30 pounds of water, the whole boiled, and a solution of 16 pounds of caustic soda and 16 pounds of caustic potash dissolved in 28 pounds of water added, after which the product is stirred until it is cold and has solidified to a brownish gelatinous mass. The proportions of the ingredients may be varied. The compound is used by applying it to the painted surface with a brush, allowing it to remain thus for twenty minutes to one hour, and then washing it off together with the paint that has been disintegrated by its action.

SAWDUST FILTERS.—Carbonized sawdust, saturated with certain chemical compounds, has recently been introduced into Germany as a material for filtering and at the same time discoloring liquids. Sawdust treated first with alum, and then with sodium carbonate, becomes impregnated with a precipitated aluminum hydrate which adheres firmly to it. After being well washed with a solution of barium chloride until no precipitate is given, the sodium sulphate simultaneously produced is entirely removed, and then prepared sawdust is ready for use. Colored liquids filtered with it have their color entirely removed by the formation of flakes of the aluminum hydrate present in the filtering material. A sawdust similarly saturated with the barium chloride is used for filtering liquids, from which it is required to remove calcium sulphate, and for the removal of calcium carbonate from a solution a sawdust that has been treated with magnesium sulphate and caustic soda is employed.

EXPENSIVE BRICKS.—Hollow, cast-iron bricks, if we may so term them, says the *Engineering and Building Record*, form the subject of a recent German patent granted to August Bockel, of Erfurt. As the name implies, they are made of regular form and size, the walls being 0.12 inches thick. No mortar or other binding material is to enter into their use, the fastening being effected as follows: The upper and lower sides of the bricks are provided with grooves and projecting ribs which fit into one another. There are, further, two large circular openings in the upper side of each brick, arranged to receive properly formed projections on the lower side of the brick above. One of these projections is hook-shaped, so as to give a more secure hold. A fluid is applied to the surfaces of the bricks with a brush, to make the joints air and water-tight. The non-conducting air spaces in the bricks, and the ease with which they may be put together and taken apart without injuring them, are cited as special advantages. The question of cost is not considered.

REPRODUCTION OF BACTERIA.—As regards the reproduction of the bacteria, many of them can double their numbers every hour when placed in the best conditions for their activity. In such circumstances, then, a single bacterium would, in twenty-four hours, produce no less than 16,777,220. At the end of forty-eight hours the offspring would amount to 281,500,000,000, and would fill a half pint measure—all produced in two days from a single germ measuring $\frac{1}{16000}$ of an inch. Fortunately, however, bacteria can rarely so propagate themselves; they meet with all sorts of drawbacks, and thus in spite of their enormous fertility the survivors are in a general way only enough to keep up a fair balance in nature. The diseases producing bacteria, however, have no claim upon our forbearance, and in these the enormous fecundity we cannot too closely contemplate. Some, like the bacteria of tuberculosis and glanders, propagate themselves slowly; but the great majority of the bacteria causing animal plagues will, in favorable cases, double their numbers hourly.—*Prof. Law.*

SOUTHERN PROGRESS.—The *Manufacturers' Record's* resume of new Southern industries for the first nine months of the present year shows a total of 4,053, as compared with 2,942 in 1888, 2,594 in 1887, and 1,175 in 1886, as currently recorded in the columns of that publication. These figures include 825 saw, planing and shingle mills, sash and door, stove or other wood-working enterprises, as compared with 626 in 1888, 512 in 1887 and 362 in 1886. There are also reported 10 agricultural implement factories, 61 furniture factories, and 42 carriage and wagon factories. Adding these to the mills and other wood-working establishments, a total of 938 new enterprises in nine months is given, as compared with 626 dependent upon mineral resources, including mining and quarrying, iron furnaces, machine shops and foundries, stove foundries, rolling mills, miscellaneous iron works, pipe works, etc. Flour mills, cotton mills, cotton compresses, cotton seed oil and canning factories make up a total of 405. It will thus be seen that from an industrial standpoint forestry products and manufactures therefrom greatly overshadow all other resources in the South in rapidity of development.

SOLE AGENTS,

170 & 172 William Street, New York.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it.

Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar.** It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

Vineyards at St. Helena, Napa County, Cal.
STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

For particulars address The Great American Tea Co., 31 and 33 Vesey St., New York, N.Y. P. O. Box 287.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing pure sodium—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of sulphate of soda, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

D. & P. ROCK CANDY.

Dissolved in Rye Whiskey, (5 lbs. Rock Candy in 1 gallon Whiskey), cures Coughs, Colds and Consumption. Read "A Lecture in a Horse Car," published in the New York Sun, containing an account of the celebrated case of the Hon. Ellis B. Schnable, who, while in the last stages of consumption, was entirely cured by the liberal use of Rock Candy and Rye Whiskey.

D. & P. Rock Candy in 5-lb. boxes is sold by leading confectioners, druggists, grocers and wine merchants. Not genuine unless the letters D. & P. are on the label. Full directions in every box. Send for recipe.

NEW BOOKS.

CHEMICAL TECHNOLOGY, OR CHEMISTRY IN ITS APPLICATIONS TO ARTS AND MANUFACTURES. Edited by C. E. Groves, F. R. S., and W. Thorp, B. S. Philadelphia: P. Blakiston, Son & Co.

This volume is the first of a new edition of "Chemical Technology" founded on that written by Richardson and Ronalds, and subsequently enlarged by Richardson and Watts. The latter work, having taken as its basis the German Technology of Dr. Knapp, has long been familiarly known as "Knapp's Technology." Owing to the constant advance of industrial processes, it has been found advisable to issue a new work on Chemical Technology, bringing the subject down to the present period. The series will be divided into sections, comprising Fuel; Lighting; Acids and Alkalies; Glass and Pottery; Metallurgy; Textile Fabrics; Leather; Paper, etc.; Coloring Matters and Dyes; Oils and Varnishes; Brewing and Distilling; Sugar, Starch, Flour, etc. The present volume treats of Fuel and its applications generally. Its importance demands more extended consideration than our present brief space allows, and the work will receive more adequate discussion in these columns at an early date.

HINTS ON HOUSE BUILDING. By Robert Grimshaw. Second and Enlarged Edition. New York: Practical Publishing Co.

This is a little volume whose usefulness is wholly disproportionate to its modest shape and size. Its purpose is explained in its title and amplified in its dedication "to those who board, and to those who inhabit 'flats' and

who are able to do better * * * with the earnest suggestion to Live in a House." Considering its small dimensions, the book contains a surprising amount of practical information for house buyers or builders, relating to sites, plans, proportions and dimensions of rooms, cellars, halls, materials, plumbing, heating, and everything that could be desired in connection with the important subject of which it treats.

ESSENTIALS OF PATHOLOGY AND MORBID ANATOMY. By C. E. Armand Semple. Philadelphia: W. B. Saunders.

This is the sixth of the popular series of Saunders' Question Compounds. It is a useful introduction to the subject of which it treats, and will also be found equally convenient for refreshing the memory. Its value is further enhanced by a large number of carefully executed illustrations.

MOTHER, NURSE AND INFANT. By S. P. Sackett, M. D. New York: H. Campbell & Co.

A very useful book for the guidance of young mothers. Besides containing a large amount of valuable information for nurses, it gives practical information as to the proper care of the child until it has passed through infancy. The best course to pursue in treating all the diseases of children when it is not practicable to call in a doctor or the suddenness and severity of the illness may require immediate action before the physician can arrive is clearly and fully explained. The book is well designed to supplement, not to supersede, the doctor's services and skill.

AM I JEW OR GENTILE? By Thomas A. Davies. New York: E. H. Coffin. 1889.

The purpose of this strangely entitled little volume may be gathered from the concluding paragraph, which claims that the work, if it stands the test of scholarly and scientific criticism, will open the book of "Genesis to a plain and consistent reading, with no confusion of terms in English and Hebrew dotted into the account. It will strengthen belief in the whole Scripture, where belief is now wanted, for the reason alone that the Genesis cannot be understood. It will also enable each inquirer to solve the all-absorbing question propounded: 'Am I Jew or Gentile?' For, by inspection, each one can determine to which type of the human races they belong, and can run back by the Divine law of reproduction to their origin in the creation, either in Adam or The Adam."

RUBBER ASPHALT.—Another article formerly considered worthless has been added to the useful and is known as Miner India rubber asphalt. Produced during the progress of refining tar by acid, and forms a black material very much like nary asphalt, and elastic like India rubber. Heated so that the slimy matter is reduced per cent. of its former size, a substance is produced hard like ebony. It can be dissolved in naphtha, and is an excellent non-conductor of electricity, and therefore valuable for covering telegraph wires and other purposes where a non-conducting substance is needed. Dissolved the mineral India rubber produces a good waterproof varnish. The manufacture of the material is very profitable, and pays the inventors 400 or 500 per cent.

PROTECT THE SCHOOLS.—The New York Evening Post asserts there are sixteen schools in this city not belonging to what is known as the public school system, "which are sharing in the public school moneys, and most of these are of a religious denominational cast. Among these are the Protestant Half-Orphan Asylum, the Methodist Home Missionary School, the Hebrew Orphan Asylum, and the Roman Catholic Asylum. The whole amount appropriated to the sixteen corporate schools referred to was \$97,298 last year." The bill introduced to enable the Catholic Protector to share in the School Fund of New York is therefore no new departure. But the time has arrived for a "new departure," so far as the Empire State is concerned, which shall debar any religious school, Catholic or Protestant, from receiving a dollar of the public school fund.

END OF VOLUME FIVE.

The present issue closes the Fifth Volume of the AMERICAN ANALYST. It would be superfluous to rehearse the wide and varied discussions in which its activities have been engaged throughout that period, for they are known across the breadth of the continent, and are "familiar in men's mouths as household words." And the fruits our efforts have borne are well known, too, being recognizable in the perceptibly weakening hold that sophistication now has upon our manufactured foods and beverages—a tendency that is emphasized by the collapse of the numerous notorious frauds in those departments which we have exposed and brought to public condemnation. Abuses of that kind are steadily diminishing, but their extirpation is yet far from being completed, and that special mission of the AMERICAN ANALYST remains largely unfulfilled. We shall go steadily on, however, as we have been doing, exposing the nefarious devices of adulterators and charlatans of every description, and thereby placing the public on its guard against the fraud and imposition of unscrupulous knaves. Our steadily developing circulation is constantly widening the radius of our influence, and with growing strength comes increased confidence. Our patrons will find a number of new

features which, we believe, will be in the line of improvement presented for their consideration during the coming year. This closing volume marks likewise the first year of our change from a bi-monthly to a weekly publication. The new system justified itself from the very outset. By reaching the public more frequently we have earned the commendation of both our reading and our advertising patrons, to achieve which we have cheerfully borne the increased expense the charge involved. If our issues have possibly appeared to some less comprehensive than they formerly did it must be recollected that they are now produced fifty-two times in a year instead of only twenty-four. A few figures will indicate the advantage to our readers. The volume for 1888 comprised 516 pages. The present volume contains 624 pages—an increase of 108 in all, including upwards of fifty more pages of reading matter than Volume 4 contained.

With which brief explanation we wish our readers health, prosperity and

A MERRY CHRISTMAS.

CURERS WHO MURDER.

A severe and decisive example should be made of the so-called "Faith Cure" fanatics, the accounts of whose murderous achievements are constantly confronting us in the newspapers. Theirs has proven to be a form of lunacy that is dangerous to society, and to leave them at large, free to carry on their monstrous absurdities, in defiance of law, reason and religion, would be sustaining them in their pernicious practices. Some days ago the health officers of Brooklyn made a descent upon a meeting place of Faith Curists (who style themselves the "Lodge of Faith"), and arrested several persons who were actually infected with scarlet fever and other contagious diseases. The arrested persons at once assumed the exalted air of martyrs, and their crazy companions followed them through the streets to the police station, encouraging them on the way with cries of "God will protect them" and other similar profane declarations. One of the persons arrested had a wife and a six months' old child sick with diphtheria, to both of whom he refused medical treatment. The sufferers were removed to the hospital, and their rooms as well as the "Lodge," were thoroughly disinfected. The prisoners were charged with violating the sections of the penal code that relate to the endangering of public health by causing the spread of contagious diseases. A man named Larssen was tried in Brooklyn last week for refusing to administer medicine prescribed by a physician to his seven-year-old son who had diphtheria. The doctor testified that when he found that the medicine he had ordered had not been administered he asked the father for an explanation. The latter said: "It is God's child, and He will take care of it. If He wants it He will take it." The Justice called Larssen to the stand and questioned him. "I didn't mean

break the law," said Larssen. "I wouldn't take the whole city and break the law, I was only doing God's command." "It's a singular thing," said the Justice, "that in this nineteenth century there are men who have such a foolish belief as you and your society have." "Well," said Larssen, "It's God's wish. We only believe what He tells us." "Then," said the Justice, "If your child fell into the water you wouldn't assist in rescuing it, would you?" "Oh! that would be different," replied Larssen. The accused was found guilty under sections 288 and 289 of the penal code, which make it a misdemeanor for a person willfully to omit "to perform a duty by law imposed upon him to furnish food, clothing, shelter or medical attendance to a minor," or for a person having the custody of a minor willfully to permit "the minor's life to be endangered or its health to be injured." The latest case of the kind was revealed in the death in Brooklyn on December 17th of Miss Frances W. Anderson, a young woman of nineteen, who rejected the medicines prescribed for her. The physician told the girl she had consumption and would probably die if she did not submit to medical treatment. She insisted there was nothing the matter with her, and also said that under no circumstances would she use any medicines which might be prescribed. "I am not ill," she said, "If I were it would be a sin to take medicine. Does not God say, 'I am the great physician?'" In the face of suicidal follies such as the foregoing it is to be hoped that outraged public sentiment will speedily interpose and put a peremptory end to the teaching and promulgating of a superstition so perilous to its votaries and so fatal to the young and helpless.

A SAUERKRAUT TRUST.

The startling information reaches us from Europe that a sauerkraut war is raging in Austria. It seems, such is the perverse levity of human nature with its patriotic impulses curbed down by the tyranny of effete monarchical institutions, to afford amusement to the public notwithstanding that it occasions much trouble and annoyance to the Government. The sauerkraut manufacturers of Austria constitute a close corporation or guild, whose charter was granted to them by the Empress Maria Theresa a century and a half ago. According to the terms of this document the manufacture of sauerkraut is limited to members of the guild in question, who although wealthy, are relatively few, and the Austrian appetite for sauerkraut is every year becoming more enormous. A number of unlicensed manufacturers have sprung up on all sides, who contemptuously ignore the privileges of the guild and a deaf ear to its protests. Public sympathy is altogether against the corner monopoly to keep up the price of sauerkraut, a staple of the Empire, which is demanded by the palace and cottage. The guild has been unable to obtain justice in the courts and jury as consumers of sauerkraut

being alike interested in the maintenance of a sufficient supply thereof to meet the demands of the market, and consequently opposed to the perpetuation of the monopoly. The members of the corporation have therefore drawn up a petition which was presented to the Emperor by a deputation of "sauerkrauters" a couple of weeks ago. His Majesty now finds himself in a quandary. For while on the one hand popular sympathy is against the guild, the latter is clearly entitled by the terms of its Imperial character to the exclusive rights and privileges contained therein.

RAILROAD COLOR-BLINDNESS.

It has become a well established fact that very many of the responsible trainmen employed on the railways of this country are color-blind to the extent of being unable to distinguish the colors used for railway signals. This fact was pointed out years ago by a physician employed by the Pennsylvania Railroad. Some of the railway companies in this country have all applicants for train service tested for color-blindness. The majority do not require this. Every road should require such tests, but not those usually employed, which are so complicated as to confuse men with almost perfect color vision. A railway employé has to know a light at once, without comparing it with any other color, when at work; he never has to match colors in his work, and should not be required to do so when examined. The colors actually necessary are blue, yellow, (which is the color of the railway signal white light), green, mauve and red. These are the colors for which tests are made on the London & Northwestern and other English railways, and an examiner for several roads in the Carlisle district has recently invented an ingenious and simple instrument for such tests, by the use of which the tests are made by means of colored glass and artificial light, instead of colored yarns and daylight. A piece of smoked glass over the colored glass gives the appearance of a fog. Vision for colored lights at nights is what should be most looked after.

ADULTERATION IN MASSACHUSETTS.

From the report of the Massachusetts Board of Health for 1888, we gather that their examination of spices resulted in finding twenty-eight samples of mustard adulterated out of ninety-seven examined. As however, the Massachusetts law makes no allowance for flour additions to prevent deterioration, very little value can be attached to this discovery. Of 146 samples of black pepper 40 were adulterated, and of white pepper 25 samples out of 69. Cayenne pepper only gave 6 bad samples out of 22 specimens, mace, 16 out of 54; cloves, 12 out of 130; and cassia, 13 out of 133. Of the manufactures whose spices were found more or less adulterated the names of A. C. Fitzpatrick & Co., New York; Bacon, Stickney & Co., Albany; F. H. Leggett & Co., New York; W. J. Stitt & Co., New York; and Bugbee & Brownell, Providence; appear the most prominently.

OCEAN LUXURIES.

A FORECAST OF THE STEAMER OF THE FUTURE.

She will be over a quarter of a mile in length, and will do the passage from Sandy Hook to Liverpool in 36 hours, being one night out, says *Once a Week*. She will be driven by electricity, and in such a fashion as to keep railway time, despite of storm or fog. Passages can be secured by flash photo, "Edison's patent," and the ticket will include an opera stall, or a concert ticket, or a seat in a church pew—the opera house, concert hall and church being all on board. A covered ring for horse exercise will also be provided, and a racing track for fast trotters. A baseball ground and tennis court will also form a portion of the attractions. For busi-

ness men a stock exchange will be operated, the quotations being posted from the tickers every two minutes on the vibration system. The leading papers of all countries will be reprinted each morning by the electric reflection system. A spacious conservatory, containing the choicest flowers of all climates, will afford an agreeable lounging-place, and bouquets will be provided gratis. As at Monaco and Monte Carlo, a suite of apartments will be laid out for play, to be kept open all night—a sumptuous supper with costliest wines free. English tailors and shoemakers will be in attendance, and clothes will be made and finished during the passage. The millinery department will contain the French fashions of the previous day, and costumes will be perfected while the ship is *en route*, and delivered complete on arrival at dock. Accommodations will be furnished for 10,000 passengers.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

December.

MEAT.—Beef, mutton, pork, venison, veal.

POULTRY AND GAME.—Chickens, fowls, ducks, geese, turkeys, grouse, capons, hare, rabbit, partridge, pheasants, pea-fowl, Guinea-fowl, snipe, widgeon, wild duck, woodcock.

FISH.—Brill, carp, cod, crabs, perch, salmon, smelts, soles, sprats, tench, turbot, whiting, haddock, sturgeon, oysters.

VEGETABLES.—Jerusalem artichokes, beets, broccoli, cabbage, carrots, celery, endive, winter spinach, eschallots, turnips.

FRUIT.—Apples, oranges, bananas, nuts.

PRACTICAL RECIPES.

STEWED OYSTERS.—Take a dozen medium sized oysters with their juice and add to them a small lump of butter and a little pepper and salt. Put half a pint of rich milk into a saucepan and let it boil up once, being careful not to burn it; add the oysters, butter, etc., let it boil up good just once and serve immediately.

BEEF STEW.—Cut up some soup greens composed of parsley, celery, two or three carrots and small onions, and a few potatoes, add six tomatoes and a good tablespoonful of butter, and pepper and salt. Put this in a saucepan, add a pint of water and boil for half an hour; then add half a pound of ham, two pounds lean beef cut into pieces. Cook for an hour and a half longer and serve. A wineglass of sherry may be added if desired, or a few mushrooms or hot sauce.

RICE WAFFLES.—Rub through a sieve one pint of warm boiled rice, add to it a tablespoonful of dry flour, two-thirds of a teaspoonful of salt, two teaspoonfuls of Horsford's baking powder. Beat separately the yolks and whites of three eggs; add to the yolks three gills of milk. Work it into the flour, then add an ounce of melted butter; beat the whites of the eggs thoroughly; mix the whole together. Heat the waffle iron and grease it evenly—a piece of salt pork is best for this purpose—pour the batter into the half of the iron over the range until nearly two-thirds full, cover, allow to cook a moment, then turn and brown slightly on the other side.

SPONGE CAKES.—One half pound powdered sugar, 5 ounces flour, six eggs, vanilla or lemon flavoring. Weigh the sugar and flour carefully and sift them. Beat the yolks of the eggs until they are very light and creamy, and when so beat into them a little more than one half of the sugar and the flavoring. Beat the egg whites until light, beat into them with long even strokes of the spoon the rest of the sugar, a teaspoonful at a

time. Add the flour and whites to the yolks gently in alternate spoonfuls. Grease small pans, fill with the mixture and bake in a moderate oven.

CHOCOLATE CARAMELS.—Take one pound of sugar with a cupful of fresh milk; put it in your boiling-pan and place on the fire; when it comes to the boil, add about one-fourth teaspoonful cream of tartar; when it has boiled about five minutes add one quarter pound of fresh butter and half a cake of chocolate; keep it well stirred; in a few minutes commence to try it; as soon as it gives one sharp crack remove; stir in a teaspoonful of vanilla extract and pour out, stir this very gently when putting in the vanilla, as it is liable to go grainy on account of the milk, cut it up in small squares.

JUMBLE PUDDING.—Break into pieces one dozen jumbles stale or fresh; put them into a mold and over them pour a cold custard made of two eggs and the yolks of five others, one pint milk and a little ginger flavoring. Serve with a sauce flavored with ginger.

CREAMED POTATOES.—Chop fine a little parsley, put to it three tablespoonfuls butter and some pepper and salt. When hot add a cup of cream or milk thickened with a little cornstarch or flour. Have ready some cold boiled potatoes, stir them into the cream and when quite hot serve.

COOKING REFORM.

PREPARING A MEAL IN A PAPER PULP OVEN.

An invitation sent by Mr. Edward Atkinson to a representative of the *Paper World* "to partake of a three-course lunch which will be prepared by my office-boy, who never cooked anything before, and which will be cooked with one lamp in the Aladdin oven, between the hours of 11 and 2, during which period no one will be permitted to remain in the room," was so unique and almost terrifying in its suggestion of agony for the dyspeptic that but for a stern sense of duty, somewhat reinforced, it must be confessed, by the rumors of Mr. Atkinson's wonderful achievements with his paper-pulp oven, it might have been declined. At the appointed hour one woman and seven men, all wearing a somewhat anxious look, as though uncertain what remorse (in the way of an injured stomach) might overtake them, sat down at the table with Mr. Atkinson at the head. The office-boy, a bright-looking young man about sixteen years old, had seemed somewhat doubtful of the results of his first efforts in the role of chef, and had reminded the guests several times that he did not know anything about cooking. This had not been at all reassuring; but fortunately the fears of the daring investigators were groundless. The menu was as follows:

Consomme.
Rock Bass, with its own fish sauce.
Chickens, roasted outside of some apples.
Macaroni.
Escalloped Potato.
Baked Tomato.
Bird's-Nest Pudding.
Coffee.

Of course there was present the married man who remembered "the pies his mother used to make;" but even he had little ground for unfavorable comparison. Mr. Atkinson said that his guests would undoubtedly find that the chicken had an unusual flavor, as the method of cooking retained the juices and gave the meat more of the chicken taste. This proved true. The chicken did not seem thoroughly cooked, but it was so tender as to show at once that this was an error, and although the flavor certainly was somewhat peculiar there is no doubt that one would soon become accustomed to it and even prefer it. The vegetables were, as a rule, cooked in a delicious way. The macaroni was not quite done—but this was merely an error of judgment in regard to the length of time it should remain in the oven. Some cold roast ham, which had been cooked some days before, was added

to the luncheon, and all agreed that it surpassed any ham that they had ever before eaten. The bread which was served was also delicious, and, although one loaf had been cooked three or four days before, it was still soft and sweet. Taken all in all, Mr. Atkinson's luncheon was an unquestioned success, and if the untrained office boy could achieve such results what might not be expected with an experienced cook in charge of the culinary department and the Aladdin oven—made of paper pulp!—*Paper World*.

WOMAN'S WAYS.

THE VARIED POSSIBILITIES OF THE FEMININE NATURE.

What can a woman do? She can laugh with her lips—make a man think she is the merriest cricket in the world, while her eyes are full of unshed tears and her heart is beating as if it would burst. She can forgive a great sin like an angel and talk to a man about a petty vice like an importation from the lower regions. She can fix over old frocks and wear them with a cheerful heart, that she may help somebody, and she can spend the first money that she really feels that she can use for herself in going to a matinee and on sweets, when she knows she needs a new pair of shoes. She can quiet a baby with one or two reassuring pats, when a man might almost knock the life out of it, give it a whole bottle of soothing syrup, and it would still be open eyed and aggressive. She can employ a whole day looking for a pair of suspenders for Jack, and yet in the time of trouble she could buy a mourning outfit in half an hour, and her needle would fly as if guided by electricity in sewing on a bridal gown, or a shroud for somebody's baby. She can cry out her troubles on a man's shoulder, and feel a relief that is only possible from masculine help, and ten minutes after she can laugh in that man's face and wonder what men were made for. She can be brave in time of mental trouble; she can stand by and hold the hand of some one who is suffering from physical trouble, and yet she will scream as if she were about to be killed at the suggestion of a mouse or

Beware

Peddlers and some unscrupulous grocers are offering imitations which they claim to be Pearlina, or "the same as Pearlina." IT'S FALSE—they are not.

JAMES PYLE, New York.

She reckons well

who does her housecleaning and washing (or has her servants do this work) with PYLE'S PEARLINE.

Why? Because Pearlina makes the largest saving all around; saves half the time; half the labor—more than half the wear. Do you know you don't have to rub the clothes when washed with Pearlina? This saves the woman and makes the clothes last longer (besides, they look better). What can be harder on woman's health than bobbing up and down over a wash board? What can be harder on the clothes—anything harder don't exist.

Millions of women know these facts well; it takes many millions of packages of PEARLINE to supply their demands for it. You have only to prove these facts and you'll demand it. The best way is—try it. Costs little and every grocer has it.

a beetle. She can smile over a dinner of bread and butter and tea, when that's all that she can get, and later on, when prosperity is to the fore, she can turn up her nose at any game below canvass-back duck, and wonder at people caring for anything but the best brand of Burgundy. What can't she do? I will tell you. She can never wear trousers with any grace, and she will never be able to resist either the man or the baby who has got the love of her heart.—*Sun*.

STRAW BINDER.—The Illinois State Grange offered \$10,000 for a device to bind grain with straw. Out of 40 competitors one was awarded the prize, but he declines it having received larger offers for his machine and patents.

SMOKELESS POWDER.—Captain Ledyard Ellsworth, of Hartford, Ct., is the inventor of the smokeless, noiseless powder, for the right to make and use which the German government pays \$500,000 and \$10,000 yearly for 99 years.

DRINK AND LIFE INSURANCE.—Joseph Cook gives the following letter addressed to him by the secretary of one of the principal life insurance organizations in Great Britain: "During the past sixteen years we have issued 9,345 policies on the lives of non-abstainers (and we are careful to exclude any who are not strictly temperate) and 3,396 on the lives of abstainers. Five hundred and twenty-four of the former have died, but only ninety-one of the latter, or less than half the proportionate number." Official statements show that the total abstainer has often paid in life assurance societies from 10 to 17 and 23 per cent. bonus over and above the moderate drinker, to say nothing of the hard drinker.

WHAT IS A SHEENEY? Barlett's Dictionary of Americanisms, edition of 1877, defines "sheeney, a sharp fellow looking out for some one whom he can cheat, or with whom he may drive a sharp bargain." The Slang Dictionary of New York, London, and Paris, edition of 1881, defines sheeney as a Jew thief, a low Jew. We are indebted to Mr. J. J. Noah of Washington, D. C. son of the late Mordecai M. Noah of New York city, one of the best authorities upon all matters relating to the Hebrew race for the following: Consult the Hebrew alphabet for letters "Sheen" and "Seen." Sheeney is a slang term originally applied by the cockneys of London to the Jews in Petticoat Lane, and other low quarters where the Jews of the common grade congregated in old times and dealt in second-hand clothing and other wares. It has no significance, philologically considered, and probably arose from some peculiar adaptation of the Hebrew letters "Sheen" and "Seen," "S" and "Sh."

HOSPITAL REMEDIES

THE Following Prescriptions of the Brightest Medical Minds in the world, as used by them in the Hospitals of London, Paris, Berlin and Vienna.

ONE MEDICINE FOR ONE DISEASE.

No. 1—Cures Catarrh, Hay Fever, Rose Cold, Catarrhal Deafness.

No. 2—Coughs, Colds, Bronchitis, Asthma, Consumption. A Peerless Remedy.

No. 3—Rheumatism, Gout.

No. 4—Liver & Kidneys, Dyspepsia, Indigestion, Constipation, Brights Disease.

No. 5—Fever and Ague, Dumb Ague, Malaria, Neuralgia.

No. 6—Female Weakness, Irregularities, Whites. A Golden Remedy.

No. 7—A Perfect Tonic, which gives Health, Form and Fullness, Clear Complexion, Good Blood and lots of it.

No. 8—Nervous Debility, Loss of Power, Impotence, an incomparable remedy.

RELIABLE AGENTS WANTED.

Every bottle guaranteed its special disease to give permanent results.

OUR MILITIA FORCE.—The registered State militia of the United States is 99,201. The number of men available for military duty in case of war is 8,331,227.

THE PEANUT SUPPLY.—The demand for peanuts has trebled in the past few years, and the crop has never been sufficient to supply the demand.

PARIS BREAD.—The 1,880 bakers of Paris are reported as using up close upon two million sacks of flour annually—equivalent to 13,300,000 bushels of wheat.

ARTIFICIAL GLOW WORMS.—An inventor named O. L. McClellan, of New York, has succeeded in reproducing artificially the light of the glow worm. The production of this illuminant means the utilization of energy without material waste and without heat.

ETHER MOTOR.—M. de Susini, a Corsican doctor, has, it is asserted, constructed a motive apparatus or propeller of 20 horse-power, which is worked by sulphuric ether—a result which the doctor anticipates will realize a saving of 65 per cent. of the combustible material at present employed for setting machinery in motion.

ELECTRIC WELDING.—The electric current has recently been employed in welding metal and tempering steel springs. An American electrician has also devised a method of expanding hoops and wheel-tires by heating them with the current. It is claimed for the new process that the heat is more uniformly distributed than with gas furnaces or piles of embers. The current is brought by wires connected to opposite points on the tire, and divides equally through each half of the ring.

VASELINE AND WATER.—According to M. Klebs, of Brussels, the inconvenience sometimes experienced in dispensing through the immiscibility of vaseline and water may be overcome by the aid of castor oil. The addition of this oil in the proportion of two drops to a gramme of liquid he has found to be sufficient to produce a perfectly homogeneous mixture. By this means potassium iodide may be introduced into an unguent without danger of the decomposition that takes place after a time when fat is used.

POTATO SOAP.—*L'Industrie Parisienne* states that in many of the laundries of Paris boiled potatoes are preferred to soap for cleansing soiled linen. The journal does not state how the tubers are used.

CRACKS IN STOVES.—Make a putty of reduced iron (iron by hydrogen) and a solution of sodium or potassium silicate, and force it into the crack. If the crack be a very narrow one, make the iron and silicate into a paste instead of putty. This material grows firmer and harder the longer the mended article is used.

TO COPY ENGRAVINGS.—To make a fac-simile of an engraving expose it in a warm, closed box to the vapor of iodine, then place it, inside downwards, on a smooth, dry sheet of clean white paper, which has been brushed with starch water. After the two prepared surfaces have been in contact for a short time a fac-simile of the engraving will be reproduced more or less accurately, according to the skill of the operator.—*British and Colonial Druggist*.

SOLID NATURAL GAS.—A dispatch to the Cleveland (O.) Press from Anderson, Ind., says the process of condensing natural gas, invented and patented by Adrian Hill, of this city, is attracting widespread attention. Every mail brings letters from capitalists inquiring into the merits of the invention. The great possibilities of it have attracted the attention of the Standard Oil Company, and representatives of that corporation from Cleveland and New York have made the inventor flattering propositions should the plan prove a success. Hill said there could be no doubt as to the possibility of his process. He is now engaged in the construction of necessary apparatus, and will shortly give a practical exhibition by reducing a quantity of natural gas into solid substance. The process itself, as well as the machinery needed to carry it out, is very simple. Gas, when transformed into solid matter, is not dangerous to handle. Its expansive force is very great, and when the substance becomes heated above a certain degree it will become very volatile, and will burst an ordinary cask or can, but the heat is gradual, and the gas does not explode. The inventor claims that with a ten-horse power engine he can reduce enough gas in one day to supply a city of fifty thousand inhabitants with fuel for twenty-four hours.

REASONS WHY

Should be preferred to all others:

Because—It is genuine-pure, just as it existed in the hepatic cells of the living fish, not depleted of its natural virtues by any process of refining, nor weakened by being made into an emulsion with an equal quantity of water, glycerine, etc., which latter device makes water bring the price of Oil.

Because—In taste and smell it is not offensive, but instead, sweet and agreeable.

Because—Its administration is always followed by satisfactory results.

Because—It is more easily assimilated than other Oils.

Because—It is more nutritious than other Oils.

Because—Of its perfect digestibility, perfect limpidity.

Because—This perfect Oil costs consumers no more than the poorer qualities abounding in the stores.

Because—It is readily obtainable; all well-stocked Drug Stores have it.

Because—It is unquestionably the purest and best COD-LIVER OIL IN THE WORLD.

W. H. SCHIEFFELIN & CO.,
NEW YORK.

Sole Agents for U. S. and Canada.

A NEW FRUIT.—Carlton Bailey, of San Mateo, Fla., who is in Baltimore looking after the orange interests of his father, Alfred Bailey, brought to "The Sun Office" several specimens of a fruit new in America. It is called "Kumquat," and is of the citrus family and of the orange variety. The fruit is about the size of an ordinary persimmon, and is oblong; otherwise it very much resembles the ordinary orange. The seed was imported from China three years ago and planted by Mr. Bailey. The tree is about ten feet high, very prolific, and its foliage is a darker green than the ordinary orange.—*Balt. Sun*.

BLAIR'S PILLS.

Great English Remedy for Gout, Rheumatism and Kidney Complaints.

Sure, Prompt and Effective. Oval round box 14 pills. At all druggists, and 224 William St., New York.

 Mrs. SARAH S. McELRATH, 393 Degraw Street, Brooklyn, N. Y.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

The Only Perfect Substitute for Mother's Milk.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructive by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, **ONLY THREE** possessed the power of acting on starch. These brands were **MALTINE**, Corbyn, Stacey & Co.'s Extract, and Keppeler's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alternatives.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Ferrated.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peptones.	MALTO-VIBURNIN.
MALTINE with Pepsin and Pancreatine.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analysis by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

The Edge Hill Wine Co.,

10 BARCLAY ST., N. Y.

Vineyards at St. Helena, Napa County, Cal.

STRICTLY PURE WINES ONLY.

LETTER FROM COL. ROBERT G. INGERSOLL.

"I have been using some of the wines produced by the Edge Hill Vineyard Company and have found them excellent. The Sauterne is superb—much better than most of the imported that costs five times as much. The same is true of the Claret and the Riesling. The time is soon coming when Americans will know enough to appreciate the wines of their own country. Most people judge of wines, not by what is in, but by what is on the bottle. They taste the label, and then they are not positive that they like it until they know the cost. If you could only manage to have the Edge Hill Wines imported, they would taste as good then to the 'judges' as they do to me now."

Yours truly, R. G. INGERSOLL.

Sura Cura

To MESSRS. WM. R. WARNER & CO.

I have used Effervescing Bromo-Soda very extensively, and can cheerfully recommend it to my professional brethren. It is of great value to those practitioners making a specialty of Nervous and Mental diseases. The addition of the grain of Caffein Hydrobromate to the thirty grains of Sodium Bromide, I think a most happy idea. I recommend your Bromo-Soda, because I have used Sodium Bromide for years instead of the Potassium Bromide. Sodium Bromide is not a foreign salt in the system, is much less depressant, can be used where the heart is extremely weak, and does not impair the integrity of the muscular tissue. Does not cause bad breath, neither does it cause acne, nor impair pharyngeal sensibility. It is much more palatable, and has the happy faculty of agreeing with the stomach, where the corresponding Potassium Salt often gives us so much trouble. I find Effervescing Bromo-Soda very valuable in cases superinduced by over-work of a mental kind. In fact, at times when overworked, I have refreshed myself with a little in water.

I use Effervescing Bromo-Soda in dessert-spoonful, rather than tea-spoonful doses, desiring to spare myself the necessity of repeating. I put this quantity in a glass not quite half full of water, order it drunk while effervescing, and find it to operate as if by magic.

J. K. BAUDY, M.D., L.L.D.,

Professor of Nervous and Mental Diseases,
 Missouri Medical College,
 St. Louis, Mo.
